The cassette player is turned off by ejecting the tape, turning the power knob (upper knob) to the "OFF" position or rotating the ignition lock cylinder to "LOCK," "OFF," or "START". When this occurs, the tape player will either eject the cassette automatically or the internal tape drive and roller will retract automatically. This is to protect the tape player and cassette tape.

For the best operation of the cassette player, do not use cassette tapes longer than 30 minutes per side (60 minutes total, both sides).

TAPE DIRECTION INDICATORS

The direction the tape is being played is indicated by indicator arrows. When the indicator arrow on the left side is on, the tape direction is to the left. When the indicator arrow on the right side is on, the tape direction is to the right.

ETR® AM-FM STEREO/CASSETTE (UN6)

Radio Operation BUICK

Figure 3

POWER

Turn the volume knob to turn radio on and off.

UPPER KNOB

Turn the rotary rocker knob clockwise to increase volume. Turn it counterclockwise to decrease volume. The control ring behind the knob is the balance control. Turn the ring clockwise to move speaker balance to the right and counterclockwise to move speaker balance to the left.

LOWER KNOB

Turn the knob to manually select radio stations. Push the knob to get AM or FM. The control ring behind the lower knob fades the sound between the front and rear speaker assemblies.

STATION PRESET SETTING

To preset six AM stations and six FM stations:

1. Tune in desired station.
2. Depress the desired preset for at least two seconds. The audio will be muted and no channel number will be displayed during this time-out period, after which audio is returned and the channel number is displayed, signaling the new preset frequency has been stored. The display will show frequency and channel number for five seconds after the preset is set.
3. Repeat these steps for each preset.

CLOCK

Clock is set using the hour (HR) and minute (MN) push buttons. There will be an initial delay of two seconds after the first button depression, before the unit will enter the time set mode and the time will advance.

- When the time set mode is entered, the display will show Time Of Day (TOD) along with an "A" (AM) or "P" (PM).
- Depressing HR will cause hours to increase, while depressing MN will cause minutes to increase.

If the electrical power is interrupted by a blown fuse, discharged battery, etc., the clock must be reset.

SEEK AND SCAN FEATURE

These radios have "SEEK" and "SCAN" features for electronic station tuning up and down the band.

SEEK

Pressing "SEEK" button will cause the receiver to seek the next higher or lower station. Audio is muted during the Seek operation.

SCAN

Press and hold "SEEK" for two seconds, "SCAN" will appear in the display. Use "SCAN" to listen to stations for a few seconds. Press "SEEK" again to stop the scanning. Audio is muted during the "SCAN" operation.

"PSCAN"

Press "PSCAN" to listen to each of the preset stations for a few seconds. Press again to stop.

"RCL" (RECALL)

Press upper knob to switch between time and frequency on the display.

Cassette Tape Player

To play a tape, the ignition lock cylinder must be in the "ACCESSORY" or "RUN" position and the receiver/tape player must be turned on. Insert the cassette squarely through the door, exposed tape side of the cassette first. When the tape is fully inserted, the radio will turn off and the tape will begin playing. After loading, the cassette player automatically senses the tape cartridge for metal tape or CR02 usage. The appropriate adjustments are made within the player and the cassette is ready to be played.

PROGRAM BUTTON

Press "PROG" to switch from one side of tape to the other.

REVERSE BUTTON

Press "REV" to reverse direction. To stop reverse motion, press "REV" lightly.

FORWARD BUTTON

Press "FWD" to advance tape. To stop forward motion, press "FWD" lightly.

"PREV" (PREVIOUS)

Press "PREV" to find beginning of current selection and resume play from that point. If held or pressed more than once, cassette returns to previous selections.

"NEXT"

Press "NEXT" when you want to hear next selection now (before the present selection is finished).

If held or pressed more than once, cassette advances farther.

"SIDE"

Press "SIDE" to change the side that the tape is playing.

"EJECT"

Push this button to eject the cassette. The radio will resume playing.

ETR® AM-FM STEREO CASSETTE WITH AUTO TONE (UL0)

BUICK

Figure 4

Radio and Cassette Tape Player

Except for the functions described below, the radio and tape player operations of the UL0 are the same as the UN6 ETR® AM-FM STEREO/CASSETTE. Refer to "Radio Operation" and "Cassette Tape Player" for the UN6 in this section.

POWER

Push volume knob to turn radio on and off.

TUNE CONTROL

Press tune button up or down to tune radio stations manually. Frequency will be displayed during tuning.

FADE CONTROL

The "FADE" control is a 270 degree rotary pop-out/pull knob with center detent that is shared with the balance function. The control adjusts the relative volume between the front and rear speakers. The control is operated by first depressing and releasing the knob to the "out" position, then pulling to the fully "extended" position. Rotating the knob clockwise will cause a volume shift from rear to front speakers and conversely, rotating the knob counter-clockwise will cause a volume shift from front to rear speakers. At full rotation in either direction, audio is completely eliminated from the corresponding front or rear channels. Depressing and releasing the knob a second time will return the knob to the "in" position.

9A-6 AUDIO SYSTEMS

BALANCE

The balance (BAL) control is a 270 degree rotary pop-out/ pull knob with center detent that is shared with the "Fade" function. The control adjusts the relative volume between the right and left speakers. The control is operated by first depressing and releasing the knob to the "out" position. Rotating the knob clockwise will cause a volume shift from left to right speakers and conversely, rotating the knob counter-clockwise will cause a volume shift from right to left speakers. At full rotation in either direction, audio will be completely eliminated from the corresponding left or right channels. Depressing and releasing the knob a second time will return the knob to the "in" position. (This control is active in either the "in" or "out" position).

AUTO TONE

The auto tone function allows the choice of treble and bass equalization settings designed for classical, pop, rock, jazz, talk, and country/western stations. "CLASS" will appear on the display when you first press "TONE". Each time you press it, another setting will appear on the display. Press it again after "C & W" appears and "MANUAL" will appear. Tone control will return to the treble and bass knobs. If you use the treble and bass knobs, control will return to them and MANUAL will appear.

"AM-FM"

Press "AM-FM" to switch frequencies.

"RCL" (RECALL)

Press this to switch between time and frequency on the display.

"SOURCE"

Press "Source" to change to the tape function when the radio is on. TAPE with an arrow will appear on the display when the tape is active.

"AUTO SET"

Press "Auto Set" and the system will set the 12 strongest FM or the 6 strongest AM stations on the preset buttons. To return to the stations previously preset, press "Auto Set" again.

ETR® AM-FM STEREO/CASSETTE TAPE PLAYER (UL0)

Radio Operation

CHEVROLET

figure 5

VOLUME KNOB

This knob turns the radio on and off. Rotate knob to control volume.

"SCV" (SPEED-COMPENSATED VOLUME)

Rotate the ring behind the volume knob to automatically compensate for increase in road noise levels at higher speeds. It causes the volume to increase slowly as speed increases. When working properly, the subtle changes in volume should not be noticeable to the driver. "SCV" can be turned off for normal driving.

"AM-FM"

Press "AM-FM" to receive "AM," "FM1," or "FM2". The lighted display shows the selection.

TUNE KNOB

Push the "TUNE" knob to release it. Rotate the knob to choose desired radio stations. Push the knob back in to store it after tuning.

"RECALL"

Press "RECALL" to recall the station being played or the clock display. Press "RECALL" also to display the time when the ignition is off.

"AUTO TONE"

Press "AUTO TONE" to choose preset treble and bass equalization settings designed for "ROCK," "NEWS," "POP," and "CLASSICAL". Each time "AUTO TONE" is pressed, another setting will appear on the display. When "MAN" (manual) appears, control of the tone will be back to the treble and bass knobs.

"SEEK"

Press "SEEK" and the radio will tune to the next higher or lower station and will stay there.

"PSCAN"

Press "PSCAN" to hear each of the preset stations for a few seconds. To stop at a chosen station, press "PSCAN" again.

CLOCK

To set the clock display on the radio:

1. Press and hold "HR" (hour) until the correct hour appears.
2. Press and hold "MIN" (minute) until the correct minute appears. There will be a two-second delay before the clock goes into the time set mode.

PUSH BUTTONS

To preset six AM stations, six FM1 stations, and six FM2 stations:

1. Tune in desired station.
2. Press and hold one of the six push buttons for five seconds. The station will fade out then return when set. The preset station will return whenever that button is pressed.
3. Repeat these steps for each push button.

SPEAKER ADJUSTMENT

Balance Knob: Push "BAL" knob to release it. Turn the knob to move the sound between the right and left speakers. Push the knob back in to store it when not adjusting.

Fade Knob: Push "FADE" knob to release it. Turn the knob to move the sound between the front and rear speakers. Push the knob back in to store it when not adjusting.

BASS AND TREBLE CONTROL

Push the "TREB" knob to release it. Rotate the knob to the right to increase treble and to the left to decrease treble. Push the knob back in to store it when not adjusting.

Push the "BASS" knob to release it. Rotate the knob to the right to increase bass and to the left to decrease bass.

If a station is weak and noisy, rotate the "TREB" knob to the left to reduce the noise.

Cassette Tape Player

The tape player is built to work best with tapes that are 30 minutes long on each side. Tapes longer than that are so thin they may not work well in this player.

To play a tape, the ignition lock cylinder must be in the "ACCESSORY" or "RUN" position and the receiver/tape player must be turned on. Insert the cassette squarely through the door, exposed tape side of the cassette first. If you hear nothing or hear just garbled sound, it may not be in squarely. Press "EJECT" to remove the tape and start over. When the tape is fully inserted, the radio will turn off and the tape will begin playing.

Once the tape is playing, use "VOL," "BAL," "FADE," "TREB," "BASS" and "AUTO TONE" just as for the radio. The arrows show which side of the tape is playing.

To rapidly advance the tape, press "FWD" (forward). Press "FWD" again to stop advancing. The radio will play during this operation.

To rapidly reverse the tape, press "REV" (reverse). Press "REV" again to stop the tape reversing. The radio will play during this operation.

To play the next selection, press "NEXT" or "SEEK" (instead of waiting until the current selection is finished). For "NEXT" to work properly, the tape must have at least three seconds of silence between each selection. The radio will not play during this operation.

To replay the current selection, press "PREV" or "SEEK". For "PREV" to work properly, the tape must have at least three seconds of silence between each selection. The radio will not play during this operation.

To switch from one side of the tape to the other, press the "PROG" (program) knob.

To reduce tape noise, press (Dolby Noise Reduction)® Button.

To stop the tape player, do any of the following:

- Turn the power off or turn the ignition key off. The cassette stays in the player and will resume playing at the point where it stopped.
- Press "AM-FM" to stop playing the cassette and switch to radio. (To switch back to the tape, press "TAPE AUX").
- Press "EJECT" to remove the cassette and switch to radio. "EJECT" will work with the ignition on or off.

ETR® AM-FM STEREO/COMPACT DISC PLAYER (UN0)**Radio Operation****CHEVROLET****Figure 6****UPPER CONTROL**

Push knob to turn radio on or off and to control volume. The control ring behind the knob is the balance control. Turn the ring clockwise to move speaker balance to the right and counterclockwise to move speaker balance to the left.

TUNE KNOB

Push the "TUNE" knob to release it. Rotate the knob to choose desired radio stations. Push the knob back in to store it after tuning.

"SCV" (SPEED-COMPENSATED VOLUME)

Rotate the ring behind the volume knob to automatically compensate for increase in road noise levels at higher speeds. It causes the volume to increase slowly as speed increases. When working properly, the subtle changes in volume should not be noticeable to the driver. "SVC" can be turned off for normal driving.

"AUTO TONE"

Press "AUTO TONE" to choose preset treble and bass equalization settings designed for "ROCK," "NEWS," "POP," and "CLASSICAL". Each time "AUTO TONE" is pressed, another setting will appear on the display. When "MAN" (manual) appears, control of the tone will be back to the treble and bass knobs.

BASS AND TREBLE CONTROL

Push the "TREB" knob to release it. Rotate the knob to the right to increase treble and the left to decrease treble. Push the knob back in to store it when not adjusting.

Push the "BASS" knob to release it. Rotate the knob to the right to increase bass and to the left to decrease bass.

If a station is weak and noisy, rotate the "TREB" knob to the left to reduce the noise.

9A-8 AUDIO SYSTEMS

PUSH BUTTONS

To preset six AM stations and five FM stations, use the following procedure:

1. Tune in desired station.
2. Push "SET". Within five seconds, push one of the five push buttons.
3. Repeat these steps for each push button.

CLOCK

To set the clock display, the ignition lock cylinder must be in the "ACC" or "RUN" position and the radio must be off. To set the clock:

1. Press and hold "HR" (hour) until the correct hour appears.
2. Press and hold "MIN" (minute) until the correct minute appears.

There will be a two-second delay before the clock goes into the time set mode.

SEEK AND SCAN FEATURE

Press "SEEK" or and the radio will tune to the next higher or lower station with enough signal strength to be heard clearly, and stay there.

Push "SEEK" for 2 seconds and the radio will tune to the next higher station with a clear signal and stay there a few seconds. Then it will tune to the next station for a few seconds, and so on. To stop scan, press "SEEK" again.

"RCL" (RECALL)

Press this to switch between time and radio frequency on the display while the radio is on.

When playing a compact disc, press "RCL" button to see the current track number. Press "RCL" again within five seconds to see volume and time elapsed in current track on the display.

Compact Disc Player

With the radio on, insert disc into slot, label side up (player pulls it in). "CD" will appear on the display and track 1 will begin to play. If disc comes back out and "ERR" appears on display, check to see if:

- Disc is upside down.
- Disc is dirty, scratched or wet.
- Too much moisture is in the air.

"PREV" (PREVIOUS)

Press "PREV" to play track again. If held or pressed more than once, the disc will return to previous track. If "PREV" is pressed within eight seconds from start of track, the disc will go to the beginning of the previous track and begin to play. If "PREV" button is pressed after eight seconds into the track, the disc will go to the beginning of the current track and begin to play.

"NEXT"

Press "NEXT" when you want to hear the next track now (before the present track is finished). If "NEXT" is held or pressed more than once, the disc will advance farther.

"FWD" (FORWARD)

Press and hold "FWD" to quickly advance within a track. Release it to resume playing.

"REV" (REVERSE)

Push "REV" and hold it to return quickly to a favorite passage on the disc. Release it to resume playing.

"RDM" (RANDOM)

Press this button and the player chooses a random order of tracks to play. When the final random track has been played, the disc will play the same random selection again. Press "RDM" again for a different selection of tracks.

"COMP" (COMPRESSION)

Push "COMP" to make loud and soft passages more nearly equal in volume.

"ST-PL" (STOP/PLAY)

Press "ST-PL" to stop disc from playing. The radio will resume playing. "ST-PL" will also restart the disc. The disc will resume playing at the point where it stopped.

"EJECT" (EJECT)

Push this to eject the disc and resume radio play.

ETR® AM-FM STEREO/COMPACT DISC/CASSETTE PLAYER (UP0)

(Buick)

Radio Operation

Figure 7

The radio operation of the UP0 radio Refer to "Compact Disc Player" for the UN0 in this section.

Cassette Tape Player

The cassette tape player operation of the UP0 radio is the same as the UL0 ETR® AM-FM STEREO/CASSETTE WITH AUTO TONE. Refer to "Cassette Tape Player" for the UL0 in this section.

Figure 7 - UP0 Radio - (Buick)

Compact Disc Player

The compact disc player of the UP0 radio is the same as the UN0 (Buick) AM-FM STEREO/COMPACT DISC PLAYER. Refer to "Compact Disc Player" for the UN0 in this section.

THEFTLOCK

The instructions below explain how to enter a security code into the system. If the vehicle loses battery power for any reason, the security code must be entered again before the system will turn on.

1. Write down any number from "000" to "1,999" and keep it in a safe place.
2. Turn ignition to "ACC" or "RUN" position.
3. Turn radio off.
4. Press and hold buttons "1" and "4" together and hold until "- -" shows on display.

You are now ready to enter the security code, pausing no more than 15 seconds between steps.

1. Press "MIN" and "000" appears on display.
2. Press "MIN" again and hold until last two digits of code appears. Release button.
3. Press and hold "HRS" until first one or two digits of the code appear.
4. Press "AM-FM," "rEP" will appear on the display.
5. Repeat steps 5 through 7.
6. Press "AM-FM," "SEC" will appear on the display. This meaning audio system is secured.

The indicator light will also flash when the ignition is off. If the display shows "—," the verification steps were not successful and the entire sequence must be done over.

UNLOCKING SECURED RADIO

If the audio system is secured ("SEC" shows on the display) and you wish to disable it, enter the security code as follow. (Do not pause more than 15 seconds between steps).

1. Turn ignition to "RUN" position. Make sure audio system is off. The time will show on the display.
2. Press pushbuttons "1" and "4" together until "SEC" shows on the display.
3. Press "MIN" and "000" will appears on the display.
4. Press "MIN" again and hold until the last two digits of the code appears. Release the button.
5. Press "HR" until the first one or two digits appear.
6. Press "AM-FM". If "—" shows, you have shut off the theft-deterrent feature. If "SEC" shows, the audio system is still secured.

DETERMINING FACTORY BACKUP UNLOCKING CODE FOR SECURED RADIO

If the security is activated and the radio is disconnected from battery power, the radio will display "LOC". The radio will not turn on until the correct unlocking code is entered. If the customer code is lost or unavailable, Refer to Dealer Communication System bulletin regarding the unlocking procedures or call technical assistance.

DIAGNOSIS

RADIO FIXED ANTENNA DIAGNOSIS

Unplug antenna lead-in at back of radio and plug a test antenna into radio. Make sure test antenna base is grounded to the vehicle chassis and keep hands off of antenna. Check radio reception in an area away from electrical interference. These include tall buildings, metal structures, power lines, fluorescent lighting and power tools. Tune to high and low ends of the dial on both AM and FM, checking weak and strong station reception. If reception is OK, problem exists with antenna and/or its lead-in cable. If reception is still poor, refer to Section 8A-150.

RADIO POWER ANTENNA MOUNTING AND CONNECTIONS

Poor grounding of the radio power antenna, either at the antenna mounting or at any other connection in the antenna/lead-in system, can result in seriously reduced radio performance. A poor ground can cause excess ignition noise in AM reception and erratic audio.

To check for a poor ground of the radio power antenna mast, perform the following:

1. Fully lower antenna.
2. Disconnect power antenna motor connector, (Buick) is in the rear compartment area (Chevrolet) is under hood right side.
3. Remove escutcheon from fender.
4. Attach alligator clips to upper end of mast to act as antenna. Leave other end of clip unattached.
5. Tune radio for weak AM station or signal which is dependent on clip, i.e., clip attached, station is present; clip removed, no station.
6. Remove clip.
7. Ground upper end of mast to body.
8. If radio station is not received, then antenna grounds are good. If station is still present or stronger, a poor ground or no ground connection is present in system.

Possible ground loss points are:

- Antenna upper mounting (bolts/screws loose, paint overspray).
- Coaxial connector at antenna (if applicable) loose or corroded. Remove to inspect inside connector for corrosion.
- Coaxial connector at extension cable (if applicable) loose.
- Coaxial connector at radio loose or corroded.
- Antenna harness connector corroded.

RADIO POWER ANTENNA LEAD-IN CABLE CHECK

Figures 8, 9, and 10

Usually, symptoms of a broken center conductor of the lead-in cable will result in no AM and weak FM. In case of continued reception or noise complaints, always check the lead-in with a multimeter. The chart and diagram in Figure 11 show accurate readings. When checking resistance, cautiously wiggle the lead-in tip and cable. If the readings shown in Figure 10 are not obtained, some portion of the lead-in is intermittent and the lead-in should be replaced.

Barbless antenna connectors are used to connect the antenna with the radio. This system consists of a barbless socket in the radio that should only be used with a barbless lead-in. In the event of installing a different radio, care should be taken not to mix the barbed and barbless connectors. Radio damage may occur. Adapter cables are available to allow any radio swapping that is necessary.

RADIO POWER ANTENNA CHECK

Figure 11

Improperly grounded antennas are usually the cause of poor reception or noise complaints. To assure a good ground, a braided ground strap should be connected from the housing case to chassis ground.

After checking and repairing the antenna, always make sure lead-in connector(s) are dirt and corrosion free, and are tightly fastened.

The antenna can be checked by using a multimeter. With the probes fastened to each point as shown in Figure 12, wiggle the separate antenna sections and antenna housing case. With a properly grounded antenna, the readings shown should always be obtained. If not, replace the antenna. Refer to "Radio Power Antenna" under "On-Vehicle Service" in this section.

MOISTURE IN RADIO POWER ANTENNA TUBE

Weak reception or fading may be caused by moisture in the support tube, due to condensation or leakage through the insulation bushings. If trouble has been traced to moisture in the tube, the antenna must be removed, disassembled, and thoroughly cleaned. All moisture can be removed by blowing out with compressed air, then pushing a clean dry cloth through the support tube as far as possible. Before assembling antenna, check drain holes in motor housing to be sure they are not obstructed.

SPEAKER DIAGNOSIS (CASSETTE ONLY)

Tools required

J 39916 Speaker Diagnostic Test Tape Kit

Important

- Always compare the front speakers to front, and rear speakers to rear. Do not compare front speaker to rear speaker because they could be different speakers or their mounting environment could cause them to sound different.

Figure 8 - Antenna Lead-In Radio

Figure 9 - Lead-In Cable Diagnosis

Figure 11 - Antenna Diagnosis (Typical)

Figure 10 - Barbless Extension Cables Dealer Replace and Upgrade Ratios

Tones are used to test and evaluate coaxial speakers or other complex speaker systems. There are three basic tones used, 50 Hz tone, 500 Hz warble tone, and 9k Hz spectral tone. The combination tone is a blend of the above three tones.

BASS/SUB-WOOFER TEST (50Hz SINE TONE)

The 50 Hz tone is used to evaluate the bass response of an audio system. This tone is also helpful in evaluating audio systems which have separate subwoofer amplifiers and speakers.

MIDRANGE SPEAKER TEST (500 Hz WARBLE TONE)

The 500 Hz warble tone is used for the evaluation of midrange speaker response. This tone is qualified as a warble tone because it has different audio characteristics than a sine tone. This tone produces a warble sound. At these tone midrange frequencies, it is better to use a warble tone than a sine wave because the location of a warble tone source, such as a speaker, is easier to identify. A normal sine tone can set up a standing wave within a vehicle which can make it difficult to determine its source location.

TWEETER TEST (9k Hz SPECTRAL TONE)

The 9 Hz spectral tone is used for tweeter or high frequency evaluation. This tone is a section of frequencies of equal amplitudes ranging from 8.5k Hz - 9.5k Hz. This sounds like a group of crickets chirping. This type of tone is used for two reasons. One, much like the warble tone, it is easy to locate its source, and two, this type of tone is easier to identify for those people with high end hearing loss problems.

ALL SPEAKER TEST

The combination tone can be used for numerous audio problems such as distorted or no sound from speaker(s). When using the combination tone, comparative AC voltage measurements can be made on the speaker terminals, provided the fade and balance controls are in the detent position. With these voltage measurements, a determination can be made in the diagnosis of speaker or amplifier.

9A-12 AUDIO SYSTEMS

SPEAKER/GRILL RATTLE TEST (50 Hz to 8k Hz SWEPT SINE)

The next portion of the tape can be used to diagnose speaker and grill rattles. The first test is two tones played back to back. The second test is a variable frequency tone, but frequency change is at a much slower rate. Both tests can be used to repair a speaker rattle or buzz. If the problem has already been isolated, the fade and balance controls can be set to the proper location and the test tones can be played in the specific problem area.

MOTOR SPEED TEST

There is a two minute time period marked in this section of tape for the purpose of checking the cassette tape motor speed. This portion of the diagnostic tape can be used to verify complaints of abnormal sound from the cassette tape player. In some cases, improper tape motor speed can cause audio abnormalities. If the time taken for this is between one minute and fifty-six seconds to two minutes and one second, the tape motor speed is within tolerance.

TAPE CLEANING PROCEDURES

The recommended time for cleaning is every fifteen hours for best performance and every fifty hours to prevent damage to the tape head. The preferred tape cleaner is available as a part of the Audio System Kit P/N J39916.

NOISE DIAGNOSIS (DEAD SPACE)

This portion can be used for noise diagnosis such as alternator whine, switch pops, etc. which can be more easily detected during dead space (blank space in between songs). This portion of the diagnostic tape may be used in conjunction with noise diagnosis in Section 8A.

ON-VEHICLE SERVICE

TAPE PLAYER AND CASSETTE CARE

Tape Head and Capstan Cleaning

Figure 12

Two parts should be cleaned on the tape player, the head and the capstan. Since they can be reached through the tape door, leave the tape player in the vehicle. The head and capstan should be cleaned every 100 hours of cassette operation.

To clean the head and capstan, use a cotton swab dipped in rubbing alcohol.

A cassette cleaning kit may also be used to clean the head and capstan. Follow instructions on the kit to clean the cassette tape player.

Do not contact tape head with magnetized tools. If the head becomes magnetized, it will degrade every cassette played in the player.

No service is performed on the cassettes. The cassette manufacturer handles warranties of cassettes. The test cassette used by the dealer should be stored in its container to keep the tape clean. Store cassette away from extreme heat and direct sunlight.

Figure 12 - Cassette Cleaning Kit

RADIO POWER ANTENNA CARE

Periodic cleaning may be necessary to assure proper radio power antenna operation.

CLEANING THE RADIO POWER ANTENNA:

1. Actuate antenna to full extension.
2. Dampen clean cloth with mineral spirits.
3. Wipe cloth over antenna sections, removing any dirt.
4. Actuate antenna through one complete cycle (retract and extend).
5. Repeat steps 1 through 4 at least two more times.

COMPACT DISC CARE

Handle discs carefully. Store in protective case away from sun, heat, and dust. If surface is soiled, dampen a clean soft cloth in a solution of mild neutral detergent and wipe clean. Mini discs called "singles" (about 3 inches in diameter) will not eject and should not be used.

RADIO

Refer to SECTION 8C for removal and installation procedures.

SPEAKERS

For removal and installation of radio front side door speakers, refer to SECTION 10-6. For removal and installation of rear speakers on sedans, refer to SECTION 10-8. For removal and installation of rear speakers on wagons, refer to SECTION 10-7.

Important

- All Delco® sound systems have ungrounded speakers. Installing add-on tape players, CBs or other units which use the vehicle speakers may damage your Delco® sound system, and is not recommended.

RADIO FIXED ANTENNA

(Buick Sedan)

Figure 13

Tool Required:
J 38536 Antenna Bezel Socket

Remove or Disconnect

1. Move rear compartment mat to access antenna.
2. Lead-in cable (24) by turning counterclockwise and pulling at cable (4).
3. Bolt/screw (7).
4. Nut (2) and bezel (3), using J 38536.
5. Mast (1) and bracket (10).

Install or Connect

NOTICE: Refer to "Notice" on page 9A-1 of this section.

1. Mast (1) and bracket (10).
 - Align mast (1) and bracket (10) to right panel (8) and secure with bolt/screw (7).

Tighten

- Bolt/screw (7) to 6 N.m (53 lb. in.).
2. Nut (2) and bezel (3), using J 38536.

Tighten

- Nut (2) to 4 N.m (35 lb. in.).
3. Lead-in cable (24).
4. Return rear compartment mat to original position.

(Except Buick Sedan)

Figure 14

Tool Required:
J 38536 Antenna Bezel Socket

Remove or Disconnect

1. Mast (33) from cable (36).
2. Mask front edge of right front side door with masking tape.
3. Loosen nut (34), using J 38536.
4. Bolt/screw (38).
5. Antenna lead-in (37).
6. Raise and suitably support vehicle. Refer to SECTION 0A.
7. Front wheelhouse panel bolts/screws from fender (39).
8. Pull out lower edge of front wheelhouse panel and block with wood to access cable (36).
9. Nut (34), using J 38536, and bezel (35).
10. Cable (36).

Figure 13 - Radio Fixed Antenna Mounting -(Buick Sedan)

Figure 14 - Radio Fixed Antenna Mounting -(Except Buick Sedan)

9A-14 AUDIO SYSTEMS

Install or Connect

NOTICE: Refer to "Notice" on page 9A-1 of this section.

1. Cable (36), nut (34) and bezel (35), loosely.
2. Align cable (36) to right fender (39) and secure with bolt/screw (38).

Tighten

- A. Bolt/screw (38) to 6 N·m (53 lb. in.).
 - B. Nut (34) to 4 N·m (35 lb. in.), using J 38536.
3. Unblock rear wheelhouse panel.
 4. Front wheelhouse panel bolts/screws.

Tighten

- A. Bolts/screws (third, sixth and seventh from front of wheelhouse panel) to 25 N·m (18 lb. ft.).

Radio Antenna Lead-In Cables

(Buick Sedan)

Figures 13 through 16 and 20

REAR RADIO ANTENNA LEAD-IN CABLE

Remove or Disconnect

- Lead-in cable (24) from cable (4) or antenna (25).
 - If removing lead-in cable (24) from cable (4), turn and pull lead-in cable connector.
- Rear seatback. Refer to SECTION 10-10.
- Floor carpet retainer. Refer to SECTION 10-5.
- Rear side door lock pillar garnish molding. Refer to SECTION 10-7.
- Right body hinge pillar trim finish panel. Refer to SECTION 10-5.
- Pull floor carpet assembly back far enough to access antenna lead-in cable (24).

Figure 19 - Radio Power Antenna Relay -(Except Buick Sedan)

- Antenna lead-in cable (24) from antenna extension (30).
- Antenna lead-in cable (24) from rear compartment and from clips (31) along right side of frame.

Install or Connect

- Route antenna lead-in cable (24) through clips (31) along right side of frame and into rear compartment.
- Antenna lead-in cable (24) into antenna extension (30).
- Return floor carpet to its original position.
- Right body hinge pillar trim finish panel. Refer to SECTION 10-5.
- Rear side door lock pillar garnish molding. Refer to SECTION 10-7.
- Floor carpet retainer. Refer to SECTION 10-5.
- Rear seatback. Refer to SECTION 10-10.
- Antenna lead-in cable (24) into cable (4) or antenna (25).

FRONT RADIO ANTENNA LEAD-IN CABLE

Remove or Disconnect

- Right body hinge pillar trim panel. Refer to SECTION 10-5.
- Pull right front edge of carpeting back to access radio lead-in cable (30).
- Radio extension cable (30) from antenna lead-in cable (24), if Buick sedan (Figure 22).
- Instrument panel sound insulator.
- Radio. Refer to SECTION 8C.
- Radio extension cable (30) from radio antenna lead-in (37) for fixed antenna or lead-in connector (47) for power antenna, except Buick sedan.

GENERAL DESCRIPTION

Cruise control is a speed control system that maintains a desired vehicle speed under normal driving conditions. However, steep grades up or down may cause variations in the selected speeds. The electronic cruise control system has the capability to cruise, coast, resume speed, accelerate, and "tap-up" and "tap-down."

The main parts of the cruise control system are the functional control switches, cruise control module, speed sensor and cruise control release switch and stoplamp switches.

The cruise control system uses a cruise control module to obtain the desired vehicle cruise operation. Two important components in the module help to do this. One is an electronic controller and the second is an electric stepper motor. The controller monitors vehicle speed and operates the electric stepper motor. The motor moves a band and throttle linkage, in response to the controller, to maintain the desired cruise speed. The cruise control module contains a low speed limit which will prevent system engagement below a minimum speed of 40 km/h (25 mph). The operation of the controller is controlled by functional control switches located on the turn signal and headlamp dimmer switch and cruise control actuator and windshield wiper and windshield washer lever.

Cruise control release switch and stoplamp switches are provided to disengage the cruise system. The switches are mounted on the brake pedal bracket. When the brake pedal is depressed, the cruise control system is electrically disengaged and the throttle is returned to the idle position.

CRUISE CONTROL MODULE

The cruise control module is mounted on the left wheelhouse panel near the brake master cylinder. The module has an electronic controller and an electric stepper motor to vary the throttle with each different cruise control mode. The module is not serviceable.

CRUISE CONTROL RELEASE SWITCH AND STOPLAMP SWITCH

The cruise control release switch and stoplamp switches are used to disengage the cruise control system. A release switch and a stoplamp switch mounted on the brake pedal bracket disengage the system electrically when the brake pedal is depressed. This is done by activating the brake cut-out input to the cruise control module. The speed of the vehicle at brake actuation will be stored in the memory of the system. The stoplamp switch has a three-wire brake lights connector and a two-wire cruise control disable connector. The cruise control release switch has two two-wire connectors: the larger cross-shaped Torque Converter Clutch (TCC) disable connector and the small cruise control disable connector.

9B-2 CRUISE CONTROL

VEHICLE SPEED SENSOR (VSS)

The Vehicle Speed Sensor (VSS) is mounted to the automatic transmission and produces an AC signal. The frequency of this signal is proportional to the speed at which the automatic transmission output shaft rotates, which in turn, is proportional to the speed of the vehicle.

The AC signal produced by the VSS is amplified and converted by the PCM. The signal is supplied to the cruise control module, speedometer, and power steering control module.

The signal to the PCM, cruise control module, and speedometer is at a rate of 4000 pulses per mile. The PCM, cruise control module, and speedometer internally convert the number of pulses per mile per second to determine vehicle speed.

For removal procedure, refer to SECTION 7A or to SECTION 8A for diagnostic information.

FUNCTIONAL CONTROLS

Off-On-Resume/Accelerate Switch

Figure 1

CAUTION: To keep the vehicle under control, and to prevent possible personal injury and vehicle damage, the cruise control should not be used on slippery or winding roads or in traffic of heavy or varying volume. When traveling down a steeply graded hill, the cruise control should be disengaged by depressing the brake pedal lightly. The automatic transmission can then be shifted into a lower gear range to help control vehicle speed.

The "OFF-ON-R/A" switch (14) has three positions. This switch turns the cruise control system "ON" and "OFF" and also returns cruise control operation to the last speed setting when momentarily moved toward the "R/A" (RESUME/ACCELERATE) position after braking. The "R/A" switch will work only after an initial speed has been set using the "SET/COAST" button. Do not hold the "OFF-ON-R/A" switch (14) in the "R/A" position. Release it immediately. If the "OFF-ON-R/A" switch (14) is held in the "R/A" position for more than one second, the system goes into the acceleration mode. To accelerate the vehicle, move the "OFF-ON-R/A" switch (14) to the "R/A" position and hold it there until the vehicle reaches the desired speed. When the "OFF-ON-R/A" switch (14) is released, the system will maintain the new cruise speed. In order to use the acceleration mode, the "OFF-ON-R/A" switch (14) must be in the "ON" position and the vehicle must be above the low-speed limit of 40 km/h (25 mph). Cruise control memory will be erased when the vehicle is put into "PARK."

The "OFF-ON-R/A" switch (14) can also be used to "tap-up" vehicle speed. In order to do this the cruise control system must be engaged and operating. "Tapping-up" is done by quickly pressing the

Figure 1 - Cruise Control Actuator Lever

"OFF-ON-R/A" switch (14) toward the "R/A" position and quickly releasing it, or "tapping" the "OFF-ON-R/A" switch (14). Do not hold the "OFF-ON-R/A" switch (14) in the "R/A" position, or the system will go into the acceleration mode. "Tap-up" is a function in which cruise speed can be increased by 1.6 km/h (1 mph) increments (one tap = 1.6 km/h (1 mph) increase).

Set/Coast Button Switch

Figure 1

The cruise control "SET/COAST" button switch (15) (located in the end of the turn signal and headlamp dimmer switch and cruise control actuator and windshield wiper and windshield washer lever) has three positions.

- **The Set Position** - With the "SET/COAST" button switch pressed and then released (vehicle speed must exceed the low speed limit point, and the "OFF-ON-R/A" switch (14) must be in the "ON" position), the cruise speed will be set at the speed the vehicle was going when the "SET/COAST" button switch (15) was released. Vehicle cruise speed will be within 1.6 km/h (1 mph) of the actual speed at engaged speed. The system will cruise until either the "OFF-ON-R/A" switch (14) is moved to "OFF," the ignition switch is turned "OFF," and/or the "SET/COAST" button switch (15) is pushed in fully and held. Pushing the brake pedal releases the "SET/COAST" button switch (15) but not the resume capability.
- **The Coast Position** - With the "SET/COAST" button switch (15) fully depressed, the driver can raise or lower vehicle speed. To increase speed, the driver can accelerate to a new speed, by fully depressing the "SET/COAST" button switch (15) and releasing the button. The cruise control module "forgets" the previously set speed. An increased control speed can be more easily set with the "OFF-ON-R/A" switch (14) as previously described. To decrease cruise speed,

the "SET/COAST" button switch (15) is held in, disengaging the cruise system, which allows the throttle to return to the idle position. When the vehicle has slowed to the desired cruise speed, releasing the "SET/COAST" button switch (15) will engage the system at the new selected speed. Cruise control memory will be erased when the vehicle is put into "PARK."

- **The "Tap Down" Position** - To "tap down," the cruise must be engaged and operating. "Tapping-down" is done by quickly pressing and releasing the "SET/COAST" button switch (15), or "tapping" the "SET/COAST" button switch (15). Do not hold the "SET/COAST" button switch (15) in or the system will go into the coast mode. "Tap-down" is a function in which cruise speed can be decreased by 1.6 km/h (1 mph) increments (one tap = 1.6 km/h (1 mph) decrease). The accelerator pedal may be pressed at any time to override the cruise system. Release of the accelerator pedal will return the vehicle to the previously set cruise speed.

DIAGNOSIS

IMPROPER CRUISE CONTROL OPERATION

In resolving any cruise system malfunction, first make a visual inspection. Check the system to ensure that there are no bare, broken or disconnected wires. If the high-mounted stoplamp bulbs are burned out, the cruise control system will be inoperable. If preliminary inspection reveals no solution and the system is inoperative, use diagnostic information in SECTION 8A.

ON-VEHICLE SERVICE

CRUISE CONTROL RELEASE SWITCH AND STOPLAMP SWITCHES

Adjustment

Figure 2

The release switch (6) and the stoplamp switch (5) cannot be adjusted until after the brake booster pushrod is assembled to brake pedal (3).

Adjust

1. Press brake pedal (3) and insert release switch (6) and stoplamp switch (5) into retainers (7 and 4) until fully seated.

Figure 2 - Cruise Control Release Switch and Stoplamp Switch

2. Pull back on brake pedal (3) to its fully retracted position. Release switch (6) and stoplamp switch (5) will move within retainers (7 and 4) to their "adjusted" position.

Measure

- The following brake pedal travel distances can be used to check for properly adjusted release switch (6) and stoplamp switch (5).
- Release switch and stoplamp switch contacts must be open at 3.5 to 12.5 mm (1/8 to 1/2 inch) brake pedal travel, measured at the centerline of the brake pedal pad. Nominal actuation of the stoplamp switch contacts is about 4.5 mm (3/16 inch) after cruise control switch contacts close.

Replacement

Remove or Disconnect

1. Two electrical connectors.
2. Release switch (6) and stoplamp switch (5) from retainers (7 and 4).
3. Retainers (4 and 7) to bracket (2).

9B-4 CRUISE CONTROL

Install or Connect

1. Retainers (4 and 7) to bracket (2).
2. Release switch (6) and stoplamp switch (5) to retainers (7 and 4).
3. Two electrical connectors.

Adjust

- Release switch (6) and stoplamp switch (5) as outlined above.

ENGAGEMENT SWITCH

Figure 3

The engagement switch cannot be serviced. The complete turn signal, headlamp dimmer switch, cruise control actuator, windshield wiper, windshield washer lever must be replaced as an assembly.

Remove or Disconnect

CAUTION: Refer to "Caution" under "Disconnecting the Battery Negative Cable" in SECTION 0A.

1. Battery negative cable.
2. Steering column cover.
3. Electrical connector.
 - Make sure windshield wiper switch is in the "OFF" position.

Figure 3 - Engagement Switch

4. Lever (13) by pulling it straight out.

Install or Connect

1. Lever (13) by pushing it in.
2. Electrical connector.
3. Steering column cover.
4. Battery negative cable.

CRUISE CONTROL MODULE

Figure 4

The cruise control module (1) is shock mounted to the left wheelhouse panel using three cruise control module bolts/screws (19) and three front wheelhouse panel hole plugs (20).

Remove or Disconnect

CAUTION: Refer to "Caution" under "Disconnecting the Battery Negative Cable" in SECTION 0A.

1. Battery negative cable.
2. Electrical connector from module (1).
3. Cruise control cable from module. Refer to "Cable Replacement" under "Cruise Control Cable" in this section.
4. Bolts/screws (19).
5. Module (1) and plugs (20).
6. Plugs (20) from module (1) if a new module (1) is being installed.

Install or Connect

NOTICE: Refer to "Notice" on page 9B-1 of this section.

1. Plugs (20) to module (1), if removed.
 - Align holes in accelerator and cruise control adjuster bracket to holes in wheelhouse panel and position module (1) on wheelhouse panel.
2. Bolts/screws (19).

Tighten

- Bolts/screws (19) to 8 N.m (71 lb. in.).
3. Cable to module (1). Refer to "Cable Replacement" under "Cruise Control Cable" in this section.
 4. Electrical connector to module (1).
 5. Battery negative cable.

Adjust

- Cable, if necessary. Refer to "Cable Adjustment" under "Cruise Control Cable" in this section.

Figure 4 - Cruise Control Module

CRUISE CONTROL CABLE

Figures 5 through 7

The cable (21) is connected between the module (1) and the throttle body fuel injection (TBI) throttle lever.

Cable Replacement

↔ Remove or Disconnect

1. Air cleaner and resonator. Refer to SECTION 6C.
2. Cruise control screw adjuster from TBI throttle lever.
 - Snaps off with flat tipped tool.
3. Cable (21) from accelerator bracket.
4. Cable (21) from module (1).
 - A. Compress conduit tangs and pull out of cruise control module housing.
 - B. Disconnect cable bead from cruise motor band end fitting on module (1).
 - C. Note routing and remove cable (21) from vehicle.

→ Install or Connect

1. Cable (21) to module (1).
 - A. Attach cable bead to cruise motor band end fitting on module (1).
 - B. Pull engine end of cable (21) until it is taut.

- C. Install cable to module with alignment arrow positioned as shown (Figure 6).
- D. Slide cable conduit over band until tangs on conduit engage holes in module housing.

! Important

- Band must not be twisted.
2. Cable (21) to support bracket.
 - Use routing noted during removal.
 - Locking tab must be fully seated to bracket. Verify secure installation by pulling back fitting in opposite direction of installation.
 3. Cable screw adjuster to TBI throttle body lever.

🔑 Adjust

- Cable. Refer to "Cable Adjustment" in the following procedure.
4. Air cleaner and resonator. Refer to SECTION 6C.

Cable Adjustment

1. Remove air cleaner and resonator. Refer to SECTION 6C.
2. With throttle closed, adjust a gap of 0-2 mm between cable slug and face of adjustment screw.
 - Turn screw adjuster clockwise to slacken cable.
 - Turn screw adjuster counter-clockwise to tighten cable.

9B-6 CRUISE CONTROL

Figure 5 - Cruise Control Cable-to-Throttle Body Injector

Figure 6 - Cruise Control Cable from Cruise Control Module

Important

- Excess slack in cable can cause hesitation or surging of cruise performance.
- Excess tightness will cause unstable engine idle.

3. Install air cleaner and resonator. Refer to SECTION 6C.

Figure 7 - Cable Adjustment

GENERAL DESCRIPTION

The twilight sentinel option provides automatic on-off control of the head lamp capsules. It will also keep the exterior lamps turned on for a preselected period of time after the ignition switch is turned "OFF".

The system consists of a headlamp automatic control ambient light sensor (photocell), the headlamp automatic control ambient light sensor module, and a time delay control with an on-off switch. Connections to the vehicle lamps parallel the regular lamp switch connections. The headlamp switch must be turned "OFF" for automatic control.

The light sensor is mounted in the windshield defroster nozzle grille to obtain an unobstructed view of skylight through the windshield. The module is mounted to the right hinge pillar behind the trim panel (kick panel).

The time delay control and on-off switch is part of the headlamp and instrument panel lamp dimmer switch.

TWILIGHT SENTINEL

Automatic Lamp Operation

The twilight sentinel operates automatically when the ignition switch is "ON," the headlamp switch is "OFF" and the control rheostat is in an "ON" position.

When the headlamp switch is in "PARK" or "ON," or the ambient light sensor module is powering the exterior lamps and instrument panel lamps, the "Lights-On" warning will function under either condition.

As the intensity of light reaching the light sensor decreases, the resistance of the light sensor increases. When the module senses a high resistance in the light sensor, the module allows battery voltage to be applied to the headlamp capsules.

With the dimmer switch in "LO," the low-beam headlamps are "ON". With the dimmer switch in "HI," the high-beam headlamps and indicator are "ON". The module also applies battery voltage to the headlamps, parking lamps, turn signal lamps and taillamps.

9C-2 TWILIGHT SENTINEL

As the intensity of the light reaching the light sensor increases, the resistance of the light sensor decreases. When the module senses a low resistance in the light sensor, the module turns the headlamps "OFF" and also turns the parking lamps, turn signal lamps and taillamps "OFF".

A time delay circuit in the module reduces the chance of switching the lamps on or off while passing under viaducts, trees, bright lights or any other condition where lamp control is not wanted. The time delay is 30 seconds. The length of the time delay is set in production and cannot be altered.

The variable time delay rheostat adjusts only the time delay during which the lamps stay on after the ignition switch is turned off. This time delay can be adjusted from a few seconds to a maximum of 3 minutes.

Manual Lamp Operation

The system can be turned off by setting the time delay rheostat to the "OFF" position. This allows non-automatic control of the exterior lamps by use of the regular headlamp switch.

If exterior lamps are desired during daylight, either of two methods can be used:

1. Exterior lamps can be operated with the regular headlamp switch. The switch is wired in parallel with the twilight sentinel and can bypass the system whether the rheostat is "ON" or "OFF". If the headlamp switch is turned "ON," all lamps will remain on after the ignition switch is turned "OFF" however, when a vehicle is equipped with a tone alarm package, a warning tone sounds as a reminder.
2. The light sensor can be covered to block out light. This causes the lamps to turn on and still enables the system to turn lamps off automatically when the ignition switch is turned off. (If the light sensor has been exposed to light, the time delay must elapse before the lamps will turn on.)

DAYTIME RUNNING LAMPS (DRL) (CANADIAN ONLY)

All Canadian vehicles are equipped with daytime running lamps. The daytime running lamp system includes a daytime running lamp control module, a relay, an ambient light sensor and a diode. When the ignition switch is in the "RUN" position, the system lights the "LO" beam headlamps at a reduced intensity during daylight, and at full intensity during low light conditions (night).

Daytime Running Lamp (DRL) Ambient Light Sensor (Canadian Only)

The headlamp automatic control ambient light (daylight) sensor is located underneath the windshield defroster nozzle grille in the center of the instrument panel upper trim pad.

As the intensity of light reaching the sensor increases, the electrical resistance of the sensor decreases. When the DRL control module senses a low resistance in the sensor, the module allows voltage to be applied to the DRL diode and then to the "LO"

beam headlamps. Due to the voltage drop across the diode, the "LO" beam headlamps are on at a reduced intensity.

As the intensity of light reaching the sensor decreases, the electrical resistance of the sensor increases. When the DRL module senses a high resistance in the sensor, the module closes an internal relay and allows the "LO" beam headlamps to come to full intensity.

DIAGNOSIS

For complete diagnostic information on Daytime Running Lamps (DRL) or twilight sentinel, refer to SECTION 8A-101 or 8A-102.

THEFT DETERRENT SYSTEMS

CAUTION: This vehicle is equipped with the Supplemental Inflatable Restraint (SIR). Refer to **CAUTIONS** in Section 9J under "ON-VEHICLE SERVICE" and the SIR Component and Wiring Location view in Section 9J before performing service on or around SIR components or wiring. Failure to follow **CAUTIONS** could result in possible air bag deployment, personal injury, or otherwise unneeded SIR system repairs.

NOTICE: Always use the correct fastener in the proper location. When you replace a fastener, use **ONLY** the exact part number for that application. General Motors will call out those fasteners that require a replacement after removal. General Motors will also call out the fasteners that require thread lockers or thread sealant. **UNLESS OTHERWISE SPECIFIED**, do not use supplemental coatings (paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

GENERAL DESCRIPTION

PASS-Key II® SYSTEM

The personal automotive security system (PASS-Key II®) is standard equipment on this vehicle. The system is designed to prevent vehicle theft by disabling the engine unless an ignition key with a specific electrical resistance is used in the ignition cylinder. The components of the system are the ignition key, the ignition cylinder, the theft deterrent module, the theft deterrent relay, and the Powertrain Control Module (PCM).

SYSTEM OPERATION

The PASS-Key II® system is designed to prevent the engine from starting if the proper resistance is not sensed from the ignition key. Of the 15 key codes (resistance values) available, only one will work with each theft deterrent module.

The PASS-Key II® system prevents the engine from starting by controlling the theft deterrent relay and the PCM fuel enable input. If the PCM does not sense the proper Pulse Width Modulated (PWM) signal on the fuel enable input, it will not provide fuel to the engine.

If the wrong resistance value is sensed when the ignition switch is in the "RUN" position, the theft deterrent module will not ground the theft deterrent relay and will not output the fuel enable PWM signal for approximately three minutes. This prevents the engine from starting and discourages the thief from trying key codes (resistance values) at random.

If the correct resistance value is sensed when the ignition switch is in the "RUN" position, the theft deterrent module will ground the theft deterrent relay assembly and output the fuel enable PWM signal. This will allow the engine to start normally.

Figure 1 - PASS-Key II® System Components (Typical)

SYSTEM COMPONENTS

Ignition Key

Figure 1

The ignition key for vehicles equipped with the PASS-Key II® system is an assembly of a typical square ignition key blank and resistor. The ignition key blank and resistor are not serviceable separately. There are 15 different ignition keys, each with a different resistance value. The ignition key also has mechanical cuts similar to non-PASS-Key II® ignition keys.

! Important

- When servicing the PASS-Key II® system, obtain all ignition keys, if possible, and verify proper values with tool J 35628-A, VATS/PASS Interrogator. Refer to "Copying Ignition Key Assemblies" in this section.

Steering Column Lock and Ignition Cylinder

Figure 2

The ignition cylinder in the system contains a set of electrical contacts used to measure the resistor in the ignition key. When servicing the ignition cylinder, be certain to maintain proper wire routing. A two pin connector at the base of the steering column connects the contacts to the vehicle wiring. The connector is also used for diagnostic purposes. The ignition cylinder also performs all functions of ignition cylinders on non-PASS-Key II® vehicles. When replacing an ignition cylinder, it will be necessary to make new ignition keys which match the PASS-Key II® key code of the theft deterrent module and the mechanical cut of the new ignition cylinder.

! Important

- The wire routing for the contacts inside the steering column is critical.

Theft Deterrent Module

The theft deterrent module contains the logic of the PASS-Key II® system. The theft deterrent module has inputs from the ignition circuit and the resistor. The theft deterrent module has outputs to the starter enable circuit, the fuel enable circuit, and the security lamp circuit.

Theft Deterrent Relay

The relay is used to stop the engine from cranking if the correct resistance is not sensed at the ignition key. It prevents the engine from cranking by opening the circuit to the starter solenoid switch.

Powertrain Control Module (PCM)

The PCM reads the fuel enable circuit to determine if fuel injection should be allowed. If the fuel enable PWM signal is not present, the PCM will not allow fuel injection. If the PWM signal is present, the PCM will allow fuel injection and normal engine operation.

The PCM has some diagnostic features associated with the fuel enable input, including diagnostic trouble codes. For details, refer to SECTION 6E.

Ignition Input

The ignition input is used to turn the theft deterrent module on. When the theft deterrent module is turned on, it will read the resistor and control the outputs accordingly. When the theft deterrent module is turned off the resistor is not read, and the theft deterrent relay and fuel enable output will not allow the engine to start. When the ignition switch is in the "OFF" position, the battery input to the theft deterrent module will draw about 1 milli-amp.

Key Resistor Inputs

The key resistor inputs are used to determine if the correct ignition key is being used to start the vehicle. The key resistor inputs are read only when the theft deterrent module is first turned on. If the key code (resistance value) of the ignition key matches the value stored in the theft deterrent module, the theft deterrent relay and fuel enable output will allow the

Figure 2 - Ignition Cylinder Wire Routing

vehicle to start. If the resistance value of the ignition key does not match the value stored in the theft deterrent module, the relay and fuel enable output will not allow the vehicle to start.

Starter Enable Output

The starter enable circuit controls the theft deterrent relay. When the theft deterrent module sees the proper resistance at the ignition key, it grounds the theft deterrent relay which closes the starter enable circuit. This process allows the engine to be cranked. If the theft deterrent module does not see the proper resistance at the ignition key, it will not ground the theft deterrent relay.

Fuel Enable Output

The fuel enable circuit is an output from the theft deterrent module and an input to the PCM. When the theft deterrent module sees the proper resistance at the ignition key, it will output a Pulse Width Modulated (PWM) signal to the PCM. If the theft deterrent module does not see the proper resistance at the ignition key, it will not output the PWM signal to the PCM.

Security Indicator Lamp Output

The security lamp for Chevrolet reads "PASS KEY FAULT," for Buick "PASS KEY". Lamp output will be grounded any of the following conditions:

- During five second bulb test.

- Key in "START" or "RUN" position when module is preventing the vehicle from starting.
- Key in "START" or "RUN" position and module not properly programmed.

DIAGNOSIS

For diagnosis of theft deterrent system, refer to SECTION 8A.

ON-VEHICLE SERVICE

IGNITION KEY

Copying Ignition Keys

Tool Required:

J 35628-A VATS/PASS Interrogator

To copy an ignition key, it is necessary to first determine which PASS-Key II® key code (resistance value) is needed. The ignition key being copied must be tested to determine the key code. The ignition key may be tested using J 35628-A. To use J 35628-A, turn the tool on, make sure the tool wiring connectors are disconnected and insert the ignition key into the tool lock cylinder. The "Key Code Reader" will display the key code of the ignition key. Obtain an ignition key blank matching this key code and cut it to match the original ignition key.

Replacing Lost Ignition Keys

Tool Required:

J 35628-A VATS/PASS Interrogator

To replace lost ignition keys it is necessary to determine the mechanical cut and the electrical key code.

The mechanical and electrical key codes are recorded on the vehicle invoice. If these codes are available, use them to create a new ignition key. If they are not, follow the procedure below.

The mechanical cut must be determined first. The mechanical cut can be determined from the key code on the ignition cylinder or from the original key "knock outs". If the mechanical cut cannot be determined, the ignition cylinder should be replaced. Make an ignition key blank with the correct mechanical cut to use while determining the proper electrical key code.

To determine the proper electrical key code, use J 35628-A and the following procedure:

Important

- Do not disconnect yellow two-way SIR connector.

1. Connect J 35628-A wiring to PASS-Key II® dash connector at base of steering column. Do not connect to steering column wiring.
2. Turn J 35628-A on and place key code switch to "1" and attempt to start engine with proper mechanically cut key. If engine starts, key code is "1".
3. If engine does not start, turn ignition off and press 4-minute timer on J 35628-A.
4. When timer light goes out, place key code switch to "2" and attempt to start engine. If engine starts, key code is "2".

5. Continue trying different key codes until proper key code is found.
6. Make new ignition key with proper key code and mechanical cut.

THEFT DETERRENT MODULE AND THEFT DETERRENT RELAY

3. Electrical connector from power steering control module, if equipped.
4. Bolt/screw (6) from theft deterrent module bracket to ABS module bracket.
5. Slowly lower module bracket and pull it forward to allow rear bracket tab to clear slot at rear of ABS module bracket.
6. Electrical connector from module (1).
7. Slide relay (8) off end of module bracket (7).
8. Electrical connector from relay (8).
9. Bolt/screw (9) from module bracket nut.

Install or Connect

NOTICE: Refer to "Notice" on page 9D-1 of this section.

1. Slide tab on theft deterrent module (1) under metal tab on module bracket (7).
2. Bolt/screw (9) through tab on module (1) to module bracket nut.
3. Electrical connector to relay (8).
4. Electrical connector to module (1).
5. Slide relay on slotted tab on module bracket (7).
6. Insert rear tab on module bracket (7) into slot at rear of ABS module bracket.
7. Insert front end of theft deterrent module bracket inside ABS module bracket.
8. Bolt/screw (6) through ABS module bracket to theft deterrent module bracket (7).
9. Electrical connector to power steering control module, if equipped.
10. Instrument panel sound insulator, if Buick. Refer to SECTION 8C.
11. Battery negative cable.

Figure 3-Theft Deterrent Module Bracket

PROGRAMMING A NEW THEFT DETERRENT MODULE

! Important

- Any new PASS-KEY II® Theft Deterrent Module will automatically program to the resistance of the key (or Interrogator setting) being used at the first ignition "ON" cycle. This can only be done once for the life of the module.

New modules are unprogrammed. Before the system will function properly after a new module has been installed, it must be programmed to the code that matches the customer's keys. Programming a new module is very simple:

1. Install the new, unprogrammed module.
2. Insert one of the customer's keys in the ignition lock cylinder and turn it to the "RUN" position. It's a good idea to start the engine at this time to verify system operation.
3. Observe the indicator lamp:
 - The indicator lamp should light for about five seconds and then go out. If the wiring or contacts to the key resistance pellet or the key is defective or intermittent and a new module is installed, the engine will start but the indicator will flash at a rate of one flash per second until the ignition switch is turned off. This indicates that the module did not program and that the system components, wiring and contacts should be checked for a fault.

Figure 4 - Theft Deterrent Module and Relays

9D-6 THEFT DETERRENT SYSTEMS

Important

- Before connecting the Interrogator to the ignition lock cylinder circuit, always verify vehicle key code and set the code into the Interrogator using the "key code" knob. This will prevent programming an unprogrammed module with an undesired key code.

GENERAL DESCRIPTION

The engine coolant heater is installed into the engine block at a water jacket plug location. An engine coolant heater cord runs from the engine coolant heater along the front wheelhouse panel, to the left front fender inner panel just forward of the windshield washer solvent container. The heater is rated at 600 watts and uses a 110-volt AC power supply.

ON-VEHICLE SERVICE

ENGINE COOLANT HEATER REPLACEMENT

Figure 1

Remove or Disconnect

CAUTION: Perform this operation when the engine is cool or personal injury may result.

1. Raise and suitably support vehicle. Refer to SECTION 0A.
2. Drain engine coolant from engine block into an approved container. Refer to SECTION 6B.
3. Cord from heater (1).
4. Loosen bolt/screw (2).

NOTICE: When removing the engine coolant heater from the engine block, be careful not to score the machined surface of the plug hole.

5. Engine coolant heater (1) carefully from plug hole.
 - If removing heater (1) permanently, install water jacket plug into plug hole and replace engine coolant. For engine coolant replacement procedures, refer to SECTION 6B.

Clean

- Plug hole.
 - Remove burrs, sealer, paint and other rough spots.

Install or Connect

NOTICE: The element must not touch the engine block inner wall in the installed position or damage to the engine block and heater could result.

NOTICE: Refer to “Notice” on page 9E-1 of this section.

1. Apply coat of engine coolant heater lubricant, GM P/N 9985164 or equivalent, to O-ring and walls of plug holes.
2. Engine coolant heater (1) into plug hole.
 - A. Insert heating element end of heater (1) into plug hole.
 - B. Line up heater (1) with plug hole and push it straight into place.
 - C. Rotate heater (1) so that center electrical contact and bolt/screw (2) are in line horizontally, parallel to crankshaft centerline.
 - D. Turn bolt/screw (2) so that yoke presses against engine block inner wall.

Tighten

- Bolt/screw (2) to 1.9 N·m (17 lb. in.).

CAUTION: Engine coolant heater cord must not touch the engine, hot pipes, manifold or any moving parts or damage to the vehicle and possible personal injury may result.

9E-2 ENGINE COOLANT HEATER

GENERAL DESCRIPTION

RESTRAINT DEVICES

Figures 1 and 2

The Supplemental Inflatable Restraint (SIR) system helps supplement the protection offered by the driver and front passenger seat belts by deploying an air bag from the center of the steering wheel and from the top of the right side of the instrument panel (Figure 1).

The air bag deploys when the vehicle is involved in a frontal crash of sufficient force up to 30 degrees off the centerline of the vehicle (Figure 2). To further absorb the crash energy there is a knee bolster located beneath the instrument panel for both the driver and passenger and the steering column is collapsible.

SYSTEM DESCRIPTION

Figure 3

The SIR system consists of the Sensing and Diagnostic Module (SDM), the forward discriminating sensor, the driver inflator module, the SIR coil

Figure 1 - Restraint Devices

assembly, the passenger inflator module and the "AIR BAG" warning lamp in the instrument cluster. The SDM, SIR coil assembly (driver side only), driver inflator module, passenger inflator module and connector wires make up the deployment loops. The function of the deployment loops is to supply current through the inflator modules, which will cause deployment of the air bags in the event of a frontal crash of sufficient force, up to 30 degrees off the centerline of the vehicle. The inflator modules are only supplied enough current to deploy when the SDM or the SDM and the forward discriminating sensor detect vehicle velocity changes severe enough to warrant deployment.

Figure 2 - SIR System "Deployment Window"

Figure 3 - Deployment Loops

The SDM contains a sensing device which converts vehicle velocity changes to an electrical signal. The electrical signal generated is processed by the SDM and then compared to a value stored in memory. When the generated signal exceeds the stored value, additional signal processing is performed and the generated signals are compared to signals stored in memory. When two of the generated signals exceed the stored values or when one of the generated signals exceeds the stored value and the forward discriminating sensor closes, the SDM will cause current to flow through the inflator modules deploying the air bags.

COMPONENT DESCRIPTION

Figure 4

SDM

CAUTION: During service procedures, be very careful when handling a Sensing and Diagnostic Module (SDM). Never strike or jar the SDM. Never power up the SIR system when the SDM is not rigidly attached to the vehicle. All SDM and mounting bracket fasteners must be carefully torqued and the arrow must be pointed toward the front of the vehicle to ensure proper operation of the SIR system. The SDM could be activated when powered while not rigidly attached to the vehicle which could cause deployment and result in personal injury.

The Sensing and Diagnostic Module (SDM) is designed to perform the following functions in the SIR system:

1. **Energy Reserve** - The SDM maintains a 36 Volt Loop Reserve (36 VLR) energy supply to provide deployment energy when ignition voltage is lost in a frontal crash.
2. **Frontal Crash Detection** - The SDM monitors vehicle velocity changes to detect frontal crashes which are severe enough to warrant deployment.
3. **Air Bag Deployment** - When a frontal crash of sufficient force is detected, the SDM will cause enough current to flow through the inflator modules to deploy the air bags.
4. **Frontal Crash Recording** - The SDM records information regarding the SIR system status during a frontal crash.
5. **Malfunction Detection** - The SDM performs diagnostic monitoring of the SIR system electrical components and sets a diagnostic trouble code when a malfunction is detected.
6. **Malfunction Diagnosis** - The SDM displays SIR diagnostic trouble codes and system status information through the use of a scan tool.
7. **Driver Notification** - The SDM warns the vehicle driver of SIR system malfunctions by controlling the "AIR BAG" warning lamp.

The SDM is connected to the SIR wiring harness by a 20-way connector. This harness connector uses a shorting bar across certain terminals in the contact area. This shorting bar connects the "AIR BAG" warning lamp to ground when the SDM harness connector is disconnected.

This will cause the "AIR BAG" warning lamp to come "ON" steady whenever the ignition switch is at the RUN, BULB TEST or START positions with the SDM disconnected.

"AIR BAG" Warning Lamp

Ignition voltage is applied to the "AIR BAG" warning lamp when the ignition switch is at the RUN, BULB TEST or START position. The SDM controls the lamp by providing ground with a lamp driver. The "AIR BAG" warning lamp is used in the SIR system to do the following:

1. Verify lamp and SDM operation by flashing seven times when the ignition switch is first turned "ON."
2. Warn the vehicle driver of SIR electrical system malfunctions which could potentially affect the operation of the SIR system. These malfunctions could result in non-deployment in case of a frontal crash or deployment for conditions less severe than intended.

The "AIR BAG" warning lamp is the key to driver notification of SIR system malfunctions. For proper lamp operation, refer to the "SIR Diagnostic System Check" in this section.

Forward Discriminating Sensor

The forward discriminating sensor is used by the SDM to determine whether or not certain frontal crashes require deployment of the air bags. The sensor

Figure 4 - SIR Component and Wiring Location Views

consists of a sensing element, normally open switch contacts and a diagnostic resistor. The sensing element closes the switch contacts when the vehicle velocity changes are severe enough to warrant deployment. The diagnostic resistor is connected in parallel with the switch contacts inside the sensor. The diagnostic resistor, in conjunction with resistors in the SDM, causes a voltage drop which allows the SDM to monitor the integrity of the forward discriminating sensor and associated circuitry.

SIR Coil Assembly

Figure 5

The SIR coil assembly consists of two current-carrying coils. They are attached to the steering column and allow rotation of the steering wheel while maintaining continuous contact of the driver deployment loop to the driver inflator module.

There is a shorting bar on the yellow 2-way connector near the base of the steering column which connects the SIR coil to the SIR wiring harness. The shorting bar shorts the circuits to the SIR coil and driver inflator module when the yellow 2-way connector is disconnected. The circuit to the driver inflator module is shorted in this way to help prevent unwanted deployment of the air bag when servicing the steering column or other SIR system components.

Figure 5 - SIR Coil Assembly

Inflator Modules

Figures 6 and 7

The inflator modules consist of an inflatable bag and an inflator (a canister of gas-generating material and an initiating device). When the vehicle is in a frontal crash of sufficient force, the SDM causes current to flow through the deployment loops. Current passing through the initiator ignites the material in the inflator module. The gas produced from this reaction rapidly inflates the air bag.

There is a shorting bar on the driver inflator module side of the upper steering column connector which connects the SIR coil assembly to the driver inflator module. The shorting bar shorts across the driver inflator module circuits when the upper steering column connector is disconnected. The circuit to the driver inflator module is shorted in this way to help prevent unwanted deployment of the air bag when servicing the driver inflator module, the steering column or other SIR system components.

There is a shorting bar on the passenger inflator module connector which connects to the SIR wiring harness. The shorting bar shorts across the passenger inflator module circuits when the passenger inflator module connector is disconnected.

The circuit to the passenger inflator module is shorted in this way to help prevent unwanted deployment of the air bag when servicing the passenger inflator module, the instrument panel or other SIR system components.

Figure 6 - Driver Inflator Module

9J-6 SUPPLEMENTAL INFLATABLE RESTRAINT (SIR) SYSTEM

Steering Column

The steering column is energy absorbing and is designed to compress in a frontal crash to decrease the chance of injury to the driver. A steering column reinforcement is also used for additional support.

Knee Bolsters

The knee bolsters are used to absorb energy and control the forward movement of the vehicle's front seat occupants during a frontal crash, by limiting leg movement.

DEFINITIONS:

AIR BAG - An inflatable cloth cushion designed to deploy in certain frontal crashes. It supplements the protection offered by the seat belts by distributing the impact load more evenly over the vehicle occupant's head and torso.

ASYNCHRONOUS - Performed in a non-periodic fashion, i.e. no defined time or interval.

B+ - Battery voltage, the voltage available at the battery at the time of the indicated measurement. With the key "ON" and the engine not running, the system voltage will likely be between 12 and 12.5 volts. At idle the voltage may be 14 to 16 volts. The voltage could be as low as 10 volts during engine cranking.

BULB TEST - The SDM will cause the "AIR BAG" warning lamp to flash seven times and then go "OFF" whenever the ignition switch transitions to the RUN position from any other ignition switch position and no malfunctions are detected.

Figure 7a - Passenger Inflator Module (Chevrolet)

Figure 7b - Passenger Inflator Module (Buick)

"CONTINUOUS MONITORING" - Tests performed by the SDM on the SIR system every 100 milliseconds while "Ignition 1" voltage is in the normal operating voltage range at the SDM.

"CURRENT SOURCE DIAGNOSTICS" - Tests performed by the SDM after ignition, 36 VLR, and deployment loop voltages are all measured within their respective normal voltage ranges. This test checks for proper resistance of the deployment loops and for proper operation of the driver and passenger current sources. If an open is detected this test is aborted before resistance's are calculated, however, should the open clear the test will be completed meaning resistance's will be checked.

DATA LINK CONNECTOR (DLC) - Formerly "ALDL," a connector which is connected by wires to multiple on-board computers allowing communication with an off-board computer, such as a scan tool.

DATUM LINE - A base line parallel to the plane of the underbody or frame from which all vertical measurements originate.

DEPLOY - To inflate the air bag.

DEPLOYMENT LOOPS - The circuits which supply current to the inflator modules to deploy the air bags.

DIAGNOSTIC TROUBLE CODE (DTC) - Formerly "Code," a numerical designator used by the SDM to indicate specific SIR system malfunctions.

DRIVER CURRENT SOURCE - An output of the SDM which injects current into the driver inflator module circuits.

DRIVER INFLATOR MODULE - An assembly located in the steering wheel hub consisting of an inflatable bag, an inflator and an initiator.

EEPROM - Electrically Erasable Programmable Read Only Memory. Memory which retains its contents when power is removed from the SDM.

FORWARD DISCRIMINATING SENSOR - A sensor which is calibrated to supply a signal to the SDM when the vehicle changes are severe enough to warrant deployment.

HIGHER PRIORITY FAULT - Each diagnostic trouble code is assigned a priority based on the detectability with other DTCs present. The priority corresponds to the detectability of the malfunction ONLY, and does NOT relate to the criticality of the malfunction with respect to deployment or non-deployment under any given condition.

IGNITION CYCLE - The voltage at the SDM "Ignition 1" input, with ignition switch "ON," greater than 6.4 volts for at least 10 seconds before turning ignition switch "OFF."

IGNITION 1 - A battery voltage (B+) circuit which is only powered with the ignition switch in the RUN, BULB TEST, or START positions.

INITIATOR - The electrical component inside the inflator module which, when sufficient current flows, sets off the chemical reaction that inflates the air bag.

NORMAL OPERATING VOLTAGE RANGE - The voltage measured between the SDM "Ignition 1" terminal and "Ground" terminal is between 6.4, and 16 volts.

PASSENGER CURRENT SOURCE - An output of the SDM which injects current into the passenger inflator module circuit.

PASSENGER INFLATOR MODULE - An assembly located in the right side of the I/P consisting of an inflatable bag, an inflator and an initiator.

SCAN TOOL - An off-board computer used to read diagnostic information from on-board computers via the data link connector.

SDM - Sensing and Diagnostic Module which provides reserve energy to the deployment loops, deploys the air bags when required and performs diagnostic monitoring of all SIR system components.

SERIAL DATA - Information representing the status of the SIR system.

SIR - Supplemental inflatable restraint.

SIR COIL ASSEMBLY - An assembly of two current-carrying coils in the driver deployment loop that allows the rotation of the steering wheel while maintaining the continuous contact of the driver deployment loop to the driver inflator module.

SIR WIRING HARNESS - The wires and connectors that electrically connect the components in the SIR system.

"TURN-ON" - Test which the SDM performs on the SIR system once during each ignition cycle immediately after "Ignition 1" voltage is applied to the SDM and before "Continuous Monitoring."

36 VLR - The 36 volt loop reserve energy supply from the SDM which provides deployment power when vehicle voltage is lost in a frontal crash.

DIAGNOSIS

CAUTION: To avoid deployment when troubleshooting the SIR system, do not use electrical test equipment such as a battery powered or ac powered voltmeter, ohmmeter, etc., or any type of electrical equipment other than that specified in this manual. Do not use a non-powered probe type tester. Instructions in this manual must be followed carefully, otherwise personal injury may result.

DIAGNOSTIC TROUBLE CODES

The "SIR Diagnostic System Check" must always be the starting point of any SIR system diagnosis. The "SIR Diagnostic System Check" checks for proper "AIR BAG" warning lamp operation and checks for SIR diagnostic trouble codes using the scan tool.

1. Current diagnostic trouble codes - Malfunctions that are presently being detected. Current diagnostic trouble codes are stored in RAM (Random Access Memory).
2. History diagnostic trouble codes - All malfunctions detected since the last time the history memory was cleared. History diagnostic trouble codes are stored in EEPROM.

Scan Tool Diagnostics

A scan tool is used to read current and history diagnostic trouble codes and to clear all diagnostic trouble codes after a repair is completed. The scan tool must be updated to communicate with the SIR system through a replaceable cartridge before it can be used for SIR diagnostics. To use the scan tool, connect it to the data link connector and turn the ignition switch "ON." The scan tool reads serial data from the SDM "Serial Data" output terminal "B3" to the data link connector terminal "M."

USE OF SPECIAL TOOLS

CAUTION: To avoid deployment when troubleshooting the SIR system, do not use electrical test equipment such as a battery powered or ac powered voltmeter, ohmmeter, etc., or any type of electrical equipment other than that specified in this manual. Do not use a non-powered probe type tester. Instructions in this manual must be followed carefully, otherwise personal injury may result.

You should be familiar with the tools listed in this section under the heading "SIR SPECIAL TOOLS." You should be able to measure voltage and resistance. You should be familiar with proper use of a scan tool such as the Tech 1 Diagnostic Computer TK-0, SIR Driver/Passenger Load Tool J 38715, Connector Test Adapter Kit J 35616-A, and the DVM (Digital Multimeter) J 39200.

Figure 8 - SIR Connector Body Face Views

CAUTION: To avoid deployment when troubleshooting the SIR system, do not use electrical test equipment such as a battery powered or ac powered voltmeter, ohmmeter, etc., or any type of electrical equipment other than that specified in this manual. Do not use a non-powered probe type tester. Instructions in this manual must be followed carefully, otherwise personal injury may result.

NOTICE: If the vehicle interior has been exposed to extensive water intrusion, such as water leaks, window left open, driving through high water and so forth, the Sensing and Diagnostic Module (SDM) may need to be replaced. With the ignition "OFF," inspect the area under the front seat and the area around the SDM, including the carpet. If any significant soaking or evidence of significant soaking is detected, the water must be removed, water damage repaired and the SDM must be replaced. Before attempting any of these repairs, the SIR system must be disabled. See section 9J under "ON-VEHICLE SERVICE" for instructions on how to disable the SIR system and replace the SDM.

SIR DIAGNOSTIC SYSTEM CHECK

The diagnostic procedures used in this section are designed to find and repair SIR system malfunctions. To get the best results, it is important to use the diagnostic charts and follow the sequence listed below.

- A. PERFORM THE "SIR DIAGNOSTIC SYSTEM CHECK." The "SIR Diagnostic System Check" must be the starting point of any SIR diagnostics. The "SIR Diagnostic System Check" checks for proper "AIR BAG" warning lamp operation, the ability of the SDM to communicate through the "Serial Data" line and whether SIR diagnostic trouble codes exist.
- B. REFER TO THE PROPER DIAGNOSTIC CHART AS DIRECTED BY THE "SIR DIAGNOSTIC SYSTEM CHECK." The "SIR Diagnostic System Check" will lead you to the correct chart to diagnose any SIR system malfunctions. **Bypassing these procedures may result in extended diagnostic time, incorrect diagnosis and incorrect parts replacement.**
- C. REPEAT THE "SIR DIAGNOSTIC SYSTEM CHECK" AFTER ANY REPAIR OR DIAGNOSTIC PROCEDURES HAVE BEEN PERFORMED. Performing the "SIR Diagnostic System Check" after all repair or diagnostic procedures will ensure that the repair has been made correctly and that no other malfunctions exist.

CIRCUIT DESCRIPTION

When the ignition switch is first turned "ON," "Ignition 1" voltage is applied from the "AIR BAG" fuse to the SDM at the "Ignition 1" input, terminal "B9" and from the "I/P INDC" fuse to the SDM at the "Redundant Indicator Ignition 1" input, terminal "A4." The SDM responds by flashing the "AIR BAG" warning lamp seven times while performing tests on the SIR system.

When the engine is being cranked, "Ignition 1" voltage is applied from the "CRANK" fuse to the SDM at the "Crank" input, terminal "B1." The SDM

responds by grounding the "SIR Indicator" output terminal "A9" until "Ignition 1" voltage is removed from the "Crank" input. This results in the "AIR BAG" warning lamp being "ON" steady during cranking.

After cranking the SDM will flash the "AIR BAG" warning lamp six times and perform tests on the SIR system.

NOTES ON SYSTEM CHECK CHART:

1. The "AIR BAG" warning lamp should flash seven times after ignition is first turned "ON."
2. The "AIR BAG" warning lamp should remain "ON" steady during cranking.
3. After cranking, the "AIR BAG" warning lamp should flash six times then go "OFF."
4. This test checks for the proper operation of the "Serial Data" line. This test will also determine whether history diagnostic trouble codes are stored and, if so, identify them.
5. When the "AIR BAG" warning lamp flashes four times during BULB TEST this indicates a malfunction in the redundant lamp driver circuitry. These malfunctions are diagnosed by DTC 62 chart.
6. Improper operation of the "AIR BAG" warning lamp is indicated. This test differentiates a warning lamp stays "ON" condition from a warning lamp does not come "ON" condition.
7. This test checks for proper operation of the "Serial Data" line. This test will also identify the stored diagnostic trouble codes and whether they are current or history.

DIAGNOSTIC AIDS:

The order in which diagnostic trouble codes are diagnosed is very important. Failure to diagnose the diagnostic trouble codes in the order specified may result in extended diagnostic time, incorrect diagnosis and incorrect parts replacement.

SIR DIAGNOSTIC SYSTEM CHECK

9J-12 SUPPLEMENTAL INFLATABLE RESTRAINT (SIR) SYSTEM

CHART A SDM INTEGRITY CHECK

Circuit Description:

When the SDM recognizes "Ignition 1" voltage, applied to terminal "B9," is greater than 6.4 volts, the "AIR BAG" warning lamp is flashed seven times to verify operation. At this time the SDM performs "Turn-ON" tests followed by "Current Source Diagnostics" and "Continuous Monitoring" tests. When a malfunction is detected the SDM sets a current diagnostic trouble code and illuminates the "AIR BAG" warning lamp. The SDM will clear current diagnostic trouble codes and move them to a history file when the malfunction is no longer detected and/or the ignition switch is cycled, except for DTCs 51, 52 and 71. DTC 51 can only be cleared using a scan tool "Clear Codes" command. DTCs 52 and 71 may not clear after a "Clear Codes" command is issued.

Chart Test Description:

Number(s) below refer to circled number(s) on the diagnostic chart.

1. This test confirms a current malfunction. If no current malfunction is occurring (History DTC set) the "Diagnostic Aids" for the appropriate diagnostic trouble code should be referenced. The SDM should not be replaced for a History DTC.
2. This test checks for a malfunction introduced into the SIR system during the diagnostic process. It is extremely unlikely that a malfunctioning SDM would cause a new malfunction to occur during the diagnostic process.
3. When all circuitry outside the SDM has been found to operate properly, as indicated by the appropriate diagnostic chart, then and only then should the SDM be replaced.

CHART A SDM INTEGRITY CHECK

CAUTION: DURING SERVICE PROCEDURES, BE VERY CAREFUL WHEN HANDLING A SENSING AND DIAGNOSTIC MODULE (SDM). NEVER STRIKE OR JAR THE SDM. NEVER POWER UP THE SIR SYSTEM WHEN THE SDM IS NOT RIGIDLY ATTACHED TO THE VEHICLE. ALL SDM AND MOUNTING BRACKET FASTENERS MUST BE CAREFULLY TORQUED AND THE ARROW MUST BE POINTING TOWARD THE FRONT OF THE VEHICLE TO ENSURE PROPER OPERATION OF THE SIR SYSTEM. THE SDM COULD BE ACTIVATED WHEN POWERED WHILE NOT RIGIDLY ATTACHED TO THE VEHICLE WHICH COULD CAUSE DEPLOYMENT AND RESULT IN PERSONAL INJURY.

THIS CHART ASSUMES THAT THE "SIR DIAGNOSTIC SYSTEM CHECK" AND EITHER A SYMPTOM CHART OR A DIAGNOSTIC TROUBLE CODE CHART DIAGNOSIS HAVE BEEN PERFORMED. WHEN ALL CIRCUITRY OUTSIDE THE SDM HAS BEEN FOUND TO OPERATE PROPERLY, AS INDICATED BY THE APPROPRIATE DIAGNOSTIC CHART, AND THE SYMPTOM OR DTC REMAINS CURRENT, THE FOLLOWING DIAGNOSTIC PROCEDURES MUST BE PERFORMED TO VERIFY THE NEED FOR SDM REPLACEMENT.

9J-14 SUPPLEMENTAL INFLATABLE RESTRAINT (SIR) SYSTEM

CHART B

"AIR BAG" WARNING LAMP COMES "ON" STEADY

Circuit Description:

When the ignition switch is first turned "ON," "Ignition 1" voltage is applied from the "I/P INDC" fuse to "Redundant Indicator Ignition 1" terminal "A4," and to the "AIR BAG" warning lamp which is connected to "SIR Indicator" terminal "A9." The "AIR BAG" fuse applies system voltage to the "Ignition 1" input, terminal "B9." The SDM responds by flashing the "AIR BAG" warning lamp seven times. If "Ignition 1" is outside of the normal operating voltage range, the "AIR BAG" warning lamp will come "ON" solid with no DTCs set.

When the engine is being cranked, "Ignition 1" voltage is applied from the "CRANK" fuse to the SDM at the "Crank" input. The SDM responds by grounding the "SIR Indicator" output until "Ignition 1" voltage is removed from the "Crank" input. This results in the "AIR BAG" warning lamp being "ON" during cranking. After cranking, the SDM will flash the "AIR BAG" warning lamp six times.

Chart Test Description:

Number(s) below refer to circled number(s) on the diagnostic chart.

1. An open "AIR BAG" fuse would cause the "AIR BAG" warning lamp to come "ON" steady.
2. A disconnected SDM harness connector will cause the warning lamp to come "ON" steady via the shorting bar from terminal "A9" to terminal "A10" (ground).
3. This test checks for an open in the ground circuit to the SDM.
4. This test checks for an open in the "Ignition 1" circuit to the SDM.
5. This test checks for a short from the "Crank" input circuit to B+.
6. This test checks for a short from the "SIR Indicator" circuit to ground.
7. This test checks whether a short to ground caused the "AIR BAG" fuse to open.
8. This test determines whether the short to ground is due to a short in the wiring.

STEADY

WHEN MEASUREMENTS ARE REQUESTED IN THIS CHART USE J 39200 DVM WITH CORRECT TERMINAL ADAPTER FROM J 35616-A. WHEN A CHECK FOR PROPER CONNECTION IS REQUESTED REFER TO "INTERMITTENTS AND POOR CONNECTIONS" IN SECTION 8A-4. WHEN A WIRE, CONNECTOR OR TERMINAL REPAIR IS REQUESTED USE J 38125-A TERMINAL REPAIR KIT AND REFER TO "WIRING REPAIR" IN THIS SECTION.

9J-16 SUPPLEMENTAL INFLATABLE RESTRAINT (SIR) SYSTEM

CHART C

(Page 1 of 2)

"AIR BAG" WARNING LAMP DOES NOT COME "ON"

Circuit Description:

When the ignition switch is first turned "ON," "Ignition 1" voltage is applied from the "I/P INDC" fuse to "Redundant Indicator Ignition 1" terminal "A4," and to the "AIR BAG" warning lamp which is connected to "SIR Indicator" terminal "A9." The "AIR BAG" fuse applies system voltage to the "Ignition 1" input, terminal "B9." The SDM responds by flashing the "AIR BAG" warning lamp seven times. If "Ignition 1" is outside of the normal operating voltage range, the "AIR BAG" warning lamp will come "ON" solid with no DTCs set.

When the engine is being cranked, "Ignition 1" voltage is applied from the "CRANK" fuse to the SDM at the "Crank" input. The SDM responds by grounding the "SIR Indicator" output until "Ignition 1" voltage is removed from the "Crank" input. This results in the "AIR BAG" warning lamp being "ON" during cranking.

After cranking, the SDM will flash the "AIR BAG" warning lamp six times.

Chart Test Description:

Number(s) below refer to circled number(s) on the diagnostic chart.

1. This test determines whether the malfunction is in the "AIR BAG" warning lamp circuitry or in the instrument cluster power feed circuitry.
2. This test checks for an open in the "SIR Indicator" circuit, instrument cluster circuitry, and "AIR BAG" warning lamp bulb.
3. This test checks whether the open is due to a bad bulb.
4. This test determines whether the malfunction is an open in the "SIR Indicator" circuit or an open in the instrument cluster.
5. This test determines whether the malfunction is due to a short from the "SIR Indicator" circuit to B+.

CHART D

"AIR BAG" WARNING LAMP DOES NOT COME "ON" STEADY DURING CRANK

Circuit Description:

When the ignition switch is first turned "ON," "Ignition 1" voltage is applied from the "I/P INDC" fuse to "Redundant Indicator Ignition 1" terminal "A4," and to the "AIR BAG" warning lamp which is connected to "SIR Indicator" terminal "A9." The "AIR BAG" fuse applies system voltage to the "Ignition 1" input, terminal "B9." The SDM responds by flashing the "AIR BAG" warning lamp seven times. If "Ignition 1" is outside of the normal operating voltage range, the "AIR BAG" warning lamp will come "ON" solid with no DTCs set.

When the engine is being cranked, "Ignition 1" voltage is applied from the "CRANK" fuse to the SDM at the "Crank" input. The SDM responds by grounding the "SIR Indicator" output until "Ignition 1" voltage is removed from the "Crank" input. This results in the "AIR BAG" warning lamp being "ON" during cranking.

After cranking, the SDM will flash the "AIR BAG" warning lamp six times.

Chart Test Description:

Number(s) below refer to circled number(s) on the diagnostic chart.

1. This test checks whether the malfunction is due to an open "CRANK" fuse.
2. This test checks for a proper signal to the "Crank" input during cranking.
3. This test determines whether the lack of a proper crank signal is due to an open "Crank" input circuit or an open power feed to the "CRANK" fuse.
4. This test checks whether the "CRANK" fuse is open due to a short to ground in the "Crank" input circuit.
5. This test determines whether the short to ground is in the wiring harness.

CHART D

“AIR BAG” WARNING LAMP DOES NOT COME “ON” STEADY DURING CRANK

WHEN MEASUREMENTS ARE REQUESTED IN THIS CHART USE J 39200 DVM WITH CORRECT TERMINAL ADAPTER FROM J 35616-A. WHEN A CHECK FOR PROPER CONNECTION IS REQUESTED REFER TO “INTERMITTENTS AND POOR CONNECTION” IN SECTION 8A-4. WHEN A WIRE, CONNECTOR OR TERMINAL REPAIR IS REQUESTED USE J 38125-A TERMINAL REPAIR KIT AND REFER TO “WIRING REPAIR” IN THIS SECTION.

9J-22 SUPPLEMENTAL INFLATABLE RESTRAINT (SIR) SYSTEM

DTC 15

PASSENGER INITIATOR CIRCUIT RESISTANCE HIGH

Circuit Description:

When the ignition switch is turned "ON," the SDM will perform tests to diagnose critical malfunctions within itself. Upon passing these tests "Ignition 1," 36 VLR, and deployment loop voltages are measured to ensure they are within their respective normal voltage ranges. The SDM then proceeds with the "Current Source Diagnostics." "Passenger Side Low" terminal "A5" is grounded through a resistor and the passenger current source connected to "Passenger Side High" terminal "A6" allows a known amount of current to flow. By monitoring the voltage difference between "Passenger Side High" and "Passenger Side Low" the SDM calculates the combined resistance of the passenger inflator module, harness wiring CKTs 1403 and 1404, and connector terminal contact.

DTC Will Set When:

The combined resistance of the passenger inflator module, harness wiring CKTs 1403 and 1404, and connector terminal contact is above a specified value. This test is run once each ignition cycle during the "Current Source Diagnostics" when: 1) No "higher priority faults" are detected during "Turn-ON," 2) No "higher priority faults" are detected during "Continuous Monitoring," 3) No "Crank" signal present, 4) "Ignition 1" voltage is above a specified value.

Action Taken:

SDM turns "ON" the "AIR BAG" warning lamp and sets a diagnostic trouble code.

DTC Will Clear When:

The ignition switch is turned "OFF."

DTC Chart Test Description:

Number(s) below refer to circled number(s) on the diagnostic chart.

1. This test determines whether the malfunction is in the passenger inflator module circuitry or in the SDM wiring harness circuitry.
2. This test checks whether the malfunction is due to high resistance in CKT 1403.
3. This test checks whether the malfunction is due to high resistance in CKT 1404.
4. This test determines whether the malfunction is due to the passenger inflator module or the passenger inflator module jumper.

Diagnostic Aids:

An intermittent condition is likely to be caused by a poor connection at the passenger inflator module harness connector terminals "A" and "B," SDM terminals "A5" and "A6," or a poor wire to terminal connection in CKT 1403 or CKT 1404. This test for this diagnostic trouble code is only run while the "AIR BAG" warning lamp is performing the bulb check, unless DTC 17 or DTC 26 is detected. When a scan tool "Clear Codes" command is issued and the malfunction is still present, the DTC will not reappear until the next ignition cycle.

DTC 15 PASSENGER INITIATOR CIRCUIT RESISTANCE HIGH

WAS THE "SIR DIAGNOSTIC SYSTEM CHECK" PERFORMED?

YES

NO

WHEN MEASUREMENTS ARE REQUESTED IN THIS CHART USE J 39200 DVM WITH CORRECT TERMINAL ADAPTER FROM J 35616-A. WHEN A CHECK FOR PROPER CONNECTION IS REQUESTED REFER TO "INTERMITTENTS AND POOR CONNECTIONS" IN SECTION 8A-4. WHEN A WIRE, CONNECTOR OR TERMINAL REPAIR IS REQUESTED USE J 38125-A TERMINAL REPAIR KIT AND REFER TO "WIRING REPAIR" IN THIS SECTION.

GO TO THE "SIR DIAGNOSTIC SYSTEM CHECK."

1

- IGNITION SWITCH "OFF."
 - DISCONNECT DRIVER AND PASSENGER INFLATOR MODULES, YELLOW 2-WAY CONNECTORS LOCATED NEAR THE BASE OF STEERING COLUMN.
 - CHECK FOR PROPER CONNECTION TO PASSENGER INFLATOR MODULE AT TERMINALS "A" AND "B."
 - IF OK, THEN CONNECT J 38715 SIR DRIVER/PASSENGER LOAD TOOL TO DRIVER AND PASSENGER INFLATOR MODULE HARNESS CONNECTORS, LOCATED NEAR THE BASE OF THE STEERING COLUMN.
 - IGNITION SWITCH "ON."
- IS DTC 15 CURRENT?

YES

NO

2

- IGNITION SWITCH "OFF."
 - DISCONNECT SIR DRIVER/PASSENGER LOAD TOOL.
 - DISCONNECT SDM.
 - CHECK FOR PROPER CONNECTION TO SDM AT TERMINALS "A5" AND "A6."
 - IF OK, THEN MEASURE RESISTANCE FROM SDM HARNESS CONNECTOR TERMINAL "A6" TO PASSENGER INFLATOR MODULE HARNESS CONNECTOR TERMINAL "A."
- IS RESISTANCE 2.0 Ω OR LESS?

4

- IGNITION SWITCH "OFF."
 - REMOVE UPPER TRIM PAD, REFER TO SECTION 8C.
 - DISCONNECT PASSENGER INFLATOR MODULE JUMPER (IF EQUIPPED, OTHERWISE REPLACE PASSENGER INFLATOR MODULE).
 - DISCONNECT SIR DRIVER/PASSENGER LOAD TOOL FROM PASSENGER INFLATOR MODULE HARNESS CONNECTOR AND CONNECT TO THE JUMPER NEAR THE PASSENGER INFLATOR MODULE, LEAVE CONNECTED TO DRIVER SIDE.
 - RECONNECT CONNECTOR NEAR BASE OF THE STEERING COLUMN.
 - IGNITION SWITCH "ON."

- CLEAR SIR DIAGNOSTIC TROUBLE CODES.
- REPEAT "SIR DIAGNOSTIC SYSTEM CHECK."

9J-24 SUPPLEMENTAL INFLATABLE RESTRAINT (SIR) SYSTEM

DTC 16

PASSENGER INITIATOR CIRCUIT RESISTANCE LOW

Circuit Description:

When the ignition switch is turned "ON," the SDM will perform tests to diagnose critical malfunctions within itself. Upon passing these tests "Ignition 1," 36 VLR, and deployment loop voltages are measured to ensure they are within their respective normal voltage ranges. The SDM then proceeds with the "Current Source Diagnostics." "Passenger Side Low" terminal "A5" is grounded through a resistor and the passenger current source connected to "Passenger Side High" terminal "A6" allows a known amount of current to flow. By monitoring the voltage difference between "Passenger Side High" and "Passenger Side Low" the SDM calculates the combined resistance of the passenger inflator module, harness wiring CKTs 1403 and 1404, and connector terminal contact.

DTC Will Set When:

The combined resistance of the passenger inflator module, harness wiring CKTs 1403 and 1404, and connector terminal contact is below a specified value. This test is run once each ignition cycle during the "Current Source Diagnostics" when: 1) No "higher priority faults" are detected during "Turn-ON," 2) No "higher priority faults" are detected during "Continuous Monitoring," 3) No "Crank" signal present, 4) "Ignition 1" voltage is above a specified value.

Action Taken:

SDM turns "ON" the "AIR BAG" warning lamp and sets a diagnostic trouble code.

DTC Will Clear When:

The ignition switch is turned "OFF."

DTC Chart Test Description:

Number(s) below refer to circled number(s) on the diagnostic chart.

1. DTC 16 and 22 will set simultaneously when the "Driver Side High" circuit is shorted to the "Passenger Side High" circuit due to parallel current paths.
2. This test determines whether the malfunction is in the passenger inflator module circuitry or in the SDM wiring harness circuitry.
3. This test checks for a short from the "Passenger Side High" circuit to the "Passenger Side Low" circuit.
4. This test checks for a short from the "Passenger Side High" circuit to the "Driver Side Low" circuit.

Diagnostic Aids:

An intermittent condition is likely to be caused by a short between CKT 1403 and CKT 347, CKT 348 or CKT 1404, or a malfunctioning shorting bar on the passenger inflator module which would require replacement of the module. The test for this diagnostic trouble code is only run while "AIR BAG" warning lamp is performing the bulb check, unless DTC 17 or DTC 26 is detected. When a scan tool "Clear Codes" command is issued and the malfunction is still present, the DTC will not reappear until the next ignition cycle.

DTC 16 PASSENGER INITIATOR CIRCUIT RESISTANCE LOW

WAS THE "SIR DIAGNOSTIC SYSTEM CHECK" PERFORMED?

YES

NO

WHEN MEASUREMENTS ARE REQUESTED IN THIS CHART USE J 39200 DVM WITH CORRECT TERMINAL ADAPTER FROM J 35616-A. WHEN A CHECK FOR PROPER CONNECTION IS REQUESTED REFER TO "INTERMITTENTS AND POOR CONNECTIONS" IN SECTION 8A-4. WHEN A WIRE, CONNECTOR OR TERMINAL REPAIR IS REQUESTED USE J 38125-A TERMINAL REPAIR KIT AND REFER TO "WIRING REPAIR" IN THIS SECTION.

GO TO THE "SIR DIAGNOSTIC SYSTEM CHECK."

9J-26 SUPPLEMENTAL INFLATABLE RESTRAINT (SIR) SYSTEM

DTC 17 PASSENGER INITIATOR CIRCUIT OPEN

Circuit Description:

When the ignition switch is turned "ON," the SDM will perform tests to diagnose critical malfunctions within itself. Upon passing these tests "Ignition 1," 36 VLR, and deployment loop voltages are measured to ensure they are within their respective normal voltage ranges. The SDM then proceeds with the "Current Source Diagnostics." "Passenger Side Low" terminal "A5" is grounded through a resistor and the passenger current source connected to "Passenger Side High" terminal "A6" allows a known amount of current to flow. After "Current Source Diagnostics" are completed the SDM removes the low resistance ground from "Passenger Side Low" and switches the passenger current source at "Passenger Side High." The SDM then measures the voltage at "Passenger Side High" and "Passenger Side Low" during "Continuous Monitoring." By monitoring the voltage difference between "Passenger Side High" and "Passenger Side Low" the SDM calculates the combined resistance of the passenger inflator module, harness wiring CKTs 1403 and 1404, and connector terminal contact.

DTC Will Set When:

The voltage difference between "Passenger Side High" terminal "A6" and "Passenger Side Low" terminal "A5" is above or equal to a specified value for 500 milliseconds during "Current Source Diagnostics" or "Continuous Monitoring."

Action Taken:

SDM turns "ON" the "AIR BAG" warning lamp and sets a diagnostic trouble code.

DTC Will Clear When:

The voltage difference between "Passenger Side High" terminal "A6" and "Passenger Side Low" terminal "A5" is below a specified value for 500 milliseconds during "Continuous Monitoring."

DTC Chart Test Description:

Number(s) below refer to circled number(s) on the diagnostic chart.

1. This test determines whether the malfunction is in the passenger inflator module circuitry or in the SDM wiring harness circuitry.
2. This test checks whether the malfunction is due to high resistance in CKT 1403.
3. This test checks whether the malfunction is due to high resistance in CKT 1404.
4. This test determines whether the malfunction is due to the passenger inflator module or the passenger inflator module jumper.

Diagnostic Aids:

An intermittent condition is likely to be caused by a poor connection at the passenger inflator module harness connector terminals "A" and "B," SDM terminals "A5" and "A6," or an open in CKT 1403 or CKT 1404.

DTC 21

DRIVER INITIATOR CIRCUIT RESISTANCE HIGH

Circuit Description:

When the ignition switch is turned "ON," the SDM will perform tests to diagnose critical malfunctions within itself. Upon passing these tests "Ignition 1," 36 VLR, and deployment loop voltages are measured to ensure they are within their respective normal voltage ranges. The SDM then proceeds with the "Current Source Diagnostics." "Driver Side Low" terminal "A2" is grounded through a resistor and the driver current source connected to "Driver Side High" terminal "A1" allows a known amount of current to flow. By monitoring the voltage difference between "Driver Side High" and "Driver Side Low" the SDM calculates the combined resistance of the driver inflator module, SIR coil assembly, harness wiring CKTs 347 and 348, and connector terminal contact.

DTC Will Set When:

The combined resistance of the driver inflator module, SIR coil assembly, harness wiring CKTs 347 and 348, and connector terminal contact is above a specified value. This test is run during the "Current Source Diagnostics" when: 1) No "higher priority faults" are detected during "Turn-ON," 2) No "higher priority faults" are detected during "Continuous Monitoring," 3) No "Crank" signal present, 4) "Ignition 1" voltage is above a specified value.

Action Taken:

SDM turns "ON" the "AIR BAG" warning lamp and sets a diagnostic trouble code.

DTC Will Clear When:

The ignition switch is turned "OFF."

DTC Chart Test Description:

Number(s) below refer to circled number(s) on the diagnostic chart.

1. This test determines whether the malfunction is in the driver inflator module circuitry or in the SDM wiring harness circuitry.
2. This test checks whether the malfunction is due to a high resistance in CKT 347.
3. This test checks whether the malfunction is due to a high resistance in CKT 348.
4. This test determines whether the malfunction is in the driver inflator module or the SIR coil assembly.

Diagnostic Aids:

An intermittent condition is likely to be caused by a poor connection at terminals "A" and "B" of the SIR coil connector at the base of the steering column, terminals "A" and "B" of the driver inflator module connector at the top of the steering column, SDM terminals "A1" and "A2" or a poor wire to terminal connection in CKT 347 or CKT 348. The test for this diagnostic trouble code is only run while the "AIR BAG" warning lamp is performing the bulb check, unless DTC 17 or DTC 26 is detected. When a scan tool "Clear Codes" command is issued and the malfunction is still present, the DTC will not reappear until the next ignition cycle.

9J-30 SUPPLEMENTAL INFLATABLE RESTRAINT (SIR) SYSTEM

DTC 22 DRIVER INITIATOR CIRCUIT RESISTANCE LOW

Circuit Description:

When the ignition switch is turned "ON," the SDM will perform tests to diagnose critical malfunctions within itself. Upon passing these tests "Ignition 1," 36 VLR, and deployment loop voltages are measured to ensure they are within their respective normal voltage ranges. The SDM then proceeds with the "Current Source Diagnostics." "Driver Side Low" terminal "A2" is grounded through a resistor and the driver current source connected to "Driver Side High" terminal "A1" allows a known amount of current to flow. By monitoring the voltage difference between "Driver Side High" and "Driver Side Low" the SDM calculates the combined resistance of the driver inflator module, SIR coil assembly, harness wiring CKTs 347 and 348, and connector terminal contact.

DTC Will Set When:

The combined resistance of the driver inflator module, SIR coil assembly, harness wiring CKTs 347 and 348, and connector terminal contact is below a specified value. This test is run during the "Current Source Diagnostics" when: 1) No "higher priority faults" are detected during "Turn-ON," 2) No "higher priority faults" are detected during "Continuous Monitoring," 3) No "crank" signal present, 4) "Ignition 1" voltage is above a specified value.

Action Taken:

SDM turns "ON" the "AIR BAG" warning lamp and sets a diagnostic trouble code.

DTC Will Clear When:

The ignition switch is turned "OFF."

DTC Chart Test Description:

Number(s) below refer to circled number(s) on the diagnostic chart.

1. DTC 16 and 22 will set simultaneously when the "Driver Side High" circuit is shorted to the "Passenger Side High" circuit due to parallel current paths.
2. This test determines whether the malfunction is in the driver inflator module circuitry or in the SDM wiring harness circuitry.
3. This test checks for a short from the "Driver Side High" circuit to the "Driver Side Low" circuit.
4. This test checks for a short from the "Driver Side High" circuit to the "Passenger Side Low" circuit.
5. This test determines whether the malfunction is in the driver inflator module or the SIR coil assembly.

Diagnostic Aids:

An intermittent condition is likely to be caused by a short between CKT 347 and CKT 348, CKT 1403 or CKT 1404, or a malfunctioning shorting bar on the driver inflator module or SIR coil assembly which would require replacement of the component. The test for this diagnostic trouble code is only run while "AIR BAG" warning lamp is performing the bulb check, unless DTC 17 or DTC 26 is detected. When a scan tool "Clear Codes" command is issued and the malfunction is still present, the DTC will not reappear until the next ignition cycle.

- REPEAT "SIR DIAGNOSTIC SYSTEM CHECK."

DTC 24

(Page 1 of 2)

INITIATOR CIRCUIT VOLTAGE LOW

Circuit Description:

When the ignition switch is turned "ON," the SDM will perform tests to diagnose critical malfunctions within itself. Upon passing these tests "Ignition 1," 36 VLR and deployment loop voltages are measured to ensure they are within their respective normal voltage ranges. The SDM monitors the voltages at "Driver Side Low" terminal "A2" and "Passenger Side Low" terminal "A5" to detect shorts to ground in the inflator module circuits.

DTC Will Set When:

The 36 VLR power supply in the SDM is in its normal operating voltage range and at least one of the two inflator modules is not open. Then the voltage measured at "Driver Side Low" and "Passenger Side Low" is below a specified value for 500 milliseconds. This test is run during "Turn-ON" tests and every 100 milliseconds during "Continuous Monitoring."

Action Taken:

SDM turns "ON" the "AIR BAG" warning lamp and sets a diagnostic trouble code.

DTC Will Clear When:

The voltage measured at "Driver Side Low" and the voltage measured at "Passenger Side Low" are above a specified value for 500 milliseconds.

DTC Chart Test Description:

Number(s) below refer to circled number(s) on the diagnostic chart.

1. This test determines whether the malfunction is occurring in the driver inflator module circuitry.
2. This test determines whether the malfunction is occurring in the passenger inflator module circuitry.

Diagnostic Aids:

Refer to DTC 24 (Page 2 of 2).

DTC 24

- RECONNECT ALL SIR SYSTEM COMPONENTS, ENSURE ALL COMPONENTS ARE PROPERLY MOUNTED.
- CLEAR SIR DIAGNOSTIC TROUBLE CODES.
- REPEAT "SIR DIAGNOSTIC SYSTEM CHECK."

DTC 24

(Page 2 of 2)

INITIATOR CIRCUIT VOLTAGE LOW

Circuit Description:

When the ignition switch is turned "ON," the SDM will perform tests to diagnose critical malfunctions within itself. Upon passing these tests "Ignition 1," 36 VLR and deployment loop voltages are measured to ensure they are within their respective normal voltage ranges. The SDM monitors the voltages at "Driver Side Low" terminal "A2" and "Passenger Side Low" terminal "A5" to detect shorts to ground in the inflator module circuits.

DTC Will Set When:

The 36 VLR power supply in the SDM is in its normal operating voltage range and at least one of the two inflator modules is not open. Then the voltage measured at "Driver Side Low" and "Passenger Side Low" is below a specified value for 500 milliseconds. This test is run during "Turn-ON" tests and every 100 milliseconds during "Continuous Monitoring."

Action Taken:

SDM turns "ON" the "AIR BAG" warning lamp and sets a diagnostic trouble code.

DTC Will Clear When:

The voltage measured at "Driver Side Low" and the voltage measured at "Passenger Side Low" are above a specified value for 500 milliseconds.

DTC Chart Test Description:

Number(s) below refer to circled number(s) on the diagnostic chart.

3. This test checks for a short from "Driver Side High" to ground.
4. This test checks for a short from "Driver Side Low" to ground.
5. This test checks for a short from "Passenger Side Low" to ground.
6. This test checks for a short from "Passenger Side High" to ground.

Diagnostic Aids:

An intermittent condition is likely to be caused by a short to ground in the inflator module circuits. Inspect CKTs 347, 348, 1403 and 1404 carefully for cutting or chafing. If the wiring pigtail of the SIR coil assembly, driver inflator module or passenger inflator module is damaged the component must be replaced.

DTC 25

(Page 1 of 2)

INITIATOR CIRCUIT SHORT TO IGNITION

Circuit Description:

When the ignition switch is turned "ON," the SDM will perform tests to diagnose critical malfunctions within itself. Upon passing these tests "Ignition 1," 36 VLR and deployment loop voltages are measured to ensure they are within their respective normal voltage ranges. The SDM monitors the voltages at "Driver Side Low" terminal "A2" and "Passenger Side Low" terminal "A5" to detect shorts to B+ in the inflator module circuits.

DTC Will Set When:

The 36 VLR power supply in the SDM is in its normal operating voltage range and neither of the two inflator modules is open. Then the voltage measured at "Driver Side Low" and "Passenger Side Low" is within a specified range. Once these conditions are met the SDM will ground "Driver Side Low" and "Passenger Side Low" through a resistor and check that "Ignition 1" is in the normal operating voltage range. When all previous conditions are met and the

voltage measured at "Driver Side Low" and at "Passenger Side Low" is above a specified value, DTC 25 will set.

Action Taken:

SDM turns "ON" the "AIR BAG" warning lamp, sets DTC 25 and also DTC 71.

DTC Will Clear When:

The malfunction is no longer occurring and the ignition switch is turned "OFF," however, DTC 71 will remain current.

DTC Chart Test Description:

Number(s) below refer to circled number(s) on the diagnostic chart.

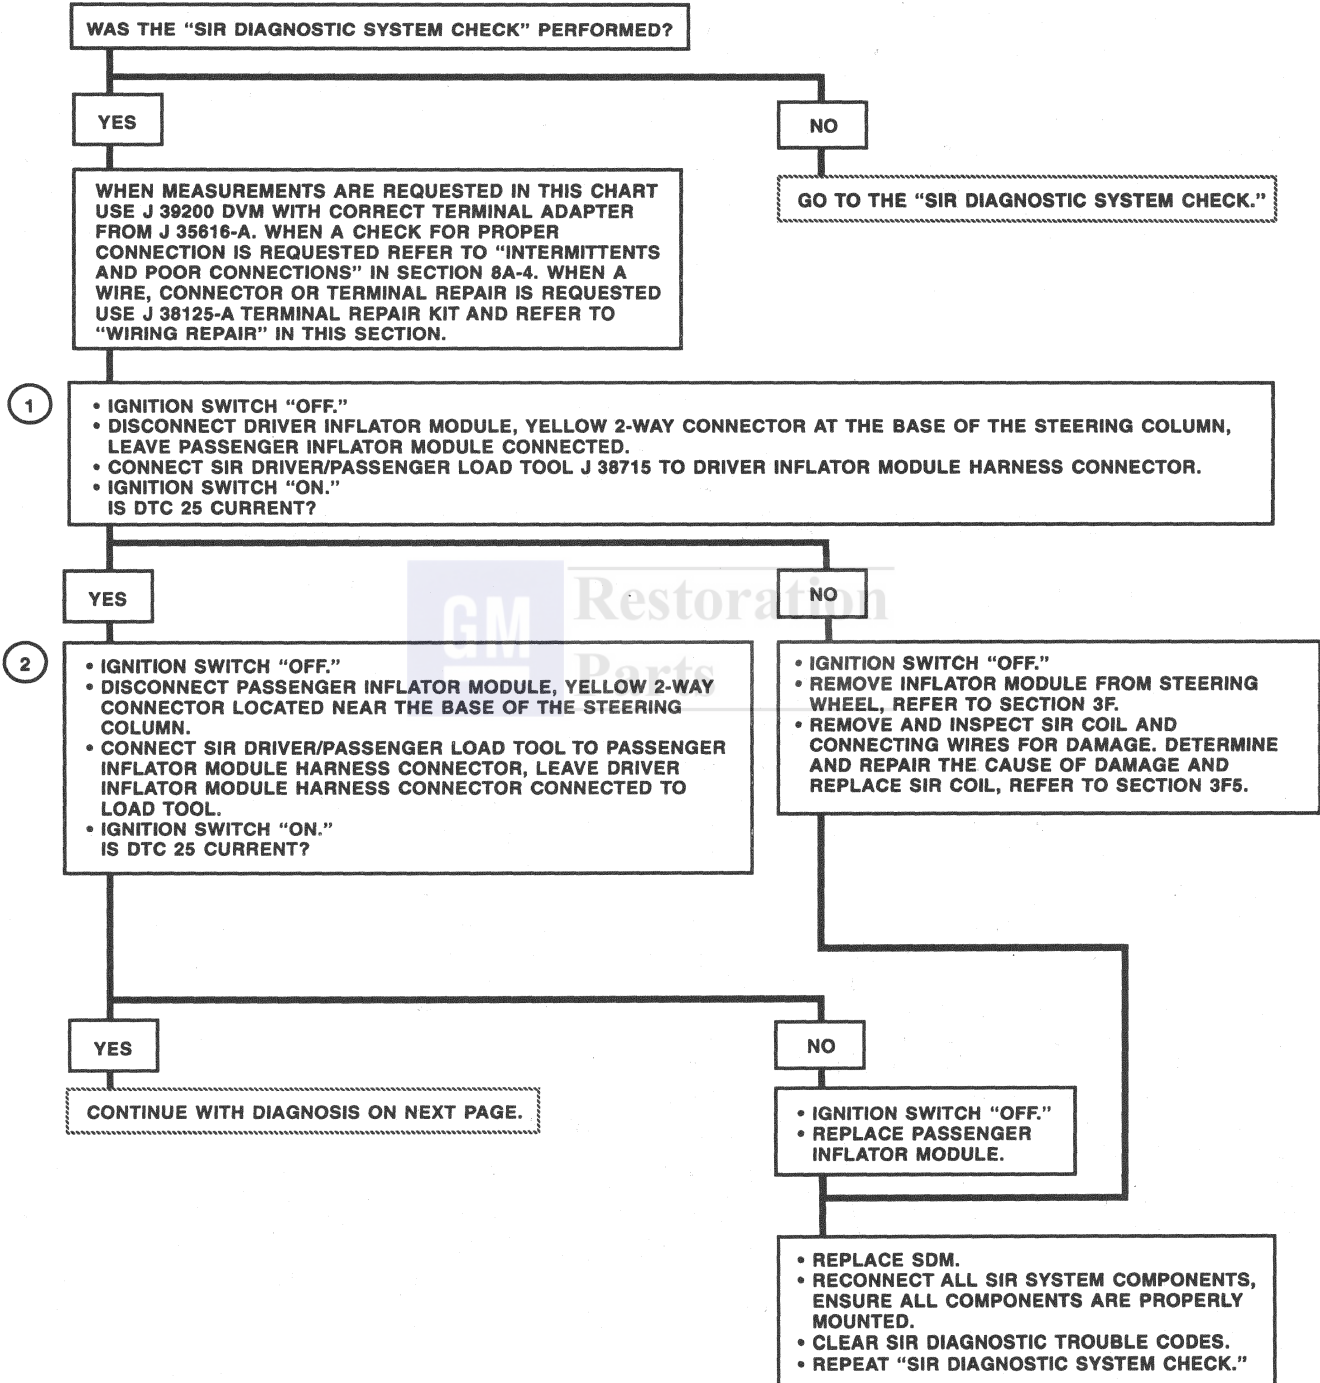

1. This test determines whether the malfunction is occurring in the driver inflator module circuitry.
2. This test determines whether the malfunction is occurring in the passenger inflator module circuitry.

Diagnostic Aids:

Refer to DTC 25 (Page 2 of 2).

NOTICE: WHEN DTC 25 HAS BEEN SET IT IS NECESSARY TO REPLACE THE SDM. SETTING DTC 25 WILL ALSO CAUSE DTC 71 TO SET. WHEN A SCAN TOOL "CLEAR CODES" COMMAND IS ISSUED AND THE MALFUNCTION IS STILL PRESENT, DTCs 25 AND 71 WILL REMAIN CURRENT. WHEN A SCAN TOOL "CLEAR CODES" COMMAND IS ISSUED AND MALFUNCTION IS NO LONGER PRESENT, DTC 25 WILL CLEAR BUT DTC 71 WILL REMAIN CURRENT. ENSURE THAT THE SHORT TO B+ CONDITION IS REPAIRED PRIOR TO INSTALLING A REPLACEMENT SDM TO AVOID DAMAGING THE SDM.

DTC 25 (Page 1 of 2) INITIATOR CIRCUIT SHORT TO IGNITION

DTC 25

(Page 2 of 2)

INITIATOR CIRCUIT SHORT TO IGNITION

Circuit Description:

When the ignition switch is turned "ON," the SDM will perform tests to diagnose critical malfunctions within itself. Upon passing these tests "Ignition 1," 36 VLR and deployment loop voltages are measured to ensure they are within their respective normal voltage ranges. The SDM monitors the voltages at "Driver Side Low" terminal "A2" and "Passenger Side Low" terminal "A5" to detect shorts to B+ in the inflator module circuits.

DTC Will Set When:

The 36 VLR power supply in the SDM is in its normal operating voltage range and neither of the two inflator modules is open. Then the voltage measured at "Driver Side Low" and "Passenger Side Low" is within a specified range. Once these conditions are met the SDM will ground "Driver Side Low" and "Passenger Side Low" through a resistor and check that "Ignition 1" is in the normal operating voltage range. When all previous conditions are met and the voltage measured at "Driver Side Low" and at "Passenger Side Low" is above a specified value, DTC 25 will set.

Action Taken:

SDM turns "ON" the "AIR BAG" warning lamp, sets DTC 25 and also DTC 71.

DTC Will Clear When:

The malfunction is no longer occurring and the ignition switch is turned "OFF," however, DTC 71 will remain current.

DTC Chart Test Description:

Number(s) below refer to circled number(s) on the diagnostic chart.

3. This test checks for a short from "Driver Side High" to B+.
4. This test checks for a short from "Driver Side Low" to B+.
5. This test checks for a short from "Passenger Side High" to B+.
6. This test checks for a short from "Passenger Side Low" to B+.

Diagnostic Aids:

An intermittent condition is likely to be caused by a short to B+ in the inflator module circuits. A DTC 25 history would be accompanied by DTC 71 current. A careful inspection of the circuits and components indicated on DTC 25 charts is essential to ensure that the replacement SDM will not be damaged.

DTC 25 (Page 2 of 2) INITIATOR CIRCUIT SHORT TO IGNITION

NOTICE: WHEN DTC 25 HAS BEEN SET IT IS NECESSARY TO REPLACE THE SDM. SETTING DTC 25 WILL ALSO CAUSE DTC 71 TO SET. WHEN A SCAN TOOL "CLEAR CODES" COMMAND IS ISSUED AND THE MALFUNCTION IS STILL PRESENT, DTCs 25 AND 71 WILL REMAIN CURRENT. WHEN A SCAN TOOL "CLEAR CODES" COMMAND IS ISSUED AND MALFUNCTION IS NO LONGER PRESENT, DTC 25 WILL CLEAR BUT DTC 71 WILL REMAIN CURRENT. ENSURE THAT THE SHORT TO B+ CONDITION IS REPAIRED PRIOR TO INSTALLING A REPLACEMENT SDM TO AVOID DAMAGING THE SDM.

9J-40 SUPPLEMENTAL INFLATABLE RESTRAINT (SIR) SYSTEM

DTC 26 DRIVER INITIATOR CIRCUIT OPEN

Circuit Description:

When the ignition switch is turned "ON," the SDM will perform tests to diagnose critical malfunctions within itself. Upon passing these tests "Ignition 1," 36 VLR, and deployment loop voltages are measured to ensure they are within their respective normal voltage ranges. The SDM then proceeds with the "Current Source Diagnostics." "Driver Side Low" terminal "A2" is grounded through a resistor and the driver current source connected to "Driver Side High" terminal "A1" allows a known amount of current to flow. After "Current Source Diagnostics" are completed the SDM removes the low resistance ground from "Driver Side Low" and switches the driver current source at "Driver Side High." The SDM then measures the voltage at "Driver Side High" and "Driver Side Low" during "Continuous Monitoring." By monitoring the voltage difference between "Driver Side High" and "Driver Side Low" the SDM calculates the combined resistance of the SIR coil assembly, driver inflator module, harness wiring CKTs 347 and 348, and connector terminal contact.

DTC Will Set When:

The voltage difference between "Driver Side High" terminal "A1" and "Driver Side Low" terminal "A2" is above or equal to a specified value for 500 milliseconds during "Current Source Diagnostics" or "Continuous Monitoring."

Action Taken:

SDM turns "ON" the "AIR BAG" warning lamp and sets a diagnostic trouble code.

DTC Will Clear When:

The voltage difference between "Driver Side High" terminal "A1" and "Driver Side Low" terminal "A2" is below a specified value for 500 milliseconds during "Continuous Monitoring."

DTC Chart Test Description:

Number(s) below refer to circled number(s) on the diagnostic chart.

1. This test determines whether the malfunction is in the driver inflator module circuitry or in the SDM wiring harness circuitry.
2. This test checks whether the malfunction is due to high resistance in CKT 347.
3. This test checks whether the malfunction is due to high resistance in CKT 348.
4. This test determines whether the malfunction is in the driver inflator module or the SIR coil assembly.

Diagnostic Aids:

An intermittent condition is likely to be caused by a poor connection at the driver inflator module terminals "A" and "B," SIR coil assembly terminals "A" and "B," SDM terminals "A1" and "A2," or an open in CKT 347 or CKT 348.

DTC 26 **DRIVER INITIATOR CIRCUIT OPEN**

WAS THE "SIR DIAGNOSTIC SYSTEM CHECK" PERFORMED?

YES

NO

GO TO THE "SIR DIAGNOSTIC SYSTEM CHECK."

WHEN MEASUREMENTS ARE REQUESTED IN THIS CHART USE J 39200 DVM WITH CORRECT TERMINAL ADAPTER FROM J 35616-A. WHEN A CHECK FOR PROPER CONNECTION IS REQUESTED REFER TO "INTERMITTENTS AND POOR CONNECTIONS" IN SECTION 8A-4. WHEN A WIRE, CONNECTOR OR TERMINAL REPAIR IS REQUESTED USE J 38125-A TERMINAL REPAIR KIT AND REFER TO "WIRING REPAIR" IN THIS SECTION.

1

- IGNITION SWITCH "OFF."
- DISCONNECT DRIVER AND PASSENGER INFLATOR MODULES, YELLOW 2-WAY CONNECTORS LOCATED NEAR THE BASE OF THE STEERING COLUMN.
- CHECK FOR PROPER CONNECTION TO SIR COIL ASSEMBLY CONNECTOR AT TERMINALS "A" AND "B."
- IF OK THEN CONNECT J 38715 SIR DRIVER/PASSENGER LOAD TOOL TO DRIVER AND PASSENGER INFLATOR MODULE HARNESS CONNECTORS, LOCATED NEAR THE BASE OF THE STEERING COLUMN.
- IGNITION SWITCH "ON."
- IS DTC 26 CURRENT?

YES

NO

GO TO CHART A.

REPAIR HIGH RESISTANCE OR OPEN IN CKT 348.

- RECONNECT ALL SIR SYSTEM COMPONENTS, ENSURE ALL COMPONENTS ARE PROPERLY MOUNTED.
- CLEAR SIR DIAGNOSTIC TROUBLE CODES.
- REPEAT "SIR DIAGNOSTIC SYSTEM CHECK."

9J-42 SUPPLEMENTAL INFLATABLE RESTRAINT (SIR) SYSTEM

DTC 35

DISCRIMINATING SENSOR OPEN OR SHORT TO GROUND

Circuit Description:

When the ignition switch is turned "ON," the SDM will perform tests to diagnose critical malfunctions within itself. Upon passing these tests "Ignition 1," 36 VLR, and deployment loop voltages are measured to ensure they are within their respective normal voltage ranges. The SDM then proceeds with the "Current Source Diagnostics" followed by "Continuous Monitoring." The SDM supplies "Reference Voltage" at terminal "B6" and measures the voltage at "Sensor Signal" terminal "B5." During normal operation the voltage measured at "Sensor Signal" will be about one half the "Reference Voltage."

DTC Will Set When:

The voltage measured at "Sensor Signal" terminal "B5" is below a specified value for 500 milliseconds during "Continuous Monitoring."

Action Taken:

SDM turns "ON" the "AIR BAG" warning lamp and sets a diagnostic trouble code.

DTC Will Clear When:

The voltage measured at "Sensor Signal" terminal "B5" is in its normal range for 500 milliseconds during "Continuous Monitoring."

DTC Chart Test Description:

Number(s) below refer to circled number(s) on the diagnostic chart.

1. This test checks proper resistance of the forward discriminating sensor.
2. This test checks for an open in the "Reference Voltage" circuit.
3. This test checks for an open in the "Sensor Signal" circuit.
4. This test checks for a short from "Reference Voltage" to ground.
5. This test checks for a short from "Sensor Signal" to ground.

Diagnostic Aids:

An intermittent condition is likely to be caused by a poor connection to the forward discriminating sensor at terminals "A" or "B," poor connection to the SDM at terminals "B5" or "B6," a short to ground in CKT 349 or CKT 354, or an open in CKT 349 or CKT 354.

DTC 35**DISCRIMINATING SENSOR OPEN
OR SHORT TO GROUND**

C9709

9J-44 SUPPLEMENTAL INFLATABLE RESTRAINT (SIR) SYSTEM

DTC 36

DISCRIMINATING SENSOR CLOSED OR SHORT TO IGNITION

Circuit Description:

When the ignition switch is turned "ON," the SDM will perform tests to diagnose critical malfunctions within itself. Upon passing these tests "Ignition 1," 36 VLR, and deployment loop voltages are measured to ensure they are within their respective normal voltage ranges. The SDM then proceeds with the "Current Source Diagnostics" followed by "Continuous Monitoring." The SDM supplies "Reference Voltage" at terminal "B6" and measures the voltage at "Sensor Signal" terminal "B5." During normal operation the voltage measured at "Sensor Signal" will be about one half the "Reference Voltage."

DTC Will Set When:

The voltage measured at "Sensor Signal" terminal "B5" is above a specified value for 500 milliseconds during "Continuous Monitoring."

Action Taken:

SDM turns "ON" the "AIR BAG" warning lamp and sets a diagnostic trouble code.

DTC Will Clear When:

The voltage measured at "Sensor Signal" terminal "B5" is in its normal range for 500 milliseconds during "Continuous Monitoring."

DTC Chart Test Description:

Number(s) below refer to circled number(s) on the diagnostic chart.

1. This test checks proper resistance of the forward discriminating sensor.
2. This test checks for a short from the "Reference Voltage" circuit to the "Sensor Signal" circuit.
3. This test checks for a short from "Reference Voltage" to B+.
4. This test checks for a short from "Sensor Signal" to B+.

Diagnostic Aids:

An intermittent condition is likely to be caused by a short from CKT 349 to CKT 354, a short from CKT 349 to B+, or a short from CKT 354 to B+.

DTC 36

DISCRIMINATING SENSOR CLOSED OR SHORT TO IGNITION

WAS THE "SIR DIAGNOSTIC SYSTEM CHECK" PERFORMED?

YES

- REPEAT "SIR DIAGNOSTIC SYSTEM CHECK."

DTC 51 FRONTAL CRASH DETECTED

CAUTION: DURING SERVICE PROCEDURES, BE VERY CAREFUL WHEN HANDLING A SENSING AND DIAGNOSTIC MODULE (SDM). NEVER STRIKE OR JAR THE SDM. NEVER POWER UP THE SIR SYSTEM WHEN THE SDM IS NOT RIGIDLY ATTACHED TO THE VEHICLE. ALL SDM AND MOUNTING BRACKET FASTENERS MUST BE CAREFULLY TORQUED AND THE ARROW MUST BE POINTING TOWARD THE FRONT OF THE VEHICLE TO ENSURE PROPER OPERATION OF THE SIR SYSTEM. THE SDM COULD BE ACTIVATED WHEN POWERED WHILE NOT RIGIDLY ATTACHED TO THE VEHICLE WHICH COULD CAUSE DEPLOYMENT AND RESULT IN PERSONAL INJURY.

9J-48 SUPPLEMENTAL INFLATABLE RESTRAINT (SIR) SYSTEM

DTC 52
DATA AREA FULL

Circuit Description:

When there is a frontal crash of sufficient force, up to 30 degrees off the centerline of the vehicle, the SDM will cause enough current to flow to deploy the air bags and will set DTC 51. At this time the SDM will record information regarding SIR system status and vehicle status in EEPROM. DTC 52 will set when the SDM has stored information regarding two frontal crash events.

DTC Will Set When:

The SDM attempts to store frontal crash information and finds the EEPROM data area full. This test is run each time the SDM stores or attempts

to store information regarding a frontal crash event and also during the "Turn-ON" tests.

Action Taken:

SDM turns "ON" the "AIR BAG" warning lamp and sets a diagnostic trouble code.

DTC Will Clear When:

A scan tool "Clear Codes" command is received by the SDM. If, at the next ignition "ON" after receiving a "Clear Codes" command, the SDM detects the data area is full, a history diagnostic trouble code is set. This allows the "AIR BAG" warning lamp to illuminate should any additional malfunctions be detected.

DTC 52
DATA AREA FULL

CAUTION: DURING SERVICE PROCEDURES, BE VERY CAREFUL WHEN HANDLING A SENSING AND DIAGNOSTIC MODULE (SDM). NEVER STRIKE OR JAR THE SDM. NEVER POWER UP THE SIR SYSTEM WHEN THE SDM IS NOT RIGIDLY ATTACHED TO THE VEHICLE. ALL SDM AND MOUNTING BRACKET FASTENERS MUST BE CAREFULLY TORQUED AND THE ARROW MUST BE POINTING TOWARD THE FRONT OF THE VEHICLE TO ENSURE PROPER OPERATION OF THE SIR SYSTEM. THE SDM COULD BE ACTIVATED WHEN POWERED WHILE NOT RIGIDLY ATTACHED TO THE VEHICLE WHICH COULD CAUSE DEPLOYMENT AND RESULT IN PERSONAL INJURY.

9J-50 SUPPLEMENTAL INFLATABLE RESTRAINT (SIR) SYSTEM

DTC 61

SIR INDICATOR CIRCUIT FAILURE

Circuit Description:

When the ignition switch is first turned "ON" battery voltage is applied to the "AIR BAG" warning lamp and to the "Ignition 1" input, terminal "B9." The SDM responds by flashing the "AIR BAG" warning lamp seven times alternating between the primary and redundant lamp drivers. The SDM monitors the primary lamp driver output by comparing the output state at "SIR Indicator" terminal "A9" to the microprocessor commanded state. When "Ignition 1" is above a specified value and the output state does not match the commanded state of the primary lamp driver for 400 milliseconds DTC 61 is set.

DTC Will Set When:

"Ignition 1" voltage is above a specified value and the output state at the "SIR Indicator" terminal "A9" does not match the commanded state of the primary lamp driver for 400 milliseconds. This test is run every 100 milliseconds during "Continuous Monitoring" tests.

Action Taken:

SDM attempts to turn "ON" the "AIR BAG" warning lamp using the redundant lamp driver and sets a diagnostic trouble code.

DTC Will Clear When:

The ignition switch is turned "OFF."

DTC Chart Test Description:

Number(s) below refer to circled number(s) on the diagnostic chart.

- When the SDM is configured for a serial data controlled warning lamp (smart cluster) DTC 61 will set. Clearing SIR diagnostic trouble codes will reset the SDM allowing the SDM to control the "AIR BAG" warning lamp.

Diagnostic Aids: Refer to CHARTS B and C to diagnose warning lamp circuit malfunctions.

DTC 61 SIR INDICATOR CIRCUIT FAILURE

9J-52 SUPPLEMENTAL INFLATABLE RESTRAINT (SIR) SYSTEM

DTC 62

REDUNDANT SIR INDICATOR CIRCUIT FAILURE

Circuit Description:

When the ignition switch is first turned "ON" battery voltage is applied to the "AIR BAG" warning lamp and to the "Ignition 1" input, terminal "B9." The SDM responds by flashing the "AIR BAG" warning lamp seven times alternating between the primary and redundant lamp drivers. The SDM monitors the redundant lamp driver output by comparing the output state at "SIR Indicator" terminal "A9" to the microprocessor commanded state. When "Ignition 1" is above a specified value and the output state does not match the commanded state of the redundant lamp driver for 400 milliseconds DTC 62 is set.

DTC Will Set When:

"Ignition 1" voltage is above a specified value and the output state at the "SIR Indicator" terminal "A9" does not match the commanded state of the redundant lamp driver for 400 milliseconds. This test is run every 100 milliseconds during "Continuous Monitoring" tests.

Action Taken:

SDM attempts to turn "ON" the "AIR BAG" warning lamp using the primary lamp driver and sets a diagnostic trouble code.

DTC Will Clear When:

The ignition switch is turned "OFF."

DTC Chart Test Description:

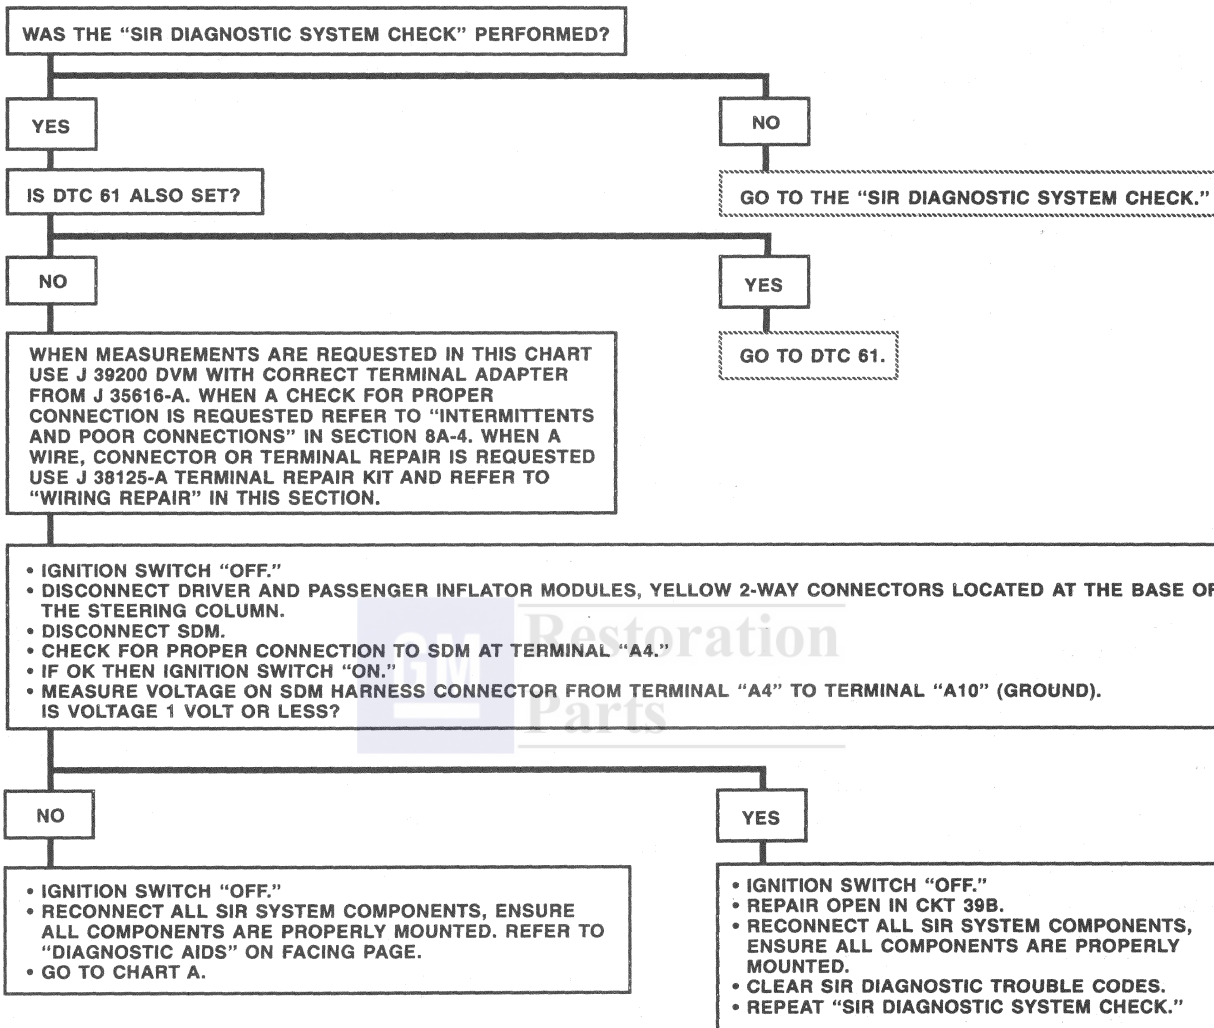

Number(s) below refer to circled number(s) on the diagnostic chart.

1. This test determines whether the malfunction is due to an open in the "Redundant Indicator Ignition 1" circuit.

Diagnostic Aids:

An intermittent condition is likely to be caused by a poor connection to the SDM at terminal "A4" or an open in CKT 39B. A poor "Redundant Indicator Ground" connection to the SDM would set DTC 62. It is important that the SDM mounting surface is free of any dirt or foreign material and that the fasteners are properly torqued to ensure a good "Redundant Indicator Ground."

DTC 62 REDUNDANT SIR INDICATOR CIRCUIT FAILURE

9J-54 SUPPLEMENTAL INFLATABLE RESTRAINT (SIR) SYSTEM

DTC 71 INTERNAL SDM FAULT

Circuit Description:

DTC 71 is an indication of a potential internal SDM malfunction and will set if any of the following conditions are detected: 1) 36 VLR voltage out of normal operating range, 2) Crash data recording reserve voltage discharge time failure for three consecutive ignition cycles, 3) The calculated checksum for internal memory does not match the stored value, 4) The voltage measured at "Driver Side Low" and/or "Passenger Side Low" is too high, 5) The sensing device inside the SDM which converts vehicle velocity changes to an electrical signal is malfunctioning, 6) The driver current source and/or passenger current source is malfunctioning, 7) The temporary memory storage area is malfunctioning, 8) SDM is unable to read from or write to EEPROM, 9) The arming sensor inside the SDM is not closed during a deployment event, 10) DTC 25 has been set.

DTC Will Set When:

Any of the above indicated malfunctions are detected by the SDM. The malfunctions described above are tested at different times: 1) "Turn-ON" and "Continuous Monitoring," 2) "Turn-ON," 3) "Turn-ON," 4) "Continuous Monitoring," 5) "Turn-ON" and "Continuous Monitoring," 6) "Current Source Diagnostics," 7) "Turn-ON," 8) "Turn-ON," 9) Asynchronously, 10) "Turn-ON" and "Continuous Monitoring."

Action Taken:

SDM turns "ON" the "AIR BAG" warning lamp and sets a diagnostic trouble code.

DTC Will Clear When:

A scan tool "Clear Codes" command is received by the SDM. Some of the indicated malfunctions will only allow the "AIR BAG" warning lamp to go out briefly then come back "ON."

DTC 71 INTERNAL SDM FAULT

CAUTION: DURING SERVICE PROCEDURES, BE VERY CAREFUL WHEN HANDLING A SENSING AND DIAGNOSTIC MODULE (SDM). NEVER STRIKE OR JAR SDM. NEVER POWER UP THE SIR SYSTEM WHEN THE SDM IS NOT RIGIDLY ATTACHED TO THE VEHICLE. ALL SDM AND MOUNTING BRACKET FASTENERS MUST BE CAREFULLY TORQUED AND THE ARROW MUST BE POINTING TOWARD THE FRONT OF THE VEHICLE TO ENSURE PROPER OPERATION OF THE SIR SYSTEM. THE SDM COULD BE ACTIVATED WHEN POWERED WHILE NOT RIGIDLY ATTACHED TO THE VEHICLE WHICH COULD CAUSE DEPLOYMENT AND RESULT IN PERSONAL INJURY.

NOTICE: WHEN DTC 25 HAS BEEN SET IT IS NECESSARY TO REPLACE THE SDM. SETTING DTC 25 WILL ALSO CAUSE DTC 71 TO SET. WHEN A SCAN TOOL "CLEAR CODES" COMMAND IS ISSUED AND THE MALFUNCTION IS STILL PRESENT, DTCs 25 AND 71 WILL REMAIN CURRENT. WHEN A SCAN TOOL "CLEAR CODES" COMMAND IS ISSUED AND MALFUNCTION IS NO LONGER PRESENT, DTC 25 WILL CLEAR BUT DTC 71 WILL REMAIN CURRENT. ENSURE THAT THE SHORT TO B+ CONDITION IS REPAIRED PRIOR TO INSTALLING A REPLACEMENT SDM TO AVOID DAMAGING THE SDM.

ON-VEHICLE SERVICE

SERVICE PRECAUTIONS

CAUTION: When performing service on or around SIR components or SIR wiring, follow the procedures listed below to temporarily disable the SIR system. Failure to follow procedures could result in possible air bag deployment, personal injury or otherwise unneeded SIR system repairs.

The SDM can maintain sufficient voltage to cause a deployment for up to 10 seconds after the ignition switch is turned "OFF," the battery is disconnected or the fuse powering the SDM is removed. Many of the service procedures require removal of the "AIR BAG" fuse and disconnection of the deployment loops to avoid an accidental deployment.

Disabling the SIR System

Figure 9

 Remove or Disconnect

- Turn the steering wheel so that the vehicle's wheels are pointing straight ahead.
- Turn the ignition switch to "LOCK" and remove key.
- 1. "AIR BAG" fuse from I/P fuse block.
- 2. Connector Position Assurance (CPA) and yellow 2-way connector for both connectors located near the base of the steering column.

 Important

- With the "AIR BAG" fuse removed and ignition switch "ON," the "AIR BAG" warning lamp will be "ON." This is normal operation and does not indicate a SIR system malfunction.

Enabling the SIR System

Figure 9

 Install or Connect

- Turn ignition switch to "LOCK" and remove key.
- 1. Both yellow 2-way connectors located near the base of the steering column and the corresponding CPA.
- 2. "AIR BAG" fuse to I/P fuse block.
- Turn ignition switch to "RUN" and verify that the "AIR BAG" warning lamp flashes seven times and then turns "OFF." If it does not operate as described, perform the "SIR Diagnostic System Check" in this section.

Figure 9 - Yellow 2-Way SIR Connectors (Driver and Passenger)

Handling/Installation/Diagnosis

1. Inflator modules should not be subjected to temperatures above 65°C (150°F).
2. Discriminating sensors, inflator modules, or SDMs should not be used if they have been dropped from a height of 91.4 centimeters (3 feet) or greater.
3. When a discriminating sensor or SDM is replaced, it MUST be oriented with the arrow on the sensor pointing toward the front of the vehicle. It is very important for the discriminating sensor and the SDM to be located flat on the mounting surface, parallel to the vehicle datum line. It is important that the mounting surface is free of any dirt or other foreign material.
4. Do not apply power to the SIR system unless all components are connected or a diagnostic chart requests it, as this will set a diagnostic trouble code.
5. The "SIR Diagnostic System Check" must be the starting point of any SIR diagnostics. The "SIR Diagnostic System Check" will verify proper "AIR BAG" warning lamp operation and will lead you to the correct chart to diagnose any SIR malfunctions. Bypassing these procedures may result in extended diagnostic time, incorrect diagnosis, and incorrect parts replacements.

REPAIRS AND INSPECTIONS REQUIRED AFTER AN ACCIDENT

 Important

- If any SIR system components are damaged, they must be replaced. If SIR component mounting points are damaged, they must be repaired or replaced.
- Never use SIR parts from another vehicle. This does not include remanufactured parts purchased from an authorized GM dealer; they may be used for SIR repairs.

- Do not attempt to service discriminating sensors, the SDM, the SIR coil assembly, or the inflator modules. Service of these items is by replacement only.
- Verify the part number of replacement inflator modules. Some GM inflator modules look identical but contain different internal components.

CAUTION: Proper operation of the sensors and Supplemental Inflatable Restraint (SIR) system requires that any repairs to the vehicle structure return it to the original production configuration. Deployment requires, at a minimum, replacement of the sensors, the inflator modules, and dimensional inspection of the steering column. Any visible damage to the SDM mounting bracket(s) requires replacement, sensors in the area of accident damage must be replaced, and the steering column must be dimensionally inspected, whether deployment occurred or not.

Accident With Deployment - Component Replacement and Inspections

Certain SIR components must be replaced or inspected for damage after a frontal crash involving air bag deployment. Those components are:

- Inflator modules.
- All SIR system sensors.

! Important

- Refer to "Sensor Replacement Guidelines" below for important information on sensor replacement in both deployment and non-deployment crashes.

Inspect and replace, if necessary, the following SIR components:

- SIR coil assembly - Inspect wiring and connector for any signs of scorching, melting, or damage due to excessive heat. Replace if damaged. Refer to SECTION 3F5.

Accident With or Without Deployment - Component Inspections

Certain SIR and restraint system components must be inspected after any crash, whether the air bag deployed or not. These components are:

- Steering column - Dimensionally inspect per "Checking Steering Column for Accident Damage" in SECTION 3F5.
- Sensors, if in the area of accident damage.

! Important

- Refer to "Sensor Replacement Guidelines" below for important information on sensor replacement in both deployment and non-deployment crashes.

- Knee bolsters and mounting points - Inspect for any distortion, bending, cracking, or other damage.
- I/P steering column reinforcement plate - Inspect for any distortion, bending, cracking, or other damage.
- I/P braces - Inspect for any distortion, bending, cracking, or other damage.
- Seat belts and mounting points - Refer to "Seat Belts" in SECTION 10-11.

Sensor Replacement Guidelines

SIR sensor replacement policy requires replacement of the sensors in the area of accident damage only.

The "area of accident damage" is defined as that area of the vehicle which is crushed, bent, or damaged in other ways. An example might be a significant front-end collision in which the forward portions of the vehicle have contacted another vehicle, tree, guardrail, etc. In this example, a sensor on the front of the vehicle, such as the radiator tie bar, would require replacement, since that portion of the vehicle was damaged in the accident. A sensor in the passenger compartment, such as the SDM would not require mandatory replacement. Of course, if the SDM sets a diagnostic trouble code and the diagnostic chart leads to a malfunctioning sensor that was not in the area of accident damage, that sensor should also be replaced.

Sensors in the area of accident damage should be replaced even if those sensors do not appear to be damaged. Do not attempt to determine whether a sensor is OK - ALWAYS replace it if it is in the area of accident damage.

Also, if a sensor is in an area of accident damage, but the SIR system has NOT been deployed, replace the sensor. The sensor bracket may be slightly bent, wiring may be damaged, etc., and the sensor might not work properly in another collision. Again, do not attempt to determine whether a sensor is OK - ALWAYS replace it if it is in the area of accident damage.

SENSING AND DIAGNOSTIC MODULE (SDM)

Figure 10

CAUTION: During service procedures, be very careful when handling a Sensing and Diagnostic Module (SDM). Never strike or jar the SDM. Never power up the SIR system when the SDM is not rigidly attached to the vehicle. All SDM and mounting bracket fasteners must be carefully torqued and the arrow must be pointing toward the front of the vehicle to ensure proper operation of the SIR system. The SDM could be activated when powered while not rigidly attached to the vehicle which could cause deployment and result in personal injury.

9J-58 SUPPLEMENTAL INFLATABLE RESTRAINT (SIR) SYSTEM

NOTICE: If the vehicle interior has been exposed to extensive water intrusion, such as water leaks, window left open, driving through high water and so forth, the Sensing and Diagnostic Module (SDM) may need to be replaced. With the ignition "OFF," inspect the area under the front seat and the area around the SDM, including the carpet. If any significant soaking or evidence of significant soaking is detected, the water must be removed, water damage repaired and the SDM must be replaced. Before attempting any of these repairs, the SIR system must be disabled. See section 9J under "ON-VEHICLE SERVICE" for instructions on how to disable the SIR system and replace the SDM.

↔ Remove or Disconnect

- Disable the SIR system. Refer to "Disabling the SIR System" in this section.
- 1. Accelerator pedal assembly, refer to SECTION 6C.
- 2. Connector Position Assurance (CPA) and electrical connector.
- 3. Fasteners from SDM.
- 4. SDM from vehicle.

CAUTION: Proper operation of the Sensing and Diagnostic Module (SDM) requires the SDM to be rigidly attached to the vehicle structure and that the arrow on the sensor be pointing toward the front of the vehicle.

→← Install or Connect

- 1. SDM to vehicle, ensure arrow is pointing toward the front of the vehicle.
- 2. SDM Fasteners.

Tighten

- Fasteners to 8.5 N·m (75 lb. in.).
- 3. Electrical connector and CPA.
- 4. Accelerator pedal assembly, refer to SECTION 6C.
- Enable the SIR system, refer to "Enabling the SIR System" in this section.

FORWARD DISCRIMINATING SENSOR

Figure 11

CAUTION: During service procedures, be very careful when handling a sensor. Never strike or jar a sensor. Under some circumstances, it could cause improper operation of the Supplemental Inflatable Restraint (SIR) system. All sensors and mounting bracket bolts must be carefully torqued to assure proper operation.

Figure 10 - Sensing and Diagnostic Module

↔ Remove or Disconnect

- Disable the SIR system. Refer to "Disabling the SIR System" in this section
- 1. Connector Position Assurance (CPA) and electrical connector.
- 2. Sensor fasteners.
- 3. Sensor from vehicle.

CAUTION: Proper operation of the forward discriminating sensor requires the sensor to be rigidly attached to the vehicle structure and that the arrow on the sensor be pointing toward the front of the vehicle.

→← Install or Connect

- 1. Sensor in vehicle, ensure arrow is pointing toward the front of the vehicle.
- 2. Sensor fasteners.

Tighten

- Fasteners to 2.8 N·m (25 lb.in.).
- 3. Electrical connector and CPA.
- Enable the SIR system, refer to "Enabling the SIR System" in this section.

Figure 11 - Forward Discriminating Sensor

Figure 12a - Passenger Inflator Module (Chevrolet)

PASSENGER INFLATOR MODULE

Figure 12

CAUTION: The following procedures must be followed in the order listed to temporarily disable the Supplemental Inflatable Restraint (SIR) system and prevent false diagnostic trouble codes from setting. Failure to follow procedures could result in possible air bag deployment, personal injury or otherwise unneeded SIR system repairs.

Live (Undeployed) Inflator Module

Refer to "Inflator Module Handling/Shipping/Scrapping" in this section.

Deployed Inflator Module

After the inflator module has been deployed, the surface of the air bag may contain a powdery residue. This powder consists primarily of cornstarch (used to lubricate the bag as it inflates) and byproducts of the chemical reaction. Sodium hydroxide dust (similar to lye soap) is produced as a byproduct of the deployment reaction. The sodium hydroxide then quickly reacts with atmospheric moisture and is converted to sodium carbonate and sodium bicarbonate (baking soda).

Therefore, it is unlikely that sodium hydroxide will be present after deployment. As with many service procedures, you should wear gloves and safety glasses.

Figure 12b - Passenger Inflator Module (Buick)

9J-60 SUPPLEMENTAL INFLATABLE RESTRAINT (SIR) SYSTEM

Remove or Disconnect

- Disable the SIR system, refer to “Disabling the SIR System” in this section.
- 1. Upper trim pad, refer to SECTION 8C.
- 2. Connector Position Assurance (CPA) and electrical connector.
- 3. Fasteners from passenger inflator module.
- 4. Passenger inflator module from vehicle.

CAUTION: When carrying a live inflator module, make sure the bag opening is pointed away from you. Never carry the inflator module by the wires or connector on the side of the module. In case of an accidental deployment, the bag will then deploy with minimal chance of injury. When placing a live inflator module on a bench or other surface, always face the bag up, away from the surface. This is necessary so that a free space is provided to allow the air bag to expand in the unlikely event of accidental deployment. Otherwise personal injury may result.

Install or Connect

1. Passenger inflator module to vehicle.
2. Fasteners to passenger inflator module.

Tighten

- Fasteners to 10 N.m (89 lb.in.).
- 3. Electrical connector and CPA.
- 4. Upper trim pad, refer to SECTION 8C.
- Enable SIR system, refer to “Enabling the SIR System” in this section.

“AIR BAG” WARNING LAMP

Refer to SECTION 8C.

DRIVER INFLATOR MODULE

Refer to SECTION 3F.

SIR COIL ASSEMBLY

Refer to SECTION 3F5.

INFLATOR MODULE HANDLING/SHIPPING/SCRAPPING

Figure 13

Live (Undeployed) Inflator Module

Special care is necessary when handling and storing a live (undeployed) inflator module. The rapid gas generation produced during deployment of the air bag could cause the inflator module, or an object in front of the inflator module, to be thrown through the air in the unlikely event of an accidental deployment.

Figure 13 - Proper Live Inflator Module Handling

CAUTION: When carrying a live inflator module, make sure the bag opening is pointed away from you. In case of an accidental deployment, the bag will then deploy with minimal chance of injury. Never carry the inflator module by the wires or connector on the underside of the module. When placing a live inflator module on a bench or other surface, always face the bag and trim cover up, away from the surface. This is necessary so that a free space is provided to allow the air bag to expand in the unlikely event of accidental deployment. Never rest a steering column assembly on the steering wheel with the inflator module face down and column vertical. Otherwise, personal injury may result.

Shipping Procedures For Live (Undeployed) Inflator Modules

Service personnel should refer to the latest Service Bulletins for proper SIR inflator module shipping procedures.

Inflator Module Scrapping Procedure

During the course of a vehicle's useful life, certain situations may arise which will necessitate the disposal of a live (undeployed) inflator module. This information covers proper procedures for disposing of a live inflator module.

Before a live inflator module can be disposed of, it must be deployed. Live inflator modules must not be disposed of through normal refuse channels.

CAUTION: Failure to follow proper Supplemental Inflatable Restraint (SIR) inflator module disposal procedures can result in air bag deployment which may cause personal injury. Undeployed inflator modules must not be disposed of through normal refuse channels. The undeployed inflator module contains substances that can cause severe illness or personal injury if the sealed container is damaged during disposal. Disposal in any manner inconsistent with proper procedures may be a violation of federal, state, and/or local laws.

If a vehicle is the subject of a Product Liability Report related to the SIR system and is subject to a Preliminary Investigation (GM-1241), DO NOT DEPLOY the inflator module and DO NOT ALTER the SIR system in any manner. Refer to the applicable service bulletin on SIR shipping procedures for details on handling SIR systems involved with GM-1241. If a vehicle is the subject of a campaign affecting inflator modules, DO NOT DEPLOY the inflator module. Follow instructions in the Campaign Service Bulletin for proper disposition of the inflator module.

If an inflator module is replaced under warranty, DO NOT DEPLOY the air bag. The inflator module may need to be returned, undeployed, to Inland Fisher Guide. Refer to procedures shown in the appropriate service bulletin regarding SIR shipping procedures.

In situations which require deployment of a live inflator module, deployment may be accomplished inside or outside the vehicle. The method employed depends upon the final disposition of the particular vehicle, as noted in "Deployment Outside Vehicle" and "Deployment Inside Vehicle" in this section.

Deployment Outside Vehicle (Driver Inflator Module)

Figures 14 through 21

Deployment outside the vehicle is proper when the vehicle is to be returned to service. This includes, for example, situations in which the vehicle will be returned to useful service after a functionally or

cosmetically deficient inflator module is replaced. Deployment and disposal of a malfunctioning inflator module is, of course, subject to any required retention period.

For deployment of a live (undeployed) inflator module outside the vehicle, the deployment procedure must be followed exactly. Always wear safety glasses during this deployment procedure until a deployed inflator module is scrapped or until an undeployed inflator module is shipped. Before performing the procedures you should be familiar with servicing the SIR system and with proper handling of the inflator module. Procedures should be read fully before they are performed.

The following procedure requires use of J 38826 SIR deployment harness with appropriate pigtail adapter. Do not attempt procedure without J 38826 adapter.

CAUTION: Failure to follow procedures in the order listed may result in personal injury. Never connect deployment harness to any power source before connecting deployment harness to the driver inflator module. Deployment harness shall remain shorted and not be connected to a power source until the air bag is to be deployed. The inflator module will immediately deploy the air bag when a power source is connected to it. Wear safety glasses throughout this entire deployment and disposal procedure.

! Important

- This information applies only to driver inflator modules. Refer to "Deployment Outside Vehicle (Passenger Inflator Module)" in this section for information on passenger inflator module scrapping.
- 1. Turn ignition switch to "LOCK," remove key and put on safety glasses.
- 2. Inspect J 38826 SIR Deployment Harness and appropriate pigtail adapter for damage. If harness or pigtail adapter is damaged, discard and obtain a replacement.
- 3. Short the two SIR deployment harness leads together by fully seating one banana plug into the other. SIR deployment harness shall remain shorted and not be connected to a power source until the air bag is to be deployed (Figure 14).
- 4. Connect the appropriate pigtail adapter to the SIR deployment harness (Figure 14).
- 5. Remove driver inflator module from vehicle. Refer to SECTION 3F.
- 6. Remove horn lead from the back of the driver inflator module.
- 7. Remove all horn buttons and steering wheel control buttons from driver inflator module, if applicable.

9J-62 SUPPLEMENTAL INFLATABLE RESTRAINT (SIR) SYSTEM

CAUTION: SIR DEPLOYMENT HARNESS SHALL REMAIN SHORTED AND NOT BE CONNECTED TO A POWER SOURCE UNTIL THE AIR BAG IS TO BE DEPLOYED.

5-23-04
ST86089J

Figure 21 - Handling a Hot, Deployed Inflator Module

9J-66 SUPPLEMENTAL INFLATABLE RESTRAINT (SIR) SYSTEM

CAUTION: When storing a live inflator module or when leaving a live inflator module unattended on a bench or other surface, always face the bag and trim cover up and away from the surface. This is necessary so that a free space is provided to allow the air bag to expand in the unlikely event of accidental deployment. Failure to follow procedures may result in personal injury.

8. Place the driver inflator module on a work bench or other surface away from all loose or flammable objects with its vinyl trim cover facing up, away from the surface (Figure 15).
9. Clear a space on the ground about 185 cm (six feet) in diameter where the driver inflator module is to be deployed. A paved, outdoor location where there is no activity is preferred. If an outdoor location is not available, a space on the shop floor where there is no activity and sufficient ventilation is recommended. Ensure no loose or flammable objects are within the deployment area (Figure 16).
10. Place the driver inflator module, with its vinyl trim cover facing up, on the ground in the space just cleared (Figure 16).
11. Stretch the SIR deployment harness and pigtail adapter from the driver inflator module to its full length (Figure 17).
12. Place a power source near the shorted end of the SIR deployment harness. Recommended application: 12 volts minimum, 2 amps minimum. A vehicle battery is suggested.
13. Connect the driver inflator module to the pigtail adapter on the SIR deployment harness. Deployment harness shall remain shorted and not be connected to a power source until the air bag is to be deployed. The driver inflator module will immediately deploy the air bag when a power source is connected to it (Figure 18).

Important

- Ensure that the pigtail adapter is firmly seated into the driver inflator module connector. Failure to fully seat the connectors may leave the shorting bar located in the driver inflator module connector functioning (shorted) and may result in non-deployment of the driver inflator module.
14. Verify that the area around the driver inflator module is clear of all people and loose or flammable objects.
 15. Verify that the driver inflator module is resting with its vinyl trim cover facing up.
 16. Notify all people in the immediate area that you intend to deploy the driver inflator module. The deployment will be accompanied by a substantial report which may startle the uninformed.
 17. Separate the two banana plugs on the SIR deployment harness (Figure 19).

NOTICE: When the air bag deploys, the driver inflator module may jump about 30 cm (one foot) vertically. This is a normal reaction of the driver inflator module to the force of the rapid gas expansion inside the air bag.

NOTICE: When the air bag deploys, the rapid gas expansion will create a substantial report. Notify all people in the immediate area that you intend to deploy the driver inflator module.

CAUTION: Deployment harness shall remain shorted and not be connected to a power source until the air bag is to be deployed. The driver inflator module will immediately deploy the air bag when a power source is connected to it. Connecting the deployment harness to the power source should always be the last step prior to deployment in the inflator module deployment procedure. Failure to follow procedures in the order listed may result in personal injury.

18. Connect the SIR deployment harness wires to the power source to immediately deploy the driver inflator module. Recommended application: 12 volts minimum, 2 amps minimum. A vehicle battery is suggested (Figure 20).
19. Disconnect the SIR deployment harness from the power source.
20. Short the two SIR deployment harness leads together by fully seating one banana plug into the other (Figure 14).
21. In the unlikely event that the driver inflator module did not deploy after following these procedures, proceed immediately with Steps 26 through 29. If the driver inflator module did deploy, proceed with Steps 22 through 25.
22. Put on a pair of shop gloves to protect your hands from possible irritation and heat when handling the deployed driver inflator module.

After the driver inflator module has been deployed, the surface of the air bag may contain a powdery residue. This powder consists primarily of cornstarch (used to lubricate the bag as it inflates) and byproducts of the chemical reaction. Sodium hydroxide dust (similar to lye soap) is produced as a byproduct of the deployment reaction. The sodium hydroxide then quickly reacts with the atmospheric moisture and is converted to sodium carbonate and sodium bicarbonate (baking soda). Therefore, it is unlikely that sodium hydroxide will be present after deployment. As a precaution, however, gloves and safety glasses are recommended to prevent any possible irritation of the skin or eyes.

CAUTION: Safety precautions must be observed when handling a deployed inflator module. After deployment, the metal surfaces of the inflator module will be very hot. Allow the inflator module to cool before handling any metal portion of it. Do not place the deployed inflator module near any flammable objects. Failure to follow procedures may result in fire or personal injury.

After a driver inflator module has been deployed, the metal canister and surrounding areas of the driver inflator module will be very hot. Do not touch the metal areas of the driver inflator module for about 10 minutes after deployment. If the deployed driver inflator module must be moved before it is cool, wear gloves and handle by the air bag or vinyl trim (Figure 21).

23. Disconnect the pigtail adapter from the driver inflator module as soon after deployment as possible. This will prevent damage to the pigtail adapter or SIR deployment harness due to possible contact with the hot driver inflator module canister. The pigtail adapter and SIR deployment harness are designed to be reused. They should, however, be inspected for damage after each deployment and replaced if necessary.
24. Dispose of the deployed driver inflator module through normal refuse channels after it has cooled for at least 10 minutes.
25. Wash your hands with mild soap and water afterward.

NOTICE: The remaining steps are to be followed in the unlikely event that the driver inflator module did not deploy after following these procedures.

26. Ensure that the SIR deployment harness has been disconnected from the power source and that its two banana plugs have been shorted together by fully seating one banana plug into the other (Figure 14).
27. Disconnect the pigtail adapter from the driver inflator module.

CAUTION: When storing a live inflator module or when leaving a live inflator module unattended on a bench or other surface, always face the bag and trim cover up and away from the surface. This is necessary so that a free space is provided to allow the air bag to expand in the unlikely event of accidental deployment. Failure to follow procedures may result in personal injury.

28. Temporarily store the driver inflator module with its vinyl trim cover facing up, away from the surface upon which it rests.
29. Call the Technical Assistance group for further assistance.

Deployment Outside Vehicle (Passenger Inflator Module)

CAUTION: Failure to follow proper SIR inflator module disposal procedures can result in air bag deployment which may cause personal injury. Undeployed inflator modules must not be disposed of through normal refuse channels. The undeployed inflator module contains substances that can cause severe illness or personal injury if the sealed container is damaged during disposal. Disposal in any manner inconsistent with proper procedures may be a violation of federal, state and/or local laws.

General Motors dealers should refer to the latest General Motors Service Bulletins for proper live (undeployed) passenger inflator module scrapping and disposal procedures. All others should contact a local General Motors dealership for proper live passenger inflator module scrapping and disposal procedures. Deployed passenger inflator modules may be disposed of through normal refuse channels.

Deployment Inside Vehicle (Vehicle Scrapping Procedure)

Figures 22 through 30

Deployment inside the vehicle is proper when the vehicle is to be destroyed or salvaged for component parts. This includes, but is not limited to, the following situations:

1. The vehicle has completed its useful life.
2. The vehicle has been damaged beyond repair in a non-deployment type accident.
3. The vehicle has been stripped or damaged beyond repair in a theft.
4. The vehicle will be salvaged for component parts to be used on a vehicle with a different Vehicle Identification Number (VIN) as opposed to being rebuilt as the same VIN. Never use SIR components from another vehicle.

This is done to ensure SIR system integrity since only new SIR system components, with the exception of remanufactured parts as noted below, may be used in servicing an SIR equipped vehicle. Remanufactured parts purchased from an authorized General Motors dealer may be used for SIR repairs.

9J-68 SUPPLEMENTAL INFLATABLE RESTRAINT (SIR) SYSTEM

Figure 22 - Cutting the Harness Connector Wires

Figure 23 - Shorting the Deployment Wires

CAUTION: Failure to follow proper SIR inflator module disposal procedures can result in air bag deployment which may cause personal injury. Undeployed inflator modules must not be disposed of through normal refuse channels. The undeployed inflator module contains substances that can cause severe illness or personal injury if the sealed container is damaged during disposal. Disposal in any manner inconsistent with proper procedures may be a violation of federal, state and/or local laws.

1. Turn ignition switch to "LOCK," remove key and put on safety glasses.
2. Remove all loose objects from front seats.
3. Disconnect driver inflator module, yellow 2-way connector located at the base of the steering column.

Figure 24 - Fabricating the Deployment Harness

4. Cut the driver inflator module yellow 2-way harness connector from the vehicle leaving at least 16 cm (six inches) of wire at the connector (Figure 22).
5. Strip 13 mm (1/2 inch) of insulation from each wire lead of the connector (Figure 22).
6. Cut two 460 cm (15 feet) deployment wires from 0.8 mm² (18 gauge) or thicker multi-strand wire. These wires will be used to fabricate the driver deployment harness.
7. Strip 13 mm (1/2 inch) of insulation from both ends of the wires cut in the previous step.
8. Short the wires by twisting together one end from each (Figure 23). Deployment wires shall remain shorted and not be connected to a power source until the air bag is to be deployed.

Figure 25 - Prepare Deployment Harness for In-Vehicle Deployment (Driver)

Figure 26 - Cutting the Harness Connector Wires

CAUTION: Failure to follow procedures in the order listed could result in personal injury. Never connect deployment wires to any power source before connecting deployment wires to the inflator module leads. Deployment wires shall remain shorted and not be connected to a power source until the air bag is to be deployed. The inflator module will immediately deploy the air bag when a power source is connected to it. Wear safety glasses throughout this entire deployment and disposal procedure.

9. Twist together one connector wire lead to one deployment wire. The connection should be mechanically secure (Figure 24-A).
10. Bend twisted connection made in the previous step flat and wrap tightly with electrical tape to insulate and secure (Figure 24-B).
11. Twist together, bend and tape the remaining connector wire lead to the remaining deployment wire (Figure 24-C).
12. Connect the deployment harness to the driver inflator module, yellow 2-way connector at the base of the steering column. Route deployment harness out the driver side of the vehicle (Figure 25).

CAUTION: Deployment wires shall remain shorted and not be connected to a power source until the air bag is to be deployed. The inflator module will immediately deploy the air bag when a power source is connected to it. Connecting the deployment wires to the power source should always be the final step in the inflator module deployment procedure. Failure to follow procedures in the order listed could result in personal injury.

13. Disconnect passenger inflator module, yellow 2-way connector located near the base of the steering column.
14. Cut the passenger inflator module harness connector from the vehicle leaving at least 16 cm (six inches) of wire at the connector (Figure 26).
15. Strip 13 mm (1/2 inch) of insulation from each wire lead of the connector (Figure 26).
16. Cut two 610 cm (20 feet) deployment wires from 0.8mm² (18 gauge) or thicker multi-strand wire. These wires will be used to fabricate the passenger deployment harness.
17. Strip 13 mm (1/2 inch) of insulation from both ends of the wires cut in the previous step.
18. Short the wires by twisting together one end from each (Figure 23). Deployment wires shall remain shorted and not be connected to a power source until the air bag is to be deployed.

CAUTION: Failure to follow procedures in the order listed could result in personal injury. Never connect deployment wires to any power source before connecting deployment wires to the inflator module leads. Deployment wires shall remain shorted and not be connected to a power source until the air bag is to be deployed. The inflator module will immediately deploy the air bag when a power source is connected to it. Wear safety glasses throughout this entire deployment and disposal procedure.

9J-70 SUPPLEMENTAL INFLATABLE RESTRAINT (SIR) SYSTEM

19. Twist together one connector wire lead to one deployment wire. The connection should be mechanically secure (Figure 27-A).
20. Bend twisted connection made in the previous step flat and wrap tightly with electrical tape to insulate and secure (Figure 27-B).
21. Twist together, bend and tape the remaining connector wire lead to the remaining deployment wire (Figure 27-C).
22. Connect the deployment harness to the passenger inflator module jumper, yellow 2-way connector located near the base of the steering column. Route deployment harness out the passenger side of the vehicle (Figure 28).

CAUTION: Deployment wires shall remain shorted and not be connected to a power source until the air bag is to be deployed. The inflator module will immediately deploy the air bag when a power source is connected to it. Connecting the deployment wires to the power source should always be the final step in the inflator module deployment procedure. Failure to follow procedures in the order listed could result in personal injury.

23. Verify that the inside of the vehicle and the area surrounding the vehicle are clear of all people and loose or flammable objects.
24. Stretch the driver and passenger deployment harnesses to their full length (Figures 25 and 28).
25. Completely cover windshield area and front door window openings with a drop cloth, blanket or similar item. This reduces the possibility of injury due to possible fragmentation of the vehicle's glass or interior.
26. Notify all people in the immediate area that you intend to deploy the air bags. The deployment will be accompanied by a substantial report which may startle the uninformed.
27. Separate the two ends of the driver deployment harness wires (Figure 29).

CAUTION: Deployment wires shall remain shorted and not be connected to a power source until the air bag is to be deployed. The inflator module will immediately deploy the air bag when a power source is connected to it. Connecting the deployment wires to the power source should always be the final step in the inflator module deployment procedure. Failure to follow procedures in the order listed could result in personal injury.

NOTICE: When the air bag deploys, the rapid gas expansion will create a substantial report. Notify all people in the immediate area that you intend to deploy the air bags.

28. Connect the driver deployment harness wires to a power source to immediately deploy the driver inflator module. Recommended application: 12 volts minimum, 2 amps minimum. A vehicle battery is suggested (Figure 29).
29. Separate the two ends of the passenger deployment harness wires (Figure 30).

Figure 28 - Prepare Deployment Harness for In-Vehicle Deployment(Passenger)

Figure 29 - Separate Shorted End of Deployment Harness and Connect to Power Source(Driver)

Figure 30 - Separate Shorted End of Deployment Harness and Connect to Power Source(Passenger)

CAUTION: Deployment wires shall remain shorted and not be connected to a power source until the air bag is to be deployed. The inflator module will immediately deploy the air bag when a power source is connected to it. Connecting the deployment wires to the power source should always be the final step in the inflator module deployment procedure. Failure to follow procedures in the order listed could result in personal injury.

30. Connect the passenger deployment harness wires to a power source to immediately deploy the passenger inflator module. Recommended application: 12 volts minimum, 2 amps minimum. A vehicle battery is suggested (Figure 30).

After an inflator module has been deployed, the surface of the air bag may contain a powdery residue. This powder consists primarily of cornstarch (used to lubricate the bag as it inflates) and byproducts of the chemical reaction. Sodium hydroxide dust (similar to lye soap) is produced as a byproduct of the deployment reaction. The sodium hydroxide then quickly reacts with atmospheric moisture and is converted to sodium carbonate and sodium bicarbonate (baking soda). Therefore, it is unlikely that sodium hydroxide will be present after deployment. As a precaution, however, gloves and safety glasses are recommended to prevent any possible irritation of the skin or eyes.

CAUTION: Safety precautions must be observed when handling a deployed inflator module. After deployment, the metal surfaces of the inflator module will be very hot. Allow the inflator module to cool before handling any metal portion of it. Do not place the hot deployed inflator module near any flammable objects. Failure to follow procedures could result in fire or personal injury.

After an inflator module has been deployed, the metal canister and surrounding areas of the inflator module will be very hot. Do not touch the metal areas of the inflator module for about 10 minutes after deployment. If the deployed inflator module must be moved before it is cool, wear gloves and handle by the air bag or vinyl trim.

31. Short the driver deployment harness wires by twisting together one end from each. Repeat this procedure for the passenger deployment harness.
32. Carefully remove drop cloth from vehicle and clean off any fragments or discard drop cloth entirely.
33. Disconnect driver deployment harness and passenger deployment harness from vehicle and discard.
34. In the unlikely event that either or both of the inflator modules did not deploy after following these procedures, proceed immediately with Steps 36 through 38.
35. With both air bags deployed the vehicle may be scrapped in the same manner as a non-SIR equipped vehicle.
36. Remove the undeployed inflator module(s) from the vehicle. For driver inflator module refer to SECTION 3F, for passenger inflator module refer to "On-Vehicle Service" in this section.

CAUTION: When storing a live inflator module or when leaving a live inflator module unattended on a bench or other surface, always face the bag up, away from the surface. This is necessary so that a free space is provided to allow the air bag to expand in the unlikely event of accidental deployment. Failure to follow procedures could result in personal injury.

37. Temporarily store the inflator module with the air bag opening facing up, away from the surface upon which it rests.
38. Call the Technical Assistance group for further assistance.

Deployed Inflator Module Handling

After the inflator module has been deployed, the surface of the air bag may contain a powdery residue. This powder consists primarily of cornstarch (used to lubricate the bag as it inflates) and byproducts of the chemical reaction. Sodium hydroxide dust (similar to lye soap) is produced as a byproduct of the deployment reaction. The sodium hydroxide then

quickly reacts with atmospheric moisture and is converted to sodium carbonate and sodium bicarbonate (baking soda). Therefore, it is unlikely that sodium hydroxide will be present after deployment. As with many service procedures, you should wear gloves and safety glasses.

WIRING REPAIR

Special wiring repair procedures have been developed for use on the Supplemental Inflatable Restraint (SIR) system due to the sensitive nature of the circuitry. These specific procedures and instructions must be followed when working with SIR system wiring, and wiring components (such as connectors and terminals).

Terminal Repair Kit J 38125-A

Essential tool kit J 38125-A contains special "sealed splices" for use in repairing SIR system wiring. A special crimping tool, heat torch, and instruction manual for these splices are also included.

Two critical features of the sealed splices are a special heat shrink sleeve with sealing adhesive to produce an environmentally sealed splice and a cross hatched (knurled) core crimp to provide necessary contact integrity for the sensitive, low energy circuits.

Terminal Repair Kit J 38125-A also serves as a generic terminal repair kit. The kit contains a large sampling of common GM electrical terminals and the correct tools to attach them to wires and remove them from connectors. **The terminals in the kit are not to be used to replace damaged SIR system terminals unless specifically indicated by the terminal package.** The SDM terminal repair assembly pack is included in J 38125-A for SIR use.

SIR Connector (Plastic Body and Terminal Metal Pin) Repair

If any connector or terminal in the SIR wire harness (except pigtailed) is damaged, it should be repaired using one of the connector repair assembly packs. These kits include an instruction sheet and the sealed splices which will be used to splice the new wires, connector, and terminals to the harness. The splice crimping tool, which is color keyed to match the splices from Terminal Repair Kit J 38125-A, must be used to apply these splices.

The terminals in the SIR system are made of a special metal to provide necessary contact integrity for the sensitive, low energy circuits. These terminals are only available in the connector repair assembly packs, do not substitute any other terminals for those in the assembly packs.

If individual terminals are damaged on the SDM connector, they should be repaired using the SDM terminal repair assembly pack. If individual terminals are damaged on any other SIR connection, the entire connection should be replaced using the appropriate connector repair assembly pack. It may be necessary to replace the entire SIR wiring harness.

SIR Wire Pigtail Repair

If the wiring pigtail (a wire or wires attached directly to the component, not by a connector) is damaged, the entire component (with pigtail) must be replaced. Examples of "pigtail" components are the passenger inflator module, the discriminating sensor and the SIR coil assembly. Absolutely no wire, connector, or terminal repairs are to be attempted on the discriminating sensor, the passenger inflator module, or the SIR coil assembly.

SIR Wire Repair

If any wire except the pigtail is damaged, the wire should be repaired by splicing in a new section of wire of the same gauge size (.5, .8, 1.0, etc.). The sealed splices and splice crimping tool from Terminal Repair Kit J 38125-A must be used for these repairs. The following wiring repair procedures must be used to ensure the integrity of the sealed splice application.

Step One: Open the Harness

If the harness is taped, remove the tape. To avoid wire insulation damage use a sewing "seam ripper" (available from sewing supply stores) to cut open the harness. The crimp and sealed splice sleeves may be used on all types of insulation except tefzel and coaxial and may only be used to form a one-to-one splice.

Step Two: Cut the Wire

Begin by cutting as little wire off the harness as possible. You may need the extra length of wire later if you decide to cut more wire to change the location of a splice. You may have to adjust splice locations to make certain that each splice is at least 40 mm (1.5 in.) away from other splices, harness branches, or connectors.

Step Three: Strip the Insulation

NOTICE: The following procedures must be followed in the order listed. If wire strands are damaged, the procedure must be repeated until a clean strip with all wire strands intact is obtained.

If it is necessary to add a length of wire to the existing harness, be certain to use the same size as the original wire. To find the correct wire size either find the wire on the schematic and convert the metric size to the equivalent AWG size or use an AWG wire gage.

If unsure about the wire size, begin with the largest opening in the wire stripper and work down until achieving a clean strip of the insulation. Strip approximately 7.5 mm (5/16 in.) of insulation from each wire to be spliced. Be careful to avoid nicking or cutting any of the strands. Check the stripped wire for nicks or cut strands. If the wire is damaged, repeat this procedure after removing the damaged section.

Step Four: Select and Position the Splice Sleeve

Select the proper sealed splice sleeve according to wire size. The splice sleeves and tool nests are color coded (see following chart).

Color Splice Sleeve	Crimp Tool Nest Color	Wire Gage AWG/(Metric)
Salmon (yellow-pink)	Red	20, 18/(0.5, 0.8)
Blue	Blue	16, 14/(1.0, 2.0)
Yellow	Yellow	12, 10/(3.0, 5.0)

Crimp and Seal Splice Chart

Using the J 38125-A Splice Crimp Tool (Figure 31), position the splice sleeve in the proper color nest of the hand crimp tool. Place the splice sleeve in the nest so that the crimp falls midway between the end of the barrel and the stop.

The sleeve has a stop in the middle of the barrel to prevent the wire from going further (Figure 32). Close the hand crimper handles slightly to hold the splice sleeve firmly in the proper nest.

Figure 31 - Splice Crimp Tool J 38125-A

Figure 32 - Seal Splice Sequence

9J-74 SUPPLEMENTAL INFLATABLE RESTRAINT (SIR) SYSTEM

Step Five: Insert Wires Into Splice Sleeve and Crimp

Insert the wire into the splice sleeve until it hits the barrel stop and close the handles of the crimp tool tightly until the crimper handles open when released (Figure 32). The crimper handles will not open until the proper amount of pressure is applied to the splice sleeve. Repeat Steps 4 and 5 for opposite end of the splice.

Step Six: Shrink the Insulation Around the Splice

Using the heat torch apply heat where the barrel is crimped. Gradually move the heat barrel to the open end of the tubing, shrinking the tubing completely as the heat is moved along the insulation. A small amount of sealant will come out of the end of the tubing when sufficient shrinking is achieved (Figure 32).

SIR System Wire Splice Repair

If any of the original equipment splices (three wires or more) in the SIR system wiring are damaged they should be repaired by applying a new splice (not sealed) from the Terminal Repair Kit J 38125-A.

Carefully follow the instructions included in the kit for proper splice clip application. Cloth duct tape may be substituted for splice tape if necessary.

Alternative Repair Methods

No alternative repair methods are available for the SIR system wiring and components.

Connector Position Assurance (CPA)

The Connector Position Assurance (CPA) is a small plastic insert that is inserted through the locking tabs of all of the SIR system connectors. The purpose of the CPA is to assure the connector halves are securely connected and they cannot vibrate apart. The CPA must be in place to ensure good contact between the SIR mating terminals.

Terminal Position Assurance (TPA)

The Terminal Position Assurance (TPA) insert is similar to the plastic "combs" used in ECM connectors. The function of the TPA is to keep the terminal securely seated in the connector body. The TPA is not to be removed from the connector body unless a terminal must be removed for replacement.

SPECIAL TOOLS

CAUTION: To avoid deployment when troubleshooting the SIR system, do not use electrical test equipment such as a battery powered or ac powered voltmeter, ohmmeter, etc., or any type of electrical equipment other than that specified in this manual. Do not use a non-powered probe type tester. Instructions in this manual must be followed carefully, otherwise personal injury may result.

SIR DRIVER/PASSENGER LOAD TOOL

The SIR Driver/Passenger Load Tool J 38715 is used only when called for in this section. It is used as a diagnostic aid and safety device to prevent inadvertent inflator module deployment.

The load tool has four yellow connectors attached to its case. The three small connectors are electrically functional and serve as resistive load substitutions. The large dummy connector does not serve as a load substitution and is not used.

No more than two connectors are used at any time. One of the small connectors is used to substitute the load of the driver inflator module when it is connected at the top of the column to the SIR coil assembly. Another small connector is used to substitute the load of the driver inflator module and the SIR coil assembly when it is connected at the base of the column to the SIR wiring harness. The third small connector is used to substitute for the load of the passenger inflator module when connected to the passenger inflator module harness connector. By substituting the resistance of the load tool when called for, a determination can be made as to whether an inflator circuit component is causing system malfunction and which component is causing the malfunction. The load tool should be used only when specifically called for in the diagnostic procedures.

J 39200 DVM

The J 39200 DVM is the preferred DVM for use in SIR diagnosis and repair. However, J 34029-A may be used if J 39200 is not available. No other DVMs are approved for SIR diagnosis and repair.

SCAN TOOL

The Tech 1 is used to read and clear SIR System Diagnostic Trouble Codes (DTCs). The Tech 1 will also provide SIR system circuit values using the "Data List" function. Refer to the Tech 1 Operator's Manual for specific information on how to use the Tech 1.

Scan tools from other manufacturers may be used. Refer to the Operator's Manual for the tool for specific instructions.

J 35616-A CONNECTOR TEST ADAPTER KIT

The J 35616-A Connector Test Adapter Kit must be used whenever a diagnostic procedure requests checking or probing a terminal. Using the appropriate adapter will ensure that no damage to the terminal will occur from the DVM probe, such as spreading or bending. The adapter will also give an idea of whether contact tension is sufficient, helping to find an open or intermittent open due to poor terminal contact.

SECTION 9K

REMOTE KEYLESS ENTRY

NOTICE: Always use the correct fastener in the proper location. When you replace a fastener, use **ONLY** the exact part number for that application. General Motors will call out those fasteners that require a replacement after removal. General Motors will also call out the fasteners that require thread lockers or thread sealant. **UNLESS OTHERWISE SPECIFIED**, do not use supplemental coatings (paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

Important

The Remote Keyless Entry System is intended to be used as a supplementary vehicle entry device. It is not intended to replace, but rather should be used in conjunction with a door lock key. The system could be disabled due to radio frequency interference or low transmitter battery power level. It is therefore necessary to always maintain access to a door lock key.

CONTENTS

General Description.....	9K-1	Automatic Door Lock Feature	9K-2
Functional Operation.....	9K-1	Diagnosis	9K-2
Transmitter.....	9K-1	On-Vehicle Service.....	9K-26
Battery Replacement	9K-1	Receiver.....	9K-26
Receiver.....	9K-2	Programming the Receiver	9K-27

GENERAL DESCRIPTION

The remote keyless entry system (remote control door lock system) is used to lock and unlock front and rear side doors, turn on interior lamps, and release the rear compartment lid or end gate window of the vehicle. A small receiver is installed on the rear window panel sheet metal of the sedan, and on the left rear inner wheelhouse of the wagon. This remote lock control feature operates on a 315 MHz radio frequency at a low energy level. If the remote lock control feature fails to operate from a normal distance, check for two conditions: weak batteries in remote lock control transmitter (expected battery life is two years): or close proximity to a radio transmitter, such as a radio station tower, airport transmitter, and some mobile or CB radios.

The transmitter is a hand-held item that is attached to a keyring. It has three buttons that control the functions of the system. The transmitter complies with FCC rules Part 15. Operation is subject to the following two conditions: 1) This device may not cause harmful interference, and 2) This device must accept any interference that may be received, including interference that may cause undesired operation.

FUNCTIONAL OPERATION

Figure 1

Unlocking Front and Rear Side Doors

1. Press "UNLOCK" button once and release to unlock driver's front side door only.

2. Press "UNLOCK" button a second time (within 1 to 5 seconds of the first depression) to unlock the remaining front and rear side doors.

Releasing Rear Compartment Lid or End Gate Window Assembly

- Press bottom button marked with vehicle symbol on top cover to release rear compartment lid or end gate window assembly.

Locking Front and Rear Side Doors

- Press "DOOR" button marked with key symbol.

TRANSMITTER

The transmitter will transmit a radio signal to the receiver, which will control functions of the receiver. The range is approximately 10 m (33 feet).

Battery Replacement

Figure 1

Remove or Disconnect

1. Keyring from transmitter.
2. Top cover from bottom cover, using flat-bladed tool at eyelet end to unsnap, if necessary.
3. Batteries.

9K-2 REMOTE KEYLESS ENTRY

Figure 1 - Remote Control Door Lock Transmitter (Typical)

Install or Connect

NOTICE: Use of wrong type of battery will cause damage to the transmitter.

1. Batteries.
 - Use battery type DL2016, or equivalent.
2. Top cover by snapping into bottom cover.
3. Keyring to transmitter.

Inspect

- Transmitter operation.

RECEIVER

The transmitter signal (frequency) is stored in the receiver assembly's non-volatile memory. However, the memory will be erased if the programming connector is grounded.

The remote control door lock receiver is battery fed and is always monitoring the transmitter signal. When the correct transmitter signal is received to lock the front and rear side doors, a transistor driver will energize the correct lock control relay coil. The receiver will also control which lock control relays will be energized to unlock the front and rear side doors, or release the rear compartment lid or end gate window.

Automatic Door Lock Feature (Buick)

The automatic door lock feature is controlled through the receiver.

With the ignition switch in the "ON" position, moving the automatic transmission control lever out of the "PARK" position, engages the receiver causing the doors to lock.

To unlock the front and rear side doors, return the automatic transmission control lever to the "PARK" position.

If a door is opened after the front and rear side doors have locked, the door will relock once it is closed, only if the transmission control lever is out of "PARK," the ignition switch is "ON" and the brake pedal is pressed.

The automatic door unlock feature may be disabled if desired. In order to disable the feature, reprogram one or both transmitter. Repeat the following button sequence three times after the last transmitter has been programmed, but before the program connector is disconnected:

- A. door lock
- B. door unlock
- C. rear compartment lid unlock

The door locks and rear compartment lid motor will cycle three times indicating that the automatic door unlock feature has been disabled.

To reinstate the automatic door unlock feature, reprogram normally.

If the automatic door lock feature fails to operate, refer to "Diagnosis" in this section or to SECTION 8A-30.

DIAGNOSIS

Perform the following troubleshooting hints before beginning system diagnosis.

- Be certain power door locks function normally using the LH and RH front door lock switches. If power door locks do not function normally, refer to SECTION 8A-130 for diagnosis.
- Check that transmitter battery terminals are clean and make good contact with the battery.
- Try a second transmitter if available. If the second transmitter works, remove the battery and install the battery in the original transmitter. Try the original transmitter again. If the original transmitter still does not work, the original transmitter is defective.

Refer to the "Symptom Table" for diagnosis of the remote keyless entry system. For a point-to-point wiring schematic refer to SECTION 8A-132.

COURTESY LAMPS REMAIN "ON" FOR MAXIMUM OF APPROX. 40 SECONDS AFTER ALL DOORS ARE CLOSED AND IGNITION SWITCH IS IN "RUN." (BUICK)	CHECK FOR OPEN IN CKT 639 TO THE RCDLR OR POOR CONNECTION AT RCDLR "C1" CONNECTOR TERMINAL "B". IF OK, REPLACE RCDLR.	
LOCKS WON'T RE-LOCK AFTER ALL DOORS ARE SHUT AND BRAKE PEDAL IS DEPRESSED. (COURTESY LAMPS AND AUTOMATIC DOOR LOCKS WORK NORMAL.) (BUICK)	CHECK FOR OPEN IN CKT 17 TO RCDLR. IF OK, REPLACE RCDLR.	

9K-4 REMOTE KEYLESS ENTRY

Figure 9K-4 - Remote Keyless Entry Wiring Diagram Sedan/Wagon (1 of 2)

9K-6 REMOTE KEYLESS ENTRY

9K-1

REMOTE KEYLESS ENTRY SYSTEM INOPERATIVE

Circuit Description:

Battery voltage is applied to the RCDLR at all times through I/P fuse 29. The RCDLR is grounded at all times.

Chart Test Description:

Number(s) below refer to circled number(s) on the diagnostic chart.

1. Isolate a power door lock system fault or a RKE system fault.

2. Check for battery voltage at the RCDLR connector.
3. Check for ground at the RCDLR connector.

Diagnostic Aids:

Program a known good transmitter (see procedure in this section), and test the RKE system. If the RKE system operates normally, the original transmitter was defective. If the RKE system is still inoperative, replace the RCDLR. If a known good transmitter will not program, refer to 9K-8, Page 9K-20 in this section.

9K-1 **KEYLESS ENTRY SYSTEM** **INOPERATIVE**

9K-2

DRIVER'S DOOR LOCK OR UNLOCK FUNCTION INOPERATIVE, PASSENGER DOOR LOCKS OPERATE NORMALLY

Circuit Description:

Lock function: Battery voltage is applied through the door lock relay and CKT 295 to the driver's door lock actuator. The driver's door lock actuator is grounded through CKT 694 and RCDLR. Unlock function: The RCDLR receiver applies voltage to the driver's door lock actuator through CKT 694. The driver's door lock actuator is grounded through CKT 295 and the door lock relay.

Chart Test Description:

Number(s) below refer to circled number(s) on the diagnostic chart.

1. Operating the door lock switches will indicate if driver's door lock functions.
2. Check for unlock signal at the RCDLR.

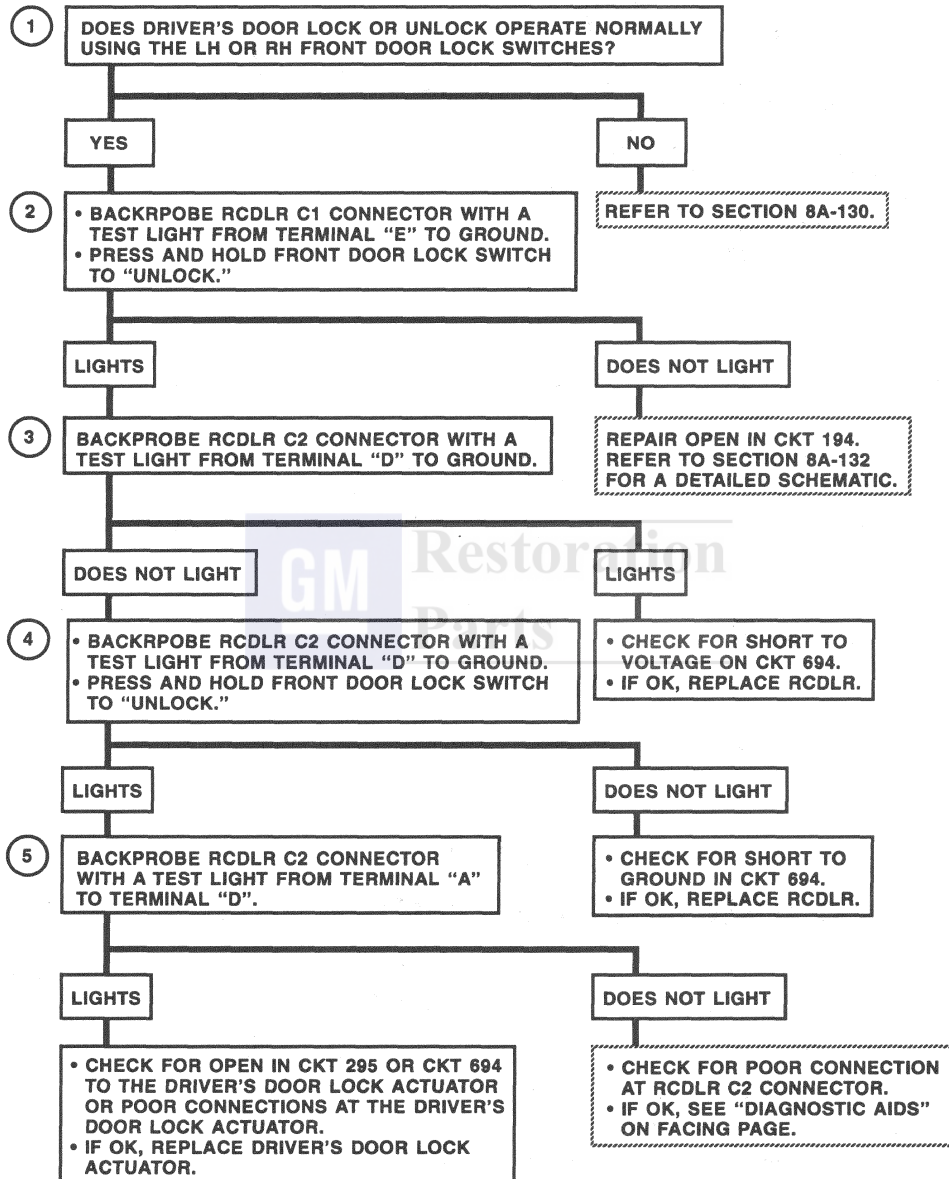

3. Check for voltage on CKT 694. Voltage on CKT 694 would prevent the driver's door lock actuator from locking.
4. Check that the RCDLR grounds CKT 694 to enable a lock request.
5. Check for open in CKT 295 or CKT 694 to driver's door lock actuator.

Diagnostic Aids:

Program a known good transmitter (see procedure in this section) and test the driver's door lock and unlock functions. If the driver's door lock and unlock functions operate normally, the original transmitter was defective. If the driver's door lock and unlock functions are still inoperative replace the RCDLR. If a known good transmitter will not program, refer to 9K-8, Page 9K-20 in this section.

9K-2

DRIVER'S DOOR LOCK OR UNLOCK FUNCTION INOPERATIVE, PASSENGER DOOR LOCKS OPERATE NORMALLY

9K-10 REMOTE KEYLESS ENTRY

9K-3

REAR GLASS RELEASE INOPERATIVE (BUICK)

Circuit Description:

When the RCDLR senses no voltage on CKT 693 and CKT 275, the rear glass release function can be activated using the transmitter. When the RCDLR senses voltage on CKT 639 and CKT 275, (ignition switch in "RUN" and A/T in "PARK") the rear glass release function can also be activated using the transmitter. When the RCDLR senses voltage on CKT 639 (ignition switch in "RUN") and no voltage on CKT 275 (A/T not "PARK") the rear glass release function cannot be activated by the transmitter.

Chart Test Description:

Number(s) below refer to circled number(s) on the diagnostic chart.

1. Determine an RKE system fault or rear glass release system fault.

2. Test the backup lamp and transmission position (PNP) switch. With the A/T in "PARK," the backup lamp and transmission position (PNP) switch should be closed, applying voltage to CKT 275.

Diagnostic Aids:

Program a known good transmitter (see procedure in this section) and test the rear glass release function. If the rear glass release function operate normally, the original transmitter was defective. If the rear glass release functions are still inoperative replace the RCDLR. If a known good transmitter will not program, refer to 9K-8, Page 9K-20 in this section.

9K-3 REAR GLASS RELEASE INOPERATIVE (BUICK)

9K-12 REMOTE KEYLESS ENTRY

9K-4

REAR GLASS RELEASE AVAILABLE WITH IGNITION SWITCH IN "RUN" AND TRANSMISSION OUT OF "PARK" (BUICK)

Circuit Description:

When the RCDLR senses no voltage on CKT 693 and CKT 275, the rear glass release function can be activated using the transmitter. When the RCDLR senses voltage on CKT 639 and CKT 275, (ignition switch in "RUN" and A/T in "PARK") the rear glass release function can also be activated using the transmitter. When the RCDLR senses voltage on CKT 639 (ignition switch in "RUN") and no voltage on CKT 275 (A/T not "PARK") the rear glass release function cannot be activated by the transmitter.

Chart Test Description:

Number(s) below refer to circled number(s) on the diagnostic chart.

1. Check for an ignition input signal to the RCDLR.
2. Check for a false signal from the backup lamp and transmission position (PNP) switch or a short to voltage on CKT 275.

9K-4

REAR GLASS RELEASE AVAILABLE WITH IGNITION SWITCH IN "RUN" AND TRANSMISSION OUT OF "PARK" (BUICK)

9K-14 REMOTE KEYLESS ENTRY

9K-5

COURTESY LAMPS DO NOT TURN "ON" WHEN UNLOCK FUNCTION IS OPERATED (COURTESY LAMPS TURN "ON" WHEN ANY DOOR IS OPEN) UNLOCK FUNCTION OPERATES NORMALLY (BUICK)

Circuit Description:

When the unlock button on the transmitter is pressed, the RCDLR grounds CKT 1393 to activate courtesy lamps relay and start an internal timer. If the internal timer reaches 30 seconds or the ignition switch is turned to "RUN," the RCDLR removes the ground on CKT 1393. The RCDLR senses voltage from I/P fuse 13 on CKT 639 when the ignition switch is turned to "RUN" to reset the internal timer.

Chart Test Description:

Number(s) below refer to circled number(s) on the diagnostic chart.

1. Check for a false ignition "ON" signal to the RCDLR.
2. Check CKT 1393, courtesy lamp relay circuit to the RCDLR.

9K-5

COURTESY LAMPS DO NOT TURN "ON" WHEN UNLOCK FUNCTION IS OPERATED (COURTESY LAMPS TURN "ON" WHEN ANY DOOR IS OPEN) UNLOCK FUNCTION OPERATES NORMALLY (BUICK)

- [illegible]

9K-6 REAR COMPARTMENT LID RELEASE INOPERATIVE

9K-18 REMOTE KEYLESS ENTRY

9K-7

REAR COMPARTMENT LID RELEASE AVAILABLE WITH IGNITION SWITCH IN "RUN" AND TRANSMISSION OUT OF "PARK"

Circuit Description:

When the RCDLR senses no voltage on CKT 639 and CKT 275, the rear compartment lid release function can be activated using the transmitter. When the RCDLR senses voltage on CKT 639 and CKT 275, (ignition switch in "RUN" and A/T in "PARK") the rear compartment lid release function can also be activated using the transmitter. When the RCDLR senses voltage on CKT 639 (ignition switch in "RUN") and no voltage on CKT 275 (A/T not in "PARK") the rear compartment lid release function cannot be activated by the transmitter.

Chart Test Description:

Number(s) below refer to circled number(s) on the diagnostic chart.

1. Check for an ignition input signal to the RCDLR.
2. Check for a false signal from the backup lamp and transmission position (PNP) switch or short to voltage on CKT 275.

Diagnostic Aids:

If voltage is absent at terminal "B" of RKE connector "C2" (with ignition "ON") and A/T out of "PARK," rear compartment lid release will be available using the transmitter.

9K-7
REAR COMPARTMENT LID RELEASE AVAILABLE
WITH IGNITION SWITCH IN "RUN" AND
TRANSMISSION OUT OF "PARK"

9K-8

REMOTE CONTROL DOOR LOCK RECEIVER/TRANSMITTER WILL NOT PROGRAM

Circuit Description:

The RCDLR applies voltage to CKT 1455. When the programming connector terminals "A" and "B" are shorted together, the RCDLR senses a voltage drop on CKT 1455. The RCDLR then cycles all door lock actuators once. The RCDLR then waits for input from the transmitter(s) or for the jumper to be removed from the keyless entry programming connector.

Chart Test Description:

Number(s) below refer to circled number(s) on the diagnostic chart.

1. Check that the RCDLR applies voltage to CKT 1455.

Diagnostic Aids:

Program a known good transmitter (see procedure in this section), and test the RKE system. If the RKE system operates normally, the original transmitter was defective. If the RCDLR does not program, using a known good transmitter, replace the RCDLR.

9K-8

REMOTE CONTROL DOOR LOCK RECEIVER/TRANSMITTER WILL NOT PROGRAM

9K-22 REMOTE KEYLESS ENTRY

9K-9

DOORS DO NOT UNLOCK WITH IGNITION SWITCH IN "RUN" AND TRANSMISSION IS SHIFTED TO "PARK" (BUICK)

Circuit Description:

When the A/T is shifted into "PARK," voltage is applied to the RCDLR on CKT 275. When the RCDLR senses voltage on CKT 639 (ignition switch in "RUN") and voltage on CKT 275, the RCDLR applies voltage to CKT 194. The door lock relay is energized to actuate the door lock actuators and unlock all doors.

Chart Test Description:

Number(s) below refer to circled number(s) on the diagnostic chart.

1. Isolate a power door lock system fault or RKE system fault.

2. Isolate a RKE system functional failure.
3. Checks for short to voltage on CKT 275 when A/T is in "DRIVE."
4. Checks for proper operation of backup lamp and transmission position (PNP) switch.

Diagnostic Aids:

RCDLR must receive voltage on CKT 639 when ignition is "ON" for auto door locks to work. Doors must be shut for normal operation of auto lock feature. (Courtesy lamps "OFF.")

9K-9

DOORS DO NOT UNLOCK WITH IGNITION SWITCH IN "RUN" AND TRANSMISSION IS SHIFTED TO "PARK" (BUICK)

9K-10

**DOORS DO NOT AUTOMATICALLY LOCK WHEN ALL
DOORS ARE CLOSED AND TRANSMISSION IS SHIFTED OUT
OF "PARK" WITH IGNITION SWITCH IN "RUN"**

Circuit Description

When the RCDLR senses voltage on CKT 639 (ignition switch in "RUN"), no voltage on CKT 275(trans. out of park) and the ground removed from CKT 156 (all door jamb switches open, all doors closed), the RCDLR applies voltage to CKT 195. The door lock relay is energized to activate the door lock actuators and lock all doors.

Chart Test Description:

Number(s) below refer to circled number(s) on the diagnostic chart.

1. Checks for normal operation of the RCDLR.

2. If the courtesy lamp function operates normally, CKT 156 to the RCDLR is not shorted to ground.
3. Checks for an unwanted voltage at terminal "C" of the "C2" connector with the A/T in "DRIVE."
4. Checks for voltage at terminal "C" of the "C2" connector with the A/T in "PARK."
5. Checks for voltage at CKT 275 through transmission position sensor switch (PNP).

Diagnostic Aids:

Terminal "B" of the "C2" connector must have voltage to it with the ignition switch "ON," for automatic function to operate.

9K-10

DOORS DO NOT AUTOMATICALLY LOCK WHEN ALL DOORS ARE CLOSED AND TRANSMISSION IS SHIFTED OUT OF "PARK" WITH IGNITION SWITCH IN "RUN" (BUICK)

ON-VEHICLE SERVICE

RECEIVER

(Sedan)

Figures 2 and 3
 Remove or Disconnect

For Chevrolet, access receiver (4) from underneath rear window panel through rear compartment using forward access hole.

For Buick, rear window panel trim must be removed to access receiver (4) (Figure 3). Refer to SECTION 10-8.

1. Rivets (10) attaching receiver (4) to rear window panel.
2. Electrical connectors from receiver (4).
3. Receiver (4).

 Install or Connect

NOTICE: Refer to "Notice" on page 9K-1 of this section.

1. Electrical connectors.
2. Receiver (4).
3. Rivets (10).
 - For Chevrolet, install from underneath panel (5).

Figure 2 - Remote Control Door Lock Receiver -
(Chevrolet Sedan)

- For Buick, install from above panel (8).

4. Rear window panel trim, for Buick. Refer to SECTION 10-8.

(Buick Wagon)

Figure 4
 Remove or Disconnect

1. Left quarter inner rear trim finish panel. Refer to SECTION 10-7.
2. Electrical connectors.
3. Receiver (4) and tape (11) from inner wheelhouse.

 Install or Connect

1. Tape (11) to bottom of receiver (4).
 - Strongly recommend using new tape to ensure adhesion over life of receiver. Do not use substitution.
2. Electrical connectors.
3. Align hole in tab on receiver (4) with gage hole in inner wheelhouse.
4. Press receiver firmly against inner wheelhouse.
5. Left quarter inner rear trim finish panel. Refer to SECTION 10-7.

Figure 3 - Remote Control Door Lock Receiver -
(Buick Sedan)

Figure 4 - Remote Control Door Lock Receiver -
(Buick Wagon)

Programming the Receiver

Figures 5 and 6

1. Reposition rear compartment trim to access the programming connector located at the left of the rear compartment, for sedan.
2. Remove left back body pillar finish panel to access programming connector, for wagon. Refer to SECTION 10-7.
3. Ground the programming connector by connecting the terminals together.
 - The system will verify this has occurred by performing a lock all, unlock drivers door/unlock all, and trunk/endgate cycle.
4. Press any key on either transmitter.
 - This step programs that particular transmitter to the receiver.
 - The system will verify by performing the same lock/unlock, lock/unlock cycle.
5. The Automatic Door Locking/Unlocking function is automatically enabled for this transmitter. To leave it enabled, skip to step 6. To disable the Automatic Door Locking/Unlocking function for this transmitter, perform the following sequence 3 times.
 - A. Press door lock button within 1 second of step C the 2nd and 3rd time through this sequence.
 - B. Press door unlock button within 1 second of step A.
 - C. Press trunk button within 1 second of step B.
 - The receiver will cycle through the lock, unlock, trunk sequence 3 times as verification.
6. To program a second transmitter to the receiver, repeat step 4 with the second transmitter. Otherwise, go to 7.

Figure 5 - Remote Control Door Lock Receiver
Programming Connector (Sedan)

Figure 6 - Remote Control Door Lock Receiver
Programming Connector (Wagon)

7. Disconnect the programming connector.
 - System will not operate if ground connection is not removed.
8. Verify operation of each transmitter.
9. Reposition rear compartment trim, for sedan.
10. Install left back body pillar finish panel, for wagon. Refer to SECTION 10-7.

BLANK

SECTION 10-1

GENERAL BODY SERVICE

CAUTION: This vehicle is equipped with Supplemental Inflatable Restraint (SIR). Refer to CAUTIONS in Section 9J under "ON-VEHICLE SERVICE" and the SIR Component and Wiring Location view in Section 9J before performing service on or around SIR components or wiring. Failure to follow CAUTIONS could result in possible air bag deployment, personal injury, or otherwise unneeded SIR system repairs.

NOTICE: Always use the correct fastener in the correct location. When you replace a fastener, use ONLY the exact part number for that application. General Motors will call out those fasteners that require a replacement after removal. General Motors will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

NOTICE: The theft deterrent label found on some major sheet metal must be masked prior to painting, rustproofing, undercoating, etc. The mask must be removed following the above operations. Failure to keep the label clean and readable may result in liability for violation of the Federal Vehicle Theft Prevention Standard, and subject the vehicle owner to possible suspicion that the part was stolen.

10-1-2 GENERAL BODY SERVICE

GENERAL DESCRIPTION

The information in this section provides body service procedures that apply to the entire vehicle.

WELDING ON THE BODY OR FRAME

Before welding on the body or frame, always disconnect the following components to prevent possible damage to sensitive electronic circuits:

- Sensing and Diagnostic Module (SDM). Refer to SECTION 9J.
- Powertrain Control Module (PCM). Refer to SECTION 6E3.
- Electronic Brake Control Module (EBCM). Refer to SECTION 5E1.
- Warning Audio Alarm Module. Refer to SECTION 8C.
- Cruise Control Module. Refer to SECTION 9B.
- Remote Control Door Lock Receiver. Refer to SECTION 9K.

ON-VEHICLE SERVICE

FASTENERS

Many aluminum components are used on present models. Aluminum in contact with steel may corrode rapidly if not protected by special finishes or isolators.

Such fasteners have a special finish meeting GM specifications, which provides adequate protection from corrosion. These special fasteners differ in color in order to more easily identify them from the standard metric fasteners, which are medium blue in color.

NOTICE: When replacing fasteners avoid substituting otherwise similar fasteners in locations which require the use of special fasteners GM P/N 6111-M, GM P/N 6047, GM P/N 6174M or equivalent for aluminum components. Failing to follow this precaution may result in premature corrosion of the sheet metal in the areas mentioned above.

Weld Stud Replacement

If during a repair procedure, a weld stud becomes damaged, the following procedure may be used to replace the weld stud.

1. Drill a hole into same location as damaged weld stud.
2. Drive a screw into drilled hole.

Important

- Make sure to apply proper anticorrosion materials as necessary.
3. Use the screw to retain clips, moldings, etc. in the same manner used with weld studs.
 4. If surface becomes marred, repair and/or paint to provide a smooth surface. Refer to "Metal Part Refinishing - Basecoat/Clearcoat" in this section.

LUBRICATION

Mechanical parts having contacting surfaces in relative motion with other body parts are lubricated during assembly. To maintain ease of operation, it is recommended that these parts be lubricated at the basic service intervals shown in SECTION 0B, using the following lubricants:

- Door hinges - oil (30 weight preferred). Apply lubricant to roller and hinge pin bushings.

Important

- Do not apply lubrication to hold-open link and roller contacting surfaces as this could cause improper roller operation.
- Compartment lid hinges and torque rod-to-hinge surfaces - Lubriplate Autolube A (GM P/N 1052196); Lubriplate Aerosol (GM P/N 1052349); Lithium Lubricant (3M P/N 8915) - Aerosol or equivalent.
- Hood latch, pivots, spring anchor and release pawl -grease, high temperature - water spray resistant GM P/N 12345996 or equivalent.
- All key lock cylinders should be lubricated with Multi-Purpose Lubricant GM P/N 12345120 or equivalent) or light machine oil.
- Seat mechanism, door hardware, and sunroof module are covered in their specific body sections in this manual.
- All weather-strips should be periodically lubricated with a silicone paste lubricant. A thin film of lubricant should be applied using a clean cloth.

STRIPES AND DECALS

Stripes and decals adhere to a painted surface using pressure sensitive adhesive.

The use of a wetting solution aids the technician in lifting and positioning the stripe or decal during installation. A wetting solution also ensures a better bond between stripe or decal and panel.

Stripe or decal replacement involving collision damage, or damage to underlying painted surface, requires that metal repair and/or refinish operations be completed before stripe or decal is installed.

NOTICE: Freshly painted surfaces must be allowed to dry thoroughly before installing stripe or decal. Residual solvents in fresh painted surfaces can lead to subsequent blistering problems if stripe or decal is applied before complete release of solvents. The stripe or decal material highlights vehicle surface imperfection. All dings, rough metal, paint defects and uneven two-tone paint break lines must be eliminated before stripe/decal application can take place.

Body surfaces, stripes and decals must be maintained between 21° C to 38° C (70° F to 100° F) during installation. Auxiliary heat sources to warm the body surfaces, stripes and decals are required if the temperature is below 21° C (70° F).

**Important**

- Never apply stripes or decals when temperatures are below 21° C (70° F). Stripes and decals may be applied “dry.” If this does not result in a consistent bubble free application, the “wet” method must be used as in the case of large graphics packages.

**Important**

- Stripes or decals that are applied on flexible surfaces (fascias, etc.) must be applied using the “wet” method. This will reduce the formation of bubbles under the stripe or decal due to the outgassing potential of the flexible materials.

REMOVAL AND INSTALLATION

The following equipment and materials are necessary when making a quality stripe or decal installation. Equivalent products may be used.

- Wetting solution - a foaming type window cleaner, that does not contain ammonia.
- Silicone, wax and grease remover.
- Isopropyl alcohol.
- Squeegee - 75 to 100 mm (3 to 4 inches) wide, plastic or hard rubber. De-burr any sharp or rough edges to prevent scratching of the stripe or decal.
- Water bucket and sponge or spray bottle.
- Sandpaper - 600 grit or finer, wet-or-dry type.
- Heat gun or infrared heat lamp.
- Clean, lint-free wiping rags.
- Sharp knife or razor blade.
- Scissors.
- Fine pin or needle.
- Marking pencil.

**Remove or Disconnect**

1. Necessary moldings or trim panels.
2. Wash and clean repair surfaces, adjacent panels and openings as required.
3. Molding attaching clips, handles, sidemarker reflectors and/or other stripe or decal overlapping parts.

NOTICE: To avoid damaging underlying paint finish, do not use pointed or sharp instruments for removal of stripe or decal from panel.

4. Stripe or decal by starting at one edge and peeling stripe or decal from panel assembly surface.
 - Application of heat to stripe or decal at point of removal aids removal operation.
5. All traces of adhesive residue from painted surfaces with a silicone, wax and grease remover.

**Install or Connect**

NOTICE: Always refer to manufacturer's packaged instructions to avoid damage.

1. Prepare surface.

**Important**

- If area where stripe or decal is to be applied has been refinished, remove any imperfections that would show through stripe or decal.

**Clean**

- A. Painted surface with silicone, wax and grease remover.
 - B. Area where stripe or decal will be applied with a 50-50 mixture of isopropyl alcohol and water.
 - Wipe panel surface with a clean cloth while solvent is still wet and allow to dry.
2. Apply wetting solution to area where stripe or decal is to be installed.
 3. Put wetting solution on adhesive side of stripe or decal.
 - Remove backing material of stripe or decal as necessary.
 4. Stripe or decal to panel. Wetting solution will allow movement of stripe or decal for proper positioning.
 - A. Working from center where possible, squeegee stripe or decal into position. Application of additional wetting solution may be necessary to ease installation of stripe or decal. Application of soapy wetting solution on top side of stripe or decal will ease pull of squeegee on stripe or decal and help to eliminate damage to it.
 - B. Apply heat to stripe or decal at recessed areas. Press stripe or decal into recess to obtain firm bond.

**Inspect**

- Stripe or decal from critical angle using adequate light reflection to detect any irregularities that may have developed during installation.
- C. Remove all air bubbles by piercing with a safety pin, needle or tool with same size piercing tip. Never use razor blade or knife edge.
 - Pierce bubble on its outer edge and force air out from opposite edge with blade of squeegee.
5. Previously removed parts and clean as required.

Woodgrain Transfers

Woodgrain transfers possess a 50-degree gloss or semi-gloss finish and are of all vinyl construction. They are designed to fasten to an acrylic painted surface by means of a pressure sensitive adhesive.

Service replacement transfers are available through service warehouses in suitably sized roll stock form. When placing orders for transfers, indicate division, model year, body style and applicable vehicle panel assembly usage.

The use of a wetting solution aids in lifting and positioning the transfer during installation. A wetting solution also insures a better bond between transfer and panel assembly.

Vinyl transfer replacement involving collision damage, or damage to underlying acrylic paint finish requires that metal repair and/or refinish operations be completed before the transfer is installed.

For quality results, the temperature of the transfer, panel assembly surface and work room should be in the range of 20° to 40° C (70° to 104° F). At temperatures below this range, the vinyl is less flexible and will not stretch easily to conform to body contours. Also, the vinyl transfer adhesive becomes low in tack, making it difficult to obtain good adhesion. At temperatures above this range, the adhesive becomes high in tack which may cause the transfer to adhere to the body before proper placement is achieved.

A proper squeegee sequence is of utmost importance. Start at top center of the transfer. Progress to right and left from center to establish alignment across the top. Then squeegee downward from this position in small increments across the transfer (Figure 1). Use firm, short, overlapping squeegee strokes to drive out all the water and air while achieving maximum transfer bond. Removal of all blisters and proper attention to edge detail make for a quality installation.

NOTICE: Heat is sometimes required at specific locations. This should be done with extreme care. Never use heat until all surrounding sections of the transfer are secured. Heat softens and allows stretching of the transfer.

REMOVAL AND INSTALLATION

Figure 1

The following equipment and materials are necessary to make a quality transfer installation:

- Wetting solution - prepare by mixing 38 ml (1 1/4 ounce) of liquid dish detergent to 3.8 liters (1 gallon) of water.

Figure 1 - Transfer Installation Sequence

- Silicone, wax and grease remover.
- Vinyl trim adhesive, brush or spray can.
- Squeegee - 75 to 100 mm (3 to 4 inches) wide, plastic or hard rubber. Smooth any sharp or rough edges to prevent scratching.
- Water bucket and sponge or spray bottle.
- Sandpaper - number 400, wet-or-dry type.
- Heat gun or infrared heat lamp and extension cord.
- Clean wiping rags or paper towels.
- Sharp knife.
- Scissors.
- Fine pin or needle.
- Marking pencil.

Remove or Disconnect

1. Necessary nameplates, moldings, molding attaching clips, tail lamps and any other overlapping parts. For removal procedures, refer to specific body section of this manual.

Clean

- Wash surfaces to be repaired, adjacent panels and openings as required.

NOTICE: To avoid gouging underlying paint finish, do not use pointed or sharp instruments for removal of transfer from panel.

2. Transfer by starting at one edge and peeling transfer as a sheet at a 90 degree angle from panel surface.
 - Application of heat to affected transfer at point of removal aids the removal operation.
3. All traces of adhesive residue from painted surfaces with a silicone, wax and grease remover.
 - Wipe panel surface with a clean, lint-free cloth while remover is still wet. Allow to dry.

**Install or Connect**

1. Prepare surface.

**Clean**

- A. Urethane painted surface with a silicone, wax and grease remover.
 - B. Wipe with clean cloth and allow to dry.
2. Scuff-sand acrylic and painted surface with number 400 sandpaper by dry sanding.
 - Freshly painted surfaces must be allowed to dry thoroughly before sanding. Residual solvents in fresh paint can lead to blistering problems if transfer is applied before paint is dry.

**Clean**

- A. Panel again.
 - B. Wipe surface with clean, lint-free cloth and allow to dry.
3. Make template to be used as a guide for transfer installation to panel surface.
 - A. Tape a suitable sheet of paper at top of panel, aligning top of paper with transfer on adjacent panels. This represents final upper trim line.
 - B. With template flush to panel, mark front, rear and bottom edges of panel on template.
 - C. Remove template from panel and place on clean flat surface. Draw lines outboard of front, rear and bottom of panel 16 to 19 mm (5/8 to 3/4 inch) from edges. Cut excess paper beyond front, rear and bottom drawn lines.
 - D. Punch small hole at front vertical edge of template to denote front. Mark underside of template.
 4. Unroll and position service transfer on clean flat surface with backing side up and woodgrain pattern running from left to right.
 5. Position prepared template on service transfer and mark perimeter cutlines on backing of service transfer. Make sure that underside of template is up, woodgrain pattern runs from left to right and is face down before marking trim line on service transfer.
 6. Cut out service transfer along trim line as required.
 7. Position and center transfer on panel for vertical and lateral alignment. Mark center of both transfer and panel (Figure 1).
 8. Lay transfer on a clean table and peel off paper backing.

**Important**

- Be sure to peel backing paper from transfer. Do not peel transfer from backing as this will cause transfer to stretch.
9. Soak sponge in wetting solution or use a spray bottle filled with wetting solution to apply ample amount of wetting solution to adhesive side of transfer and to panel surface.

NOTICE: Wetting solution should be used at all times as it ensures a better bond between transfer and painted surface.

10. Center and line up transfer cutouts with door handle and lock cylinders, and/or with transfers on adjacent panels.
 - A. Press down lightly across upper edge of transfer.
 - B. Squeegee transfer firmly at center for distance of 75 to 100 mm (3 to 4 inches). Then squeegee upward over same spot.
11. With cheese cloth, rub out all air bubbles and wetting solution in area of lock cylinder opening.
12. Upper edge of transfer.
 - A. Raise one side of transfer from panel up to secured area at top center.
 - B. Working from center, squeegee transfer into place, using firm, short, overlapping strokes.
 - C. Squeegee laterally first and then up when working across upper edge.
 - D. Complete securing opposite upper edge of transfer in similar fashion.
13. Lower area of transfer.
 - A. With one hand, lift unsecured lower area of transfer from panel.
 - If transfer sticks prematurely, break bond with fast, firm pull.
 - B. Reposition lower area of transfer at center of panel and squeegee laterally toward each end of panel.
 - C. Continue bonding transfer to panel with firm, overlapping strokes (Figure 1).
14. Periodically apply soapy wetting solution to panel to ease raising and positioning transfer during squeegee operations.
15. Work downward in small increments across transfer (Figure 1).
16. Cut 90 degree notches in transfer edges at lower corners as required. Cut "V" notches in transfer sides where necessary.
17. Apply light coating of vinyl trim adhesive to door hem flanges and rear body lock pillar facing where surface is covered by transfer. Avoid use of excessive adhesive.
18. With heat gun or heat lamp, heat inboard side of door hem flanges (or body lock pillar facing, etc.) and edges of transfer film to about 32° C (90° F).
19. Fold ends of transfer over door hem flanges (or over corners at panel ends) and press to secure edges of transfer to panel surfaces. Avoid undue pulling or stretching at ends as tearing could result.
20. Apply heat as required to transfer at door handle holes, side marker lamps and other recessed areas. Press transfer into recessed areas to obtain a firm bond.
21. With sharp knife, carefully cut out excess transfer as required.

Inspect

- Transfer installation from critical angle using adequate light reflection to detect any irregularities that may have developed during installation.
- 22. Remove all air or moisture bubbles by piercing each at an acute angle with a fine pin or needle and by pressing bubble down.
- 23. Previously removed parts and clean vehicle as required.

ADHESIVE NAMEPLATES/EMBLEMS

For information on adhesive nameplate and emblems, refer to SECTION 10-8.

ADHESIVE MOLDINGS

The moldings are attached to the body panels with adhesive tape. To ensure a good replacement of new or old moldings, the panel surface should be warm, 21° to 32° C (70° to 90° F), clean and free of any wax or oily film. Methods are listed to attach loose molding ends, completely removed moldings, and replacement moldings.

Secure Loose Moldings

1. Wash affected area with soap and water and wipe dry. Wipe panel and adhesive side of molding with clean rag using oil-free naphtha or alcohol.
If molding has been pulled loose from adhesive backing (tape remains on body panel), do not remove tape from body panel. Clean back of molding assembly and tape on body panel with oil-free naphtha or alcohol and proceed with step 3.
2. If needed, apply length of masking tape as molding guide. Straight edge may also be used.
3. Apply adhesive to back of molding and press in place. If adhesive (GM P/N 1052621 or equivalent), is used, apply constant pressure to molding for 30 seconds or until firm bond has been made.

Molding Completely Removed

Figure 2

Important

- Do not use this procedure if molding is dented or was pried from body panel.
- 1. Wash affected area with soap and water and wipe dry.
- 2. Remove all traces of adhesive from body panel and back of molding using oil-free naphtha or isopropyl alcohol.
- 3. Mark proper position of molding with length of masking tape (Figure 2). Use adjacent moldings as guide.
- 4. Warm body panel with heat lamp or heat gun to 21° C (70° F).

5. Apply double-coated foam tape (3M P/N 06380 or equivalent) to the molding.
6. Line up molding to tape guideline on body panel or use straight edge to align molding to front or rear moldings already on vehicle.
7. Peel backing from end of molding.
8. Press firmly into place while continuing to remove backing.
9. Hand roll molding to body panel to ensure proper adhesion.

Molding Replacement

Figure 2

Remove or Disconnect

- Molding.
 - A. Hold hot air gun 152 mm (6 inches) from surface of molding to be removed.
 - B. Apply heat, using circular motion for about 30 seconds.
 - C. Place catgut or fishing line between molding and body panel. Using sawing motion, remove molding from panel surface.
 - D. Discard molding.

Install or Connect

- Molding.
 - A. Mark proper position of molding with length of masking tape or straight edge, aligning to front or rear moldings already on vehicle.

Clean

- Area with soap and water and wipe dry.
- Body panel using oil-free naphtha or isopropyl alcohol.
- B. If needed, warm body panel with heat lamp or heat gun to 21° C (70° F).
- C. Peel backing from front end of molding.
 - Do not touch adhesive backing.

Figure 2 - Adhesive Molding Repair

- D. Press molding to body panel while continuing to remove backing.
- E. Hand roll molding to body panel to ensure proper adhesion.
- F. Molding ends should not overlap door edge, door edge guard, lock cylinder or body openings.

Inspect

- Molding ends for bonding.
- Hand roll loose ends.

WATERLEAK DIAGNOSIS AND REPAIR

Figures 3 and 4

GM vehicles are designed to operate under normal environmental conditions. The design criteria for sealing materials and components takes into consideration the sealing forces required to withstand the natural elements. These specifications do not, and cannot, take into consideration all artificial conditions such as may be encountered in some high-pressure car washes.

The watertest procedure has been correlated to the natural elements and will determine the ability of a vehicle to perform under normal operating conditions.

Repairing body waterleaks is a problem of proper testing, diagnosis and repair through adjustment of misaligned components and/or application of proven repair materials. The first step in water leak diagnosis is finding the conditions under which the leak occurs.

Figure 3 - Watertest Stands Positioned for Front Water Test

For example, the leak is noticed only when parked on an inclined drive, or when water is in the jack and spare tire stowage assembly.

If the general leak area can be found, the exact entry point can be quickly isolated by use of a localized test such as a water hose or air hose. If the leak source is not obvious, a testing method using watertest equipment should be used (Figures 3 and 4). It may be necessary to remove some interior trim panels or components to locate areas needing repairs.

Generalized Testing

The watertest stand must be constructed.

• Watertest stand specifications:

- Volume of flow should be 14 liters (3.7 gallons) per minute.
- Water pressure, measured at nozzle - 155 kPa (22 psi).
- Windshield and front body pillar - approximately 30 degrees down, 45 degrees toward rear and aimed at corner of windshield (Figure 4).
- Doors - approximately 30 degrees down, 45 degrees towards rear and aimed at center of rear door or rear quarter panel.
- Rear window and rear compartment lid - approximately 30 degrees down, 30 degrees toward front and aimed about 600 mm (24 inches) from corner of rear window.
- If specified water pressure of 155 kPa (22 psi) cannot be obtained because of a local situation, both test stands may be moved toward the body until water spray overlap can be obtained (Figure 3).

Localized Testing (Spot Test)

Localized testing may be made with either water or air. Begin the test at the base of the suspected area and move upward slowly until the leak is located.

Important

- Pinpoint leak area before any repair is made. Random repair may only temporarily restrict water entry and make future diagnosis and repair more difficult.

Continue localized testing in the same general area to confirm that all leaks have been located.

Figure 4 - Watertest Stand Specifications

10-1-8 GENERAL BODY SERVICE

Water Hose Test

Figures 5 and 6

1. Have helper inside vehicle to detect actual leak point.
2. Use unrestricted water flow (no nozzle).
3. Begin at base of suspected leak area and move upward slowly.

Air Hose Test

Figures 7 and 8

1. Apply bubble solution (liquid soap) to suspected area.
2. Apply air pressure with an air hose from inside vehicle. Do not exceed 205 kPa (30 psi).
3. Observe for bubbles on outside at suspected leak area.

Waterleak Repair

Figures 9, 10 and 11

To locate the exact leak point or to repair the leak, it may be necessary to remove some interior trim panels or components. Waterleak repair is covered in the section covering the component. For example, for the repair procedure on stationary windows, refer to SECTION 10-2.

Figure 5 - Water Hose Test of Windshield pillar

Figure 6 - Pressure Test of Wheelhouse

After completion of any water leak repair, the general area should be re-tested using the watertest stand. Do not use the air hose or water hose to test repaired areas as the repair material may dislodge under abnormal pressure.

Figure 7 - Air Hose and Bubble Solution Test of Windshield Glass Sealant

Figure 8 - Air Hose and Bubble Solution Test of Panel Joints

Figure 9 - Sealing Rear End To Prevent Waterleaks - (Sedan)

Figure 10 - Sealing Rear End To Prevent Waterleaks - (Wagon)

Material recommended for specific leak areas include:

- Urethane adhesive (GM P/N 12346284 or equivalent) for windshield, rear window and stationary window repair.
- Brushable seam sealer which can be painted for metal joints.
- Bedding and glazing compound for ventilation ducts and drip moldings.
- Drip-check sealer for small cracks and pin holes.
- All around automobile body sealant (3M P/N 8500 or equivalent) for large holes.
- Weatherstrip adhesive (3M P/N 08011 or equivalent) for weather-strips.
- Strip caulk for bolts, studs and screws.

WINDNOISE DIAGNOSIS AND REPAIR

Figures 7, 8, 12, 13 and 14

Many of the water leak diagnosis tests are also used for wind noise diagnosis.

- Visual inspection:
 - Misaligned components.
 - Loose fasteners.
 - Torn weather-strips.
 - Broken weld joints.
 - Sealer and/or adhesive skips.

Figure 11 - Sealing Front End To Prevent Waterleaks

• Tracing powder or chalk test:

- A. Clean weather-strips and contact surfaces with solvent.
- B. Apply powder or chalk in an unbroken line to contact surface of weatherstrip around perimeter of rear compartment lid, door, side door window, or hood. Surrounding areas must be free of chalk or powder.
- C. Close panel completely. Do not slam. This presses weatherstrip firmly against mating surfaces.

Figure 12 - Masking Tape Application to Identify Wind Noise

Figure 13 - Typical Sealing to Prevent Windnoise

Inspect

- Applied line on weatherstrip will be marred where contact is good. A corresponding imprint will be on mating surfaces.
- Gaps or irregularities in powder or chalk line indicate a poor seal.
- Air pressure test:
 - A. Mask off pressure relief valves.
 - B. Turn on vehicle's ventilation fan.
 - C. Close all openings - windows, doors, etc. An abnormal amount of high pressure will build up in vehicle and will escape through poor seals.

D. With stethoscope or length of heater hose, listen for escaping air along door and window seals.

- Smoke or dusting powder test can be used in same manner. Exact leak location can be seen as smoke or powder travels through bad seal.

- Soap suds or bubble test:

A. Pressurize interior of vehicle.

B. Apply soapy solutions to potential leak areas. Escaping air pinpoints leak area. Air pressure from air hose inside vehicle can be used instead of pressurizing vehicle's interior. Do not exceed 205 kPa (30 psi) when using air hose (Figures 7 and 8).

- External wind noise:

A. Road-test vehicle to determine source of noise.

- Wind roar is caused by outside air passing over an opening.
- Wind whistle is caused by inside air seeping through a bad seal, or by outside air passage over a protruding edge.
- Wind rush is outside air passing over vehicle's body.

B. Tape various moldings and gaps until noise is eliminated (Figure 12).

NOTICE: If masking the grille and headlamp capsule areas, care must be taken not to restrict airflow and cause vehicle overheating.

Windnoise leak repairs are very similar to waterleak repairs. The actual procedure depends on the type of seal being repaired (Figure 13).

Leaks around door opening weatherstrip do not always indicate a faulty weatherstrip. A door or window adjustment may resolve the condition (Figure 14). Refer to SECTION 10-6.

Figure 14 - Airflow over Align/Misaligned Surfaces

SQUEAK AND RATTLE DIAGNOSIS AND REPAIR

Basically, squeaks and rattles are caused by improperly controlled relative motion between components. There are three ways to prevent the squeak or rattle.

1. Attach component securely so there is no relative motion during operation.
2. Separate components so there is no contact under operating conditions.
3. Insulate components so that no squeaks or rattles occur with relative motion between components. Low uniform friction surfaces can be provided to eliminate "stick-slip" motion.

ANTICORROSION TREATMENT

Figures 15 through 25

CAUTION: When applying sound deadeners due care and preventive measures must be exercised to prevent any materials from being sprayed into door and quarter outer panel mechanisms such as door lock cylinders, channels, window regulators and seat belt retractors, as well as any moving or rotating mechanical or suspension parts on the underbody. After material application, be sure all body drain holes are open.

Anticorrosion materials are used on interior and exterior surfaces of metal panels providing rust resistance. These materials include metals such as one-sided and two-sided galvanized zincrometal and zinc-iron alloy steels. These treated metals are used on components such as fenders, doors, quarter outer panels, wheelhouses and other critical parts.

Metal conditioners and primers are used on interior and exterior surfaces along with protective waxes on interior surfaces in areas where moisture might accumulate. Sealers are applied along exposed joints and moisture-repelling asphaltic sound deadeners are applied inside the wheel wells and on some underbody components.

Any procedure that disturbs these special treatments, such as panel replacement or collision damage repair operations, may leave the metal unprotected and result in corrosion. Proper recoating of these surfaces with service-type anticorrosion material is essential.

Metal conditioners and primer coatings are applied to all metal panels at the time of vehicle manufacture. After repair and/or replacement parts are installed, all accessible bare metal surfaces must be treated with metal conditioner and re primed using an acrylic chromate material. This operation is to be performed prior to the application of sealers, waxes, deadeners and anti-rust compounds.

Figure 15 - Typical Sealer and Anticorrosion Compound Treatment

Figure 16 - Typical Anticorrosion Treatment of Rear Compartment

10-1-12 GENERAL BODY SERVICE

Figure 17 - Typical Anticorrosion of Rear Compartment - (Wagon)

Figure 18 - Typical Joint Sealing, Rear End Area - (Sedan)

Figure 19 - Typical Joint Sealing, Rear End Area - (Wagon)

Figure 20 - Sealer Application to Rear Wheelhouse Panel to Prevent Fume Intrusion - (Wagon)

Figure 21 - Sealer Application to Wheelhouse Panel to Prevent Fume intrusion (Wagon)

Figure 22 - Sealer Application to Rear Compartment to Prevent Fume Intrusion - (Sedan)

Sealers are applied to specific joints during manufacture. These sealers are intended to prevent water and dust from entering the vehicle and also are anticorrosion barriers. Sealers are applied to such areas as lid hem flanges, wheelhouse panel, quarter outer panel, floor panel, cowl, roof module and various other panel-to-panel attaching points. The originally sealed joints are obvious and any damage to these sealed locations should be corrected by resealing.

Figure 23 - Sealer Application to Rear Compartment to Prevent Fume Intrusion - (Wagon)

Figure 24 - Typical Acoustic Deadener Application, Wheelhouse Panel and Floor Extension Areas - (Sedan)

Attaching points of new replacement panels should be resealed. Replacement lids and doors will also require sealing in the hem flange areas.

Flanged joints, overlap joints and seams should be sealed using a quality sealer of medium-bodied consistency. The sealer used must retain its flexible characteristics after curing and be paintable.

Open joints which require bridging of the sealer to close a gap should be sealed using a heavy-bodied caulking material. Follow the label directions for the material selected.

Color application may be required to restore repaired areas such as the hood, fenders, doors, quarter outer panels, lids, roof module, engine compartment, underbody and inner panels to original appearance. When this is necessary, conventional refinishing preparation, undercoat build-up and color application techniques should be followed.

Figure 25 - Typical Acoustic Deadener Application
Wheelhouse Panel and Floor Panel Extension Areas -
(Wagon)

Deadener materials (spray-on type) are used on various metal panels to provide corrosion resistance and joint sealing. They control the general noise level inside the passenger area of the vehicle. When deadeners are disturbed because of damage, removed during repair operations, or a new replacement panel is installed, the deadener material must be replaced by a service equivalent material. The application pattern and location of deadener materials can be determined by observing the original production installation.

Anticorrosion compounds are light-bodied materials designed to penetrate between metal-to-metal surfaces.

Conventional undercoating is recommended to coat large areas such as replacement quarter outer panels, floor panel assemblies, etc.

The sequence of application steps for anticorrosion materials is as follows:

1. Clean and prepare metal.
2. Apply primer (acrylic chromate).
3. Apply sealers at all previously sealed joints.
4. Apply color in areas where color is required, such as hem flanges, exposed joints and underbody components.
5. Apply deadeners as indicated by original application pattern.
6. Apply anticorrosion compounds.
7. Apply underbody rustproofing material.

Cleaning of the interior and underbody panel surfaces is necessary when original galvanized or other anticorrosion materials have been burned off during welding or heating operations. Removal of the residue from burning will require additional care in such areas as interior surfaces of box-type construction and when configurations of the metal panels limit access to interior surfaces. One or more of the following methods will remove the residue.

CAUTION: Approved safety glasses should be worn when performing this procedure to reduce the chance of personal injury.

- Where access is possible, scraping can be used. If a standard putty knife or scraper will not fit into the affected area, fabricate a small, flexible scraper from a narrow piece of sheet metal.
- A jet of compressed air will remove most residue and could be effective in limited-access areas. Eye protection is absolutely necessary in an operation of this type.
- Sandblasting is most effective and should be used when the equipment is available and access to the area is good. Sandblasting is an excellent method for cleanup and preparation of open joints, underbody components and hem flange areas.
- Wire brushing (power and by hand).
- When access is good, sandpaper and steel wool can be used.

CORROSION REPAIR

Prior to replacing exterior body parts, check condition of paint on all covered or hidden interior surfaces. If corrosion is found in these areas, proceed as follows:

1. Remove corrosion with suitable wire brush, abrasive or liquid corrosion removing agent. Follow label directions.
2. If necessary, wash with detergent, rinse and dry.
3. Apply a heavy coating of anticorrosion compound to all cleaned hidden surfaces before installing exterior body parts. Also, apply anticorrosion compound to all inner surfaces of exterior body parts being installed.

ANTI-CHIP COATING MATERIAL

An anti-chip coating material is applied to specific lower areas of the body prior to the color coat application. The presence of the applied material can be detected through visual inspection. If the production-applied anti-chip coating requires replacement, a chip resistant air dry vinyl that is solvent borne and sprayable is available for field use.

Materials and equipment necessary for repair:

VINYL GRAVEL GUARD

- Sandpaper - 80 grit.
- Portable heat lamp or heat gun.
- Extension cord.
- Clean shop towel.
- Conventional hand spray gun with pressure feed cup attached.
- Putty knife.

METAL PART REFINISHING - BASECOAT/CLEARCOAT

CAUTION: Many paint repair systems require additives containing isocyanates. It is essential that all recommendations and warnings listed on the container label for materials selected be followed. It is mandatory that adequate respiratory protection such as air line respirators with a full hood be worn. Such protection should be worn during the entire mixing and painting process. Persons with respiratory problems or those allergic to isocyanates must not be exposed to isocyanate vapors or spray mist.

Basecoat/clearcoat paint is factory applied in four layers: a cathodic immersion primer, a primer surfacer, base color of high solids acrylic enamel (basecoat), and a clear acrylic top coat (clearcoat) to give the finish a high-gloss look.

Clearcoat Repair without Repainting

Figure 26

If the damage or imperfection can be sanded or polished out without reaching the basecoat, you don't have to repaint.

1. Thoroughly wash repair area with a mild detergent.
2. Apply a small amount of medium to fine machine rubbing compound to repair area and smear evenly with compounding pad.
3. With polisher running at approximately 1,700 rpm, compound repair area. Keep pad flat against panel while applying light pressure. Feature lines and panel edges should be hand-rubbed to avoid burn-through. Check repair area frequently and, if necessary, add more compound.
4. If sanding is required, proceed to step 6; if not, apply polish to repair area and evenly smear with polishing pad.
5. Keep pad flat to panel and allow weight of polisher to do the work. Use polish sparingly to achieve original shine. Machine or hand polish repair area first, then blend in with rest of panel.
6. If repair is near adjacent panels, mask adjacent panel to protect against sand scratches and burn-through of panel edges.
7. Saturate a piece of micro-fine sandpaper in a container of water and attach to a sanding pad. The addition of a small amount of liquid detergent to the water will improve wet-out and sanding performance.
8. Keep repair area wet while sanding. Sand lightly and evenly in one direction only, using straight strokes.

Figure 26 - Minor Paint Defects That Can Be Repaired without Repainting

Important

- Frequently wipe or squeegee repair to determine when defect has been removed. Sand only enough clearcoat to remove defect. Sanding below clearcoat requires repainting.
- 9. Using a clean cloth, wipe repair area clean of water and clearcoat residue.
- 10. Compound and polish as necessary. Often, hand compounding and polishing of a small repair area is all that is necessary to restore appearance.

Basecoat/Clearcoat Preparation

1. Wash with detergent and water.
2. Clean with solvent.
3. Repair and feather-edge damaged areas.
4. Treat metal surface with metal conditioner and conversion coating. Allow to dry.
5. Apply primer-surfacer. Dry 20 to 30 minutes.
6. Sand basecoat paint area with 400 grit paper. (For clearcoat only, wet sand with 600 grit or finer paper or hand compound.)
7. Clean with solvent and tack wipe.

Important

- Do not do step 8 if basecoat enamel used for repair does not require it. Always refer to manufacturer's label directions.
- 8. Apply one or two coats of adhesion promoter:
 - A. Within moldings or breaklines.
 - B. Onto adjacent panel 100 to 150 mm (4 to 6 inches) if repair is not confined and beyond area to be covered by clearcoat.
 - C. Allow to flash at least 30 minutes before applying clearcoat.

Basecoat Application - Polyurethane Enamel

CAUTION: Refer to "Caution" under "Metal Part Refinishing - Basecoat/Clearcoat."

1. Activate enamel material per manufacturer's instructions.
2. Mix thoroughly.
3. Reduce basecoat per manufacturer's instructions.
4. Check viscosity with a Zahn number 2 viscosity cup, equivalent, or a measuring stick.
5. Spray only enough basecoat color to achieve full hiding and color match. Do not spray a heavy, wet coat.
6. Cure per manufacturer's instructions.

Clearcoat Application - Polyurethane Enamel

CAUTION: Refer to "Caution" under "Metal Part Refinishing - Basecoat/Clearcoat."

1. Activate materials per manufacturer's instructions.
2. Mix thoroughly.
3. Reduce clearcoat per manufacturer's instructions.
4. Check viscosity with a Zahn number 2 viscosity cup, equivalent, or a measuring stick.
5. Spray at 50 psi gun pressure. Apply 2 medium-wet coats, 15 to 20 minutes apart.
 - Cover entire panel wherever possible.
 - When there are no breaklines, blend spray within adhesion promoter area.

Important

- Clean spray equipment immediately after use with lacquer thinner.

INDUSTRIAL FALLOUT (ACID RAIN)

Important

- The following information regards the use of finesse type repairs to environmental (industrial fallout) and rail dust damage of basecoat/clearcoat paint finishes.

Since the severity of the condition varies from area to area, proper diagnosis of the damage extent is critical to the success of repairs. Diagnosis should be performed under high intensity florescent lighting, on horizontal surfaces (hood, roof panel, rear compartment lid) after they have been properly cleaned.

There are three basic types of acid rain damage:

- Surface level contamination - may be repaired by simply washing the vehicle, cleaning the surface with a wax and grease remover, neutralizing acidic residue and finesse polishing.
- Clearcoat etching - slight etching still noticeable after the above washing and finesse polishing procedure.
- Basecoat etching - severe etching beyond the clearcoat into the basecoat.

Surface Level Contamination Repair

1. Wash vehicle with standard car detergent and water, and dry thoroughly.
2. Clean affected area with wax and grease remover.
3. Neutralize left over acidic residue by cleaning damaged areas with a mixture of baking soda and water (one tablespoon per one quart of water), rinse thoroughly and dry the panels completely.
4. Apply finesse type polish with a foam pad.

Clean

- If the damage has been repaired, remove any swirl marks with a dual action orbital polisher and foam pad.
- If some damage remains, proceed to "Slight Clearcoat Damage - Wet Sanding, Finesse Polishing" in the following procedure.

Slight Clearcoat Damage - Wet Sanding, Finesse Polishing

1. Select a small test area on a damaged panel.
2. Wet sand the damaged area with an American Grade ultra fine sandpaper of 1,500 to 2,000 grit and a rubber sponge sanding block. During the wet sand process:
 - A. Use ample amounts of clean water.
 - B. Go slow to prevent removing too much clearcoat.

Important

- Be sure to use American sandpaper. European sandpaper has a P before the grit number and European grits do not align with American grits the majority of the time.
3. Remove excess water with a rubber squeegee and inspect the area.
 - If this has repaired the damage, continue the sanding procedure on the entire panel, apply a finesse type polish with a foam pad and remove any swirl marks with a dual action orbital polisher and foam pad.
 - If (during the repair) it is suspected or observed that etching has penetrated into the basecoat, too much clearcoat has been removed during sanding or base color is transferred to pad during polishing, the affected areas may require re-clearcoating/colorcoating or refinishing. Refer to "Clearcoat Application - Polyurethane Enamel," "Metal Part Refinishing," "Flexible Plastic Part Refinishing" and/or "Rigid Plastic Part Refinishing" later in this section.
 4. Polish entire vehicle after all damage has been repaired.

Clearcoat Thickness

The clearcoat on the vehicle is typically 1.5 to 2 mm (0.06 to 0.08 inch) thick. At least 1 mm (0.04 inch) thickness is required to provide lasting protection to the vehicle basecoat.

Paint Gages

The best way to accurately measure how much clearcoat has been removed is to use a paint gage before, during and after the sanding process. Paint gages measure the total thickness of the finish and when used, can determine how much clearcoat has been removed during the repair process. Paint gages range from magnetic pull types to sophisticated electronic types and are available from a variety of sources.

The older magnetic type gages, at best, have a $\pm$ 5 percent accuracy range and are not sensitive enough to detect removal of 0.5 mm (0.02 inch) clearcoat. The newer type magnetic gages have improved accuracy ranges. Most gages are confined to checking either a ferrous metal (steel) or non-ferrous metal (aluminum) panels. At this time, there are no viable gages for reading film thickness on non-metallic panels.

The more sophisticated digital type gages are able to read film thickness on both ferrous and nonferrous metal panels. Digital gages can have an accuracy range of $\pm$ 1 percent and includes thickness standards for re-calibration.

Rail Dust Damage Repair

CAUTION: Rail dust remover (oxalic acid) is an acidic substance containing chemicals that will break down the iron particles embedded in the finish. When working with it, use the necessary safety equipment, including gloves and goggles. Follow the manufacturer's directions closely because it may require special handling and disposal.

Rail dust damage comes from the tiny iron particles produced from the friction between the train wheels and the track. It can also be deposited on vehicles if stored near any operation producing iron dust (i.e., steel ore yards). This dust can either lay on top of, or embed into the paint surface. It is usually diagnosed as bumps in the paint surface or rust color spots in the paint.

1. Wash vehicle with soap and water, dry it and clean affected area with wax and grease remover.
2. Rinse surface with cold water, keeping vehicle in cool or shaded area.
3. Soak several terry cloth towels in container of rail dust remover solution and, after damaged areas have been rinsed with cold water, lay wet towels on damaged areas.
4. Allow towels to remain in place for 20 minutes, keeping them moist by spraying with water and not allowing to dry on surface of vehicle.
5. After 20 minutes of applying towels, remove them and rinse area thoroughly with cold water. Inspect affected area to ensure dust has been removed. Use both touch (feeling for bumpy surface) and sight (magnifying glass for close inspection).
6. If, upon inspection, some particles are still present, process of applying towels can be repeated 3 times.
7. Select test area and hand wet sand with American ultra fine 1,500 grit to 2,000 grit sandpaper to repair damage (surface pitting from dust). Use ample amounts of clean water and go slow to prevent removing too much clearcoat.

NOTICE: Use a paint gage to determine the amount of clearcoat removed. If too much has been removed, additional clearcoat will have to be applied.

Important

- If rail dust has penetrated into the basecoat, the panel requires refinishing. Make sure all rail dust has been removed prior to refinishing or the rust spots will return, causing customer comebacks.

10-1-18 GENERAL BODY SERVICE

8. If damage has been repaired, complete repair to entire panel.
9. Polish entire vehicle after all damage has been repaired.

Preventing Industrial Fallout Damage

Customers should be urged to wash and dry their vehicles frequently and garage them, or at least cover them with a quality car cover when not in use.

Vehicles in dealer inventories should be kept clean and dry. A vehicle that sits unattended, especially after the sun has dried any water on the body surface, is a target for acid rain damage.

PLASTIC PART IDENTIFICATION

HOW TO IDENTIFY PLASTIC PARTS

Figures 27 through 30

CAUTION: General Motors does NOT recommend using a plastic "Burn Test" to distinguish different types of plastics. This test produces vapors that can be harmful to your health.

Plastics which may be used on this vehicle are shown in the plastics identification charts. The procedures provided in this section classify the plastics into two groups; flexible and rigid. Refer to the figures to identify the parts and the repair/refinish procedure to use.

Figure 27 - Typical Plastic Marking Symbol

The following information can be used to specifically identify plastic parts when necessary.

1. Look on back of part for International Organization for Standardization (ISO) code marking as shown in Figure 27.
2. Refer to The Charts of Plastic Parts Identification and Refinishing Systems. Match ISO code found on parts with those on charts.
3. Use chart to identify special handling procedures and repair/refinish classification (rigid or flexible) (Handling Precautions for plastics).

FLEXIBLE PLASTIC PART REPAIR AND REFINISHING

Repair Materials

Important

- Use supplies and repair materials from the same manufacturer for the best results. Do not intermix systems.

These flexible plastic panel repair procedures require the use of GM Goodwrench Compoxy Repair Material (GM P/N 12345744) or equivalent such as Loctite® CMR-8 Composite Material Repair (P/N 82091).

Fabricating a Patch Panel

Flexible plastics requiring splicing or sustaining major damage may need a reinforcement panel or patch panel. If possible, obtain this part by cutting a piece from the original damaged panel. If a piece of the original damaged panel is used for reinforcement backing, be sure the surfaces are sanded and cleaned to completely remove any paint or finish material because it will inhibit proper bonding. The piece should be 75 to 100 mm (3 to 4 inches) in width if the damage is a split or break. If a part of the damaged panel is missing, the reinforcement panel or patch should extend 75 to 100 mm (3 to 4 inches) beyond the edges of the damaged area. An adequate reinforcement may be made as follows:

1. Lay out piece of wax paper larger than damaged area on panel.
2. Apply layer of GM Goodwrench Compoxy Repair Material (GM P/N 12345744) or equivalent.
3. Cut piece of reinforcement mat material to desired size and shape, and place over repair material.
4. Apply coat of repair material as necessary.
5. Place piece of wax paper over mat material and roll with saturation roller to ensure saturation of mat.
6. Remove wax paper from panel.
7. Apply patch to inner side of damaged area, working out any air pockets.
8. Allow to cure.

When cleaning your work area after completing a repair, be sure to save any leftover pieces of repair material that may be of useful size. They can be used later for reinforcing the back of small damaged areas and puncture repairs.

CHART OF PLASTIC PARTS IDENTIFICATION AND REFINISHING SYSTEMS

Identifying Symbol Old Symbol in ()	Chemical Composition or Plastic "Family" Name	Typical Area(s) Where Part Used	Examples of Common and/or Trade Names	Typical Paint Repair System

HANDLING PRECAUTIONS FOR PLASTICS

Abbreviation	Material Name	Heat Resisting Temperature C° (F°)	Resistance to Gasoline and Solvents	Other Cautions
PE	Polyethylene	80 (176)	Gasoline and most solvents are harmless.	Flammable
PVC	Polyvinyl chloride	90 (194)	Gasoline and most solvents are harmless if applied for a very short time (wipe up quickly).	Poison gas is emitted when burned.
PP	Polypropylene	90 (194)	Gasoline and most solvents are harmless.	Flammable
ABS	Acrylonitrile butadiene styrene resin	90 (194)	Avoid gasoline and solvents.	Avoid brake fluid.
AES	Acrylonitrile ethylene styrene	90 (194)	Avoid gasoline and solvents.	Avoid brake fluid.
PMMA	Polymethyl methacrylate	90 (194)	Avoid gasoline and solvents.	Avoid brake fluid.
PUR	Polyurethane	90 (194)	Gasoline and most solvents are harmless.	Avoid brake fluid.
AAS	Acrylonitrile acrylic rubber styrene	95 (203)	Avoid gasoline and solvents.	Avoid brake fluid.
PPE	Polyphenylene, ether	110 (230)	Avoid gasoline and solvents.	
POM	Polyacetal	120 (248)	Gasoline and most solvents are harmless.	Avoid battery acid.
PC	Polycarbonate	120 (248)	Avoid gasoline and solvents.	
PA, PAG, PAGG	Polyamide (Nylon)	150 (302)	Gasoline and most solvents are harmless.	Avoid immersing in water.
FRP	Fiber reinforced plastics	170 (338)	Gasoline and most solvents are harmless.	
PPC	Polypropylene composite	115 (239)	Gasoline and most solvents are harmless.	Flammable
PBT	Polybutylene terephthalate	140 (284)	Gasoline and most solvents are harmless.	
TPR	Thermoplastic rubber	80 (176)	Avoid gasoline and solvents.	
TPE	Thermoplastic elastomer	80 (176)	Avoid gasoline and solvents.	
1. When repairing and painting a portion of the body adjacent to plastic parts, consider their characteristics (influence of heat and solvent) and remove them if necessary or take suitable measures to protect them. 2. Plastic parts should be repaired and painted using methods suiting the materials.				

Figure 30 - Plastics Handling Precautions

T5430

When using mat reinforcement to repair the inner or outer surface of a panel, be sure there are no strands of the mat left uncovered or unsaturated by the

repair material. If exposed, the mat may act as a wick, and will draw moisture into the repaired area affecting the integrity and finish.

Flexible Plastic Part Repair

Figures 31 through 38

1. Clean and inspect damaged area as required (Figure 31).
2. Support and align parts as necessary using tape for minor damage (Figure 32). Fabricate a patch panel if necessary. Refer to "Fabricating a Patch Panel" in this section.
3. Begin reinforcement repair to inner surface of panel by abrading area with an 80 grit disc on an orbital sander or by hand if access is limited.

! Important

- Use only compressed air or a clean dry cloth to remove residue.
4. If necessary, cut piece of reinforcement mat (porous or unidirectional) to desired shape. Extend mat 13 to 50 mm (1/2 to 2 inches) beyond repair area (Figure 33).
 5. Mix and apply a skim coat of GM Goodwrench Compoxy Repair Material (GM P/N 12345744) or equivalent.
 6. Lay pre-cut piece of reinforcement mat into skim coat of repair material using applicator to press mat so it becomes saturated. Make sure all trapped air is forced out.
 7. If mat is not screen type, use saturation roller to ensure mat is completely saturated and there are no exposed fibers or trapped air.
 8. Apply second coat of flexible repair material making sure mat is completely saturated and there are no exposed fibers or trapped air (Figure 34).
 9. Allow to cure per manufacturer's instructions.
 10. Remove tape or clamps used for maintaining alignment and contours.
 11. At outer surface of panel, bevel damaged area with a 50 grit Roloc disc. This step extends contact between repair material and substrate (Figure 35).
 12. Using a 180 grit disc on an orbital sander, feather out several inches beyond damaged area to remove any paint or primer from substrate. This provides proper surface for adhesion (Figure 36).
 13. Apply light coat of repair material to damaged area, taking care to apply it smoothly. Repair material should be level and slightly above surrounding contour (Figure 37).
 14. Allow to cure per manufacturer's recommendations.
 15. Rough out surface with an 80 grit disc on an orbital sander.
 16. Finish contour sanding with 220 to 320 grit (wet or dry) sandpaper on a sanding block (Figure 38).

Flexible Plastic Part Refinishing

To refinish repaired flexible parts, it is very important to follow the paint manufacturer's system regarding preparation, priming, and refinishing. Because these parts are flexible, they may require special additives in the primers and topcoat to prevent cracking and poor adhesion. Always use manufacturer's recommended materials and never intermix with other systems.

RIGID PLASTIC PART REPAIR AND REFINISHING

Repair Materials

! Important

- Use supplies and repair materials from the same manufacturer for the best results. Do not intermix systems.

These rigid plastic panel repair procedures require the use of GM Goodwrench Structural Bonding Epoxy (GM P/N 12345726) or equivalent such as Lord's Fusor Body Panel Repair Adhesive (P/N 320-322 PK).

Figure 31 - Inspect Damaged Area

Figure 32 - Aligning Damage With Tape and Clamp

Figure 33 - Cutting Fiberglass Cloth to Size

Figure 36- Panel Feathering

Figure 34 - Applying Repair Material

Figure 35 - Panel Beveling

Figure 37 - Bonding Epoxy Application

Rigid Plastic Part Repair**Figures 31, 32, and 39 through 42**

1. Clean and inspect damaged area as required (Figure 31).
2. Support and align parts as necessary, using tape for minor damage (Figure 32).
3. Begin reinforcement repair to inner surface of panel by scuffing area with an 80 grit disc on an orbital sander or by hand if access is limited. Do not heavily abrade substrate of panel.

! Important

- Use only compressed air or a clean dry cloth to remove residue.
4. If damaged area is small, cut piece of reinforcement mat to desired shape. Extend mat 38 to 50 mm (1 1/2 to 2 inches) beyond either side of repair area (Figure 39).
 5. Apply skim coat of GM Goodwrench Structural Bonding Epoxy (GM P/N 12345726) or equivalent (Figure 40).
 6. If using backing panel, lay backing panel onto coat of bonding epoxy and use clamps or props to apply slight pressure until curing is complete

Figure 38 - Block Sanding for Accurate Contour

Figure 39 - Reinforcement Mat

(Figure 41). Do not use excessive force because this may cause distortion of panel, and may also squeeze out epoxy.

7. If pre-cut reinforcement mat is used in repair, press it into skim coat of binding epoxy using applicator to press mat so it becomes saturated, and all trapped air is forced out.
8. If mat is not screen type, use saturation roller to ensure mat is saturated. Make sure all trapped air is forced out.
9. When using backing panel from original damaged panel or when using pre-made rigid backing panel to reinforce repair area, make sure there are no voids at edges of repair area that may allow entry of water or chemicals.
10. When using piece of reinforced mat material for backing, apply second coat of bonding epoxy, making sure mat is completely saturated and there are no exposed fibers or trapped air.
11. Allow to cure per manufacturer's instructions.
 - Bonding epoxy can be force dried at temperatures of 65° C (150° F) minimum to 121° C (250° F) maximum for 45 minutes.
 - Force drying speeds cure time and increases bond strength.
 - Use uniform heat source.
 - Allow panel to return to room temperature.
12. Remove tape or clamps used for maintaining alignment and contours.
13. At outer surface of panel, bevel damaged area with 50 grit disc on Roloc sander. This step extends contact between repair material and substrate (Figure 35).
14. Using 180 grit disc on an orbital sander, feather out several inches beyond damaged area to remove any paint or primer from substrate. This provides proper surface for adhesion (Figure 36).
15. Apply light coat of GM Goodwrench Structural Bonding Epoxy (GM P/N 12345726) or equivalent (Figure 40).
16. Apply bonding epoxy smoothly. Bonding epoxy should be level and slightly above surrounding area (Figure 42).
17. Lay pre-cut piece of reinforcement mat into bonding epoxy. Use applicator to saturate and remove all trapped air (Figure 41).
18. Apply second coat of bonding epoxy, making sure mat is fully enclosed, and no air is trapped. Smooth surface with applicator.
19. Place second layer of reinforcement mat over second coat of bonding epoxy, working it smooth and removing all trapped air.
20. Apply final coat of bonding epoxy, and place sheet of wax paper over it. Use saturation roller to ensure full penetration of bonding epoxy into mat.
21. Cure bonding epoxy by force drying for 45 minutes at no more than 121° C (250° F). If second coat of bonding epoxy is necessary, it does not require saturation rolling, but does require force drying at 121° C (250° F) or less for 45 minutes. Allow panel to return to room temperature.

Figure 40 - Bonding Epoxy

Figure 41 - Secure Backing Panel

Figure 42 - Cross-Section of Splice

22. Rough out surface with 80 grit disc on an orbital sander.
23. Finish contour sanding with 220 to 320 grit (wet or dry) sandpaper on sanding block.

Rigid Plastic Part Refinishing

To refinish repaired rigid parts, it is very important to follow the paint manufacturer's directions regarding preparation, priming, and refinishing. Some rigid parts like Thermo Plastic Olefin (TPO) and Ethylene/Propylene (E/P) require special polypropylene primers for adhesion. Always use manufacturer's recommended materials and never intermix with other systems.

CARPET INSERT REATTACHMENT

Carpet inserts attached to body sides, doors and quarter trim panels which have become loose may be reattached with general trim adhesive (3M P/N 08080 or equivalent).

Use the following procedure:

1. Remove trim panel when necessary and place on clean work surface. Mask off trim panel to prevent glue over spray.
2. Sand areas of trim panel where carpet is to be re glued using a coarse grit sandpaper. Polypropylene panels should have a rough surface for best adhesion. Remove all sanding debris.
3. Spray general trim adhesive (3M P/N 08080 or equivalent) on sanded surface and back side of carpet following manufacturer's instructions.
4. When both sprayed surfaces become tacky to the touch, press carpet in place, smooth out any irregularities.
5. Remove masking materials and reinstall panel.

BODY PANEL ADJUSTMENT AND ALIGNMENT

Use Figure 43 as a maximum and minimum gap reference.

LOCATION	CLEARANCE GAP* MILLIMETERS	FLUSHNESS* MILLIMETERS
A. HOOD TO HEADLAMP CAPSULE	11.0 (+1.5/-2.0) [PARALLEL WITHIN 2.0] — EXCEPT BUICK SEDAN 9.6 (+1.5/-2.0) — BUICK SEDAN	± 2.5 [PARALLEL WITHIN 1.5]
B. HOOD TO FRONT FENDER	4.0 (+1.0/-1.5) [PARALLEL WITHIN 2.0] — WAGON 4.35 (+1.0/-1.5) — SEDAN	+ 0.5/ - 1.5

SECTION 10-2

STATIONARY WINDOWS

CAUTION: This vehicle is equipped with Supplemental Inflatable Restraint (SIR). Refer to CAUTIONS in Section 9J under "ON-VEHICLE SERVICE" and the SIR Component and Wiring Location view in Section 9J before performing service on or around SIR components or wiring. Failure to follow CAUTIONS could result in possible air bag deployment, personal injury, or otherwise unneeded SIR system repairs.

CAUTION: When replacing a windshield, back window, or hatch roof window, urethane adhesive (GM P/N 12346284 or equivalent) must be used to maintain original installation integrity. Failure to use urethane adhesive GM P/N 12346284 or equivalent will result in poor retention of the windshield which may allow unrestrained occupants to be ejected from the vehicle with resulting personal injury. For vehicles with air bag systems, windshields must be replaced properly so that occupant protection provided by the air bag system is maintained.

CAUTION: Electrochromic material may irritate eyes and skin. In case of contact, take the following actions: Eye contact-rinse thoroughly with water. Skin contact - wash with soap and water. If ingested - consult a physician immediately.

NOTICE: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. General Motors will call out those fasteners that require a replacement after removal. General Motors will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

10-2-2 STATIONARY WINDOWS

GENERAL DESCRIPTION

STATIONARY WINDOWS

The windshield, rear window, and quarter window are installed from outside the body, using self-curing urethane adhesive. Replacement of the windshield or rear window requires removal of components and the cutting of the window away from the urethane adhesive.

Replacement of the rear side door vent window requires removal of the rear side door components. Replacement of the roof stationary window requires removal of the headlining panel and cutting of the roof stationary window away from the urethane adhesive.

QUARTER WINDOW

Replacement of the quarter window requires removal of interior trim components, quarter window nuts, and cutting of the quarter window away from the urethane adhesive. If a stud is damaged during shipping or installation, it can be replaced with a flat washer and self-tapping screw.

The quarter window has a reveal molding around the perimeter as part of the quarter window. The quarter window reveal molding can only be replaced by installing a new quarter window.

URETHANE ADHESIVE

The urethane adhesive (GM P/N 12346284) is used for window adhesive service operations and leak repair. This kit includes urethane adhesive and primers.

Failure to use urethane adhesive (GM P/N 12346284) or an equivalent, when indicated, will result in poor retention of the windows.

REVEAL MOLDINGS

Figures 1 through 6

Two types of reveal moldings are used on the windshield and rear window.

The windshield has right and left windshield side reveal moldings, which are fastened by reveal molding bolts/screws to the windshield pillars. The windshield upper reveal molding is flexible plastic and is hand pressed along the upper edge of the window before windshield installation. The windshield upper reveal molding can be replaced without removing the windshield.

The rear window has a rear window reveal molding that wraps around the window. It is flexible plastic and is hand pressed along the sides and upper and lower edges of the window before rear window installation. The rear window reveal molding cannot be replaced without removing the rear window.

The roof stationary window has a reveal molding around the perimeter. The roof stationary window reveal molding can only be replaced by installing a new roof stationary window.

ON-VEHICLE SERVICE

REVEAL MOLDINGS

Windshield Side Reveal Molding

Figure 5

Remove or Disconnect

1. Open front side door for access.
2. Weatherstrip (7) from pinch-weld flange.
 - Grasp with hand near upper end of reveal molding (9) and pull outward and toward lower end.
3. Bolts/screws (10, 49, 51, 52 if police or taxi vehicle, and 48) and molding (9) from windshield pillar.

Clean

- Windshield (2) and molding (9) with soap and water before reinstallation or replacement.

Install or Connect

NOTICE: Refer to "Notice" on page 10-2-1 of this section.

1. Molding (9), and bolts/screws (48, 52 if police or taxi vehicle, 51, 49 and 10).
 - A. Align bolt/screw holes in molding (9) to bolt/screw holes in windshield pillar.
 - B. Install bolts/screws in the following order: 48, 52, 51, 49 and 10.

Tighten

- Bolts/screws (48, 52, 51, 49 and 10) in sequence to 1.3 N·m (12 lb. in.).
2. Weatherstrip (7).
 - Press onto pinch-weld flange. Work from still-fastened portion to loose end.
 - Ensure that weatherstrip (7) is behind reveal molding lip and weatherstrip bead.
 3. Close front side door.

Windshield Upper Reveal Molding

Figure 4

The windshield upper reveal molding can be replaced without removing the windshield. The original molding cannot be reused and must be replaced with a new service part.

If the windshield is also being removed, then follow the windshield service procedure under "Windshield and Rear Windows" in this section.

10-2-6 STATIONARY WINDOWS

Figure 4 - Windshield Upper Reveal Molding

Remove or Disconnect

1. Windshield side reveal moldings. Refer to "Windshield Side Reveal Molding" in this section.
2. Windshield upper reveal molding (1).
 - Grasp molding end and rotate forward while removing from cavity.
3. Cut bottom edge of new windshield upper reveal molding (1) (Figure 4).

Inspect

- Dry fit of new molding into cavity. New molding must sit flush on both windshield and roof panel. If any gaps are present, trim urethane adhesive as necessary until molding is flush.

Install or Connect

1. Apply clear primer GM P/N 9981570 to underside of windshield upper reveal molding (1).
2. Apply urethane adhesive GM P/N 12346284 into cavity up to bottom side of windshield (2).
3. Windshield upper reveal molding (1).

- Tape windshield upper reveal molding (1) to body using masking tape.
- Allow urethane adhesive to cure before removing tape.

Figure 5 - Windshield Side Reveal Molding

Figure 6 - Windshield and Sedan Rear Window Reveal Molding

4. Windshield side reveal moldings. Refer to "Windshield Side Reveal Molding" in this section.

Rear Window Reveal Molding

Figure 6

The rear window reveal molding cannot be replaced without removing the rear window. The original reveal molding cannot be reused and must be replaced with a new service part.

↔ Remove or Disconnect

1. Rear window. Refer to "Windshield and Rear Window" in this section.
2. Rear window reveal molding (4 or 6) from rear window (3 or 5).
 - Heat lamps may be used to make rear window reveal molding (4 or 6) more pliable.
 - Remove any pieces of rear window reveal molding (4 or 6) remaining on window after removal of rear window (3 or 5).

Clean

- Rear window (3 or 5) of all traces of urethane adhesive, using an alcohol-dampened cloth.

→ Install or Connect

1. Rear window reveal molding (4 or 6) onto rear window (3 or 5).

- A. Position lower left and right corners of rear window reveal molding (4 or 6) to lower left and right corners of rear window (3 or 5).
- B. Press rear window reveal molding (4 or 6) onto edge of rear window (3 or 5).
- C. Work from lower corners to center line on upper edge of rear window (3 or 5).
- D. Heat lamps may be used to make rear window reveal molding (4 or 6) more pliable.

2. Rear window. Refer to "Windshield and Rear Windows" in this section.

Quarter Window and Roof Stationary Window Reveal Moldings

Figure 3

The quarter window and roof stationary window reveal moldings are an integral part of their respective assemblies. Replacement of these reveal moldings will require replacing the whole window. Refer to "Quarter Window" or "Roof Stationary Window" in this section.

BODY LOCK PILLAR APPLIQUE

BUICK WAGON

Figure 7

↔ Remove or Disconnect

1. Open rear side door.

10-2-8 STATIONARY WINDOWS

Figure 7 - Quarter Window - (Wagon)

2. Body lock pillar applique bolts/screws (47, 43, 42 and 41) in sequence.
3. Applique (44).

- Pry applique (44) from quarter window, being careful not to damage surrounding surfaces.

Clean

- Area with general purpose cleaner.

Install or Connect

NOTICE: Refer to "Notice" on page 10-2-1 of this section.

1. Tabs, if missing or damaged.
2. Applique (44).
 - A. Align tabs with grooves in quarter window.
 - B. Press to engage tabs into grooves.
3. Roll front and rear edges of applique (44) to secure adhesive tape. Bottom of applique (44) should be within 1 mm (1/32 inch) of horizontal door surface.
4. Body lock pillar applique bolts/screws (41, 42, 43 and 47) in sequence.

Tighten

- Bolts/screws (41, 42, 43 and 47) in sequence to 1.3 N·m (12 lb. in.).
5. Close rear side door.

STATIONARY WINDOWS

Windshield and Rear Windows

All windshields and sedan rear windows are installed from outside the body using self-curing urethane adhesive. To replace a windshield or sedan rear window installed with urethane adhesive requires either partial or complete replacement of the windshield or rear window urethane adhesive. Partial replacement of the windshield or rear window urethane adhesive is known as the short method. Complete replacement of the windshield urethane adhesive is known as the extended method.

Reusing Window

Occasionally, there are reasons for window removal other than replacement. In these cases, it is possible to reuse the window if it was removed carefully. Refer to the following when preparing window for reinstallation.

- Trim and level remaining urethane adhesive leaving 1 to 2 mm of urethane adhesive on window.
- If remaining urethane adhesive is loose, damaged or has voids, remove all urethane adhesive from window and scrape all traces of black primer from window. Apply new primers and urethane adhesive as though it were a new window.

Short Method

Figures 8 through 12

Tools Required:

J 24402-A Glass Sealant Remover (Cold Knife)

- or -

J 24709-01 or J 24899-01 Urethane Glass Sealant Remover (Hot Knife)

CAUTION: Approved safety glasses and gloves should be worn when performing this procedure to reduce the chance of personal injury.

Remove or Disconnect

1. Place protective coverings around area where window is being removed.
 2. Inside rearview mirror, if replacing windshield. Refer to "Inside Rearview Mirror" in this section.
 3. Wiper arm and wiper blades, if replacing windshield. Refer to SECTION 8E.
 4. Air inlet grille panels, if replacing windshield. Refer to SECTION 10-5.
 5. Windshield side reveal moldings, if replacing windshield. Refer to "Windshield Side Reveal Molding" in this section.
 6. Bolts/screws (54) and supports (13), if replacing windshield (2).
 7. Quarter window garnish moldings (Chevrolet) or quarter upper trim (Buick). Refer to SECTION 10-7.
 8. Electrical connector from terminal on defogger grid bus bar, if replacing rear window (3 or 5) (Figure 9).
 9. Reposition rear compartment front trim to access ground wire.
 10. Bolt/screw (15) and ground wire from upper right corner of rear compartment (Figure 10).
 11. Mask area around window opening to protect painted surfaces and to aid in cleanup after installation.
 - Tape must not touch window sealant surface.
 12. Using commercial razor knife, make preliminary cut into urethane adhesives and reveal molding around entire perimeter of window, staying as close to edge of window as possible.
 13. Pull away portion of reveal molding between window and body, if necessary.
 14. Cut out windshield (2) or rear window (3 or 5), using J 24402-A, J 24709-01 or J 24899-01.
 - Keep blade as close to edge of window as possible. After removal of window, trim remaining urethane adhesive bead (on body opening).
 - Windshield: Cut, or trim, the bead flat - leaving 3 to 5 mm thickness.
 - Rear Window: Cut, or trim the bead flat - leaving a 1 mm thickness.
- This is required for rear window replacement due to molding encapsulation of window.

Figure 8 - Windshield Supports and Sedan Rear Window Supports

10-2-10 STATIONARY WINDOWS

Figure 9 - Rear Window Defogger Electrical Connectors

Figure 10 - Rear Window Defogger Ground Wire

Figure 11 - Applying Urethane Adhesive Material

Figure 12 - Installing Windshield

Molding cross-section incorporates a “spacer ridge” along lower edge that could require previous urethane adhesive to be cut close to lower bond flange in order to “flush out” window to opening flanges.

During “dry fitting” of new window to body, it may be necessary to trim that “spacer ridge” to accommodate flush fit in opening.

15. Windshield (2) or rear window (3 or 5).

Clean

- Window opening of any loose material. Use an alcohol-dampened cloth to clean remaining urethane adhesive on window and bond surface, wiping entire bond area.

Install or Connect

CAUTION: Approved safety glasses and gloves should be worn when performing this procedure to reduce the chance of personal injury.

NOTICE: Refer to “Notice” on page 10-2-1 of this section.

1. Using touch up paint of appropriate color, or body primer if repair will not be visible, repair any areas on window frame nicked during window removal to prevent corrosion. Do not get paint or any other contamination on remaining urethane adhesive base, or in urethane adhesive bond area.
2. If window is to be reused, refer to “Reusing Window” in this section, before proceeding with installation.

Inspect

- Window frame for any metal damage or irregularity of the metal surface. If these or similar conditions exist, it will be necessary to follow extended method for window replacement.
3. Supports (13) and bolts/screws (54) if replacing windshield (2).

Tighten

- Bolts/screws (54) to 1.5 N.m (13 lb. in.).
4. Windshield upper reveal molding, if installing windshield. Refer to “Windshield Upper Reveal Molding” in this section.
 5. Rear window reveal molding, if installing rear window. Refer to “Rear Window Reveal Molding” in this section.
 6. Windshield (2) or rear window (3 or 5) in opening for fit.
 - A. With aid of helper, properly position window in opening and apply a piece of masking tape over each edge of windshield (2) or rear window (3 or 5) and adjacent body pillars.
 - B. Slit tape vertically at edge of window.
 - C. During installation, tape on windshield (2) or rear window (3 or 5) can be aligned with tape on body to guide windshield (2) or rear window (3 or 5) into desired position.
 7. Remove windshield (2) or rear window (3 or 5). Adjust height of remaining urethane adhesive base as necessary.

Clean

- A. Surface of window to which urethane adhesive will be applied (around edge of inside surface) by wiping with clean, alcohol-dampened cloth.
 - B. Allow to air dry.
8. Clear and black primers from urethane adhesive, GM P/N 12346284 or equivalent.
 - Windshield (2) - Clear primer is used on windshield prior to black primer. Apply clear primer around entire perimeter of windshield edge and 6 mm (1/4 inch) inboard on inner surface. Apply black primer over clear primer within 30 minutes of clear primer application and allow to dry for five minutes.
 - Rear Window (3 or 5) - Clear primer is used on rear window (3 or 5) prior to black primer. Apply clear primer around entire perimeter of rear window encapsulation. Apply black primer over clear primer within 30 minutes of clear primer application and allow to dry for five minutes.

Important

- Maximum body temperature must not exceed 49°C (120°F) at time of primer application.

10-2-12 STATIONARY WINDOWS

9. Urethane Adhesive from kit.

- With household cartridge-type caulking gun and nozzle, apply smooth continuous bead of adhesive, approximately 4.5 mm (1/8" to 3/16") diameter, around edge of window where primed in previous step. A caulk tip cut for short method should be used (Figure 11).

10. Windshield (2) or rear window (3 or 5) into window opening with aid of a helper.

- Vacuum cups will be needed to position rear window (3 or 5) in opening.
- For the windshield (2), carry with one hand on inside of window and one hand on outside (Figure 12). Guide windshield (2) along rear edge of front fender to avoid smearing fresh windshield adhesive on instrument panel upper trim pad. At window opening, put windshield (2) in horizontal position. While one person holds windshield (2) in this position, second person can reach one arm around body pillar and support it while other person assumes same position.

- For rear window (3 or 5), position upper corners of rear window (3 or 5) to upper corners of rear window opening. Lay rear window (3 or 5) into body opening, pushing up on bottom of rear window (3 or 5) so upper edge of rear window (3 or 5) is firmly positioned to upper body opening.

11. Windshield (2) onto windshield supports or rear window (3 or 5) onto rear window supports.

- Center in opening.
- Use tape guides previously applied to place windshield (2) or rear window (3 or 5) in proper position.

12. Press window firmly to wet-out and set urethane adhesive.

- Use care to avoid squeezing out excessive amounts of adhesive that would cause an appearance problem.

13. Using small disposable brush or flat, soft fiberglass tool, paddle material around edge of window to ensure watertight seal.

- If necessary, paddle additional material to fill voids in seal.

14. Water test vehicle at once, using soft spray.

- Use cold water.
- Do not direct hard stream of water at fresh adhesive material.
- Water applied on top of urethane adhesive, either during water test or as separate operation, will speed up cure of urethane adhesive.

Inspect

- For leaks. Paddle in extra adhesive at leak point, using small disposable brush or flat, soft fiberglass tool.

15. Ground wire and bolt/screw (15) to hole in upper right corner of rear compartment (Figure 10).

Tighten

- Bolt/Screw (15) to 6 N.m (53 lb. in.).

16. Electrical connector, if disconnected.

- Connect electrical connectors to terminals on defogger grid bus bars (Figure 9).

17. Quarter window molding garnish (Chevrolet) or quarter upper trim (Buick), tucking rear window defogger electrical connectors under panels. Refer to SECTION 10-7.

18. Windshield side reveal moldings, if replacing windshield. Refer to "Windshield Side Reveal Molding" in this section.

19. Air inlet grille panels, if removed. Refer to SECTION 10-5.

20. Wiper arm and wiper blades, if removed. Refer to SECTION 8E.

21. Inside rearview mirror, if removed. Refer to "Inside Rearview Mirror" in this section.

Important

- On windshield (2) and rear window (3 or 5) installations, vehicle must remain at normal room temperature for six hours to complete proper cure of windshield or rear window urethane adhesive.

Extended Method

Figures 8 through 13

The window removal method is the same for both the short and extended installation methods with one exception. Use more care with the short method during cutout to make certain that an even bead of windshield or rear window urethane adhesive remains on the window opening to serve as a base for the new urethane adhesives. Refer to "Short Method" in this section.

The extended method is used only for extreme cases such as:

- When the old urethane adhesive can no longer serve as a good base.
- When there is damage to the window frame.
- When there is a need for the window frame to be repainted in a body shop.

Windshield spacers are used to maintain the correct windshield-to-pinch-weld flange dimensions. For the same reason, spacers are used on the rear window on sedans with vinyl tops only. The spacers are specific to certain vehicle styles and can be found in the service parts manual. Spacers should be reused or replaced before installing the windshield or rear window.

Clean

- Window opening.

— Using a sharp scraper or chisel, remove old adhesive material from window opening pinch-weld flange.

Figure 13 - Windshield and Sedan Rear Window Spacer Locations

— On urethane adhesive installations, all traces of material need not be removed, but there should not be any mounds or loose pieces left.

Install or Connect

CAUTION: Approved safety glasses and gloves should be worn when performing this procedure to reduce the chance of personal injury.

NOTICE: Refer to “Notice” on page 10-2-1 of this section.

1. Supports (13) and bolts/screws (54) in their original position or supports (55) over studs, sliding down to secure.

Tighten

- Bolts/screws (54) to 1.5 N·m (13 lb. in.).
2. Windshield upper reveal molding, if removed. Refer to “Windshield Upper Reveal Molding” in this section.
 3. Rear window reveal molding, if removed. Refer to “Rear Window Reveal Molding” in this section.
 4. Windshield (2) or rear window (3 or 5) in opening for fit.
 - Check relationship of new windshield (2) or rear window (3 or 5) to urethane adhesive of pinch-weld flange. Excessive gaps must be

corrected by locating windshield spacers (14 or 19) or by applying more urethane adhesive than specified.

5. Piece of masking tape over each edge of windshield (2) or rear window (3 or 5) and adjacent body pillars.
 - Slit tape vertically at edge of window.
 - During installation, tape on windshield (2) or rear window (3 or 5) can be aligned with tape on body to guide windshield (2) or rear window (3 or 5) into desired position.
6. Remove windshield (2) or rear window (3 or 5).

Clean

- A. Surface of window and body opening to which windshield or rear window urethane adhesive will be applied (around edge of inside surface) by wiping with clean, alcohol-dampened cloth.
 - B. Allow to air dry.
7. Clear and black primers from urethane adhesive, GM P/N 12346284 or equivalent.
 - Windshield (2) - Clear primer is used on windshield prior to black primer. Apply clear primer around entire perimeter of windshield edge and 13 mm (1/2 inch) inboard on inner surface. Apply black primer over clear primer within 30 minutes of clear primer application and allow to dry for five minutes.
 - Rear Window (3 or 5) - Clear primer is used on rear window (3 or 5) prior to black primer. Apply clear primer around entire perimeter of

10-2-14 STATIONARY WINDOWS

rear window encapsulation. Apply black primer over clear primer within 30 minutes of clear primer application and allow to dry for five minutes.

Important

- Maximum body temperature must not exceed 49° C (120° F) at time of primer application.
- 8. Black primer to window opening flange. Do not apply over existing urethane adhesive.
- 9. Urethane Adhesive.
 - With household cartridge-type caulking gun and nozzle, apply smooth continuous bead of adhesive, 4.5 mm wide x 10.0 mm high (3/16" x 3/8") around edge of window where primed in previous step. A caulk tip cut for extended method should be used (Figure 11).
- 10. Windshield (2) or rear window (3 or 5) into window opening with aid of helper.
 - Vacuum cups will be needed to position rear window (3 or 5) in opening.
 - For windshield (2), carry with one hand on inside of window and one hand on outside (Figure 12). Guide windshield (2) along rear edge of front fender to avoid smearing fresh windshield adhesive on instrument panel upper trim pad. At window opening, put windshield (2) in horizontal position. While one person holds windshield (2) in this position, second person can reach one arm around body pillar and support it while other person assumes same position.
 - For rear window (3 or 5), position upper corners of rear window (3 or 5) to upper corners of rear window opening. Lay rear window (3 or 5) into body opening pushing up on bottom of rear window (3 or 5) so upper edge of rear window (3 or 5) is firmly positioned to upper body opening.
- 11. Windshield (2) on windshield supports (13) or rear window (3 or 5) on lower supports (55).
 - Center in opening.
 - Use tape guides previously applied to place windshield (2) or rear window (3 or 5) in proper position.
- 12. Press window firmly to wet-out and set adhesive.
 - Use care to avoid squeezing out excessive amounts of adhesive that would cause an appearance problem.
- 13. Using small disposable brush or flat, soft fiberglass tool, paddle material around edge of window to ensure watertight seal.
 - If necessary, paddle additional material to fill voids in seal.
- 14. Water test vehicle at once, using soft spray.
 - Use cold water.
 - Do not direct hard stream of water at fresh adhesive material.
 - Water applied on top of adhesive, either during water test or as separate operation, will speed up cure of urethane adhesive.

Inspect

- For leaks. Paddle in extra adhesive at leak point, using a small disposable brush or flat, soft fiberglass tool.
15. Ground wire and bolt/screw (15) to hole in upper right corner of rear compartment (Figure 10).

Tighten

- Bolt/screw (15) to 6 N.m (53 lb. in.).
16. Electrical connectors, if disconnected.
 - Connect electrical connectors to terminals on defogger grid bus bars (Figure 9).
17. Quarter window garnish moldings (Chevrolet) or quarter upper trim (Buick), tucking electrical connectors under molding or panel. Refer to SECTION 10-7.
18. Windshield side reveal moldings, if removed. Refer to "Windshield Side Reveal Molding" in this section.
19. Air inlet grille panels, if removed. Refer to SECTION 10-5.
20. Wiper arm and wiper blades, if removed. Refer to SECTION 8E.
21. Inside rearview mirror, if removed. Refer to "Inside Rearview Mirror" in this section.

Important

- On windshield (2) and rear window (3 or 5) installations, vehicle must remain at normal room temperature for six hours to complete proper cure of adhesive.

Quarter Window

CHEVROLET SEDAN

Figures 14 and 15

Tool Required:

J 24402-A Glass Sealant Remover (Cold Knife)

- or -

J 24709-01 or J 24899-01 Urethane Glass Sealant Remover (Hot Knife)

The quarter window is made of solid tempered safety plate glass with reveal molding and fastening studs attached. Quarter windows are installed from the outside of the vehicle. Once the quarter window has been removed from the vehicle, it cannot be reinstalled into the vehicle. A new quarter window must be used.

CAUTION: Approved safety glasses and gloves should be worn when performing this procedure to reduce the chances of personal injury.

Figure 14 - Quarter Window - (Chevrolet Sedan)

Remove or Disconnect

1. Radio rear speaker grilles. Refer to SECTION 10-8.
2. Quarter window garnish moldings. Refer to SECTION 10-7.
3. Rear seat and seatback cushions. Refer to SECTION 10-10.
4. Rear side door lock pillar garnish moldings. Refer to SECTION 10-7.
5. Rear window panel trim by pulling forward.
6. Nuts (18).
7. Quarter window (17).
 - Cut out quarter window (17) from inside using J 24402-A or J 24709-01 or J 24899-01. Quarter window (17) will not be used again.

Clean

- Window opening of any loose material.

Install or Connect

NOTICE: Refer to “Notice” on page 10-2-1 of this section.

1. Quarter window (17) into opening.
 - Be sure to install new quarter window (17). Do not reuse old quarter window (17).
2. Masking tape over each edge of reveal molding and adjacent body panels.

Figure 15 - Applying Primer and Adhesive to Quarter Window - (Chevrolet Sedan)

10-2-16 STATIONARY WINDOWS

3. Slit tape at edge of reveal molding.
4. Align tape on reveal molding to tape on body.
5. Remove quarter window (17).
6. Primer from urethane adhesive, GM P/N 12346284, or equivalent, in and around perimeter of reveal molding seal track. Allow primer to dry five minutes.
 - Two primers are used in urethane adhesive.
 - Clear primer is used in reveal molding seal track prior to application of urethane adhesive. This primer acts as agent that will bond urethane adhesive to quarter window (17).
 - Black primer is used on window opening pinch-weld flange if paint has been exposed during window removal or cleaning, or if painting or refinishing is required. The primer acts as agent that will bond urethane adhesive to body surface.

Important

- Maximum body temperature must not exceed 95° C (120° F) at time of primer application.
7. Urethane adhesive from kit to primed reveal molding seal track with cartridge caulking gun and nozzle.
 - Use smooth, continuous line of adhesive 6 mm (1/4-inch) wide and 13 mm (1/2-inch) high.
 8. Quarter window (17) into opening.
 - If, during installation or shipping, a stud is damaged or broken off, replace it with a flat washer and self-tapping screw.

Tighten

- Self-tapping screw to 2 N.m (18 lb. in.).
9. Use tape guides to align quarter window (17) to pinch-weld flange.
 10. Press window firmly to pinch-weld surface to wet and set adhesive.
 - Be careful to avoid squeezing out excessive amounts of adhesive that could cause an appearance problem.
 11. Using a small, disposable brush or flat, soft fiberglass tool, paddle adhesive into gap between pinch-weld flange and reveal molding for a watertight seal.
 12. Paddle in additional adhesive to fill any voids in seal.
 13. Water test vehicle with soft spray.
 - Use cold water.
 - Do not direct hard stream of water at fresh adhesive.
 - Water applied on top of urethane adhesive will speed up cure of adhesive.

Inspect

- Window installation for leaks. Paddle in extra adhesive at leak point, using a small disposable brush or flat, soft fiberglass tool.

14. Quarter window garnish molding to bottom four studs on quarter window. Refer to SECTION 10-7.
15. Nuts (18).

Tighten

- Nuts (18) to 1.9 N.m (17 lb. in.).
16. Rear window panel trim by pulling forward.
 17. Rear side door lock pillar garnish moldings. Refer to SECTION 10-7.
 18. Rear seat and seatback cushions. Refer to SECTION 10-10.
 19. Quarter window garnish moldings. Refer to SECTION 10-7.
 20. Radio rear speaker grilles. Refer to SECTION 10-8.

WAGON

Figures 7 and 16

Tool Required:

J 24402-A Glass Sealant Remover (Cold Knife)

- or -

J 24709-01 or J 24899-01 Urethane Adhesive Glass Sealant Remover (Hot Knife)

This procedure is for replacing the whole quarter window, including stationary quarter window, moveable quarter window and reveal molding. If only the moveable quarter window needs replacing, refer to SECTION 10-7.

The quarter window is made of solid tempered safety plate glass with reveal molding and fastening studs attached. It is installed from outside of the vehicle.

CAUTION: Approved safety glasses and gloves should be worn when performing this procedure to reduce the chance of personal injury.

Remove or Disconnect

1. Body lock pillar applique, if Buick. Refer to "Body Lock Pillar Applique" in this section.
2. Open quarter window.
3. Quarter window latch pin connecting quarter window latch bearing to quarter window latch.
4. Quarter inner rear trim finish panel, back body pillar finish panel, body lock pillar trim finish panel and quarter window garnish molding. Refer to SECTION 10-7.
5. Headlining panel. Refer to SECTION 10-9.
6. Quarter window nuts (57) from studs.
7. Quarter window bolt/screw (33) from quarter window (29).
8. Quarter window (29).
 - Cut out quarter window (29) from inside using J 24402-A or J 24709-01 or J 24899-01.

Figure 16 - Applying Primer and Adhesive to Quarter Window - (Chevrolet Wagon)

**Clean**

- Window opening of any loose material. Remove all adhesive with an alcohol-dampened cloth.

**Install or Connect**

NOTICE: Refer to "Notice" on page 10-2-1 of this section.

1. Quarter window (29) into opening.
2. Body lock pillar applique, if removed. Refer to "Body Lock Pillar Applique" in this section.

**Adjust**

- Quarter window (29) in opening.
3. Masking tape over each edge of reveal molding and adjacent body panels.
 4. Slit tape at edge of reveal molding.
 5. Align tape on reveal molding to tape on body.
 6. Remove body lock pillar applique, if necessary. Refer to "Body Lock Pillar Applique" in this section.
 7. Remove quarter window (29).
 8. Primer from urethane adhesive, GM P/N 12346284, or equivalent, in and around perimeter of reveal molding seal track. Allow primer to dry five minutes.
 - Two primers are used in urethane adhesive.

- Clear primer is used in reveal molding seal track prior to application of urethane adhesive. This primer acts as agent that will bond urethane adhesive to quarter window (29).
- Black primer is used on window opening pinch-weld flange if paint has been exposed during window removal or cleaning, or if painting or refinishing is required. The primer acts as agent that will bond urethane adhesive to body surface.

**Important**

- Maximum body temperature must not exceed 49° C (120° F) at time of primer application.
9. Urethane adhesive from kit to primed reveal molding seal track with cartridge caulking gun and nozzle.
 - Use a smooth, continuous line of adhesive 6 mm (1/4-inch) wide and 12 mm (1/2-inch) high.
 10. Quarter window (29) into opening.
 - If, during installation or shipping, a stud is damaged or broken off, replace it with a flat washer and self-tapping screw.

**Tighten**

- Self-tapping screw to 2 N.m (18 lb. in.).
11. Use tape guides to align quarter window (29) to pinch-weld flange.

10-2-18 STATIONARY WINDOWS

12. Press window firmly to pinch-weld surface to wet and set adhesive.
 - Be careful to avoid squeezing out excessive amounts of adhesive that could cause an appearance problem.
13. Using small, disposable brush or flat, soft fiberglass tool, paddle adhesive into gap between pinch-weld flange and reveal molding for a watertight seal.
14. Paddle in additional adhesive to fill any voids in seal.
15. Water test vehicle with soft spray.
 - Use cold water.
 - Do not direct hard stream of water at fresh adhesive.
 - Water applied on top of urethane adhesive will speed up cure of adhesive.

Inspect

- Window installation for leaks. Paddle in extra adhesive at leak point, using small disposable brush or flat, soft fiberglass tool.
16. Quarter window garnish molding to bottom four studs on quarter window. Refer to SECTION 10-7.
 17. Quarter window nuts (57).

Tighten

- Nuts (57) to 2.4 N·m (21 lb. in.).
18. Quarter window bolt/screw (33), if removed, through quarter window (29) into body.

Tighten

- Quarter window bolt/screw (33) to 1.5 N·m (13 lb. in.).
19. Apply sealant (GM P/N 9981111 or equivalent) to head of quarter window bolt/screw (33). Spread to completely cover bolt/screw head and area.
 20. Headlining panel. Refer to SECTION 10-9.
 21. Body lock pillar trim finish panel, back body pillar finish panel and quarter inner rear trim finish panel. Refer to SECTION 10-7.
 22. Quarter window latch pin connecting quarter window latch bearing to quarter window latch.
 23. Close quarter window.
 24. Body lock pillar applique, if removed. Refer to "Body Lock Pillar Applique" in this section.

Rear Side Door Vent Window

BUICK SEDAN

Figure 17

The rear side door vent window is made of solid tempered safety plate glass with a seal around the perimeter. Rear side door vent windows are installed from the inside of the vehicle.

CAUTION: Approved safety glasses and gloves should be worn when performing this procedure to reduce the chance of personal injury.

Remove or Disconnect

1. Rear side door right/left trim. Refer to SECTION 10-6.
 - Move rear side door water deflector to gain access.
2. Rear side door window. Refer to SECTION 10-6.
3. Upper support, belt support, and lower support bolts/screws (30, 31 and 34) and spacer (56).
4. Division channel (35) from front channel (38).
5. Division channel (35) from rear side door (36).
6. Vent window (16).
7. Seal from vent window (16), if necessary.

Install or Connect

NOTICE: Refer to "Notice" on page 10-2-1 of this section.

1. Seal to vent window (16), if removed.
 - Use rubber mallet to seat seal around window.
2. Vent window (16).
 - Apply soapy water solution around seal to aid in installation.
3. Division channel (35) to rear side door (36).
4. Division channel (35) to front channel (38).
5. Spacer (56) and upper support, lower support, and belt support bolts/screws (30, 34, and 31), in sequence.

Tighten

- A. Upper support bolt/screw (30) to 1.9 N·m (17 lb. in.).
- B. Lower support bolt/screw (34) to 10 N·m (89 lb. in.).
- C. Belt support bolt/screw (31) to 10 N·m (89 lb. in.).
6. Rear side door window. Refer to SECTION 10-6.
7. Reposition rear side door water deflector.
8. Rear side door right/left trim. Refer to SECTION 10-6.

- 16 WINDOW, REAR SIDE DOOR VENT
- 30 BOLT/SCREW, REAR SIDE DOOR VENT WINDOW DIVISION CHANNEL UPPER SUPPORT, 1.9 N·m (17 LB. IN.)
- 31 BOLT/SCREW, REAR SIDE DOOR VENT WINDOW DIVISION CHANNEL BELT SUPPORT, 10 N·m (89 LB. IN.)
- 34 BOLT/SCREW, REAR SIDE DOOR VENT WINDOW DIVISION CHANNEL LOWER SUPPORT, 10 N·m (89 LB. IN.)
- 35 CHANNEL, REAR SIDE DOOR VENT WINDOW DIVISION
- 36 DOOR, REAR SIDE
- 38 CHANNEL, REAR SIDE DOOR WINDOW FRONT
- 56 SPACER, REAR SIDE DOOR VENT WINDOW DIVISION CHANNEL

4-20-94

Figure 17 - Removing Rear Side Door Stationary Window and Window Division Channel - (Buick Sedan)

10-2-20 STATIONARY WINDOWS

Roof Stationary Window

BUICK WAGON

Figures 18 and 19

Tool Required:

J 24402-A Glass Sealant Remover (Cold Knife)

- or -

J 24709-01 or J 24899-01 Urethane Adhesive Glass Sealant Remover (Hot Knife)

CAUTION: Approved safety glasses and gloves should be worn when performing this procedure to reduce chance of personal injury.

Remove or Disconnect

1. Headlining panel. Refer to SECTION 10-9.
2. Roof stationary window nuts (46) from studs on roof stationary window (45).
3. Roof stationary window (45).
4. Cut out roof stationary window (45) from inside using J 24402-A, J 24709-01 or J 24899-01.

Clean

- Window opening of any loose material. Remove all adhesive with an alcohol-dampened cloth.

Install or Connect

NOTICE: Refer to "Notice" on page 10-2-1 of this section.

1. Roof stationary window (45) into opening.
2. Masking tape over each edge of reveal molding and roof.
3. Slit tape at edge of reveal molding.
 - During installation, align tape on reveal molding to tape on roof.
4. Remove roof stationary window (45).
5. Primer from urethane adhesive, GM P/N 12346284, or equivalent, in and around perimeter of reveal molding seal track. Allow primer to dry five minutes.

- Two primers are used in urethane adhesive.

— Clear primer is used in reveal molding seal track prior to application of urethane adhesive. This primer acts as an agent that will bond the urethane adhesive to roof stationary window (45).

— Black primer is used on window opening pinch-weld flange if paint has been exposed during window removal or cleaning, or if painting or refinishing is required. Primer acts as agent that will bond urethane adhesive to body surface.

4-20-94
BS018102

Figure 18-Roof Stationary Window-(Buick Wagon)

Figure 19-Applying Primer and Adhesive to Roof Stationary Window-(Buick Wagon)

! Important

- Maximum body temperature must not exceed 49° C (120° F) at time of primer application.
- 6. Urethane adhesive from kit to primed reveal molding seal track with cartridge caulking gun and nozzle.
 - Use smooth, continuous line of adhesive 13 mm (1/2-inch) wide and 12 mm (1/2-inch) high.
- 7. Roof stationary window (45) into opening.
 - Use tape guides to align roof stationary window (45) to pinch-weld flange.
- 8. Press roof stationary window (45) firmly to pinch-weld surface to wet and set adhesive.
 - Be careful to avoid squeezing out excessive amounts of adhesive that could cause an appearance problem.
- 9. Using a small, disposable brush or flat, soft fiberglass tool, paddle adhesive into gap between pinch-weld flange and reveal molding for a watertight seal.
- 10. Paddle in additional adhesive to fill any voids in seal.
- 11. Water test vehicle with a soft spray.
 - Use cold water.
 - Do not direct a hard stream of water at fresh adhesive.
 - Water applied on top of urethane adhesive will speed up cure of adhesive.

🔍 Inspect

- Window installation for leaks. Paddle in extra adhesive at leak point, using a small disposable brush or flat, soft fiberglass tool.
- 12. Roof stationary window nuts (46) to studs on roof stationary window (45).

🔧 Tighten

- Roof stationary window nuts (46) to 2.4 N.m (21 lb. in.).
- 13. Headlining panel. Refer to SECTION 10-9.

WATERLEAK CORRECTION

Figure 20

Where accessible, waterleaks can be corrected without removing and reinstalling the window. This method applies only to urethane adhesive installed windows and use of urethane adhesive furnished in urethane adhesive GM P/N 12346284 or equivalent.

1. Remove reveal moldings in area of leak.
 - In some cases, it may become necessary to remove interior moldings or finishing lace to locate the source of leak.
2. Mark location of leak(s).
 - A. Carefully push outward on window in area of leak to determine extent of leak.
 - B. This operation should be performed while water is being applied to leak area.
 - C. Mark extent of leak area.

Figure 20 - Window Adhesive Waterleak Correction - (Typical)

3. Using sharp knife, trim off uneven edge of adhesive at leak point and 76 mm to 102 mm (3 inches to 4 inches) on both sides of leak point or beyond limits of leak area.
4. Clean dirt or foreign material from leak area with water (outside body). Dry area with air hose.
5. Apply urethane adhesive from kit at leak point and 76 mm to 102 mm (3 inches to 4 inches) on both sides of leak point or beyond limits of leak area.
6. Right after performing previous step, use a flat stick or other suitable flat, soft fiberglass tool to work adhesive material well into leak point and into joint of original material and body. This will ensure a watertight seal along entire length of material application.
7. Using cold water, spray test to assure that leak has been corrected.
 - Do not run heavy stream of water directly on freshly applied urethane adhesive.
8. If leak still exists, use a flat, soft fiberglass tool and paddle additional adhesive material into leak point.
9. Replace all previously removed parts.

INSIDE REARVIEW MIRROR

Figures 21 and 22

The inside rearview mirror is fastened to an inside rearview mirror support that is secured to the windshield.

Both the conventional and electronic mirrors offered on this vehicle are "breakaway" type. Breakaway rearview mirrors are designed to detach from the windshield in the event of an inflatable restraint deployment. Both styles of mirror attach to the support on the windshield, but break away in different manners. The electrochromic mirror separates at the mirror support, while the conventional mirror arm separates from the base. Be sure to follow the appropriate procedure when servicing the rearview mirror.

The electrochromic day/night mirror adjusts for glare by using a chemical sensitive to light. The mirror is designed to keep annoying glare from reflecting into the driver's eyes when a vehicle with bright lights is in the rear. Once in the "auto" position, it never has to be turned off.

For further information on the electrochromic day/night mirror, refer to SECTION 8A.

Electrochromic Day/Night Rearview Mirror

Figures 21 and 22

CAUTION: Electrochromic material may irritate eyes and skin. In case of contact, take the following actions: Eye contact -rinse thoroughly with water. Skin contact - wash with soap and water. If ingested - consult a physician immediately.

Figure 21 - Electrochromic Rearview Mirror

NOTICE: Do not use ammonia-based cleansers on the electrochromic inside rearview mirror.

Remove or Disconnect

1. Wiring harness cover.
 - A. Near top, slide from under headlining trim finish panel by pivoting 90 degrees.
 - B. Wires from channel and pull wiring harness cover away from ball joint.
2. Electrical connector.

NOTICE: Do not use tools or other objects to pry mirror support or inside rearview mirror away from windshield. Use of tools or other objects may damage mirror support.

3. Inside rearview mirror (23) from mirror support (21).
 - A. Use one hand to support one end of inside rearview mirror (23) against windshield (2).

Figure 22 - Removing Electrochromic Inside Rearview Mirror

B. Use other hand to pull inside rearview mirror (23) away from mirror support (21).

Install or Connect

NOTICE: Refer to "Notice" on page 10-2-1 of this section.

1. Inside rearview mirror (23) to mirror support (21).
 - A. Center bottom of inside rearview mirror (23) to top of mirror support (21).
 - B. Slide inside rearview mirror (23) onto mirror support (21), keeping inside rearview mirror (23) parallel to windshield (2).
 - C. Apply at least 90 N (20 pounds) of force to fully seat inside rearview mirror (23) onto mirror support (21). Audible click will be heard when inside rearview mirror (23) is fully seated.
2. Electrical connectors.
3. Wiring harness cover.

- A. Position cover to inside rearview mirror (23) at a 90-degree angle from vertical position.
- B. Push cover onto ball joint.
- C. Position wiring in channel. Pivot 90 degrees to vertical position to fit under headlining trim finish panel.

Inside Rearview Mirror Lamp Bulb Replacement

Figure 21

There are two inside rearview mirror lamps (left and right) on the inside rearview mirror. These lamps have replaceable bulbs.

CAUTION: Electrochromic material may irritate eyes and skin. In case of contact, take the following actions: Eye contact - rinse thoroughly with water. Skin contact - wash with soap and water. If ingested - consult a physician immediately.

Remove or Disconnect

1. Inside rearview mirror lamp housing bolt/screw (27).
2. Inside rearview mirror lamp housing (25).
3. Inside rearview mirror lamp bulb (26).

Install or Connect

1. New inside rearview mirror lamp bulb (26).
2. Inside rearview mirror lamp housing (25).
3. Inside rearview mirror lamp housing bolt/screw (27). Snug, (do not strip).

Conventional Rearview Mirror

Figure 23

Remove or Disconnect

1. Set screw (8) at base of mirror (10).
2. Mirror (10) from support (21).
3. Bolt/screw (11) and retainer (12) if mirror was detached at base.

Install or Connect

NOTICE: Refer to "Notice" on page 10-2-1 of this section.

1. Bolt/screw (11) and retainer (12).
 - Tighten until snug.
2. Mirror (10) to support (21).
3. Set screw (8) at base of mirror (10).
 - Tighten until snug.

Figure 23 - Conventional Inside Rearview Mirror

Inside Rearview Mirror Support

Figures 21 through 24

CAUTION: Electrochromic material may irritate eyes and skin. In case of contact, take the following actions: Eye contact - rinse thoroughly with water. Skin contact - wash with soap and water. If ingested - consult a physician immediately.

The inside rearview mirror support is secured to the windshield glass. This support is installed by the window supplier, using a plastic polyvinyl butyl adhesive.

Service replacement windshield glass has the inside rearview mirror support bonded to the windshield. To install a detached support or install a new part, the following items are needed.

- GM P/N 1052369, Loctite® 312 Adhesive kit, two-component pack or equivalent.
- Inside rearview mirror support.
- Wax marking pencil or crayon.
- Window cleaning solution or window polishing compound.
- Rubbing alcohol.
- Clean paper towels.
- Fine grit emery cloth or sandpaper, number 320 or number 360.
- Clean toothpick.

Measure

- Distance from bottom of windshield (2) to bottom of support (21) to determine location of support (21).
- A. Mark location on outside of windshield (2) with wax pencil or crayon.

Figure 24 - Inside Rearview Mirror Support Placement

- B. Make a larger diameter circle around support circle on outside windshield surface (Figure 23).

Clean

- Large circle on inside windshield surface with paper towel and window cleaning solution or window polishing compound.
 - A. Rub until area is completely clean and dry.
 - B. When dry, clean area with an alcohol-saturated paper towel to remove any traces of cleaning solution or polishing compound.
 1. Sand bonding surface of new support (21) or factory installed support with a piece of fine grit emery cloth or sandpaper, number 320 or number 360.
- If original support (21) is to be reused, all traces of factory installed adhesive must be removed prior to installation.
 2. Wipe sanded support (21) with clean paper towel saturated with alcohol and allow to dry.

10-2-26 STATIONARY WINDOWS

Install or Connect

- Support (21) to windshield (2).
 - A. Follow directions on adhesive kit to prepare mirror support (21) prior to installation on windshield (2).
 - B. Lightly apply adhesive accelerator to bonding surfaces of support (21) and windshield (2) and allow to dry completely.

Important

- Due to rapid bonding of adhesive, the following steps must be performed without hesitation.
 - A. Apply two drops of adhesive to support (21).
 - B. Use toothpick to evenly distribute adhesive over entire bonding surface of support (21).
 - C. Properly position support (21) to its pre-marked location, with rounded end pointed upward.
 - D. Press mirror support (21) against window for 30 to 60 seconds, exerting steady pressure against windshield (2).
 - E. After five minutes, remove excess adhesive with an alcohol-moistened paper towel or window cleaning solution.

REAR WINDOW AND END GATE WINDOW DEFOGGER

The rear window defogger system on the sedan and the end gate window defogger system on the wagon consist of tinted windows that have a number of horizontal ceramic silver compound element lines, and two vertical bus bars baked into the inside surface during the window forming operation. The feed wire or terminal is soldered to the feed bus bar on the left side. The ground wire or terminal is soldered to the ground bus bar on the right side.

Both systems operate on 12 volts. Under some conditions, heat from the window may not be detected by finger touch. The length of time required to remove interior fog from the back window will vary with such conditions as vehicle speed, outside window temperature, atmospheric pressure and number of passengers.

Both systems use a heater and air conditioning control mounted switch with an integral indicator lamp and will operate for five to ten minutes, automatically turning off through the use of a timer. Both systems can be turned off during this operation period by pressing the defogger switch or turning ignition switch to "OFF."

Testing Grid Lines

Figures 25 and 26

To locate inoperative grid lines, start the engine and turn on the rear window or end gate window defogger system. Ground one test lamp lead and lightly touch other probe to each grid line. Figure 24 illustrates pattern of test lamp brilliance to be expected with a properly functioning grid.

Figure 25 - Normal Test Lamp Bulb Brilliance Zones

Figure 26 - Test Lamp Bulb Brilliance with Broken Grid Lines

If test lamp bulb shows full brilliance at both ends of grid lines, check for loose ground wire contact to body metal.

The range of zones of bulb brilliance may vary slightly from one window to another. Bulb brilliance will decrease proportionately to increased resistance in grid line as probe is moved from feed bus bar to the ground bus bar.

All grid lines must be tested in at least two places to eliminate the possibility of bridging a break. For best results, contact each grid line a few centimeters (inches) either side of window centerline. If an abnormal lamp reading is apparent on a specific grid line, place test lamp probe on that grid at the feed

bus bar and move probe toward the ground bus bar until the lamp goes out. This will indicate a break in the continuity of the grid line (Figure 25).

If no break in continuity is found and braided lead wire repairs are not needed but system is still inoperative, refer to SECTION 8A for electrical diagnosis.

CAUTION: To avoid personal injury

- Do not allow the repair material to come in contact with skin or eyes and avoid breathing vapor.
- Do not use near heat, sparks or open flame.

Grid Line Repair

Figures 27 and 28

Remove or Disconnect

CAUTION: Refer to "Caution" under "Disconnecting the Battery Negative Cable" in SECTION 0A.

- Battery negative cable.

Inspect

1. Rear window or end gate window defogger grid lines.
2. Mark grid line breaks on outside of window with grease pencil.

Clean

1. Grid line area to be repaired.
2. Buff with fine steel wool and wipe clean, using cloth dampened with alcohol.

Figure 27 - Applying Repair Material to Broken Grid Line

- Buff and clean about 6 mm (1/4 inch) beyond each side of break in grid line.

Install or Connect

CAUTION: Approved safety glasses should be worn when performing this procedure to reduce the chance of personal injury.

1. Grid line repair decal or two strips of tape positioned above and below repair area.
 - Repair decal or tape must be used to control width of repair area.
 - If decal is used, be sure die-cut metering slot is same width as grid line.
2. Mix grid repair material according to manufacturer instructions.
3. Grid repair material, at room temperature, to repair area, using small wood stick or spatula.
4. Carefully remove decal or tape.

NOTICE: Grid line repair material must be cured with heat. To avoid heat damage to interior trim, protect trim near repair area where heat is to be applied.

5. Apply heat to repair area for one or two minutes with heat gun capable of reaching 260° C (500° F).
 - Hold heat gun nozzle 25 mm (1 inch) from surface.
 - A minimum temperature of 149° C (300° F) is required.
6. Battery negative cable.

Figure 28 - Applying Heat to Grid Line Repair

**Inspect**

1. Grid line repair area.
 - A. If repair appears discolored, apply coating of tincture of iodine to repair area, using a pipe cleaner or fine brush.
 - B. Allow iodine to dry for about 30 seconds and carefully wipe off excess with lint-free cloth.
2. Test rear window or end gate window defogger operation to verify grid line repair. Refer to "Testing Grid Lines" in this section.

NOTICE: At least 24 hours are required for complete curing of repair materials. Unit should not be physically disturbed until after that time, or repair may not hold.

Braided Lead Wire Repair**Figure 29**

CAUTION: Approved safety glasses should be worn when performing this procedure to reduce the chance of personal injury.

The rear defogger bus bar lead wire or terminal can be reattached by re-soldering, using a solder containing 3 percent silver and a rosin flux paste.

**Remove or Disconnect**

CAUTION: Refer to "Caution" under "Disconnecting the Battery Negative Cable" in SECTION 0A.

1. Battery negative cable.
2. Quarter upper trim or quarter window garnish molding from affected side, if sedan. Refer to SECTION 10-7.
3. End gate window strut on repair side, if necessary, on wagon.

**Clean**

- Buff repair area with fine steel wool to remove the oxide coating formed during window manufacture.

NOTICE: To prevent burning bus bar, soldering iron tip temperature should be just enough to melt solder and allow it to run freely. Iron should be in contact with bus bar as short a time as possible.

**Figure 29 - Bus Bar Repair****Install or Connect**

1. Paste-type rosin flux in small quantities to wire lead and bus bar repair, using a brush.
 - Soldering iron tip should be coated with solder beforehand.
2. Solder to feed bus bar or ground bus bar.
 - A. Protect surrounding interior trim from possible damage from hot solder.
 - B. Draw soldering iron tip across fluxed area, thinly coating bus bar with solder.
3. Small amount of flux to underside of lead wire braid.
 - Align spots with fluxed and tinned spots on feed bus bar or ground bus bar.
4. Coat tip of soldering iron with solder.
5. Solder to underside of lead wire braid.
 - Draw iron across fluxed spot, thinly coating spot with solder.
6. Solder spot on braid against spot on feed bus bar or ground bus bar.
 - A. Apply heat to top of lead wire braid, causing solder spots to melt and fuse together.
 - B. Holding force should not be removed until solder has solidified.
7. Wipe off excess flux with solvent.
8. Quarter upper trim or quarter window garnish molding, if removed. Refer to SECTION 10-7.
9. End gate window strut on repair side, if disconnected, on wagon.
10. Battery negative cable.

BODY DIMENSIONS, FRAME AND UNDERBODY

CAUTION: This vehicle is equipped with Supplemental Inflatable Restraint (SIR). Refer to CAUTIONS in Section 9J under "ON-VEHICLE SERVICE" and the SIR Component and Wiring Location view in Section 9J before performing service on or around SIR components or wiring. Failure to follow CAUTIONS could result in possible air bag deployment, personal injury, or otherwise unneeded SIR system repairs.

CAUTION: To help avoid personal injury when a vehicle is on a hoist, provide additional support for the vehicle at the opposite end from which components are being removed. This reduce the possibility of the vehicle falling off the hoist.

NOTICE: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. General Motors will call out those fasteners that require a replacement after removal. General Motors will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

NOTICE: The theft deterrent label found on some major sheet metal must be masked prior to painting, rustproofing, undercoating, etc. The mask must be moved following the above operations. Failure to keep the label clean and readable may result in liability for violation of the Federal Vehicle Theft Prevention Standard, and subject the vehicle owner to possible suspicion that the part was stolen.

GENERAL DESCRIPTION

GENERAL FRAME CONSTRUCTION

Figure 1

Frames consist of full-length right and left side members joined laterally by front and rear suspension crossmembers. Several different frames are used to meet various vehicle size and function requirements, but the basic shape for each line is the same. Differences between frames in a given line exist only in metal gage, part size and numbers of parts necessary to meet the particular structural requirements

of the models involved. There is a wax base coating on the frame for corrosion protection.

The body of the vehicle is mounted to the chassis with body mounts. Thick rubber insulators, or cushions, are between each mount and the chassis to absorb road noise and suspension vibration.

DIAGNOSIS

To determine the extent of frame damage from a collision, use the dimension illustration chart (Figures 2 and 3). Any good frame measuring equipment may be used to measure the frame. Any reputable frame straightening equipment may be used to bring a frame

10-3-2 BODY DIMENSIONS, FRAME AND UNDERBODY

back to its original specifications. Use the procedures with the equipment to prevent damage to the body and frame attachments.

Improperly installed insulators (using the wrong part or the wrong torque on the body mount) may cause structural shake, road noise or squeaks.

Body mounts with locator tabs must be positioned so the tab rests in the frame notch. Improperly located insulators may cause squeaks by rubbing on the frame rail.

ON-VEHICLE SERVICE

FRAME INSPECTION

Inspect

1. Raise and suitably support vehicle. Refer to SECTION 0A.
2. Inside, top, and ends of frame rails for loose dirt, rust, and corrosion.
3. Frame box sections for accumulation of debris. Remove if present.
4. Lower vehicle.

UNDERBODY INSPECTION

Inspect

1. Raise and suitably support vehicle. Refer to SECTION 0A.
2. Floor panel for damage.

3. Inside of floor panel and frame rail access holes for loose dirt and rust.

- This is first indication of corrosion in hidden areas. Repairs may be necessary before final cleaning and protective treatment.

4. Drain holes in floor panel with chisel to make sure they are open.

5. Drain holes in body side panels to make sure they are open.

- Body side panel drain holes are in rear section of rocker inner panels and in lower rear quarter panels. If blocked, open with punch or drift.

6. Lower vehicle.

UNDERBODY FLUSH

Due to buildup of road salts and corrosives on the vehicle's underbody, the underbody (including suspension, exhaust and fuel line areas) should be flushed with clean water annually, preferably each spring. This will increase the life and strength of the underbody components.

ALIGNMENT CHECKING

Frame Repair

Figures 2 and 3

Vehicles involved in an accident of any nature which might result in a "bent" or "sprung" frame should always be checked for proper frame alignment, in addition to steering geometry and tire and wheel alignment.

Figure 2-Frame Gaging Dimensions

10-3-4 BODY DIMENSIONS, FRAME AND UNDERBODY

Use the dimensions in Figure 3 to check the alignment of the frame. Use either the tram gage or plumb bob method to measure the frame. All measurements should be made with the vehicle on level ground. The dimensions between the reference points will show where straightening operations are necessary. Corresponding measurements must be equal within 6 mm (1/4 inch).

TRAM GAGE METHOD

Make crisscross measurements with the tram gage points set at the center of each locating point. To find the center of each point, tape two pieces of tape across the point so they intersect in the middle. With a pen, mark the center point and use it for consistent measurements. Keep the crossbar level to ensure accuracy.

Next, check the vertical dimensions from the datum plane (plane below and parallel to underbody) to the tramming points. The tram bar should be on a parallel plane to the frame. The exception is when one of the reference points used is in the misaligned area.

PLUMB BOB METHOD

If a tram gage is not available, use the plumb bob method for checking. Use a piece of cord attached to a surveyor's plumb bob to measure the distance between two points. Place the free end of the cord on the center of the reference point (as described above). Let the plumb bob hang to the floor. Make a mark on the floor just under the plumb bob. Repeat at all reference points. Measure marks on the floor with a tape measure.

The dimensions between the reference points will show where straightening operations are necessary. Corresponding measurements must be equal within 6 mm (1/4 inch).

- Measure X to check alignment of front portion of frame.
- Measure Y to check alignment of center portion of frame.
- Measure Z to check alignment of rear portion of frame.

TRANSMISSION SUPPORT REPLACEMENT

Figure 4

Remove or Disconnect

1. Raise and suitably support vehicle. Refer to SECTION 0A.
2. Transmission mount nut and washer. Refer to SECTION 7A.
3. Loosen catalytic converter-to-intermediate pipe bolts/screws to allow for pivot.
4. Raise and suitably support automatic transmission.
5. Bolts/screws (6).
6. Transmission support (1).

Install or Connect

NOTICE: Refer to "Notice" on page 10-3-1 of this section.

Figure 3-Frame Crosschecking Dimensions

Figure 4-Transmission Support

1. Transmission support (1).
2. Bolts/screws (6).

Tighten

- Bolts/screws (6) to 34 N.m (25 lb. ft.).
3. Lower automatic transmission.

Tighten

- Catalytic converter-to-intermediate pipe bolts/screws to 20 N.m (15 lb. ft.).
4. Transmission mount nut and washer. Refer to SECTION 7A.
 5. Lower vehicle.

BODY MOUNT REPLACEMENT

Figure 5

NOTICE: Perform these procedures exactly as specified regardless of the number of body mounts to be replaced or damage to sheet metal or other components could result.

POSITION NUMBER 1 THROUGH POSITION NUMBER 3

Remove or Disconnect

1. Storage battery and battery tray. Refer to SECTION 6D1.
2. Radiator support nuts, lower washers and bolts/screws. Refer to SECTION 10-5.

3. Raise and suitably support vehicle. Refer to SECTION 0A.

4. Front wheelhouse panel front extension. Refer to SECTION 10-5.

5. Two steering gear bolts/screws securing steering gear to frame. Loosen third steering gear bolt/screw. Refer to SECTION 3B.

6. Loosen intermediate steering shaft bolt/screw. Refer to SECTION 3F.

7. Steering column shift control linkage from frame. Refer to SECTION 7A.

8. Catalytic converter heat shield. Refer to SECTION 6F.

9. Bolts/screws (14), washers (43) and lower cushions (13) at position numbers 1, 2, and 3.

- Store bolts/screws (14 and 15) and lower cushions (13) so they can be identified for reinstallation at same location.

10. Loosen remaining bolts/screws (14) at position numbers 4, 6 and 7.

11. Place jackstands under body side rails near position number 4 and at floor panel reinforcement plates near position number 2.

NOTICE: Do not separate body and frame more than necessary. Damage to sheet metal and other components could result.

12. Lower chassis until separation between body and frame is just enough to slip out upper cushions (11 and 12) at position numbers 1, 2 and 3.

10-3-6 BODY DIMENSIONS, FRAME AND UNDERBODY

Figure 5-Body Mounts

13. Upper cushions (11 and 12) and shims, if present, at position numbers 1, 2 and 3, as needed.

 Install or Connect

NOTICE: Refer to “Notice” on page 10-3-1 of this section.

1. Upper cushions (11 and 12) as needed.
 - Install shims, if any were found during disassembly, between upper cushions (11 and 12) and frame.
2. Alignment gage pins, 305 mm (12 inches) long and 15.9 mm (5/8 inch) in diameter, through frame and into body at gage pin hole locations near position numbers 1 and 4.
3. Raise chassis until body is supported by frame and lifted from jackstands.
 - Ensure body is aligned with gage pins.
4. Attempt to rotate upper cushions (11 and 12) at position numbers 1, 2 and 3 by hand. If they can be rotated, separate body and frame as before, and install shims as required.

 Tighten

- Bolts/screws (14) at position numbers 4, 6 and 7 to 70 N·m (52 lb. ft.).
5. Remove jackstands.
 6. Bolts/screws (14), washers (43) and lower cushions (13) to positions 1, 2 and 3.

 Tighten

- Bolts/screws (14) at position numbers 1, 2 and 3 to 70 N·m (52 lb. ft.).

 Important

- Ensure torque on all bolts/screws (14) is uniform, or vehicle ride could be affected.
7. Catalytic converter heat shield. Refer to SECTION 6F.
 8. Steering column shift control linkage to frame. Refer to SECTION 7A.
 9. Tighten intermediate steering shaft bolt/screw. Refer to SECTION 3F.
 10. Two steering gear bolts/screws attaching steering gear to frame. Tighten all three bolts/screws. Refer to SECTION 3B.
 11. Front wheelhouse panel front extension. Refer to SECTION 10-5.
 12. Lower vehicle.
 13. Radiator support nuts, lower washers and bolts/screws. Refer to SECTION 10-5.
 14. Storage battery and battery tray. Refer to SECTION 6D1.

POSITION NUMBER 4 THROUGH POSITION NUMBER 7. body

 Remove or Disconnect

1. Storage battery and battery tray. Refer to SECTION 6D1.
2. Radiator support nuts, lower washers and bolts/screws. Refer to SECTION 10-5.
3. Raise and suitably support vehicle. Refer to SECTION 0A.
4. Front wheelhouse panel front extension. Refer to SECTION 10-5.
5. Two steering gear bolts/screws securing steering gear to frame. Loosen third steering gear bolt/screw. Refer to SECTION 3B.
6. Loosen intermediate steering shaft bolt/screw. Refer to SECTION 3F.
7. Steering column shift control linkage from frame. Refer to SECTION 7A.
8. Catalytic converter heat shield. Refer to SECTION 6F.
9. Bolts/screws (14), washers (43) and lower cushions (13) at position numbers 3, 4, 6 and 7.
 - Store bolts/screws (14), washers (43) and lower cushions (13) so they can be identified for reinstallation in the same location.
10. Loosen, but do not remove, bolts/screws (14) at position numbers 1 and 2.
11. Place jackstands under reinforced portion of underbody near position number 4.

NOTICE: Do not separate body and frame more than necessary. Damage to sheet metal and other components could result.

12. Lower chassis until separation between body and frame is just enough to slip out upper cushions (16, 23, 24 and 42) at position numbers 4, 5, 6 and 7.
13. Upper cushions (16, 23, 24 and 42) and shims, if present, at position numbers 4, 5, 6 and 7, as needed.

 Install or Connect

NOTICE: Refer to “Notice” on page 10-3-1 of this section.

1. New upper cushions (16, 23, 24 and 42) to position numbers 4, 5, 6 and 7 as needed.
 - Install shims, if any were found during disassembly, between upper cushions (16) and frame.
2. Alignment gage pins, 305 mm (12 inches) long and 15.9 mm (5/8 inch) in diameter, through frame and into body at gage pin hole locations near position numbers 1 and 4.
3. Raise chassis until body is supported by frame and lifted from jackstands.
 - Ensure body is aligned with gage pins.

10-3-8 BODY DIMENSIONS, FRAME AND UNDERBODY

4. Attempt to rotate upper cushions (16) at position numbers 4, 5, 6 and 7 by hand. If any can be rotated, separate body and frame as before and install shims as required.
5. Remove jackstands.

Tighten

- Bolts/screws (14) at position numbers 1 and 2 to 70 N·m (52 lb. ft.).
6. Washer (43), lower cushions (13) and bolts/screws (14) to position numbers 3, 4, 6 and 7.

Tighten

- Bolts/screws (14) at position numbers 3, 4, 6 and 7 to 70 N·m (52 lb. ft.).

Important

- Ensure torque on all bolts/screws (14 and 15) is uniform or vehicle ride could be affected.
7. Catalytic converter heat shield. Refer to SECTION 6F.
 8. Steering column shift control linkage to frame. Refer to SECTION 7A.
 9. Tighten intermediate steering shaft bolt/screw. Refer to SECTION 3F.
 10. Two steering gear bolts/screws securing steering gear to frame. Tighten all three bolts/screws. Refer to SECTION 3B.
 11. Front wheelhouse panel front extension to frame. Refer to SECTION 10-5.
 12. Lower vehicle.
 13. Radiator support nuts, lower washers and bolts/screws. Refer to SECTION 10-5.
 14. Storage battery and battery tray. Refer to SECTION 6D1.

FRONT AND REAR SIDE DOOR CARPET RETAINER

Figure 6

Remove or Disconnect

1. Bolt/screw (18 or 40).
2. Retainer (20 or 41).
3. Trim plate (19 or 21).

Figure 6-Front and Rear Side Door Sill Trim Plates

Install or Connect

NOTICE: Refer to "Notice" on page 10-3-1 of this section.

1. Trim plate (19 or 21).
2. Retainer (20 or 41).
3. Bolt/screw (18 or 40).

Tighten

- Bolt/screw (18 or 40) to 1.4 N·m (12 lb. in.).

FRAME DIMENSIONS

For frame dimensions, refer to Figures 2 and 3 in this section.

SECTION 10-4

BUMPERS

NOTICE: Always use the correct fastener in the proper location. When you replace a fastener, use **ONLY** the exact part number for that application. General Motors will call out those fasteners that require a replacement after removal. General Motors will also call out the fasteners that require thread lockers or thread sealant. **UNLESS OTHERWISE SPECIFIED**, do not use supplemental coatings (paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

GENERAL DESCRIPTION

BUMPERS

For repair of the urethane fascia, refer to SECTION 10-1.

ANTICORROSION PROTECTION

Anticorrosion materials have been applied to the interior surfaces of some metal panels to provide rust resistance. When servicing these panels, areas on which this material has been disturbed should be properly recoated with service-type anticorrosion material.

ENERGY ABSORBING UNITS

The Chevrolet and Buick bumper systems are designed to take a collision into a fixed barrier at 8 km/h (5 mph) with limited damage. After absorbing the energy of a collision, these bumper systems restore themselves to their original position. Energy absorbers,

attached to the vehicle frame and to the mounting points at each end of the bumper, collapse on impact. Gases compressed during the impact expand, extending the energy absorbers back to their original length.

DIAGNOSIS

The right and left energy absorbers should be diagnosed separately. The following checks and separate judgments should be made on each energy absorber.

ENERGY ABSORBER LEAK DIAGNOSIS

Some oil wetting may be visible due to the grease packed in the crimp recess. Therefore, a stain or trace of oil on the piston tube near the crimp is normal. However, if oil drips continuously from the crimp or the stud end of the energy absorber, there is a leak and the energy absorber should be replaced.

10-4-2 BUMPERS

ENERGY ABSORBER DAMAGE DIAGNOSIS

CAUTION: Energy absorbers are under constant internal gas pressure. They can cause severe injury if not handled properly.

- To prevent injury to others, relieve gas pressure before throwing away any energy absorber.
- Do not try to repair a damaged energy absorber. Replace it with a new one.
- Do not apply heat to energy absorbers.
- Do not weld near energy absorbers.
- Gas pressure in a collapsed energy absorber can cause it to extend without warning. Keep clear of the line of travel.
- Hold a collapsed bumper in position with chains or cables, and relieve gas pressure before making bumper system repairs.

Look at the bumper bracket, piston tube, frame bracket and cylinder tube for signs of visible distortion. Scuffing of the piston tube will occur when it is stroked and should be considered normal.

If there is obvious damage to the energy absorber, it should be replaced. If a collision is so severe that the bumper does not return to its original position, the energy absorber(s) must be replaced.

TESTING ENERGY ABSORBER OPERATION

1. Remove energy absorber. Refer to "Bumper Energy Absorber Replacement" in this section.
2. Position energy absorber lengthwise in an arbor press.
3. Using suitable measuring device, note original length of energy absorber, then use the arbor press to compress it at least 10 mm (3/8 inch).
4. Release pressure on energy absorber and determine whether it has extended to the original length. If not, discard it. Refer to "Relieving Energy Absorber Gas Pressure" in this section.
5. Install either the original or a new energy absorber as needed. Refer to "Bumper Energy Absorber Replacement" in this section.

ON-VEHICLE SERVICE

BUMPER ENERGY ABSORBER REPLACEMENT

Figures 1 and 2

CAUTION: Refer to Energy Absorber "Caution" above.

 **Remove or Disconnect**

1. Front or rear bumper impact bar. Refer to "Front Bumper Impact Bar," "Rear Bumper Impact Bar (Sedan)" or "Rear Bumper Impact Bar (Wagon)" in this section.

2. Nuts (13 or 31) and bolts/screws (11 or 32).
3. Washer (39) and ground strap (40) or frame brace (56), on rear bumper energy absorber, if equipped.
4. Shims (12 or 33), if equipped.
5. Note placement and number of shims (12 or 33) so they can be reinstalled in the same location from which they were removed.
6. Bolt/screw (7 or 23).
7. Absorber (10 or 30) with assembled bracket (37 or 41).
8. Nut (38 or 42), if required.
9. Bracket (37 or 41), if required.

Install or Connect

NOTICE: Refer to "Notice " on page 10-4-1 of this section.

1. Bracket (37 or 41) onto absorber (10 or 30), if removed.
 - Bracket (37 or 41) must be positioned so weld nut will line up with bolt/screw hole in frame (35) when absorber (10 or 30) is installed.
2. Nut (38 or 42), if removed.

Tighten

- Nut (38 or 42) to 27 N·m (20 lb. ft.).
3. Absorber (10 or 30) with assembled bracket (37 or 41).
 4. Bolt/screw (7 or 23).

Tighten

- Bolt/screw (7) on absorber (10) to 4.2 N·m (37 lb. ft.).
 - Bolt/screw (23) on absorber (30) to 27 N·m (20 lb. ft.).
5. Shims (12 or 33), if removed, in same location from which they were removed.
 6. Washer (39) and ground strap (40), if equipped.
 7. Bolts/screws (11 or 32) and nuts (13 or 31). May be installed in either direction.

Tighten

- Nuts (13 or 31) to 20 N·m (15 lb. ft.).

10-4-4 BUMPERS

8. Front or rear bumper. Refer to "Front Bumper Impact Bar," "Rear Bumper Impact Bar (Sedan)" or "Rear Bumper Impact Bar (Wagon)" in this section.

RELIEVING ENERGY ABSORBER GAS PRESSURE

Figure 3

CAUTION: Energy absorbers are under constant internal gas pressure. They can cause severe injury if not handled properly.

- To prevent injury to others, relieve gas pressure before throwing away any energy absorber.
- Do not try to repair damaged energy absorber. Replace with a new one.
- Do not apply heat to energy absorbers.
- Do not weld near energy absorbers.
- Gas pressure in a collapsed energy absorber can cause it to extend without warning. Keep clear of the line of travel.
- Hold a collapsed bumper in position with chains or cables, and relieve gas pressure before making bumper system repairs.

Collapsed Energy Absorbers

Figure 3

Collapsed energy absorbers should be relieved of their gas pressure before they are removed from the vehicle. This method must be used on partly or fully collapsed energy absorbers. It may also be used as an alternate method on fully extended energy absorbers.

Figure 3 - Relieving Pressure

CAUTION: Energy absorbers are under constant internal gas pressure. They can cause severe injury if not handled properly.

CAUTION: Approved safety glasses should be worn when performing this procedure to reduce the chance of personal injury.

1. Hold collapsed bumper in position with chains or cables.
2. Using center punch, make small dent in energy absorber piston tube near bumper bracket.
3. Using 1/8-inch drill bit, drill through piston tube wall to relieve gas pressure.

Fully Extended Energy Absorbers

Fully extended energy absorbers which have been removed from the vehicle may be relieved of their gas pressure before disposal using the following method. Do not try to use this method on partly or fully collapsed energy absorbers. The method shown in "Collapsed Energy Absorbers" in this section may be used as an alternate to this method.

CAUTION: Refer to Energy Absorber "Caution" above.

CAUTION: Approved safety glasses should be worn when performing this procedure to reduce the chance of personal injury.

1. Place energy absorber in vise with bumper end up.
2. Using 5/32-inch drift pin punch, drive sealing ball inward to release gas.
 - Sealing ball is located in center of piston tube at bumper end of energy absorber.

FRONT BUMPER

Front Bumper Fascia

Figures 4, 5 and 6

Remove or Disconnect

1. Front parking/sidemarkers lamps. Refer to SECTION 8B.
2. Six upper retainers (86) or four upper retainers (29).
3. Raise and suitably support vehicle. Refer to SECTION 0A.
4. Front fender wheel opening moldings and front wheelhouse panel extension with radiator air side deflectors attached. Refer to SECTION 10-5.
5. Four lower retainers (86 or 29).
6. Four bolts/screws (5).
7. Fascia (66, 2 or 99).

10-4-8 BUMPERS

Install or Connect

NOTICE: Refer to "Notice" on page 10-4-1 of this section.

1. Fascia (66, 2 or 99).
2. Four bolts/screws (5).

Tighten

- Bolts/screws (5) to 6 N.m (53 lb. in.).
3. Four lower retainers (86 or 29).
 4. Front fender wheel opening moldings and front wheelhouse panel extensions with radiator air side deflectors attached. Refer to SECTION 10-5.
 5. Lower vehicle.
 6. Six upper retainers (86), or four upper retainers (29).

Adjust

- Front bumper. Refer to "Front Bumper Alignment" in this section.
7. Front parking/sidemarkers lamps. Refer to SECTION 8B.

Front Bumper Fascia Upper Moldings

BUICK

Figures 4 and 5

Remove or Disconnect

1. Front bumper fascia. Refer to "Front Bumper Fascia" in this section.
2. Caps (19 and 20 or 71 and 72) and retainers (27).
3. Escutcheons (21 and 22 or 73 and 74) and retainers (27).
4. Moldings (16, 17 and 18 or 70).
 - A. Straighten bend tabs before removing.
 - B. Hold hot air gun 152 mm (6 inches) from molding surfaces.
 - C. Apply heat, using circular motion for about 30 seconds.
 - D. Use flat-bladed tool, being careful not to damage paint, and remove moldings (16, 17 and 18 or 70) from front bumper fascia surface.
 - E. Discard moldings (16, 17 and 18 or 70).

Install or Connect

1. Moldings (16, 17 and 18 or 70).
 - A. Mark position of moldings (16, 17 and 18 or 70) with length of masking tape.

Clean

- Area with soap and water. Wipe dry.
 - Area with oil-free naphtha or alcohol.
- B. If needed, warm fascia (66 or 2) with heat lamp or heat gun to 21° C (70° F).

- C. Peel paper from moldings (16, 17 and 18 or 70).
 - Do not touch adhesive backing.
- D. Press moldings (16, 17 and 18 or 70) to fascia (66 or 2) to secure.
- E. Hand-roll moldings (16, 17 and 18 or 70) to ensure proper adhesion.

Inspect

- Molding ends for bonding. Hand-roll loose ends.
- F. Bend back bend tabs after applying moldings.
2. Escutcheons (21 and 22 or 73 and 74) and retainers (27).
 3. Caps (19 and 20 or 71 and 72) and retainers (27).
 4. Front bumper fascia. Refer to "Front Bumper Fascia" in this section.

Front Bumper Fascia Lower Moldings

BUICK

Figures 4 and 5

Remove or Disconnect

1. Front bumper fascia. Refer to "Front Bumper Fascia" in this section.
2. Nuts (26) from studs on moldings (65, 67 and 68 or 1, 3 and 4).
3. Moldings (65, 67 and 68 or 1, 3 and 4).

Install or Connect

NOTICE: Refer to "Notice" on page 10-4-1 of this section.

1. Moldings (65, 67 and 68 or 1, 3 and 4).
2. Nuts (26) to studs on moldings (65, 67 and 68 or 1, 3 and 4).

Tighten

- Nuts (26) to 4 N.m (35 lb. in.).
3. Front bumper fascia. Refer to "Front Bumper Fascia" in this section.

CHEVROLET

Figure 6

Remove or Disconnect

1. Front bumper fascia. Refer to "Front Bumper Fascia" in this section.
2. Retainers (101).
3. Molding (94).
 - A. Hold hot air gun 152 mm (6 inches) away from molding surface.
 - B. Apply heat, using circular motion for about 30 seconds.
 - C. Use flat-bladed tool, being careful not to damage paint, and remove molding (94) from front bumper fascia surface.
 - D. Discard molding (94).

Install or Connect

NOTICE: Refer to "Notice" on page 10-4-1 of this section.

1. Molding (94).

- A. Mark position of molding (94) with length of masking tape.

Clean

- Area with soap and water. Wipe dry.
- Area with oil-free naphtha or alcohol.

- B. If needed, warm fascia (99) with heat lamp or heat gun to 21° C (70° F).

- C. Peel paper from molding (94).

- Do not touch adhesive backing.

- D. Press molding (94) to fascia (99) to secure.

- E. Hand-roll molding (94) to ensure proper adhesion.

Inspect

- Molding ends for bonding. Hand-roll loose ends.

2. Retainers (101).

3. Front bumper fascia. Refer to "Front Bumper Fascia" in this section.

Front Bumper Guards

BUICK

Figures 4 and 5

Remove or Disconnect

1. Open hood.
2. Nuts (28) from studs on guards (24 or 100) behind fascia (66 or 2).
3. Guards (24 or 100), pads (25 or 98) and bushings (90 or 97).

Install or Connect

NOTICE: Refer to "Notice" on page 10-4-1 of this section.

1. Guards (24 or 100), pads (25 or 98) and bushings (90 or 97) to front of fascia (66 or 2).
2. Nuts (28) to studs on guards (24 or 100).

Tighten

- Nuts (28) to 11 N.m (97 lb. ft.).

3. Lower hood.

Front Bumper Impact Bar

Figures 4, 5 and 6

Remove or Disconnect

1. Front bumper fascia. Refer to "Front Bumper Fascia" in this section.
2. Radiator air side baffles and radiator air side baffle retainers. Refer to SECTION 10-5.
3. Supports (34), if equipped.
4. Nuts (15).
5. Impact bar (91, 9 or 92).

Install or Connect

NOTICE: Refer to "Notice" on page 10-4-1 of this section.

1. Impact bar (91, 9 or 92).
2. Nuts (15).

Tighten

- Nuts (15) to 27 N.m (20 lb. ft.).
3. Supports (34), if equipped.
 4. Radiator air side baffles and radiator air side baffle retainers. Refer to SECTION 10-5.
 5. Front bumper fascia. Refer to "Front Bumper Fascia" in this section.

REAR BUMPER

Rear Bumper Fascia (Sedan)

Figures 7 and 8

Remove or Disconnect

1. Open rear compartment lid.
2. Backup lamp connector from backup lamp harness (Buick only). Refer to SECTION 8B.
3. Four upper retainers (53) (Buick) or six upper retainers (108) (Chevrolet).
4. Rear license pocket and fuel tank filler doors (Chevrolet). Refer to SECTION 10-8.
5. Six nuts (62) (Buick) or four upper nuts (62) (Chevrolet) from studs (57).
6. Raise and suitably support vehicle. Refer to SECTION 0A.
7. Four lower retainers (50) (Buick) or seven lower retainers (79) (Chevrolet).
8. Four lower nuts (62) (Chevrolet).
9. Lower vehicle.
10. Fascia (58) (Buick) or (112) (Chevrolet).

10-4-12 BUMPERS

Install or Connect

NOTICE: Refer to “Notice” on page 10-4-1 of this section.

1. Fascia (58) (Buick) or (112) (Chevrolet).
2. Raise and suitably support vehicle. Refer to SECTION 0A.
3. Four lower nuts (62) (Chevrolet).
4. Four lower retainers (50) (Buick) or seven lower retainers (79) (Chevrolet).
5. Lower vehicle.
6. Six nuts (62) (Buick) or four upper nuts (62) (Chevrolet) to studs (57).

Tighten

- Nuts (62) to 6 N.m (53 lb. in.).
7. Rear license pocket and fuel tank filler doors (Chevrolet). Refer to SECTION 10-8.
 8. Four upper retainers (53) (Buick) or six upper retainers (108) (Chevrolet).

Adjust

- Rear bumper. Refer to “Rear Bumper Alignment (Sedan)” in this section.
9. Backup lamp connector from backup lamp harness (Buick only). Refer to SECTION 8B.
 10. Close rear compartment lid.

Rear Bumper Fascia (Wagon)

Figures 9 and 10

Remove or Disconnect

1. Five retainers (87).
2. Raise and suitably support vehicle. Refer to SECTION 0A.
3. Seven lower retainers (79).
4. Rear quarter transfer lower rear finish moldings (Buick) from rear bumper fascia (Buick). Refer to “Rear Quarter Transfer Lower Rear Finish and Bumper Fascia Moldings (Wagon)” in this section.
5. Rear bumper fascia moldings (Chevrolet) from rear bumper fascia (Chevrolet). Refer to “Rear Quarter Transfer Lower Rear Finish and Bumper Fascia Moldings (Wagon)” in this section.
6. Four rivets (85).
 - Drill out.
7. Four nuts (62) from studs (57).
8. Fascia (78).

Install or Connect

NOTICE: Refer to “Notice” on page 10-4-1 of this section.

1. Fascia (78).
2. Four nuts (62) to studs (57).

Tighten

- Nuts (62) and studs (57) to 6 N.m (53 lb. in.).
3. Rivets (85).
 4. Rear quarter transfer lower rear finish moldings (Buick) to rear bumper fascia (Buick). Refer to “Rear Quarter Transfer Lower Rear Finish and Bumper Fascia Moldings (Wagon)” in this section.
 5. Rear bumper fascia moldings (Chevrolet) from rear bumper fascia (Chevrolet). Refer to “Rear Quarter Transfer Lower Rear Finish and Bumper Fascia Moldings (Wagon)” in this section.
 6. Seven lower retainers (79).
 7. Lower vehicle.
 8. Five upper retainers (87).

Rear Bumper Fascia Lower Moldings (Sedan)

Figures 7 and 8

Remove or Disconnect

1. Rear bumper fascia. Refer to “Rear Bumper Fascia (Sedan)” in this section.

Figure 10 - Rear Bumper - (Chevrolet Wagon)

Rear Quarter Transfer Lower Rear Finish and Bumper Fascia Moldings (Wagon)

Figures 9 and 10

Remove or Disconnect

- Molding (77) with studs (Buick) or molding (107) (Chevrolet).
 - A. Hold hot air gun 152 mm (6 inches) from molding surface.
 - B. Apply heat, using circular motion for about 30 seconds.
 - C. Use flat-bladed tool, being careful not to damage paint, and remove molding (77 or 107) from rear bumper fascia surface.
 - D. Discard molding (77) with retainers or (107).

Install or Connect

- Molding (77) (Buick) or (107) (Chevrolet).
 - A. Mark position of molding (77 or 107) with length of masking tape.

Clean

- Area with soap and water. Wipe dry.
- Area with oil-free naphtha or alcohol.
- B. If needed, warm fascia (78) with heat lamp or heat gun to 21° C (70° F).
- C. Peel paper from molding (77 or 107).
 - Do not touch adhesive backing.
- D. Press molding (77 or 107) to fascia (78) to secure retainer.
- E. Hand-roll molding (77 or 107) to fascia (78) to ensure proper adhesion.

Inspect

- Molding ends for bonding.
 - Hand-roll loose ends.

Rear Bumper Impact Bar (Sedan)

Figures 7 and 8

Remove or Disconnect

1. Rear bumper fascia. Refer to “Rear Bumper Fascia (Sedan)” in this section.
2. Nuts (36).
3. Impact bar (43) and retainers (55) (Buick) or impact bar (102) from support (110) (Chevrolet).
 - Remove rivets (111) (Chevrolet) using 1/4-inch drill bit.

Install or Connect

NOTICE: Refer to “Notice” on page 10-4-1 of this section.

1. Impact bar (43) and retainers (55) (Buick) or impact bar (102) to support (110) with rivets (111) (Chevrolet).

Adjust

- Impact bar. Refer to “Rear Bumper Alignment (Sedan)” in this section.
- 2. Nuts (36).

Tighten

- Nuts (36) to 27 N.m (20 lb. ft.).
- 3. Rear bumper fascia. Refer to “Rear Bumper Fascia (Sedan)” in this section.

Rear Bumper Impact Bar (Wagon)

Figures 9 and 10

Remove or Disconnect

1. Rear bumper fascia. Refer to “Rear Bumper Fascia (Wagon)” in this section.
2. Nuts (36).
3. Impact bar (80) and retainers (55).

Install or Connect

NOTICE: Refer to “Notice” on page 10-4-1 of this section.

1. Impact bar (80) and retainers (55).

Adjust

- Impact bar. Refer to “Rear Bumper Alignment (Wagon)” in this section.
- 2. Nuts (36).

Tighten

- Nuts (36) to 27 N.m (20 lb. ft.).
- 3. Rear bumper fascia. Refer to “Rear Bumper Fascia (Wagon)” in this section.

FRONT BUMPER ALIGNMENT

Figures 1, 4, 5, 6, 11 and 12

Remove or Disconnect

1. Raise and suitably support vehicle. Refer to SECTION 0A.
2. Front wheelhouse panel extensions with radiator air side deflectors attached and radiator air side baffles. Refer to SECTION 10-5.

Adjust

NOTICE: Refer to “Notice” on page 10-4-1 of this section.

- Front bumper.
 - A. Loosen nuts (15).
 - B. Move impact bar (91, 9 or 92) up or down to achieve proper clearance. Front bumper fascia (66, 2 or 99) should be adjusted to specification shown in Figures 11 and 12.

10-4-16 BUMPERS

Figure 11 - Front Bumper Alignment - (Buick Sedan)

Figure 12 - Front Bumper Alignment - (Chevrolet Sedan, Buick and Chevrolet Wagon)

Tighten

- Nuts (15) to 27 N.m (20 lb. ft.).

Install or Connect

1. Front wheelhouse extension panels with air deflectors attached and radiator air side baffles. Refer to SECTION 10-5.
2. Lower vehicle.

REAR BUMPER ALIGNMENT (SEDAN)

Figures 2, 7, 8 and 13

NOTICE: Proper alignment of rear impact bar flange to impact bar support is critical. If alignment specifications are not followed, the vehicle may not properly absorb the energy of a collision, causing excessive damage.

NOTICE: Refer to "Notice" on page 10-4-1 of this section.

1. Raise and suitably support vehicle. Refer to SECTION 0A.

Adjust

- Rear bumper.
 - A. Loosen nuts (36).
 - B. Move impact bar (43) up or down until fascia (58) just contacts license plate filler pocket (Buick); or move impact bar (102) up or down to achieve proper clearance.

Tighten

- Nuts (36) to 27 N.m (20 lb. ft.).
- 2. Lower vehicle.

REAR BUMPER ALIGNMENT (WAGON)

Figures 2, 9, 10 and 14

NOTICE: Proper alignment of rear impact bar flange to impact bar support is critical. If alignment specifications are not followed, the vehicle may not properly absorb the energy of a collision, causing excessive damage.

NOTICE: Refer to "Notice" on page 10-4-1 of this section.

1. Raise and suitably support vehicle. Refer to SECTION 0A.

Adjust

- Rear bumper.
 - A. Loosen nuts (36).

Figure 13 - Rear Bumper Alignment - (Chevrolet Sedan)

Figure 14 - Rear Bumper Alignment - (Wagon)

B. Move impact bar (80) up or down to achieve proper clearance. Fascia-to-endgate clearance should be adjusted to specifications shown in Figure 14.

The impact bar (80) should be centered on the absorber (30) so the fascia (78), when applied to the impact bar (80), will fit with no interference. The body construction is such that the fascia (78) should fit snugly to the rear end.

Tighten

- Nuts (36) to 27 N.m (20 lb. ft.).

2. Lower vehicle.

BLANK

SECTION 10-5

BODY FRONT END

CAUTION: This vehicle is equipped with Supplemental Inflatable Restraint (SIR). Refer to CAUTIONS in Section 9J under "On-Vehicle Service" and the SIR Component and Wiring Location view in Section 9J before performing service on or around SIR components or wiring. Failure to follow CAUTIONS could result in possible air bag deployment, personal injury, or otherwise unneeded SIR system repairs.

CAUTION: To help avoid personal injury when a vehicle is on a hoist, provide additional support for the vehicle at the opposite end from which components are being removed. This will reduce the possibility of the vehicle falling off the hoist.

NOTICE: Always use the correct fastener in the correct location. When you replace a fastener, use ONLY the exact part number for that application. General Motors will call out those fasteners that require a replacement after removal. General Motors will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

NOTICE: The theft deterrent label found on some major sheet metal must be masked prior to painting, rustproofing, undercoating, etc. The mask must be removed following the above operations. Failure to keep the label clean and readable may result in liability for violation of the Federal Vehicle Theft Prevention Standard, and subject the vehicle owner to possible suspicion that the part was stolen.

GENERAL DESCRIPTION

BODY FRONT END

Figures 1 and 2

The hood (21) is composed of a single outer panel and an inner reinforcement. Further rigidity is obtained by the use of reinforcement braces and brackets located so as not to interfere with adjustments or service repair. The primary latch (35) is attached to the radiator support (31).

Front fenders (25) each consist of an outer panel with a bolt-in reinforcement inner panel.

The fascia, a urethane wrap, attaches to the impact bar and front fenders (25).

LUBRICATION

Figures 1 and 2

The primary latch (35) is a cable released, positive locking latch located on the radiator support (31) which locks the hood-mounted latch bolt. The hood release cable handle (16) is located at the front of the left-hand carpet retainer (52). A "pop-up" spring, attached to the hood (21), provides initial opening of the hood (21) upon release. The secondary latch (30) is used to fully open the hood (21) after the hood release cable handle (16) is pulled.

The secondary latch (30) is attached to the hood (21). To raise the hood (21), once the hood release cable handle (16) has been pulled, the secondary latch (30) attached to the grille lower bracket (50 or 34) must be moved. A rod connects the secondary latch release handle (32) to the secondary latch (30). The assembly should be lubricated periodically with Lubriplate®, GM P/N 1052196.

FASTENERS

NOTICE: When replacing fasteners avoid substituting otherwise similar fasteners in locations which require the use of GM 6174 or GM 6047 type special fasteners for aluminum components. Failing to follow this precaution may result in premature corrosion of the sheet metal in the areas mentioned above.

ANTICORROSION PROTECTION

Anticorrosion materials are part of the coating on most metal panels to provide rust resistance. When servicing these panels, use only GM replacement parts and recoat with specified service primers and paints.

ON-VEHICLE SERVICE

FRONT END PANELS

Radiator Lower Air Deflectors

To replace radiator lower air deflectors, refer to SECTION 6B.

Radiator Air Side Baffles

Figures 3 through 5

Remove or Disconnect

1. Wheelhouse panel extension retainers (84).
2. Baffle retainers (88).
3. Baffle retainers (87).
4. Baffles (85).

Install or Connect

1. Baffles (85).
2. Baffle retainers (87).
3. Baffle retainers (88).
4. Wheelhouse panel extension retainers (84).

Radiator Air Side Deflectors

Figures 3 and 4

The radiator air side deflectors (89) are attached to the bottom of the wheelhouse panel extensions (79) with three bolts/screws. The radiator air side deflectors (121) on police, taxi and public service vehicles are attached with two bolts/screws.

Remove or Disconnect

1. Raise and suitably support vehicle. Refer to SECTION 0A.
2. Bolts/screws (90).
3. Radiator air side deflector (89 or 121) from wheelhouse panel extension (79).

Install or Connect

NOTICE: Refer to "Notice" on page 10-5-1 of this section.

1. Radiator air side deflector (89 or 121) to wheelhouse panel extension (79).
2. Bolts/screws (90).

Tighten

- Bolts/screws (90) to 1.9 N.m (17 lb. in.).
3. Lower vehicle.

Radiator Support

Figures 5 and 6

Remove or Disconnect

1. Disable SIR system. Refer to SECTION 9J.
2. Air intake duct and resonator duct. Refer to SECTION 6E3.
3. Battery tray. Refer to SECTION 6D1.
4. Electrical connectors from inflatable restraint front end sheet metal sensors, outside air temperature sensor, horns and sockets from park and turn signal lamp bulb, front cornering lamp bulb and front sidemarker lamp bulb.
5. Radiator upper mounting panel.
6. Move electrical wiring and connections away from radiator support (31).
7. Headlamp capsule and brace. Refer to SECTION 8B.
8. Cable from primary latch and radiator support. Refer to "Hood Primary Latch Release Cable" in this section.

Important

- Do not remove entire cable. Disconnect from primary latch and radiator support only.
9. Shrouds and radiator from radiator support. Refer to SECTION 6B.
 10. Air conditioning condenser. Refer to SECTION 1B.

11. Wheelhouse panel extension with radiator air side deflector attached. Refer to "Front Wheelhouse Panel Extension" in this section.

12. Wheelhouse panels. Refer to "Front Wheelhouse Panel" in this section.

13. Bolts/screws at radiator support (31).

14. Baffle retainers (88) at radiator support (31).

15. Bolts/screws (66), nuts (74), lower washers (106), upper washers (67), and upper cushions (68).

16. Radiator support (31), lower cushions (69), retainers (70), and shims (71 and 72) from frame (73).

Install or Connect

NOTICE: Refer to "Notice" on page 10-5-1 of this section.

1. Shims (71 and 72), retainers (70), lower cushions (69), and radiator support (31) to frame (73).
2. Upper cushions (68), upper washers (67), bolts/screws (66), lower washers (106) and nuts (74).

Tighten

- Nuts (74) to 50 N.m (37 lb. ft.).
3. Baffle retainers (88) at radiator support (31).
 4. Bolts/screws at radiator support (31).

Figure 6 - Radiator Support-(Typical)

5. Wheelhouse panels. Refer to "Front Wheelhouse Panel" in this section.
6. Wheelhouse panel extensions with radiator air side deflector attached. Refer to "Front Wheelhouse Panel Extension" in this section.
7. Air conditioning condenser. Refer to SECTION 1B.
8. Shrouds and radiator to radiator support Refer to SECTION 6B.
9. Cable to primary latch and radiator support. Refer to "Hood Primary Latch Release Cable" in this section.
10. Headlamp capsule and brace. Refer to SECTION 8B.
11. Radiator upper mounting panel.
12. Position wire harness and secure to radiator support (31).
13. Electrical connectors to inflatable restraint front end sheet metal sensors, outside air temperature sensor, horns and sockets to park and turn signal lamp bulb, front cornering lamp bulb and front sidemarker lamp bulb.
14. Battery tray. Refer to SECTION 6D1.
15. Air intake duct and resonator duct. Refer to SECTION 6E3.
16. Enable SIR system. Refer to SECTION 9J.

Grille

Figures 7 through 10

Remove or Disconnect

1. Four bolts/screws (43).
2. Bolt/screw caps (42) and bolts/screws (44).

4. Bracket (50, 34 or 132) and supports (45), if necessary.
 - A. Remove clip (116) from rod (33).
 - B. Remove two bolts/screws (104).
 - C. Remove two bolts/screws (105).
 - D. Raise bracket (50, 34 or 132) toward hood assembly (21) until rod (33) disconnects from latch (30).
5. Bracket (50, 34 or 132) from supports (45), if necessary.
 - Remove two bolts/screws (47).

Install or Connect

NOTICE: Refer to "Notice" on page 10-5-1 of this section.

1. Bracket (50, 34 or 132) to supports (45), if removed.
 - Install two bolts/screws (47).

Tighten

- Bolts/screws (47) to 2.5 N·m (22 lb. in.).
2. Bracket (50, 34 or 132) and supports (45), if removed.
 - A. Install rod (33) to latch (30).
 - B. Install clip (116) to rod (33).
 - C. Install two bolts/screws (105).
 - D. Install two bolts/screws (104).

Tighten

- Bolts/screws (104 and 105) to 2.5 N·m (22 lb. in.).
3. Grille (51 or 39).
 - Align studs to holes in hood (21).
 4. Bolt/screw caps (42) and bolts/screws (44).

18. Bolts/screws attaching fascia to fender. Refer to SECTION 10-4.
19. Lower vehicle.
20. Upper bracket bolts/screws (62).
21. Shims (63).

- Note placement and number of shims (63) so they can be reinstalled in same location from which they were removed.

22. Lower panel bolt/screw (109).
23. Lower bracket bolt/screw (115).
24. Fender (25).

Figure 15 - Front Wheelhouse Panel

Figure 16 - Front Wheelhouse Panel-(Splash Shield)

Install or Connect

NOTICE: Refer to "Notice" on page 10-5-1 of this section.

Important

- When fender is removed from vehicle, a special insulator must be installed in replacement procedure.

1. Fender (25) and insulator (65).

- Peel paper off insulator (65) and press insulator (65) onto fender (25).

2. Lower bracket bolt/screw (115).

Tighten

- Lower bracket bolt/screw (115) to 50 N.m (37 lb. ft.).

3. Lower panel bolt/screw (109).

Tighten

- Lower panel bolt/screw (109) to 10 N.m (89 lb. in.).

4. Shims (63) in same location from which they were removed.

5. Upper bracket bolts/screws (62).

Tighten

- Upper bracket bolts/screws (62) to 50 N.m (37 lb. ft.).

6. Raise and suitably support vehicle. Refer to SECTION 0A.

7. Bolts/screws attaching fascia to fender. Refer to SECTION 10-4.

8. Wheelhouse panel extension with radiator air side deflectors attached. Refer to "Front Wheelhouse Panel Extension" in this section, but do not lower vehicle at this time.

9. Wheelhouse panel bolts/screws (111).

Tighten

- Wheelhouse panel bolts/screws (111) to 10 N.m (89 lb. in.).

10. Lower vehicle.

11. Wheelhouse panel bolts/screws (75).

Tighten

- Wheelhouse Panel bolts/screws (75) to 25 N.m (18 lb. ft.).

12. Inner panel bolts/screws (23).

Tighten

- Inner panel bolts/screws (23) to 25 N.m (18 lb. ft.).

13. Upper bracket bolts/screws (54), inner panel bolts/screws (55) and baffle bolts/screws (56).

Tighten

- Upper bracket bolts/screws (54) to 10 N.m (89 lb. in.).

- Inner panel bolts/screws (55) to 25 N.m (18 lb. ft.).

- Baffle bolts/screws (56) to 10 N.m (89 lb. in.).

14. Battery tray, if removed. Refer to SECTION 6D1.

15. Wiring harness clips, if removed.

16. Horn. Refer to SECTION 8B.

17. Upper and lower braces (58 and 59).

18. Lower brace nut (61).

Tighten

- Lower brace nut (61) to 25 N.m (18 lb. ft.).

19. Upper brace bolt/screw (60) to nut on fender (25).

20. Upper brace bolt/screw (57) to upper brace nut (9).

Tighten

- Upper brace bolts/screws (57 and 60) to 25 N.m (18 lb. ft.).

21. Front fender lower rear molding, wheel opening molding, and center rear moldings, if removed. Refer to "Exterior Moldings" in this section.

22. Headlamp capsule and brace. Refer to SECTION 8B.
23. Air inlet grille panels. Refer to "Air Inlet Grille Panels" in this section.
24. Hood. Refer to "Hood" in this section.

Front Wheelhouse Panel

Figure 15

Remove or Disconnect

CAUTION: Refer to "Caution" under "Disconnecting the Battery Negative Cable" in SECTION 0A.

1. Battery negative cable.
2. Battery tray, if removing right wheelhouse panel. Refer to SECTION 6D1.
3. Move electrical wiring and connections away from wheelhouse panel (76).
4. Coolant recovery reservoir, if removing right wheelhouse panel. Refer to SECTION 6B.
5. Fuel vapor canister and air intake duct, if removing left wheelhouse panel. Refer to SECTION 6E3.
6. Windshield washer solvent container, if removing left wheelhouse panel. Refer to SECTION 8E.
7. Wiring harness clips at wheelhouse panel (76).
8. Bolts/screws attaching cruise control module to left wheelhouse panel (76), if removing left wheelhouse panel (76).
9. Nuts from studs attaching multi-purpose relay bracket and air conditioning accumulator bracket to right wheelhouse panel (76), if removing right wheelhouse panel (76).
10. Battery cable junction block, if removing right wheelhouse panel. Refer to SECTION 6D1.
11. Wheelhouse panel extension with radiator air side deflector attached. Refer to "Front Wheelhouse Panel Extension" in this section.
12. Tire and wheel. Refer to SECTION 3E.
13. Wheelhouse panel bolts/screws (75 and 111).
14. Wheelhouse panel (76).

Install or Connect

NOTICE: Refer to "Notice" on page 10-5-1 of this section.

1. Wheelhouse panel (76).
2. Wheelhouse panel bolts/screws (75 and 111).

Tighten

- Wheelhouse panel bolts/screws (75) to 25 N·m (18 lb. ft.).
 - Wheelhouse panel bolts/screws (111) to 10 N·m (89 lb. in.).
3. Tire and wheel. Refer to SECTION 3E.

4. Wheelhouse panel extension with radiator air side deflector attached. Refer to "Front Wheelhouse Panel Extension" in this section.
5. Battery cable junction block, if right wheelhouse panel was removed. Refer to SECTION 6D1.
6. Nuts onto studs attaching air conditioning accumulator bracket and multi-purpose relay bracket to right wheelhouse panel (76), if right wheelhouse panel (76) was removed.
7. Bolts/screws attaching cruise control module to left wheelhouse panel (76), if left wheelhouse panel (76) was removed.
8. Wiring harness clips at wheelhouse panel (76).
9. Windshield washer solvent container, if left wheelhouse panel was removed. Refer to SECTION 8E.
10. Fuel vapor canister and air intake duct, if left wheelhouse panel was removed. Refer to SECTION 6E3.
11. Coolant recovery reservoir, if right wheelhouse panel was removed. Refer to SECTION 6B.
12. Battery tray, if right wheelhouse panel was removed. Refer to SECTION 6D1.
13. Battery negative cable.

Front Wheelhouse Panel Splash Shield

Figure 16

Remove or Disconnect

1. Resonator duct, if removing left wheelhouse panel splash shield. Refer to SECTION 6E3.
2. Six splash shield retainers (78).
3. Wheelhouse panel splash shield (77).

Install or Connect

1. Wheelhouse panel splash shield (77).
2. Six splash shield retainers (78).
3. Resonator duct, if removed. Refer to SECTION 6E3.

Front Wheelhouse Panel Extension

Figure 3

Remove or Disconnect

1. Raise and suitably support vehicle. Refer to SECTION 0A.
2. Wheelhouse panel extension retainers (84).
3. Wheelhouse panel extension bolts/screws (82).
4. Wheelhouse panel extension bolts/screws (83).
5. Wheelhouse panel extension nuts (81) from studs (86).
6. Wheelhouse panel extension bolt/screw (80).
7. Wheelhouse panel extension bolts/screws (90).
8. Radiator air side deflector (89).
9. Wheelhouse panel extension (79).

10-5-14 BODY FRONT END

Install or Connect

NOTICE: Refer to “Notice” on page 10-5-1 of this section.

1. Wheelhouse panel extension (79).
2. Radiator air side deflector (89).
3. Wheelhouse panel extension bolts/screws (90).

Tighten

- Wheelhouse panel extension bolts/screws (90) to 1.9 N·m (17 lb. in.).
4. Wheelhouse panel extension bolt/screw (80).

Tighten

- Wheelhouse panel extension bolt/screw (80) to 1.9 N·m (17 lb. in.).
5. Wheelhouse panel extension nuts (81) to studs (86).

Tighten

- Wheelhouse panel extension nuts (81) to 10 N·m (89 lb. in.).
6. Wheelhouse panel extension bolts/screws (83).

Tighten

- Wheelhouse panel extension bolts/screws (83) to 1.9 N·m (17 lb. in.).
7. Wheelhouse panel extension bolts/screws (82).

Tighten

- Wheelhouse panel extension bolts/screws (82) to 1.9 N·m (17 lb. in.).
8. Wheelhouse panel extension retainers (84).
 9. Lower vehicle.

HOOD

Figures 11 and 17

NOTICE: Raise hood and install protective coverings over fender areas to prevent damage to paint and moldings when removing or installing the hood.

Remove or Disconnect

1. Underhood lamp wire.
2. Mark positions of hood hinges (24) on hood (21) to allow alignment during installation.
3. With aid of a helper, support hood (21).
4. Hood open assist rod (28) from ball stud (27).
5. Hood hinge bolts/screws (22 and 26).
6. Hood (21).

Figure 17 - Hood Open Assist Rod

Install or Connect

NOTICE: Refer to “Notice” on page 10-5-1 of this section.

1. Hood (21), with aid of a helper so that alignment marks made during removal line up with hood hinges (24).
2. Hood hinge bolts/screws (22 and 26).

Tighten

- Hood hinge bolts/screws (22) to 25 N·m (18 lb. ft.).
 - Hood hinge bolt/screw (26) to 8 N·m (71 lb. in.).
3. Hood open assist rod (28) to ball stud (27).

Inspect

NOTICE: Failure to align hood hinge properly may result in damage to the hood seal.

- A. Close hood (21) slowly, checking clearance between hood (21) and front fenders (25).
- B. With hood (21) closed, check alignment of hood (21). For hood alignment specifications, refer to “Body Panel Adjustment and Alignment” in this section.

Figure 18 - Hood Insulator

Adjust

- Hood, if necessary. Refer to “Hood Adjustment” in this section.

4. Underhood lamp wire.

Hood Insulator

Figure 18

Remove or Disconnect

1. Retainers (131) from hood (21).
2. Hood insulator (130).

Install or Connect

1. Hood insulator (130).
2. Retainers (131) to hood (21).

Hood Hinge

Figures 11, 17 and 19

NOTICE: Raise hood and install protective coverings over the fender areas to prevent damage to paint and moldings when removing or installing hood hinges.

Remove or Disconnect

1. Mark position of hood hinge (24) on hood (21) to allow alignment during installation.
2. Safely support hood (21).
3. Block hood (21) on side where hood hinge (24) is to be removed.
4. Outer seals (4).
5. Hood open assist rod (28) from ball stud (27).

6. Hood hinge bolts/screws (22 and 26).
7. Inner panel bolts/screws (23).
8. Hood hinge (24).

Install or Connect

NOTICE: Refer to “Notice” on page 10-5-1 of this section.

1. Hood hinge (24) so that it lines up with marks made on hood (21) during removal.
2. Inner panel bolts/screws (23).
3. Hood hinge bolts/screws (22 and 26).

Tighten

- Hood hinge bolts/screws (22) and inner panel bolts/screws (23) to 25 N.m (18 lb. ft.).
 - Hood hinge bolt/screw (26) to 8 N.m (71 lb. in.).
4. Hood open assist rod (28) to ball stud (27).
 5. Outer seals (4).
 6. Remove block and close hood (21).

NOTICE: Failure to align hood hinge properly may result in damage to the hood seal.

Inspect

- A. Close hood (21) slowly, checking clearance between hood (21) and front fenders (25).
- B. With hood (21) closed, check alignment of hood (21). For hood alignment specifications, refer to “Body Panel Adjustment and Alignment” in this section.

Figure 19 - Air Inlet Grille Panel

Adjust

- Hood, if necessary. Refer to “Hood Adjustment” in this section.

Hood Primary Latch

Figure 20

Remove or Disconnect

1. Primary latch release cable from primary latch. Refer to “Hood Primary Latch Release Cable” in this section.
2. Mark position of primary latch (35).
3. Bracket bolts/screws (36) and primary latch (35).

Install or Connect

NOTICE: Refer to “Notice” on page 10-5-1 of this section.

1. Primary latch (35) and bracket bolts/screws (36).
 - Align primary latch (35) with marks made during removal.

Tighten

- Bracket bolts/screws (36) to 25 N·m (18 lb. ft.).

Figure 20 - Hood Primary Latch

2. Primary latch release cable to primary latch. Refer to "Hood Primary Latch Release Cable" in this section.
3. Check operation of primary latch release cable.

Adjust

- Primary latch (35), if necessary.

Hood Secondary Latch

Figure 10

Remove or Disconnect

1. Secondary latch bolts/screws (29).
2. Secondary latch (30).
3. Clip (116) from rod (33).
4. Rod (33) from secondary latch (30) and handle (32).

Install or Connect

NOTICE: Refer to "Notice" on page 10-5-1 of this section.

1. Rod (33) to secondary latch (30) and handle (32).
2. Clip (116) to rod (33).
3. Secondary latch (30).
4. Secondary latch bolts/screws (29).

Tighten

- Secondary latch bolts/screws (29) to 10 N.m (89 lb. in.).

Hood Secondary Latch Release Handle

Figures 7 through 10

Remove or Disconnect

1. Secondary latch release bolts/screws (40).
2. Handle (32).
3. Clip (116) from rod (33).
4. Rod (33) from handle (32) and secondary latch (30).

Install or Connect

NOTICE: Refer to "Notice" on page 10-5-1 of this section.

1. Rod (33) to handle (32) and secondary latch (30).
2. Clip (116) to rod (33).
3. Handle (32).
4. Secondary latch bolts/screws (40).

Tighten

- Secondary latch bolts/screws (40) to 2.3 N.m (20 lb. in.).

Hood Primary Latch Release Cable

Figures 20 through 22

Remove or Disconnect

1. Cable (48) from primary latch (35) and radiator support (31).
 - A. Disconnect cable (48) by prying cable (48) from primary latch (35).
 - B. Pry cable grommet from primary latch (35).
 - C. Pull cable (48) out through hole in radiator support (31).
2. Windshield washer solvent container. Refer to SECTION 8E.
3. Four carpet retainer bolts/screws (15) from left side carpet retainer (52) ahead of center pillar.
4. Left side body hinge pillar trim panel (13).
 - Slide left side body hinge pillar trim panel (13) out from beneath left side carpet retainer (52).
5. Primary latch release cable bolts/screws (5) and hood release cable handle (16).
6. Cowl grommet.
7. Cable (48).
 - Note where cable (48) is routed before removing so it can be installed correctly.

Install or Connect

NOTICE: Refer to "Notice" on page 10-5-1 of this section.

1. Cable (48) through cowl.
 - Route cable (48) where previously noted.
2. Cowl grommet.
3. Hood release cable handle (16) and primary latch release cable bolts/screws (5).

Tighten

- Primary latch release cable bolts/screws (5) to 1.9 N.m (17 lb. in.).
4. Left side trim panel (13).
 - Slide left side trim panel (13) under left side carpet retainer (52).
 5. Four carpet retainer bolts/screws (15) to left side carpet retainer (52) ahead of center pillar.

Tighten

- Carpet retainer bolts/screws (15) to 1.3 N.m (12 lb. in.).
6. Windshield washer solvent container. Refer to SECTION 8E.
 7. Cable (48) to primary latch (35).
 - A. Route cable (48) through hole in radiator support (31).
 - B. Insert end of cable (48) into latch clip and attach cable grommet.

Figure 21 - Body Hinge Pillar Trim Panel

Figure 22 - Hood Primary Latch Release Cable

Hood Open Assist Rod

Figure 17

CAUTION: Hood open assist rods hold the hood in the up position. Ensure the hood is safely supported when hood open assist rods are removed or installed to avoid the possibility of damage to the vehicle or personal injury.

Remove or Disconnect

1. Raise hood (21) to full open position.
2. Safely support hood (21).
3. Hood open assist rod (28) from ball stud on bracket (49).
4. Hood open assist rod (28) from front fender ball stud (27).
5. Front fender ball stud (27), if required.

Install or Connect

NOTICE: Refer to "Notice" on page 10-5-1 of this section.

1. Front fender ball stud (27), if removed.

Tighten

- Front fender ball stud (27) to 27 N.m (20 lb. ft.).
2. Hood open assist rod (28) to front fender ball stud (27).
 3. Hood open assist rod (28) to ball stud (27) on bracket (49).

Hood Adjust Front Bumpers

Figure 23

Remove or Disconnect

- Bumper (103) from radiator support (31) by turning 1/8 turn counterclockwise and pulling up.

Install or Connect

- Bumper (103) to radiator support (31) by turning 1/8 turn clockwise.

Adjust

- Bumper (103). Refer to "Body Panel Adjustment and Alignment" in this section.

Air Inlet Grille Panels

Figure 19

Tool Required:
J 21104-B Universal Weatherstrip Remover

Remove or Disconnect

1. Hood seal (3) from left and right air inlet grille panels (1 and 2).
 - Remove 15 retainers using J 21104-B.
2. Wiper arms. Refer to SECTION 8E.
3. Outer seals (4).
4. Two covers (11) and eight grille panel bolts/screws (6) from left and right air inlet grille panels (1 and 2).
5. Screen retainer bolt/screw (8) and retainer (10).
6. Retainers (7).

NOTICE: When removing left and right air inlet grille panels, always remove the left first, then the right, to avoid windshield breakage.

7. Left and right air inlet grille panels (1 and 2).

Install or Connect

NOTICE: Refer to "Notice" on page 10-5-1 of this section.

NOTICE: When installing left and right air inlet grille panels, the right must be installed first, then the left, to avoid windshield breakage.

1. Right and left air inlet grille panels (1 and 2).
2. Retainers (7).
3. Screen retainer bolt/screw (8) and retainer (10).
4. Two covers (11) and eight grille panel bolts/screws (6).

Tighten

- Grille panel bolts/screws (6) to 1.5 N.m (13 lb. in.).
 - Screen retainer bolt/screw (8) to 1.5 N.m (13 lb. in.).
5. Outer seals (4).

Figure 23 - Hood Adjust Front Bumper

10-5-20 BODY FRONT END

6. Wiper arms. Refer to SECTION 8E.
7. Hood seal (3) to left and right air inlet grille panels (1 and 2).
 - Install 15 retainers firmly.

FRONT END SEALING

All potential water leak locations are sealed in production with high quality durable sealers. To reseal specific areas, a high quality medium-bodied sealer that will remain flexible after curing and can be painted should be used. Refer to SECTION 10-1.

BODY HINGE PILLAR TRIM PANELS

Figure 21

The left trim panel (13) attaches under the left side carpet retainer (52) which contains the hood release cable handle (16) for the cable. The right trim panel (14) attaches under the right side carpet retainer (53). This trim panel (14) covers the Daytime Running Lamp (DRL) module or twilight sentinel module.

Remove or Disconnect

1. Four carpet retainer bolts/screws (15) from left or right side carpet retainer (52 or 53), just ahead of center pillar.
2. Left or right trim panel (13 or 14).
 - Slide left or right trim panel (13 or 14) out from beneath left or right side carpet retainer (52 or 53).

Install or Connect

NOTICE: Refer to “Notice” on page 10-5-1 of this section.

1. Left or right trim panel (13 or 14) under left or right side carpet retainer (52 or 53).
2. Four carpet retainer bolts/screws (15) to left or right side carpet retainer (52 or 53), just ahead of center pillar.

Tighten

- Carpet retainer bolts/screws (15) to 1.3 N.m (12 lb. in.).

Figure 24 - Door Jamb Switch

AUDIO SPEAKERS

NOTICE: All Delco® audio systems have ungrounded speakers. Installing add-on tape players, CB radios or other units which use the vehicle speakers may damage your Delco® audio system. Please consult your dealer in advance if you are considering additions. Refer to SECTION 9A for speaker information.

FRONT DOOR JAMB SWITCHES

Figures 24 and 25

Door jamb switches (17 or 18) consist of a plunger, plunger collar, threaded retainer and terminals. They are installed in the door hinge pillars. When the door of the vehicle is closed, the plunger is depressed which creates an open in the ground circuit. When the door is opened, the plunger is released and completes the circuit to ground.

When a new door jamb switch (17 or 18) is installed and the door is closed the first time, the plunger is forced into the sleeve and automatically adjusts the door jamb switch (17 or 18) for that particular door. If a door jamb switch (17 or 18) fails, it should not be readjusted by hand. A new door jamb switch (17 or 18) should be installed.

Remove or Disconnect

CAUTION: Refer to “Caution” under “Disconnecting the Battery Negative Cable” in SECTION 0A.

1. Battery negative cable.
2. Double or single terminal door jamb switch (17 or 18).
3. Electrical connector(s) (20) and seal (19).

Install or Connect

NOTICE: Refer to “Notice” on page 10-5-1 of this section.

1. Seal (19) and electrical connector(s) (20).
2. Double or single terminal door jamb switch (17 or 18).

Tighten

- Door jamb switch (17 or 18) to 8 N.m (71 lb. in.).
- 3. Battery negative cable.

FRONT LICENSE BRACKET

Figure 26

Remove or Disconnect

1. Bolts/screws (92).

Figure 25 - Door Jamb Switch Installation

2. Bracket (91).

Install or Connect

NOTICE: Refer to "Notice" on page 10-5-1 of this section.

1. Bolt/screw (92) to bottom hole in bracket (91) so that only screw tip is protruding.
2. Align bracket (91) to fascia (108), placing screw tip on dimple or in lower hole in fascia (108).
3. Bolt/screw (92) to fascia (108).
4. If upper holes are not present in fascia (108), drill two holes in fascia (108) where two upper holes in bracket (91) are located.
5. Remaining two bolts/screws (92).

Tighten

- Bolts/screws (92) to 5.5 N·m (49 lb. in.).

EXTERIOR MOLDINGS

Figures 27 through 30

NOTICE: Failure to place a protective shield over nearby trim and paint may cause damage to the vehicle.

Adhesive Body Stripe (Wagon)

Refer to SECTION 10-1 for removal and installation of adhesive body stripe on vehicles without woodgrain.

Woodgrain Transfers (Wagon)

For removal and installation of woodgrain transfers, refer to SECTION 10-1.

Figure 26 - Front License Bracket

Figure 27 - Front Fender Lower Rear Molding-(Chevrolet Sedan and Wagon, Buick Sedan)

Weld Stud Replacement

If a weld stud on an outer panel becomes damaged or broken off, a replacement weld stud must be installed. For weld stud replacement, refer to SECTION 10-1.

Front Fender Lower Rear Molding

Figures 27 and 28

 Remove or Disconnect

1. Lower rear molding bolts/screws (94 or 95).
2. Lower rear molding (93).

 Install or Connect

NOTICE: Refer to “Notice” on page 10-5-1 of this section.

1. Lower rear molding (93).
2. Lower rear molding (94 or 95).

Tighten

- Lower rear molding bolts/screws (94 or 95) to 1.3 N.m (12 lb. in.).

Front Fender Transfer Upper Finish Moldings

WAGON

Figure 30

 Remove or Disconnect

1. Finish molding bolt/screw (128).
2. Finish moldings (123 and 124) together.

Figure 28 - Front Fender Lower Rear Molding

Figure 29 - Front Fender Transfer Lower Rear Finish Molding-(Buick Wagon)

3. Disengage upper edge of finish molding (124) and (123) separate.

 Install or Connect

NOTICE: Refer to “Notice” on page 10-5-1 of this section.

1. Finish molding (123) to clips on fender (25).
2. Finish molding (124) to clips on fender (25).

Figure 30 - Front Fender Transfer Upper Finish Molding-(Wagon)

Figure 31 - Front Fender Wheel Opening Molding-(Chevrolet)

Tighten

- Finish molding nuts (128) to 1.3 N·m (12 lb. in.).
- Disengage studs from nuts (96) and finish molding (124) from (129) by pulling gently.

Front Fender Transfer Lower Rear Finish Molding

BUICK WAGON

Figure 29

Remove or Disconnect

1. Finish molding bolt/screw (126).
2. Finish molding (122) from clip (127) on fender (25).

- Lift up on finish molding (122) and pull top of finish molding (122) out gently.

Install or Connect

NOTICE: Refer to "Notice" on page 10-5-1 of this section.

1. Finish molding (122) to clip (127) on fender (25).
 - A. Engage bottom edge of finish molding (122) to bottom of clip (127).

3. Finish molding (128) nuts (96).
 - A. Engage bottom edge of finish moldings (123 and 124 to bottom of clips (129).
 - B. Push up on bottom of finish molding (124) until top engage with top of clip (129).
4. Finish molding Bolt/screw (128).

Figure 32 - Front Fender Wheel Opening Molding-(Buick Wagon)

- B. Push up on bottom of finish molding (122) until top of finish molding (122) engages with top of clip (127).

2. Finish molding bolt/screw (126).

Tighten

- Finish molding bolt/screw (126) to 1.3 N·m (12 lb. in.).

3. Disengage studs from nuts (96) and finish molding (124) from clips (129) by pulling gently.

Install or Connect

1. Finish moldings (123 and 124) together.
 - A. Push studs into nuts (96).
 - B. Engage finish molding (124) to clips (129). Push gently to secure.
2. Finish molding bolt/screw (128).

Tighten

- Finish molding bolt/screw (128) to 1.3 N·m (12 lb. in.).

Front Fender Wheel Opening Moldings

Figures 31 through 33

Remove or Disconnect

1. Lower rear molding bolts/screws (95).
2. Wheel opening molding (97), or woodgrain wheel opening molding (125), if Buick wagon.

Install or Connect

NOTICE: Refer to "Notice" on page 10-5-1 of this section.

1. Wheel opening molding (97), or woodgrain wheel opening molding (125), if Buick wagon.
2. Lower rear molding bolts/screws (95).

Tighten

- Lower rear molding bolts/screws (95) to 1.3 N·m (12 lb. in.).

Front Fender Center Rear Molding

BUICK SEDAN

Figure 33

Remove or Disconnect

1. Lower rear molding bolt/screw (95) from wheel opening molding (97).
2. Center rear molding (113).

- Push down on top of center rear molding (113) while pulling bottom away from fender (25). Push bottom upward to disengage top of molding from clip.

Install or Connect

NOTICE: Refer to "Notice" on page 10-5-1 of this section.

1. Center rear molding (113).
 - A. Place bottom of center rear molding (113) behind bottom of clip.
 - B. Push bottom of center rear molding (113) up and snap top of center rear molding (113) into place.
2. Lower rear molding bolt/screw (95) to wheel opening molding (97).

**Tighten**

- Lower rear molding bolt/screw (95) to 1.3 N.m (12 lb. in.).

Front Fender Center Rear Molding (Adhesive Type)

BUICK SEDAN

Figure 33

NOTICE: To avoid damaging to underlying paints finish, do not use pointed or sharp instrument for removal of molding from quarter panel.

**Remove or Disconnect**

1. Molding by starting at one edge and peeling molding from front fender.
 - Application of heat to molding at point of removal aids removal operation.
2. All trace of adhesive residue from painter surface with silicone, wax and grease remover.

**Install or Connect**

NOTICE: Always refer to manufacturer's packaged instructions to avoid damage.

1. Prepare surface.

**Clean**

- A. Painted surface with silicone, wax and grease remover.
- B. Area where molding will be applied with a 50-50 mixture of isopropyl alcohol and water.
- C. Remove backing material of molding as necessary.

2. Molding to front fender.

- For up/down location, refer to (Figure 1) for set up dimensions.

**Important**

- Roll the molding with approximately 25 lb. force over each adhesive contact point.
- Be certain that adhesive contact points make full contact on surface or molding will not adhere.

Headlamp Opening Molding

BUICK SEDAN

Figure 34

**Remove or Disconnect**

1. Raise hood (21) to full open position.
2. Headlamp opening molding bolts/screws (118).

Figure 33 - Front Fender Center Rear Molding-(Buick Sedan)

10-5-26 BODY FRONT END

3. Headlamp opening molding (117).

Install or Connect

NOTICE: Refer to "Notice" on page 10-5-1 of this section.

1. Headlamp opening molding (117).
2. Headlamp opening molding bolts/screws (118).

Tighten

- Headlamp opening molding bolts/screws (118) to 1.3 N.m (12 lb. in.).
3. Close hood (21).

Front Fender Park Lamp Upper Molding

BUICK SEDAN

Figure 34

Remove or Disconnect

1. Front cornering/turn signal lamp. Refer to SECTION 8B.
2. Park lamp upper bolts/screws (120).
3. Park lamp upper molding (119).

Figure 34 - Front Fender Park Lamp Upper Molding-(Buick Sedan)

Install or Connect

NOTICE: Refer to "Notice" on page 10-5-1 of this section.

1. Park lamp upper molding (119).
2. Park lamp upper bolts/screws (120).

Tighten

- Park lamp upper bolts/screws (120) to 1.3 N.m (12 lb. in.).
3. Front cornering/turn signal lamp. Refer to SECTION 8B.

HOOD ORNAMENT

Figure 35

Remove or Disconnect

1. Raise hood (21).
2. Nut (101), washer (100) and spacer (99) from underside of hood (21).
3. Hood ornament (12 or 98).

Install or Connect

NOTICE: Refer to "Notice" on page 10-5-1 of this section.

1. Hood ornament (12 or 98).
2. Spacer (99), washer (100) and nut (101) to underside of hood (21).

Tighten

- Hood ornament nut (101) to 6.5 N.m (58 lb. in.).
3. Close hood (21).

BODY PANEL ADJUSTMENT AND ALIGNMENT

Figures 36 through 38

NOTICE: Failure to align hood hinge properly could result in damage to the hood seal.

For proper fit, appearance, and operation of doors (102) and hood (21), front end body panels should be adjusted to the specifications shown in Figures 36 through 38.

Hood Adjustment

Slotted holes are provided at all hood hinge attaching points for proper adjustment both vertically and forward and rearward. Vertical adjustment at the front may be made by adjusting rubber bumpers up and down. For best results, make one adjustment at a time.

Figure 35 - Hood Ornament

Raise or Lower Rear Corners of Hood

Figures 11, 19, 20, 36, 37 and 38

Remove or Disconnect

- Right or left outer seal (4).

NOTICE: Failure to align hood hinge properly could result in damage to the hood seal.

Adjust

- Hood hinge (24).
 - Loosen inner panel bolts/screws (23).
 - Move hood hinge (24) up or down, as needed. For hood alignment specifications refer to Figures 36 through 38.

NOTICE: Refer to "Notice" on page 10-5-1 of this section.

Tighten

- Inner panel bolts/screws (23) to 25 N·m (18 lb. ft.).

Install or Connect

- Right or left outer seal (4).
- Repeat above steps for opposite side of hood (21), if necessary.

Raise or Lower Front Corners of Hood

Figures 20, 36, 37 and 38

Adjust

- Bumpers (103).
 - Close hood (21) firmly.
 - Determine amount of adjustment needed. For hood alignment specifications refer to Figures 36 through 38.
 - Raise hood (21) to full open position.
 - Change height by loosening jam nuts, and turning bumpers (103) up or down, and tightening jam nuts.
 - Repeat above steps until hood (21) is properly aligned.

Forward and Rearward Hood Adjustment

Figures 11, 36, 37 and 38

NOTICE: Failure to align hood hinge properly could result in damage to the hood seal.

Adjust

- Hood (21).
 - Loosen hood hinge bolts/screws (22 and 26).
 - Move hood (21) forward or rearward. For hood alignment specifications refer to Figures 36 through 38.

NOTICE: Refer to "Notice" on page 10-5-1 of this section.

Tighten

- Hood hinge bolts/screws (22) to 25 N·m (18 lb. ft.).
- Hood hinge bolt/screw (26) to 8 N·m (71 lb. in.).

- Repeat above steps for opposite side of hood (21), if necessary.

Front Fender Adjustment

Figures 12 through 14, 36, 37 and 38

Adjust

- Front fender (25).
 - Loosen bolts/screws at locations where adjustment is to be made.

NOTICE: Be careful when prying on body panels to avoid damage.

Tighten

- Pry shift panels to allow clearance for removal or installation of shims (63).

- All bolts/screws that were loosened to proper torque. Refer to "Specifications" in this section.

2. Remove or install shims (63) as needed.

3. Primary latch (35), if necessary.

NOTICE: Refer to "Notice" on page 10-5-1 of this section.

SECTION 10-6

DOORS

CAUTION: This vehicle is equipped with Supplemental Inflatable Restraint (SIR). Refer to CAUTIONS in Section 9J under "On-Vehicle Service" and the SIR Component and Wiring Location view in Section 9J before performing service on or around SIR components or wiring. Failure to follow CAUTIONS could result in possible air bag deployment, personal injury, or otherwise unneeded SIR system repairs.

CAUTION: Make sure to disconnect the front side door window switch when working inside the driver's door. When operated, the Express Down feature allows the front side door window to drop very quickly which could cause personal injury.

NOTICE: Always use the correct fastener in the correct location. When you replace a fastener, use ONLY the exact part number for that application. General Motors will call out those fasteners that require a replacement after removal. General Motors will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

NOTICE: The theft deterrent label found on some major sheet metal must be masked prior to painting, rustproofing, undercoating, etc. The mask must be removed following the above operations. Failure to keep the label clean and readable may result in liability for violation of the Federal Vehicle Theft Prevention Standard, and subject the vehicle owner to possible suspicion that the part was stolen.

GENERAL DESCRIPTION

This section contains the service operations necessary for the removal, installation, adjustment, and sealing of doors, hardware, and trim (Figures 1 through 17).

THREAD LOCKING FASTENERS

All factory installed door hardware attaching bolts/screws contain an epoxy thread-locking compound to ensure the torque setting will be maintained.

Service replacement bolts/screws may not contain a thread-locking compound. Such bolts/screws must be treated with No. 1052279, Loctite® 75, or equivalent. The adhesive is placed on the fastener prior to installation. After the fastener is installed and tightened, the adhesive will cure, preventing the fastener from becoming loose.

WATER DEFLECTOR

A waterproof plastic deflector is used to seal the door inner panel and prevent entry of water into the body. The deflector is secured to the door inner panel with pressure sensitive adhesive located on the outboard surface of the deflector. This allows the deflector to be peeled back as needed to service door components.

LOCK STRIKERS

The lock strikers consist of a dual pin striker plate attached to a floating anchor plate in the body. This design is also known as the "mini-wedge" type lock striker. The door is secured in the closed position when the door lock fork snaps over and engages the first striker pin.

DOOR LOCKING SYSTEM MODULE

The door locking system module contains the door lock and door lock actuators, inside handle and rods. The module receives its rigidity from the door structure and should not be checked for proper operation without first mounting to the door.

OUTSIDE HANDLES

Outside handles actuate front and rear side door locks through connecting rods. The right front and left rear are identical and the left front and right rear are identical.

REAR WINDOW LOCKOUT FEATURE

The rear window lockout feature consists of a "lockout" switch located on the driver side front power window switch. The "lockout" switch allows the driver to prevent rear seat occupants from operating power windows. When in lockout mode, the driver may still control rear window operation.

REAR DOOR SECURITY LOCK

The rear door security lock (lock-out switch) is an integral part of the door lock. No attempt should be made to repair the rear door security lock of the lock itself.

EXPRESS DOWN

Express down fully lowers the driver's front side door window when the front side door window switch is fully pressed and then released. The express down module is an integral part of the window switch.

DOOR HINGES

All but the front side door lower hinge are directly accessible. The front side door lower hinge requires partial removal of the front fender for replacement, or J 39927 Door Hinge Adjustment Wrench for adjustment.

OUTSIDE REARVIEW MIRRORS

The outside rearview mirrors are remote control electric and/or remote control. Electric mirrors have a heated face.

ON-VEHICLE SERVICE

FRONT SIDE DOOR INTERIOR TRIM

Front Side Door Trim

Figures 18 through 23

The front and rear side door trim is serviced the same way. Use the following procedure for both. Replace the spring clip (GM P/N 10221260) whenever the switch mount plate (6 or 160) is removed from the door trim.

Tool Required:

J 24595-C Door Trim Pad and Garnish Clip Remover

 Remove or Disconnect

CAUTION: Refer to "CAUTION" under "Disconnecting the Battery Negative Cable" in SECTION 0A.

1. Battery negative cable.

Figure 18 - Removing Front Side Door Right/Left Trim

2. Bezel bolt/screw.
3. Bezel (7 or 211).
4. Electrical connectors from bezel (7 or 211).
5. Switch mount plate (6 or 160) or switch panel (3).
 - A. Insert screwdriver under forward edge of switch (6 or 160) to disengage spring clip.
 - B. Slide forward and up to remove.
 - C. Insert screwdriver in outward slots to disengage tabs and remove switch panel (3) (Chevrolet).
6. Front side door window switch floodlamp, if equipped.
 - Twist 90 degrees to remove.
7. Loosen setscrew (257) connecting knob (183) from switch mount plate.
8. Knob (183), if equipped.
9. Outside rearview mirror knob (183) to bezel (211), if equipped.
10. Front side door ashtray, if equipped. Refer to "Front Side Door Ashtray" in this section.
11. Front side door window regulator handle, if equipped. Refer to "Front Side Door Window Regulator Handle" in this section.
12. Electrical connectors from switch (6 or 160).
13. Pull handle bolts/screws.
14. Front side door armrest, if necessary. Refer to "Front Side Door Armrest" in this section.

Figure 19 - Removing Front Side Door Armrest Switch Mount Plate-(Buick)

15. Front side door map pocket bolt/screw (248), located in lower edge of door in carpeted area.
 - If rear side door, remove rear side door trim finish panel bolt/screw (249), located above edge of rear side door carpet strip.
16. Courtesy lamp connector from body crosscar wiring harness.
17. Trim (1, 2, 5 or 366) using J 38778.
18. Electrical connectors from front side door courtesy lamp.

Install or Connect

NOTICE: Refer to "Notice" on page 10-6-1 of this section.

1. Replace any damaged retainers on trim pad (1).
2. Pull electrical connectors through their respective cutouts in trim (2).
3. Front side door courtesy lamp electrical connectors.
4. Trim (2), using a clean, rubber mallet to seat retainers (1).
5. Front side door map pocket bolt/screw (248), located in lower edge of door in carpeted area (Buick).
 - If rear side door, install rear side door trim finish panel bolt/screw (249), located above edge of rear side door carpet strip.

Figure 20 - Removing Front Side Door Armrest Switch/Knob Mount Plate-(Buick)

Tighten

- Front side door map pocket bolt/screw (248) or rear side door trim finish panel bolt/screw (249) to 1.5 N.m (13 lb. in.).
6. Front side door armrest. Refer to "Front Side Door Armrest" in this section.
 7. Pull handle bolts/screw (253) and (254).

Tighten

- Pull handle bolts/screws (253) and (254) to 6 N.m (53 lb. in.).
8. Switch electrical connectors.
 9. Knob (183).
 10. Tighten setscrew (257) connecting knob (183) to bezel (211).

Figure 21 - Removing Accessory Switch Panel-(Chevrolet)

Figure 22 - Outside Rearview Control Knob-(Chevrolet)

10-6-22 DOORS

11. Front side door window switch floodlamp, if equipped.
 - Twist 90 degrees to secure.
12. Snap bezel (7 or 211) into trim (1 or 5).
13. Bolt/screw (8) to 3.25 N·m (30 lb. in.).

Figure 23 - Removing Front Side Door Inside Handle Bezel

Tighten

- Bolt/screw (8) to 1.5 N·m (13 lb. in.).
14. New spring clip to switch mount plate (6 or 160).
 - Slide clip into groove on bezel until fully seated.
 15. Front side door ashtray, if equipped. Refer to "Front Side Door Ashtray" in this section.
 16. Front side door window regulator handle, if equipped. Refer to "Front Side Door Window Regulator Handle" in this section.
 17. Electrical connectors to switch mount plate (6 or 160) or switch panel (3).
 18. Switch mount plate (6 or 160) or switch panel (3).
 - Snap in to secure.
 19. Battery negative cable.

Front Side Door Armrest

CHEVROLET

Figure 24

The front and rear door armrests are serviced the same way. Use the following procedure for both.

Remove or Disconnect

1. Bolts/screws (9).
2. Armrest (10) from hanger plate (11).
 - Pull armrest (10) away from door to disengage clips.

Figure 24 - Removing Front Side Door Armrest-(Chevrolet)

↔ Install or Connect

NOTICE: Refer to "Notice" on page 10-6-1 of this section.

1. Armrest (10) to hanger plate (11).
 - Push armrest (10) toward door to engage clips.
- 2 Bolts/screws (9).

⌚ Tighten

- Bolts/screws (9) to 2.4 N.m (21 lb. in.).

Body Side Front Window Garnish Molding

Figure 25

↔ Remove or Disconnect

1. Front side door trim. Refer to "Front Side Door Trim" in this section.
2. Bolt/screw (13).
3. Fastener (14) from door inner panel.
4. Garnishing molding (12).
 - Disengage clips.

↔ Install or Connect

NOTICE: Refer to "Notice" on page 10-6-1 of this section.

1. Molding (12).
 - Engage clips.

2. Fastener (14) to hole in door inner panel.
3. Bolt/screw (13).

⌚ Tighten

- Bolt/screw (13) to 1.3 N.m (12 lb. in.).
4. Front side door trim. Refer to "Front Side Door Trim" in this section.

FRONT SIDE DOOR EXTERIOR TRIM

Front Side Door Moldings

NOTICE: When removing or installing any outside molding, cover adjacent finishes with masking tape to prevent damage to the finish. Use proper tools and care to prevent damage to the molding. Seal all holes for bolts/screws or clips in body panels with body caulking compound or presealed bolts/screws, nuts, or clips to prevent water entry into the body interior.

FRONT SIDE DOOR TRANSFER UPPER FINISH MOLDING

The rear side door transfer upper finish molding is serviced the same way as the front side door transfer upper finish molding. Use the following procedure for both.

Figure 25 - Removing Body Side Front Window Garnish Molding

Figure 26 - Wood Grain Side Door Transfer Upper Finish Molding-(Wagon)

WAGON

Figure 26

Remove or Disconnect

1. Bolt/screw (147), if necessary.
2. Molding (190 or 191).
 - Carefully pry molding (190 or 191) off with flat-bladed tool such as a putty knife.
3. Clips (151 or 152), if necessary.
 - Slide forward to disconnect.
4. Nuts (192 or 193), if necessary.

Install or Connect

NOTICE: Refer to "Notice" on page 10-6-1 of this section.

1. Nuts (192 or 193), if removed.
2. Clips (151 or 152), if removed.
 - Slide rearward to engage.
3. Molding (190 or 191).
 - Align studs to nuts (192 or 193) and snap onto clips (151 or 152).
4. Bolt/screw (147), if necessary.

Tighten

- Bolt/screw (147) to 1.3 N·m (12 lb. in.).

FRONT SIDE DOOR TRANSFER LOWER FINISH MOLDING

The rear side door transfer lower finish molding is serviced the same way as the front side door transfer lower finish molding. Use the following procedure for both.

BUICK SEDAN

Figure 27

Remove or Disconnect

1. Nut (149).
2. Molding (197).
 - Push up on bottom of molding (197) and remove from tops of clips (194).
3. Clips (194), if necessary.
 - Slide rearward and then downward to disconnect.

Install or Connect

NOTICE: Refer to "Notice" on page 10-6-1 of this section.

1. Clips (194), if removed.
 - A. Place over bottom studs.
 - B. Slide upward.
 - C. Align upper holes in clips (194) to upper studs.

Figure 27 - Wood Grain Side Door Transfer Lower Finish Molding-(Buick Wagon)

- D. Slide upper parts of clips (194) forward.
2. Molding (197).
 - A. Engage bottom edge to bottoms of clips (194).
 - B. Push up on bottom of molding (197) until top engages with tops of clips (194).
3. Nut (149).

**Tighten**

- Nut (149) to 3.5 N·m (31 lb. in.).

FRONT SIDE DOOR CENTER MOLDING

The rear side door center molding is serviced the same way as the front side door center molding. Use the following procedures for both.

BUICK SEDAN**Figure 28 and 29****Remove or Disconnect**

1. Molding by starting at one edge and peeling molding from rear door.
 - Application of heat to molding at point of removal aids removal operation.
2. All traces of adhesive residue from painted surfaces with a silicone, wax, and grease remover.

**Install or Connect**

1. Prepare surface.

**Clean**

- A. Painted surface with silicone, wax, and grease remover.
- B. Area where molding will be applied with a 50-50 mixture of isopropyl alcohol and water.
 - Wipe panel surface with a clean cloth while solvent is still wet and allow to dry.
2. Remove backing material of molding as necessary.
3. Molding to door.
 - For up/down location, Refer to (Figures 2 and 3) for set-up dimensions.
 - For fore/aft location, place exterior center molding to trailing edge of outer door panel to provide the most door swing clearance at leading edge.

**Important**

- Roll the molding with approximately 25 lb. of force over each adhesive contact point.
- Be certain that adhesive contact points make full contact on surface or molding will not adhere.

CHEVROLET SEDAN**Remove or Disconnect**

1. Molding (226).
 - A. Hold hot air gun 152 mm (6 inches) away from molding surface.
 - B. Apply heat, using circular motion for about 30 seconds.

10-6-26 DOORS

- C. Use flat-bladed tool, being careful not to damage paint, and remove molding (226) from door.
- D. Discard molding (226).

Install or Connect

NOTICE: Refer to "Notice" on page 10-6-1 of this section.

1. Molding (226).
 - A. Caprice molding should be placed 5mm below door feature line. Impala SS molding should be placed 19 mm below door feature line.
 - B. Mark position of molding (226) with length of masking tape.

Clean

- a. Area with soap and water. Wipe dry.
- b. Area with oil-free naphtha or alcohol.
- C. If needed, warm door surface with heat lamp or heat gun to 21° C (70° F).
- D. Peel paper from molding (226).
 - Do not touch adhesive backing.
- E. Press molding (226) to door to secure.
- F. Hand-roll molding (226) to ensure proper adhesion.

Inspect

- Molding ends for bonding. Hand-roll loose ends.

FRONT SIDE DOOR LOWER MOLDING

The rear side door lower molding is serviced the same way as the front side door lower molding. Use the following procedure for both.

Figure 30

Remove or Disconnect

1. Nuts (16).
2. Molding (18) from door.
3. Nuts (206).

Install or Connect

NOTICE: Refer to "Notice" on page 10-6-1 of this section.

1. Nuts (206).
 - Press into holes to secure.
2. Molding (18) by pressing studs (174) to nuts (206).
3. Nuts (16).

Tighten

- Nuts (16) to 3.5 N.m (31 lb. in.).

Figure 28 - Front Side Door Center Molding-(Buick Sedan)

Figure 29 - Rear Side Door Center Molding-(Buick Sedan)

Figure 30 - Removing Front Side Door Lower Molding-(Typical)

Figure 31 - Removing Front Side Door Window Reveal Moldings

FRONT SIDE DOOR WINDOW UPPER REVEAL MOLDING

Figure 31

Remove or Disconnect

1. Fully lower front side door window.
2. Peel back rubber edge of front side door window weatherstrip.
3. Bolt/screw (166).
4. Molding (21).

Install or Connect

1. Molding (21).
 - Align T-nut to pierced hole at rear upper corner of front side door.
2. Bolt/screw (166).

Tighten

- Bolt/screw (166) to 1.3 N·m (12 lb. in.).

FRONT SIDE DOOR REVEAL MOLDING

Figure 31

Remove or Disconnect

1. Outside rearview mirror. Refer to "Outside Rearview Mirror" in this section.
2. Front side door trim. Refer to "Front Side Door Trim" in this section.
3. Bolt/screw (23).
4. Reveal molding (22).

Install or Connect

NOTICE: Refer to "Notice" on page 10-6-1 of this section.

1. Reveal molding (22).
 - Place over pinch-weld flange.
2. Bolt/screw (23).

Tighten

- Bolt/screw (23) to 1.5 N·m (13 lb. in.).
3. Front side door trim. Refer to "Front Side Door Trim" in this section.
 4. Outside rearview mirror. Refer to "Outside Rearview Mirror" in this section.

FRONT SIDE WINDOW UPPER REVEAL MOLDING

BUICK SEDAN

Figure 31

Remove or Disconnect

1. Front side door window upper reveal molding. Refer to "Front Side Door Window Upper Reveal Molding" under "Front Side Door Moldings" in this section.
2. Reveal molding (180).
 - Pull from flange.

Install or Connect

1. Reveal molding (180).
 - Align to flange and press to secure.
2. Front side door window upper reveal molding. Refer to "Front Side door Window Upper Reveal Molding" under "Front Side Door Moldings" in this section.

FRONT SIDE DOOR WINDOW FRONT REVEAL MOLDING

Figure 31 and 32

Tool Required:
J 24595-C Door Trim Pad and Garnish Clip Remover

Remove or Disconnect

1. Outside rearview mirrors Refer to "Outside Rearview Mirror" in this section.
2. Bolt/screw (26).

NOTICE: Tape door to prevent vehicle damage during removal and installation of front side door window reveal molding.

3. Fastener.
 - A. Pull forward edge of molding (24) away from door.

Figure 32 - Removing Front Side Door Window Front Reveal Molding

B. Using J 24595-C, pry fastener from door.

4. Molding (24).

- Slide molding (24) toward front of vehicle to disengage it from front side door window upper reveal molding and front side door window reveal molding.

→→ Install or Connect

NOTICE: Refer to "Notice" on page 10-6-1 of this section.

1. Molding (24).

- A. Place under front side door window reveal molding, then under front side door upper reveal molding.

B. Slide molding (24) toward rear of vehicle.

2. Fastener.

3. Remove tape from door.

4. Bolt/screw (26).

⌚ Tighten

- Bolt/screw (157) to 1.3 N·m (12 lb. in.).

5. Outside rearview mirror. Refer to "Outside Rearview mirror" in this section.

Figure 33 - Front and Rear Side Door Edge Guard Moldings

FRONT SIDE DOOR EDGE GUARD MOLDING

Figure 33

↔ Remove or Disconnect

- Molding (137).
— Pull from edge of door.

→→ Install or Connect

- Molding (137).
A. Match to shape of door edge.
B. Press along entire length to secure.

FRONT SIDE DOOR OUTER PANEL EDGE PROTECTOR

Figure 34

↔ Remove or Disconnect

- Door outer panel edge protector (244).

→→ Install or Connect

- Door outer panel edge protector (244).
— Position to rear edge of front door and press forward to secure.

Figure 34 - Removing Front and Rear Side Door Outer Panel Edge Protector

Front Side Door Window Frame Applique

BUICK SEDAN

Figure 35

Remove or Disconnect

1. Front side door window reveal moldings. Refer to "Front Side Door Window Upper Reveal Molding," "Front Side Door Window Reveal Molding" or "Front Side Door Window Rear Reveal Molding" under "Front Side Door Moldings" in this section.
2. Applique (28).
 - Use heat gun to soften adhesive.

Clean

- Surface with 50/50 alcohol and water solution.

Install or Connect

1. Applique (28).
 - A. Surface temperature must be between 15° C and 32° C (60° F and 90° F). If necessary, adjust surface temperature by using a heat gun or allowing surface to cool.
 - B. Peel back paper on applique (28).
 - C. Align top notch in applique (28) to top pierced hole on window frame.
 - D. Working downward, remove paper backing and align applique to bottom pierced hole on window frame, using squeegee to smooth applique (28).
 - E. Fold remaining edge of applique (28) over window frame flange.
2. Front side door window reveal moldings. Refer to "Front Side Door Window Upper Reveal Molding," "Front Side Door Window Reveal Molding" or "Front Side Door Window Rear Reveal Moldings" under "Front Side Door Moldings" in this section.

FRONT SIDE DOOR WEATHERSTRIP

Figure 36

Remove or Disconnect

1. Center pillar upper trim finish panel. Refer to "Center Pillar Upper Trim Finish Panel" in this section.
2. Floor carpet retainer. Refer to "Floor Carpet Retainer" in this section.
3. Windshield garnish molding. Refer to SECTION 10-9.
4. Weatherstrip (31).
 - Pull from pinch-weld flange.

Figure 35 - Applying Side Door Window Frame Appliques-(Buick Sedan)

Figure 36 - Front and Rear Side Door Weatherstrips-(Typical)

Install or Connect

- Weatherstrip (31).
 - Position to body by locating weatherstrip to slot and engage onto pinch-weld flange.
 - Roll the weatherstrip onto the pinch-weld flange. Make sure weatherstrip is fully seated in corner areas.
 - Install the last 300 mm (11.8 inches) by fitting ends together and evenly compressing onto pinch-weld flange.
- Windshield garnish molding. Refer to SECTION 10-9.
- Floor carpet retainer. Refer to "Floor Carpet Retainer" in this section.
- Center pillar upper trim finish panel. Refer to "Center Pillar Upper Trim Finish Panel" in this section.

FRONT SIDE DOOR SEALING STRIPS

FRONT SIDE DOOR WINDOW BELT OUTER SEALING STRIP

The front side door window belt outer sealing strip is part of the front side door window belt reveal molding. Refer to "Front Side Door Window Belt Reveal Molding" under "Front Side Door Moldings" in this section.

FRONT SIDE DOOR WINDOW BELT INNER SEALING STRIP

The front side door window belt inner sealing strip is not serviceable. If the sealing strip requires service, the door trim must be replaced.

Figure 37 - Removing Front Side Door Bottom Auxiliary Sealing Strip

Front Side Door Bottom Auxiliary Sealing Strip

Figure 37

Remove or Disconnect

- Front side door lower molding. Refer to "Front Side Door Lower Molding" or "Front Side Door Transfer Lower Finish Molding" (Buick Wagon) under "Front Side Door Moldings" in this section.
- Sealing strip (33) from lower door flange.

10-6-32 DOORS

↔ Install or Connect

1. Sealing strip (33) to lower door flange.
 - Tap with rubber mallet, making sure to hit square to flange.
2. Front side door lower molding. Refer to "Front Side Door Lower Molding" or "Front Side Door Transfer Lower Finish Molding" (Buick Wagon) under "Front Side Door Moldings" in this section.

FRONT SIDE DOOR WINDOW CHANNELS AND FRONT SIDE DOOR WINDOW WEATHERSTRIP

Front Side Door Window Front And Rear Channels

Figure 38

↔ Remove or Disconnect

1. Front side door trim. Refer to "Front Side Door Trim" in this section.
2. Front side door water deflector. Refer to "Front Side Door Water Deflector" in this section.

CAUTION: When activated, the window switch may lock into the express down mode causing the driver's side front side door window to lower fully without stopping even though the switch has been released. Failure to exercise caution around the front side door window regulator when operating the switch may result in personal injury and regulator damage.

3. Fully raise front side door window.
4. Bolt/screw (39).
5. Channel (35).
 - Disengage tabs on upper edge of channel (35) from tabs on door inner panel.
6. Bolt/screw (36).
7. Channel (34).
 - Disengage tabs on upper edge of channel (34) from tabs on door inner panel.

↔ Install or Connect

NOTICE: Refer to "Notice" on page 10-6-1 of this section.

1. Channel (34).
 - Engage tabs on upper edge of channel (34) and push upward to secure.
2. Bolt/screw (36).
 - Align hole on lower end of channel (34) to hole in door inner panel.

⌚ Tighten

- Bolt/screw (36) to 11 N.m (97 lb. in.).

Figure 38 - Removing Front and Rear Side Window Channels

3. Channel (35).
 - Engage tabs on upper edge of channel (35) and push upward to secure.
4. Bolt/screw (39) to channel (35).
 - Align hole on lower end of channel (35) to hole in door inner panel.

⌚ Tighten

- Bolt/screw (39) to 11 N.m (97 lb. in.).
5. Make sure mirror cable is looped around outside of channel (34).
 6. Front side door water deflector. Refer to "Front Side Door Water Deflector" in this section.
 7. Front side door trim. Refer to "Front Side Door Trim" in this section.

Front Side Door Window Weatherstrip

Figure 39

↔ Remove or Disconnect

1. Front side door window. Refer to "Front Side Door Window" in this section.
2. Weatherstrip (37).
 - Using finger pressure, squeeze weatherstrip (37) together and pull weatherstrip (37) from window frame.

Figure 39 - Removing Front Side Door Window Weatherstrip

Install or Connect

- Weatherstrip (37).
 - Squeeze together.
 - Working from position A forward along upper header toward position B, seat weatherstrip (37) into window frame.
- Front side door window. Refer to "Front Side Door Window" in this section.
- Seat weatherstrip (37) into front side door front and rear window channels.

FRONT SIDE DOOR SWITCHES

Front Side Door Lock Switch

Figure 23

Remove or Disconnect

CAUTION: Refer to "Caution" under "Disconnecting the Battery Negative Cable" in SECTION 0A.

- Battery negative cable.
- Bolt/screw (8).
- Bezel (7 or 211).
- Switch from bezel (7 or 211).
 - Unsnap switch from bezel (7 or 211).
- Wiring harness connector from switch.

Install or Connect

NOTICE: Refer to "Notice" on page 10-6-1 of this section.

- Switch to wiring harness connector.
- Switch to bezel (7 or 211).
 - Snap switch into bezel (7 or 211).
- Bezel (7 or 211).
- Bolt/screw (8).

Tighten

- Bolt/screw (8) to 1.5 N.m (13 lb. in.).
- Battery negative cable.

Front Side Door Window Switch

Figures 19 through 21

Remove or Disconnect

CAUTION: Refer to "Caution" under "Disconnecting the Battery Negative Cable" in SECTION 0A.

- Battery negative cable.
- Switch panel (3) or switch plate (6 or 160).
 - Insert screwdriver under center of forward edge of switch panel (3) or switch plate (6 or 160) to compress spring clip.
 - Slide up and forward to remove switch panel or plate.
- Wiring harness connector from switch.
- Switch from switch panel (3) or switch plate (6 or 160).
 - Insert screwdriver at two forward and two rearward corners of switch. Push in and pry up (Buick).
 - Remove bolts/screws, if driver's side of vehicle (Chevrolet).
 - Unsnap, if passenger side of vehicle (Chevrolet).

Install or Connect

- Switch to switch panel (3) or switch plate (6 or 160).
 - Snap into place (Buick).
 - Install bolts/screws, if driver's side of vehicle (Chevrolet).
 - Snap to secure, if passenger side of vehicle (Chevrolet).
- Wiring harness connector to switch.
- Switch panel (3) or switch plate (6 or 160).
 - Slide rearward and snap in to secure.
- Battery negative cable.

Front Side Door Power Seat Switch

Figures 19 through 21

Remove or Disconnect

CAUTION: Refer to “Caution” under “Disconnecting the battery negative cable” in SECTION 0A.

1. Battery negative cable.
2. Switch panel (3) or switch mount plate (6).
 - A. Insert screwdriver under center of forward edge of switch panel (3) or switch plate (6 or 160) to compress spring clip.
 - B. Slide up and forward to remove switch panel or plate.
3. Wiring harness connector from power seat switch.
4. Bolts/screws from switch.
5. Switch.

Install or Connect

1. Switch.
2. Bolts/screws to switch.
3. Wiring harness connector to switch.
4. Switch panel (3) or switch mount plate (6).
 - Slide rearward and snap into place.
5. Battery negative cable.

Front Side Door Outside Rearview Mirror Electrical Remote Switch/ Remote Control Knob

BUICK

Figures 19 and 20

Remove or Disconnect

CAUTION: Refer to “Caution” under “Disconnecting the Battery Negative Cable” in SECTION 0A.

1. Battery negative cable.
2. Switch plate (6 or 160).
 - A. Insert screwdriver under center of forward edge of switch panel (3) or switch plate (6 or 160) to compress spring clip.
 - B. Slide up and forward to remove switch panel or plate.
3. Wiring harness connector from switch, if electrical remote mirror.
4. Switch or knob (183) from switch plate (6 or 160).
 - A. Insert screwdriver at forward and rearward sides of switch, if equipped. Push in and pry up.
 - B. Unsnap remote control knob, if equipped, from switch plate (6 or 160).

Install or Connect

1. Switch or knob (183) to switch plate (6 or 160).
 - Snap switch or knob (183) in place.
2. Wiring harness connector to switch, if removed.
3. Switch plate (6 or 160).
4. Battery negative cable.

FRONT SIDE DOOR WATER DEFLECTOR

Figures 2, 3, 24 and 40

Remove or Disconnect

1. Front side door trim. Refer to “Front Side Door Trim” in this section.
2. Radio front side door speaker. Refer to “Radio Front Side Door Speaker” in this section.
3. Brackets (262) (Buick) or hanger plate (11) (Chevrolet).
 - Remove rivets with drill and 1/4-inch bit.
4. Deflector (38).
 - A. Pull away from door to break sealer bond.
 - B. Pull bottom edge of water deflector (38) from retaining slots.
 - C. Do not allow dirt or lubricants to contact sealer.

Inspect

- For tears or holes. Repair tears or holes using waterproof body tape on both sides of deflector (38).

Install or Connect

1. Deflector (38).
 - A. If installing new deflector (38), use old deflector (38) as template.
 - B. Pull electrical connectors through their respective holes and slots in deflector (38).
 - C. Apply string sealer in a continuous bead that will guide water to drain slots.
 - D. Insert bottom edge of deflector (38) into retaining slots.
 - E. Press deflector (38) into inner panel to ensure good bond.
 - F. Apply 75 mm (3.0-inch) strip of tape to secure top of deflector (38) to door inner panel.
2. Brackets (262) (Buick) or hanger plate (11) (Chevrolet), if removed.
3. Radio front side door speaker. Refer to “Radio Front Side Door Speaker” in this section.
4. Front side door trim. Refer to “Front Side Door Trim” in this section.

38 DEFLECTOR, FRONT SIDE DOOR WATER

5-10-94
BS040106

Figure 40 - Removing Front Side Door Water Deflector

OUTSIDE REARVIEW MIRROR**Mirror Face (Non-Heated Type)****Figure 41****↔ Remove or Disconnect**

CAUTION: To minimize the chance of personal injury, gloves and safety glasses should be worn when removing broken glass.

NOTICE: When breaking the outside rearview mirror face, cover the front side door in the area of the mirror to avoid damage to the paint.

- Face (158) from mirror frame.
 - A. Place tape over face (158).
 - B. Break face (158) and remove broken pieces.

→ Install or Connect

- Face (158).
 - A. Remove paper backing to expose adhesive.
 - B. Press face (158) firmly onto center of mirror frame.

Standard and Remote Control Outside Rearview Mirror**Figure 41****↔ Remove or Disconnect**

1. Front side door trim. Refer to "Front Side Door Trim" in this section.
2. Peel back upper edge of front side door water deflector to access nuts (44) and mirror cable, if equipped.

3. Remote control knob of mirror cable (127) from pierced hole in door inner panel.
4. Nuts (44).
5. Mirror (47).

→ Install or Connect

NOTICE: Refer to "Notice" on page 10-6-1 of this section.

1. Mirror (47).
2. Nuts (44).

⌚ Tighten

- Nuts (44) to 5 N.m (44 lb. in.).
3. Remote control end of mirror cable (127) into pierced hole in door inner panel.
 4. Upper edge of front side door water deflector.
 5. Front side door trim. Refer to "Front Side Door Trim" in this section.

Power Remote Heated Outside Rearview Mirror**Figure 41**

Heated outside rearview mirrors are included if the vehicle is equipped with electric mirrors. The mirror's heating elements are not functional unless the vehicle is also equipped with an electric rear window defogger.

↔ Remove or Disconnect

1. Front side door trim. Refer to "Front Side Door Trim" in this section.

Figure 41 - Removing Outside Rearview Mirror

2. Peel back upper edge of front side door water deflector to access wiring harness (46) and electrical connector.
3. Wiring harness (46) from reinforcement.
4. Electrical connector.
5. Wiring harness (46) from door.
6. Nuts (44).
7. Mirror (47) and wiring harness (46).

Install or Connect

NOTICE: Refer to "Notice" on page 10-6-1 of this section.

1. Mirror (47) and wiring harness (46).
 - Insert studs in mirror base through holes, in window front reveal molding.
2. Nuts (44).

Tighten

- Nuts (44) to 5 N.m (44 lb. in.).
3. Wiring harness (46) through door.
 - Make sure wiring harness (46) is looped around outside of lower portion of window front channel.
 4. Electrical connector.
 5. Wiring harness (46) to reinforcement.
 6. Reposition upper edge of water deflector.
 7. Front side door trim. Refer to "Front Side Door Trim" in this section.

Outside Rearview Mirror Motor

Remove or Disconnect

CAUTION: Refer to "Caution" under "Disconnecting the Battery Negative Cable" in SECTION 0A.

1. Battery negative cable.
2. Outside rearview mirror and case.
 - Unsnap mirror and case from outside rearview mirror shell.
3. Note position of outside rearview mirror motor.
4. Outside rearview mirror motor bolts/screws.
5. Outside rearview mirror motor.
 - A. Label wiring harness wires 1 through 4 beginning with bottom wire.
 - B. Cut wires from motor as close to motor as possible.

Install or Connect

1. Outside rearview mirror motor.
 - Splice motor wires to wiring harness wires in proper order.
2. Outside rearview mirror motor bolts/screws.
3. Tuck wires and connectors into shell.

4. Outside rearview mirror and case.
 - Snap mirror and case into outside rearview mirror shell.
5. Battery negative cable.

RADIO FRONT SIDE DOOR SPEAKER

Figures 42 and 43

The front side door tweeter is serviced as part of the front side door inside handle bezel. For service information, refer to "Front Side Door Trim" in this section. The following procedure is for the midrange speaker mounted to the door inner panel.

Remove or Disconnect

1. Front side door trim. Refer to "Front Side Door Trim" in this section.
2. Rosebud clip on speaker connector (52), if equipped, from deflector (38) and front door inner panel.
3. Wiring harness connector (53) from speaker (173) (Buick) or speaker connector (52) (Chevrolet).
4. Bolts/screws (54) connecting speaker (173 or 51) to housing (179 or 50).

Install or Connect

NOTICE: Refer to "Notice" on page 10-6-1 of this section.

1. Bolts/screws (49) connecting housing (179 or 50) to door inner panel.

Tighten

- Bolts/screws (49) to 1.9 N.m (17 lb. in.).
2. Bolts/screws (54) connecting speaker (173 or 51) to housing (179 or 50).

Tighten

- Bolts/screws (54) to 1.5 N.m (13 lb. in.).
3. Wiring harness connector (53) to speaker (173) or speaker connector (52).
 4. Rosebud clip on speaker connector (52), if equipped, through deflector (38) to front door inner panel.
 5. Front side door trim. Refer to "Front Side Door Trim" in this section.

FRONT SIDE DOOR ASHTRAY

CHEVROLET

POLICE AND TAXI VEHICLES

Remove or Disconnect

1. Front side door trim. Refer to "Front Side Door Trim" in this section.

Figure 42 - Removing Radio Front Side Door Speaker-(Buick)

Figure 43 - Removing Radio Front Side Door Speaker-(Chevrolet)

Figure 44 - Front and Rear Side Door Window Regulator Handle-(Chevrolet)

2. Ashtray.
3. Backing plate bolts/screws.
4. Backing plate.

Clean

- Ashtray in solution of warm water and soap, if necessary.

Install or Connect

1. Backing plate.
2. Backing plate bolts/screws.
3. Ashtray.
4. Front side door trim. Refer to "Front Side Door Trim" in this section.
5. Bolts/screws (49) connecting housing (179 or 50) to door inner panel.

Figure 45 - Removing Front Side Door Window Regulator Handle-(Chevrolet)

FRONT SIDE DOOR HANDLES

Front Side Door Window Regulator Handle CHEVROLET

Figures 44 and 45

Tool Required:

J 9886-01 Door Handle Clip Remover

Remove or Disconnect

1. Close front side door window.
2. Clip (273), by pushing J 9886-01 between handle (269) and trim (5) or plate (268).
3. Handle (269) from spindle (267).

Install or Connect

1. Clip (273) to handle (269).
2. Plate (268) to handle (269).
3. Position handle (269) on horizontal plane pointing forward, if front door. If rear door, position on vertical plane pointing upward.
4. Use mallet as required on handle to secure.

Front Side Door Pull Handle

BUICK

Figures 2, 3 and 46

Remove or Disconnect

1. Front side door trim (1). Refer to "Front Side Door Trim" in this section.
2. Pull handle (61) from trim (1).
 - A. Unsnap front and rear ends of pull handle from retainer to expose bolts/screws (253).
 - B. Bolts/screws (253) and nuts (254).

Install or Connect

1. Pull handle (61) to trim (1).
 - A. Bolts/screws (253) and nuts (254).

Tighten

- Bolts/screws (253) to 6 N.m (53 lb. in.).
 - B. Snap front and rear ends of pull strap in place on retainer.
2. Front side door trim (1). Refer to "Front Side Door Trim" in this section.

CHEVROLET

Figure 47

Remove or Disconnect

1. Front side door trim. Refer to "Front Side Door Trim" in this section.
2. Handle (234).
 - A. Unlock and remove hinge spring from back of trim (5).
 - B. Remove pins (60) from back of trim (5).

Install or Connect

1. Handle (234).
2. Pins (60) to back of trim (5).
3. Hinge spring to back of trim (5).
 - Hook hinge spring over tab.
4. Front side door rim. Refer to "Front Side Door Trim" in this section.
 - A. Move adjusting nut until it aligns with clip (68) on outside door handle lock lever.
 - B. Insert adjusting nut into clip (68) and press to secure.
5. Reposition front side door water deflector.
6. Front side door trim. Refer to "Front Side Door Trim" in this section.

SPRING CLIPS

Spring clips are used to secure various rods and levers of the door hardware. Discard spring clips after removal and use new spring clips for installation.

Front Side Door Inside Handle Lever

Figure 48

Remove or Disconnect

1. Front side door trim. Refer to "Front Side Door Trim" in this section.

CAUTION: When activated, the front side door window switch may lock into the express down mode causing the driver's side front side door window to lower fully without stopping even though the switch has been released. Failure to exercise caution around the front side door window regulator when operating the switch may result in personal injury and regulator damage.

2. Fully raise front side door window.
3. Move front side door water deflector out of the way to access inside handle lever (64).
4. Rivets (65), using 1/4-inch drill bit.
5. Inside handle rod (63) from inside handle lever (64).
6. Locking rod (62) from bellcrank (186).
7. Inside handle lever (64).

Install or Connect

1. Inside handle lever (64).
2. Locking rod (62) to bellcrank (186).
3. Inside handle rod (63) to inside handle lever (64).
4. Rivets (65).
5. Reposition front side door water deflector.
6. Front side door trim. Refer to "Front Side Door Trim" in this section.

Front Side Door Outside Handle

Figures 49 and 50

Remove or Disconnect

CAUTION: When activated, the front side door window switch may lock into the express down mode causing the driver's side front side door window to lower fully without stopping even though the switch has been released. Failure to exercise caution around the front side door window regulator when operating the switch may result in personal injury and regulator damage.

1. Fully raise front side door window.
2. Front side door trim. Refer to "Front Side Door Trim" in this section.
3. Upper edge of front side door water deflector.
4. Rod (67) from module (70).

- A SLOT ON BRACKET USED FOR WAGON
- B SLOT ON BRACKET USED FOR SEDAN
- 27 PULL HANDLE, REAR SIDE DOOR
- 61 PULL HANDLE, FRONT SIDE DOOR

5. Nuts (66).
6. Handle (69), rod (67) and clip (68).
7. Rod (67) and clip (68) from handle (69).

Install or Connect

NOTICE: Refer to "Notice" on page 10-6-1 of this section.

1. Rod (67) and new clip (68) to handle (69).
2. Snap new clip (68) into place.
3. Hold handle (69) in open position.
4. Insert handle (69) through hole in door outer panel.
5. Nuts (66) to handle (69) through access holes.

Figure 49 - Removing Front Side Door Outside Handle

Figure 50 - Front Side Door Locking System Module

**Tighten**

- Nuts (66) to 5 N·m (44 lb. in.).
6. Rod (67) to module (70).

**Adjust**

- Handle (69), if necessary.

**Remove or Disconnect**

1. Spring clip.
 - Use scratch awl, pick or similar tool to push spring clip tang away from rod.

10-6-44 DOORS

2. Rod from spring clip and lever.
3. Spring clip from lever.

Install or Connect

1. Push new spring clip over lever and snap into place.
2. Rod to spring clip and lever.
3. Spring clip.
 - Snap spring clip tang over rod.

FRONT SIDE DOOR LOCKING SYSTEM MODULE

Figure 50

The rear side door locking system module is serviced the same way as the front side door locking system module. Use the following procedure for both.

Remove or Disconnect

1. Front side door trim. Refer to "Front Side Door Trim" in this section.
2. Move upper half of front side door water deflector to access module (70).
3. Front side door window rear channel. Refer to "Front Side Door Window Front and Rear Channels" in this section.
4. Rivets (72), using a 1/4-inch drill bit.
5. Bolts/screws (74).
6. Rod (67) from module (70).
7. Lock cylinder rod (71) from module (70).
8. Wire harness from lock module connector (135).
9. Module (70).

Install or Connect

NOTICE: Refer to "Notice" on page 10-6-1 of this section.

1. Module (70).
2. Wire harness to lock module connector (135).
3. Lock cylinder rod (71) to module (70).
4. Rod (67) to module (70).
5. Bolts/screws (74).

Tighten

- Bolts/screws (74) to 10 N·m (89 lb. in.).

Important

- A. Module (70) must be held tight against door facing while driving all attaching bolts/screws (74).
 - B. All bolts/screws (74) must be driven at a 90-degree angle to door facing.
6. Rivets (72).
 - Attach uppermost forward rivet (72) first.

7. Front side door window rear channel. Refer to "Front Side Door Window Front and Rear Channels" in this section.
8. Reposition front side door water deflector.
9. Front side door trim. Refer to "Front Side Door Trim" in this section.

FRONT SIDE DOOR LATCH AND FRONT SIDE DOOR LOCK STRIKER

The illuminated entry and theft deterrent switches are not serviced separately from the latch. If either switch must be replaced, the entire latch must be replaced.

The rear side door latch and lock strikers are serviced the same way as the front side door latch and lock strikers. Use the following procedures.

Front Side Door Latch

Figure 51

CAUTION: Do not attempt to repair a broken latch. A latch malfunction may result in serious bodily injury. A broken latch must be replaced.

Remove or Disconnect

CAUTION: When activated, the front side door window switch may lock into the express down mode causing the driver's side front side door window to lower fully without stopping even though the switch has been released. Failure to exercise caution around the front side door window regulator when operating the switch may result in personal injury and regulator damage.

1. Fully raise front side door window.
2. Front side door trim. Refer to "Front Side Door Trim" in this section.
3. Move front side door water deflector to access door latch.
4. Front side door locking system module. Refer to "Front Side Door Locking System Module" in this section.
5. Handle rod (63) from module (70).
6. Locking rod (62) from module (70).
7. Bolts/screws connecting door latch to module (70).
8. Door latch.

Install or Connect

1. Door latch.
 - Hand tighten.
2. Bolts/screws connecting door latch to module (70).
3. Locking rod (62) to module (70).
4. Handle rod (63) to module (70).

Figure 51 - Front Side Door Latch

5. Front side door locking system module. Refer to "Front Side Door Locking System Module" in this section.
6. Reposition front water deflector.
7. Front side door trim. Refer to "Front Side Door Trim" in this section.

FRONT SIDE DOOR ADJUSTMENT

Figure 52 and 54

Tool Required
J 39927 Door Hinge Adjustment Wrench

↔ Remove or Disconnect

- Front door lock striker bolts/screws (77) and striker (76).
— Leave one bolt/screw (77) in door lock striker anchor at all times.

🔑 Adjust

- Front side door inward or outward.
A. Loosen door upper and lower door side hinge nuts (201).
B. Position door as necessary.

🔧 Tighten

- Door upper and lower door side hinge nuts (201) to 32 N.m (24 lb. ft.).

Figure 52 - Front Side Door Adjustment Using J 39927

- Front side door forward or rearward.
A. Loosen door upper and lower body side hinge bolts/screws using J 39927 for the lower body side hinge bolts/screws.
B. Position door as necessary.

🔧 Tighten

- Door upper and lower door side hinge bolts/screws to 32 N.m (24 lb. ft.).

↔ Install or Connect

- Front side door lock striker (76) and bolts/screws (77) loosely.

🔑 Adjust

- Front side door lock striker. Refer to "Front Side Door Lock Striker Adjustment" in this section.

Figure 53 - Adjusting Front Side Door Lock Striker With J 39346(Typical)

Front Side Door Lock Striker Adjustment (with J 39346)

Figures 53 and 54

Tool Required
J 39346 "Mini-Wedge" Door Striker Aligner

NOTICE: Refer to "Notice" on page 10-6-1 of this section.

1. Be sure front side door is properly aligned.
2. Loosen bolts/screws (77). Do not remove.

Figure 54 - Removing Front and Rear Side Door Lock Striker

3. Align J 39346 to striker (76).
 - Magnets will hold in place.
4. Hold outside door handle in open position and shut door.
 - Do not slam door.
5. Open door.

Tighten

- Bolts/screws (77) to 24 N·m (18 lb. ft.).
6. Remove J 39346.

Front Side Door Lock Striker Adjustment (without J 39346)

Figure 53 and 54

The front and rear side door lock strikers are adjusted the same way. Use the following procedure for both.

Important

- Front side door must be properly aligned prior to adjusting striker (76).

Adjust

NOTICE: Refer to "Notice" on page 10-6-1 of this section.

1. Striker (76).
 - A. Loosen striker (76).
 - B. Shift striker (76) up or down, inboard or outboard as required.
 - Striker (76) should enter center of striker opening and should not pull up or down when closed.

- C. Apply modeling clay or body caulking compound to striker (76) opening on door latch.
- D. Close door only far enough for striker (76) to make an impression in modeling clay or body caulking compound. Closing door too far will make it hard to remove clay or caulking compound.
- E. Open door and check forward and rearward adjustment.
 - Impression should be centered forward and rearward.
 - Spacers (75) are available to achieve desired forward and rearward alignment.
- F. If forward or rearward adjustment is needed:
 - Mark location of striker (76) on body.
 - Remove striker (76).
 - Add or remove spacers (75) as needed.
 - Install striker (76) and any spacers (75) to location marked on body.

**Tighten**

- Bolts/screws (77) to 24 N·m (18 lb. ft.).
2. Touch up any exposed, unpainted metal.

Front Side Door Lock Striker**Figure 54**

The front and rear side door lock strikers are serviced the same way. Use the following procedure for both.

**Remove or Disconnect**

1. Mark position of striker (76) on body using a pencil.
2. Bolts/screws (77).
3. Striker (76), any spacers (75) and washer (100).

**Install or Connect**

NOTICE: Refer to “Notice” on page 10-6-1 of this section.

1. Striker (76) and spacers (75) if needed, and washer (100) to location marked on body.
2. Bolts/screws (77).

**Tighten**

- Bolts/screws (77) to 24 N·m (18 lb. ft.).

**Inspect**

- For proper latch-to-striker (76) engagement. If adjustment is needed, refer to “Front Side Door Lock Striker Adjustment” in this section.

FRONT SIDE DOOR LOCK ACTUATORS**Remove or Disconnect**

CAUTION: When activated, the front side door window switch may lock into the express down mode causing the driver's side front side door window to lower fully without stopping even though the switch has been released. Failure to exercise caution around the front side door window regulator when operating the switch may result in personal injury and regulator damage.

1. Fully raise front side door window.
2. Front side door trim. Refer to “Front Side Door Trim” in this section.
3. Move front side door water deflector to gain access.
4. Front side door lock actuator rivets, using drill and 1/4-inch drill bit.
5. Electrical connector.
6. Front side door lock actuator.

**Install or Connect**

NOTICE: Refer to “Notice” on page 10-6-1 of this section.

1. Front side door lock actuator.
2. Electrical connector.
3. Front side door lock actuator rivets.
4. Reposition front side door water deflector.
5. Front side door trim. Refer to “Front Side Door Trim” in this section.

FRONT SIDE DOOR LOCK ROD LEVER**Figure 23****Remove or Disconnect**

1. Bolt/screw (8).
 - Unsnap bezel (7 or 211) to remove.
2. Front side door lock switch connector from front side door lock switch.
3. Retainer covering lever (15).
 - Use small screwdriver to unsnap retainer.
4. Lever (15).

**Install or Connect**

NOTICE: Refer to “Notice” on page 10-6-1 of this section.

1. Lever (15).
2. Retainer covering rear side of lever (15).
 - Snap in place.

10-6-48 DOORS

3. Front side door lock switch connector to front side door lock switch.
 - Snap into bezel (7 or 211).
4. Bolt/screw (8).

Tighten

- Bolt/screw (8) to 1.5 N.m (13 lb. in.).

FRONT SIDE DOOR LOCK CYLINDER

Figure 55

Remove or Disconnect

CAUTION: When activated, the front side door window switch may lock into the express down mode causing the driver's side front side door window to lower fully without stopping even though the switch has been released. Failure to exercise caution around the front side door window regulator when operating the switch may result in personal injury and regulator damage.

1. Fully raise window.
2. Front side door trim. Refer to "Front Side Door Trim" in this section.
3. Peel back front side door water deflector to access cylinder (78).
4. Retainer (80).
 - Using screwdriver, slide retainer (80) forward until it disengages.
5. Rod (71) from cylinder (78) and gasket (79) by unsnapping clip (83).
6. Cylinder (78) and gasket (79) from door panel.

Disassemble

1. Pawl clip (82) from pawl (81) and cylinder (78) using pointed tool.
2. Pawl (81) from cylinder (78).

Assemble

1. For information on assembling tumblers to lock cylinders, refer to SECTION 0A.
2. Pawl (81) to cylinder (78).
3. Pawl clip (82) to pawl (81) and cylinder (78).

Install or Connect

1. Lubricate black cylinders (78) with light oil.
2. Lubricate all other cylinders (78) with general purpose silicone lubricant.
3. Cylinder (78) and gasket (79) to door panel.
4. Rod (71) to cylinder (78) and gasket (79) by snapping clip (83).

10-26-94
BS055106

Figure 55 - Disassembling Front Side Door Lock Cylinder

5. Retainer (80).
6. Reposition front side door water deflector. Refer to "Front Side Door Water Deflector" in this section.
7. Front side door trim. Refer to "Front Side Door Trim" in this section.

Front Side Door Lock Cylinder Inspection

Figure 55

1. Insert key into cylinder (78).
2. Move inside lock switch up and down.
 - A. Key should not move in cylinder (78).
 - B. Key should be able to be removed with inside lock switch in any position.
3. Move key to fully locked position and return key to neutral position.
 - A. Operate front side door inside handle lever. Door should not open.
 - B. Operate front side door outside handle. Door should not open.
4. Move key to unlocked position, then back to neutral position.
 - A. Operate front side door inside and outside handle levers. Doors should open.

FRONT SIDE DOOR UPPER AND LOWER HINGES

Front Side Door Upper Hinge

Figure 56

Tool Required:
J 28500 Door Hinge Wrench

Remove or Disconnect

1. Bolt/screws (84) with shim (165), if applicable.
2. Support door in full-open position.

3. Mark position of hinge (85) on hinge pillar, and on door.
4. Nuts (88).
5. Bolts/screws (86), using J 28500.
6. Hinge (85).

Install or Connect

NOTICE: Refer to "Notice" on page 10-6-1 of this section.

NOTICE: Before installing a hinge, apply a coat of heavy-bodied sealer to the surface of the hinge that contacts the door and the hinge pillar to prevent corrosion damage.

1. Hinge (85).
 - Align hinge (85) with marks made before removing hinge (85).
2. Bolts/screws (86), using J 28500.
3. Nuts (88).

Tighten

- A. Bolts/screws (86) to 32 N·m (24 lb. ft.).
- B. Nuts (88) to 32 N·m (24 lb. ft.).
4. Bolt/screws (84) and shim (165), if equipped.

Tighten

- Bolt (84) to 50 N·m (37 lb. ft.).

Adjust

- Front side door, if required. Refer to "Front Side Door Adjustment" in this section.

10-24-94
BS056106

Figure 56 - Front Side Door Upper and Lower Hinges

10-6-50 DOORS

Front Side Door Lower Hinge

Figures 56 through 58

Tools Required:

- J 39079 Door Hinge Spring Compressor
- J 28500 Door Hinge Wrench

Remove or Disconnect

1. Raise and suitably support vehicle. Refer to SECTION 0A.
2. Tire and wheel. Refer to SECTION 3E.
3. Support front side door and mark location of hinge (89).
4. Lower rear panel bolt/screw (172) with shim (165), if applicable.
5. Wheelhouse panel bolts/screws (185).
6. Lower bracket bolt/screw (171) with shim (165), if applicable.
7. Wheelhouse panel bolts/screws (164).
8. Hood rear outer seal.
9. Rear upper brace bolts/screws (182) with shims (165), if applicable.
10. Upper bracket bolt/screw (161) with shims (165), if applicable.
11. Bolt/screw (84) with shim (165), if applicable.
12. Support front fender away from body.

CAUTION: Do not remove front side door upper door side hinge bolts/screws. If removed, front side door will fall when the front side door lower hinge hardware is removed. This could cause personal injury as well as damage to the front side door.

13. Loosen bolts/screws (86).
14. Spring (87), using J 39079.
15. Nuts (163).
16. Bolts/screws (162), using J 28500.
17. Hinge (89), with aid of helper.

- One person raises front side door while other removes hinge (89).

Install or Connect

NOTICE: Refer to “Notice” on page 10-6-1 of this section.

NOTICE: Before installing a hinge, apply a coat of heavy-bodied sealer to the surface of the hinge that contacts the side door and the hinge pillar to prevent corrosion damage.

1. Hinge (89), with aid of helper.
 - A. One person raises front side door while other places hinge (89).
 - B. Align hinge (89) to marks made previously.

2. Bolts/screws (162).

Tighten

- Bolts/screws (162) to 32 N.m (24 lb. ft.).

3. Nuts (163).

Tighten

- Nuts (163) to 32 N.m (24 lb. ft.).

4. Spring (87).

Tighten

- Bolts/screws (86) to 32 N.m (24 lb. ft.).

Adjust

- Front side door, if necessary. Refer to “Front Side Door Adjustment” in this section.

5. Remove front fender support.

6. Bolt/screw (84) with shim (165), if removed.

Tighten

- Bolt/screw (84) to 50 N.m (37 lb. in.).

Adjust

- Front side door, if required. Refer to “Front Side Door Adjustment” in this section.

7. Upper bracket bolt/screw (161) with shims (165), if removed.

Adjust

- Upper bracket bolt/screw (161) to 50 N.m (37 lb. ft.).

8. Upper brace bolts/screws (182).

Tighten

- Upper brace bolts/screws (182) to 25 N.m (18 lb. ft.).

9. Hood rear outer seal.

10. Wheelhouse panel bolts/screws (164).

Tighten

- Wheelhouse panel bolts/screws (164) to 10 N.m (89 lb. in.).

11. Lower bracket bolt/screw (171) with shim (165), if removed.

Tighten

- Lower bracket bolt/screw (171) to 50 N.m (37 lb. in.).

12. Wheelhouse panel bolts/screws (185).

Tighten

- Wheelhouse panel bolts/screws (185) to 10 N.m (89 lb. in.).

11. Wheelhouse panel bolts/screws (164).
12. Hood rear outer seal.
13. Upper brace bolts/screws (182).
14. Upper bracket bolt/screw (161) with shims (165), if applicable.
15. Bolt/screw (84) with shim (165), if applicable.
16. Support front fender away from body.
17. Nuts (88 and 163), using J 28500.
18. Front side door, with aid of helper.

Install or Connect

NOTICE: Refer to "Notice" on page 10-6-1 of this section.

1. Front side door, with aid of helper.
2. Nuts (88 and 163), using J 28500.

Tighten

- Nuts (88) to 32 N.m (24 lb. ft.).

Adjust

- Front side door. Refer to "Front Side Door Adjustment" in this section.
3. Remove front fender support.
 4. Bolt/screw (84) with shim (165), if removed.

Tighten

- Bolt/screw (84) to 50 N.m (37 lb. ft.).
5. Upper bracket bolt/screw (161) with shims (165), if removed.

Tighten

- Upper bracket bolt/screw (161) to 50 N.m (37 lb. ft.).
6. Upper brace bolts/screws (182).

Tighten

- Upper brace bolts/screws (182) to 25 N.m (18 lb. ft.).
7. Hood rear outer seal.
 8. Wheelhouse panel bolts/screws (164).

Tighten

- Wheelhouse panel bolts/screws (164) to 10 N.m (89 lb. in.).
9. Lower bracket bolt/screw (171) with shim (165), if removed.

Figure 59 - Removing Front Side Door Window

Tighten

- Lower bracket bolt/screw (171) to 50 N.m (37 lb. ft.).

10. Wheelhouse panel bolts/screws (185).

Tighten

- Bolts/screws (185) to 10 N.m (89 lb. in.).

11. Lower rear panel bolt/screw (172) and shims (165), if removed.

Tighten

- Lower rear panel bolt/screw (172) to 10 N.m (89 lb. in.).

12. Remove front side door support.
13. Tire and wheel. Refer to SECTION 3E.
14. Lower vehicle.
15. Wire harness and wire conduit.
16. Electrical connectors to front side door-mounted components.
17. Reposition front side door water deflector.
18. Front side door trim. Refer to "Front Side Door Trim" in this section.

FRONT SIDE DOOR WINDOW

Figures 59 through 61

The window (94) is riveted to the filler (93) and window sash channel. This is then riveted to a window regulator sash. The window (94) and the sash (92) with filler (93) are removed from the door as a unit. Replacement window is installed to the sash (92) as a bench operation.

CAUTION: Approved safety glasses and gloves should be worn when performing these procedures to reduce the chance of personal injury should window breakage occur.

Remove or Disconnect

CAUTION: When activated, the front side door window switch may lock into the express down mode causing the driver's side front side door window to lower fully without stopping even though the switch has been released. Failure to exercise caution around the front side door window regulator when operating the switch may result in personal injury and regulator damage.

1. Lower window (94) enough to access rivets (96).

Figure 60 - Removing Front Side Door Window Sash

CAUTION: Tape the front side door window to the front side door frame. If the window drops into the door, personal injury or window damage may result.

2. Front side door trim. Refer to "Front Side Door Trim" in this section.
3. Move front side door water deflector to access front side door window hardware.
4. Support window (94) in position needed to access rivets (96) by taping it to door frame using cloth-backed body tape.
5. Front side door window front channel bolt/screw.
6. Front side door window front channel.
7. Rivets (96) holding window sash (92) to window regulator sash, using a drill and 5/16-inch drill bit.
8. Window (94) with window sash (92).

A. Support window (94) and remove cloth-backed body tape.

CAUTION: Refer to Front Side Door Window Switch "Caution" above.

- B. Run regulator (98) to full-down position.
- C. Disengage rear edge of window (94) from front side door window rear channel.
- D. Slide window (94) forward and tilt it slightly to remove from front side door window rear channel.

Figure 61 - Front Side Door Window Regulator

**Disassemble**

1. Rivets (91), using drill and 1/4-inch drill bit.
2. Window sash channel.
3. Filler (93) from window (94).

**Assemble**

1. Filler (93) to window (94).
2. Window sash channel.
3. Rivets (91).

**Install or Connect**

NOTICE: Refer to "Notice" on page 10-6-1 of this section.

1. Window (94) with sash (92).
 - A. Install window (94) front end first.
 - B. Engage rear edge of window (94) to front side door window rear channel.
2. Rivets (96).
3. Front side door window front channel.

CAUTION: Refer to Front Side Door Window Switch "Caution" above.

4. Front side door window front channel bolt/screw.
 - Run regulator (98) to position sash (92) for rivet (96) installation.

**Adjust**

- Window (94) if top edge is not parallel to front side door window weatherstrip.
 - A. Loosen bolts/screws (99).

- B. Raise window (94) to full upward position.
- C. Push up or down, as necessary, on rear of window regulator cam and secure with bolts/screws (99).

**Tighten**

- Bolts/screws (99) to 11 N.m (97 lb. in.).
5. Reposition front side door water deflector.
 6. Front side door trim. Refer to "Front Side Door Trim" in this section.

FRONT SIDE DOOR WINDOW DOWN STOP BUMPER**Figure 62****Remove or Disconnect**

- Down stop bumper (265).
 - Insert screwdriver under bumper and pry up.

**Install or Connect**

- Down stop bumper (265).
 - A. Align bumper to pierced hole in bottom of front door inner panel.
 - B. Press down with sufficient pressure to seat properly.

265 DOWN STOP BUMPER, FRONT SIDE DOOR WINDOW

5-10-94
BS062106

Figure 62 - Front Side Door Window Down Stop Bumper

FRONT SIDE DOOR WINDOW REGULATOR

Figures 60 and 61

Remove or Disconnect

CAUTION: When activated, the front side door power window switch may lock into the express down mode causing the driver's side front side door window to lower fully without stopping even though the switch has been released. Failure to exercise caution around the front side door power window regulator when operating the switch may result in personal injury and regulator damage.

1. Raise window (94) as necessary.

CAUTION: Tape the front side door window to the front side door frame. If the window drops into the door when the front side door window regulator is removed, personal injury or window damage may result.

2. Front side door trim. Refer to "Front Side Door Trim" in this section.
3. Front side door water deflector. Refer to "Front Side Door Water Deflector" in this section.
4. Support window (94) in position needed to access rivets (96) by taping it to door frame, using cloth-backed body tape.
5. Front side door locking system module. Refer to "Front Side Door Locking System Module" in this section.
6. Rivets (96) connecting sash (92) to window regulator sash, using drill and 5/16-inch drill bit.
7. Bolts/screws (99) securing regulator cam to door panel.
8. Electrical connection, if necessary.
9. Rivets (97) securing regulator (98) to door panel, using drill and 5/16-inch drill bit.
10. Reinforcement (263), if manual window regulator.
11. Regulator (98).

Install or Connect

NOTICE: Refer to "Notice" on page 10-6-1 of this section.

1. Regulator (98).
2. Reinforcement (263), if manual window regulator.
3. Rivets (97) securing regulator (98) to door panel.
 - Secure upper rearmost, center rearmost, center foremost, then lower rearmost.
4. Electrical connection, if removed.
5. Bolts/screws (99) securing regulator cam to door inner panel.

Tighten

- Bolts/screws (99) to 11 N.m (97 lb. in.).
6. Rivets (96) connecting sash (92) to window regulator sash.
 7. Front side door locking system module. Refer to "Front Side Door Locking System Module" in this section.
 8. Remove cloth-backed tape.

Inspect

CAUTION: Refer to Front Side Door Window Switch "Caution" above.

- A. Regulator (98) operation.
 - B. Window (94) alignment.
 - Refer to "Front Side Door Window" in this section for adjustment procedures.
9. Front side door water deflector. See "Front Side Door Water Deflector" in this section.
 10. Front side door trim. Refer to "Front Side Door Trim" in this section.

FRONT SIDE DOOR WINDOW REGULATOR MOTOR

Important

- Front Side Door Window Regulator Motor is not serviceable, and is replaced as a unit.

CENTER PILLAR INTERIOR TRIM

Center Pillar Upper Trim Finish Panel

Figure 63

Remove or Disconnect

1. Open cover (104).
2. Bolt/screw (105).
3. Panel (103) by unseating clip (106).

Install or Connect

CAUTION: Replace belts, retractors, and hardware in use during all but a minor collision. Also, restraint systems should be replaced and anchorages properly repaired if they were in areas damaged by a collision, whether the belt was in use or not. If there is any question, replace the belt system. Damage, whether visible or not, could result in serious personal injury in the event of an accident.

NOTICE: Refer to "Notice" on page 10-6-1 of this section.

2. Bolt/screw (105).

Tighten

- Bolt/screw (105) to 48 N·m (35 lb. ft.).
3. Snap cover (104) closed.

Install or Connect

CAUTION: Replace belts, retractors, and hardware in use during all but a minor collision. Also, restraint systems should be replaced and anchorages properly repaired if they were in areas damaged by a collision, whether the belt was in use or not. If there is any question, replace the belt system. Damage, whether visible or not, could result in serious personal injury in the event of an accident.

NOTICE: Refer to "Notice" on page 10-6-1 of this section.

1. Belt (117) through upper and lower slots in retainer (115).
2. Bolt/screw (107).

Tighten

- Bolt/screw (107) to 42 N·m (31 lb. ft.).
3. Retainer (115).

- A. Slide end underneath body lock pillar trim finish panel at rear.
- B. Position to center pillar and seat securely into front side door weatherstrip.
- C. Apply outward pressure to lock pillar trim finish panel to engage clips.

Floor Carpet Retainer

Figures 64 through 66

Remove or Disconnect

1. Center pillar upper trim finish panel. Refer to "Center Pillar Upper Trim Finish Panel" in this section.
2. Unsnap escutcheon (114) from retainer (115).
3. Bolts/screws (109).
4. Forward carpet retainer (116).
5. Bottom edge of body lock pillar trim finish panel.
 - Carefully pull forward and inward to disengage clips.
6. Rear carpet retainer (113).
7. Retainer (115).
 - Slide from underneath lock pillar trim finish panel at rear.
8. Bolt/screw (107).
9. Belt (117) by removing through upper and lower slots in retainer (115).

Figure 64 - Removing Floor Carpet Retainer

Figure 65 - Front Seat Belt Bolt/Screw

4. Rear carpet retainer (113).
5. Bottom edge of body lock pillar trim finish panel.
6. Forward carpet retainer (116).
7. Bolts/screws (109).

8. Snap escutcheon (114) into retainer (115).
9. Center pillar upper trim finish panel. Refer to "Center Pillar Upper Trim Finish Panel" in this section.

Tighten

- Bolts/screws (109) to 1.3 N.m (12 lb. in.).

CENTER PILLAR EXTERIOR TRIM**Center Pillar Applique**

BUICK SEDAN

Figure 67**↔ Remove or Disconnect**

1. Roof side rail auxiliary weatherstrip by pulling off flange.
2. Applique (118).
 - Use heat gun to soften adhesive.

**Clean**

- Surface with 50/50 alcohol and water solution.

→→ Install or Connect

1. Applique (118).
 - A. Surface temperature must be between 15° C and 32° C (60° F and 90° F). If necessary, adjust surface temperature by using heat gun or allowing surface to cool.
 - B. Partially remove paper backing from applique (118).
 - C. Align top of applique (118) to roof header.
 - D. Working downward, remove paper backing and position applique (118) to center pillar using a squeegee to smooth applique (118).
 - E. Carefully remove protective premask by pulling it back over itself in a smooth, steady motion, at a 180-degree angle.
2. Roof side rail auxiliary weatherstrip by pushing onto flange.

CENTER PILLAR SWITCHES**Door Jamb Switches****Figure 68**

Door jamb switches consist of a plunger, plunger collar, threaded retainer and terminals. They are installed in the door hinge pillars. When the door of the vehicle is closed, the plunger is pressed down creating an open in the ground circuit. When the door is opened, the plunger is released and completes the circuit to ground.

When a new door jamb switch is installed and the door is closed for the first time, the plunger is forced into the sleeve and automatically adjusts the switch for that particular door. If a door jamb switch fails, it should not be readjusted by hand. A new switch should be installed.

**Remove or Disconnect**

CAUTION: Refer to "Caution" under "Disconnecting the Battery Negative Cable" in SECTION 0A.

1. Battery negative cable.
2. Switch (121).
3. Electrical connector(s).
4. Seal (120).

**Install or Connect**

NOTICE: Refer to "Notice" on page 10-6-1 of this section.

1. Seal (120).
2. Electrical connector(s).

**Figure 67 - Center Pillar Applique-(Buick Sedan)**

Figure 68 - Removing Door Jamb Switches

3. Switch (121).

Tighten

- Switch (121) to 8 N•m (71 lb. in.).
4. Battery negative cable.

REAR SIDE DOOR INTERIOR TRIM

Rear Side Door Trim

The rear side door trim is serviced the same way as the front side door trim. For service procedure, refer to "Front Side Door Trim" in this section.

Rear Side Door Armrest

CHEVROLET

The rear side door armrest is serviced the same way as the front side door armrest. For service procedure, refer to "Front Side Door Armrest" in this section.

Body Side Rear Window Garnish Molding

Figure 10

Remove or Disconnect

1. Rear side door trim. Refer to "Front Side Door Trim" in this section.
2. Bolts/screws.
3. Molding (208).
 - Disengage clips.

Clean

- Area of door inner panel where rear doughnut is to be positioned with a suitable solvent of isopropyl alcohol, 50-50 mixture by volume of water.

Install or Connect

NOTICE: Refer to "Notice" on page 10-6-1 of this section.

1. Molding (208).
 - A. Engage clips.
 - B. Peel back paper and press to secure doughnut.
2. Bolts/screws.

Tighten

- Bolts/screws to 1.3 N•m (12 lb. in.).
3. Rear side door trim. Refer to "Front Side Door Trim" in this section.

REAR SIDE DOOR EXTERIOR TRIM

Rear Side Door Moldings

NOTICE: When removing or installing any outside molding, cover adjacent finishes with masking tape to prevent damage to the finish. Use proper tools and care to prevent molding. Seal all holes for bolts/screws or clips in body panels with body caulking compound or presealed bolts/screws, nuts or clips to prevent water entry into the body interior.

REAR SIDE DOOR WINDOW REVEAL MOLDINGS

BUICK SEDAN

Figure 69

Remove or Disconnect

1. Fully lower window.
2. Rear side door window channel.
 - Peel rear side door window channel away from front reveal molding (142) and upper reveal molding (139).
3. Rear side door vent window, if removing upper reveal molding or rear reveal molding. Refer to "Rear Side Door Vent Window and Rear Side Door Stationary Window Division Channel" in this section.
4. Bolt/screw (143) in belt reveal molding (141).
5. Belt reveal molding (141) by sliding upward.
6. Front reveal molding (142).
7. Bolt/screw (123) in upper reveal molding (139).
8. Rock upper reveal molding (139) down and rear reveal molding (140) forward as one unit until removed from door flanges.

Figure 69 - Rear Side Door Window Reveal Molding-(Buick)

9. Slide rear reveal molding (140) out from upper reveal molding (139).

BUICK WAGON**Figure 69**

Install or Connect

NOTICE: Refer to "Notice" on page 10-6-1 of this section.

1. Slide rear reveal molding (140) into upper reveal molding (139).
2. Rock rear reveal molding(140) rearward and upper reveal molding (139) upward until installed on door flanges.
3. Bolt/screw (123) to upper reveal molding (139).

Tighten

- Bolt/screw (123) to 1.3 N.m (12 lb. in.).
4. Front reveal molding (142), pushing upward and toward front of vehicle.
 5. Belt reveal molding (141).
 6. Bolt/screw (143) in belt reveal molding (141).

Tighten

- Bolt/screw (143) to 1.5 N.m (13 lb. in.).
7. Rear side door vent window if removed. Refer to "Rear Side Door Vent Window and Rear Side Door Stationary Window Division Channel" in this section.
 8. Rear side door window channel.
 - Push rear side door window channel over edge of front reveal molding (142) and upper reveal molding (139).

Remove or Disconnect

1. Fully lower window.
2. Body side rear window garnish molding. Refer to "Body Side Rear Window Garnish Molding" in this section.
3. Rear side door window channel. Refer to "Rear Side Door Window Channel and Rear Side Door Window Weatherstrip" in this section.
4. Rear side door window weatherstrip. Refer to "Rear Side Door Window Weatherstrip" in this section.
5. Bolt/screw (168) in reveal molding (167).
6. Reveal molding (167) by sliding upward.
7. Bolt/screw (123) in upper reveal molding (139).
8. Rock upper reveal molding (139) down and rear reveal molding (140) forward as one unit until removed from door flanges.
9. Slide rear reveal molding (140) out from upper reveal molding (139).

Install or Connect

1. Slide rear reveal molding (140) into upper reveal molding (139).
2. Rock rear reveal molding (140) rearward and upper reveal molding (139) upward until installed on door flanges.
3. Bolt/screw (123) to upper reveal molding (139).

Tighten

- Bolt/screw (123) to 1.3 N.m (12 lb. in.).

10-6-62 DOORS

4. Reveal molding (167).
5. Bolt/screw (168) in reveal molding (167).

Tighten

- Bolt/screw (168) to 1.5 N·m (13 lb. in.).
6. Rear side door window weatherstrip. Refer to "Rear Side Door Window Weatherstrip" in this section.
 7. Rear side door window channel. Refer to "Rear Side Door Window Channel and Rear Side Door Window Weatherstrip" in this section.
 8. Body side rear window garnish molding. Refer to "Body Side Rear Window Garnish Molding" in this section.
 9. Fully raise window.

CHEVROLET

Figure 70

Remove or Disconnect

1. Fully lower window.
2. Bolts/screws (123 and 224) in upper reveal molding (170).
3. Upper reveal molding (170).
4. Bolts/screws (225) in reveal molding (169).
5. Reveal molding (169).

Install or Connect

NOTICE: Refer to "Notice" on page 10-6-1 of this section.

1. Reveal molding (169).
2. Bolts/screws (225) in reveal molding (169).

Tighten

- Bolts/screws (225) to 1.5 N·m (13 lb. in.).
3. Upper reveal molding (170).
 4. Bolts/screws (123 and 224) in upper reveal molding (170).

Tighten

- Bolts/screws (123 and 224) to 1.3 N·m (12 lb. in.).

REAR SIDE DOOR EDGE GUARD MOLDING

Figure 33

Remove or Disconnect

- Molding (138).
- Pull from edge of door.

Install or Connect

- Molding (138).
- A. Match to shape of door edge.
- B. Press along entire length to secure.

- 123 BOLT/SCREW, REAR SIDE DOOR WINDOW UPPER REVEAL MOLDING, 1.3 N·m (12 LB. IN.)
- 169 MOLDING, REAR SIDE DOOR WINDOW REVEAL
- 170 MOLDING, REAR SIDE DOOR WINDOW UPPER REVEAL
- 224 BOLT/SCREW, REAR SIDE DOOR WINDOW UPPER REVEAL MOLDING, 1.3 N·m (12 LB. IN.)
- 225 BOLT/SCREW, REAR SIDE DOOR WINDOW REVEAL MOLDING, 1.5 N·m (13 LB. IN.)

Figure 70 - Rear Side Door Window Reveal Molding-(Chevrolet)

Rear Side Door Window Frame Rear Applique

BUICK WAGON

Figure 71

Remove or Disconnect

1. Bolt/screw (229).
2. Nuts (178).
3. Applique (177).
 - Pry applique (177) from rear side door, being careful not to damage surrounding surfaces.
4. Discard applique (177).

Clean

- Area with general purpose cleaner.

Install or Connect

NOTICE: Refer to "Notice" on page 10-6-1 of this section.

1. Clips (228) if missing or damaged.
2. New applique (177).
 - A. Heat surface to between 15° C and 32° C (60° F and 90° F), if necessary, by using a heat gun.
 - B. Align rosebuds at top of applique (177) with holes in door.
 - C. Align three studs on applique (177) to clips on door.
 - D. Press rosebuds and studs in place to secure.
 - E. Pull tabs (A) at top of applique (177) to remove protective liner from adhesive.
3. Nuts (178).
4. Bolt/screw (229).

Tighten

- Bolt/screw (229) to 1.5 N·m (13 lb. in.).
5. Roll front and rear edges of applique (177) to secure adhesive tape. Bottom of applique (177) should be within 1 mm (1/32 inch) of horizontal door surface.

REAR SIDE DOOR WEATHERSTRIP AND REAR SIDE DOOR UPPER FRONT AUXILIARY WEATHERSTRIP

Rear Side Door Weatherstrip

Figure 36

Remove or Disconnect

1. Center pillar upper trim finish panel. Refer to "Center Pillar Upper Trim Finish Panel" in this section.

2. Rear side door lock pillar garnish molding (Sedan) or body lock pillar trim finish panel (Wagon). Refer to SECTION 10-7.
3. Floor carpet retainer. Refer to "Floor Carpet Retainer" in this section.
4. Weatherstrip (30).
 - Pull from pinch-weld flange.

Install or Connect

1. Weatherstrip (30).
 - A. Position to body by locating joint area of weatherstrip to rearward rocker panel sill plate hole. Engage weatherstrip (30) onto pinch-weld flange.
 - B. Engage each corner onto pinch-weld flange.
 - C. Finish installing by engaging between corners onto pinch-weld flange.
 - D. It may be necessary to tap weatherstrip (30) onto pinch-weld with rubber mallet.
2. Floor carpet retainer. Refer to "Floor Carpet Retainer" in this section.
3. Rear side door lock pillar garnish molding (Sedan) or body lock pillar trim finish panel (Wagon). Refer to SECTION 10-7.
4. Center pillar upper trim finish panel. Refer to "Center Pillar Upper Trim Finish Panel" in this section.

Figure 71 - Rear Side Door Window Frame Rear Applique-(Buick Sedan)

Rear Side Door Upper Front Auxiliary Weatherstrip

Figure 72

Remove or Disconnect

1. Body side rear window garnish molding. Refer to "Body Side Rear Window Garnish Molding" in this section.
2. Bolts/screws (143, 168 or 225).
3. Bolt/screw (123).
4. Retainers (231).
5. Auxiliary weatherstrip (230).

Install or Connect

1. Auxiliary weatherstrip (230).
 - Align holes in auxiliary weatherstrip (230) to holes in rear door frame.
2. Retainers (231).

Tighten

- Retainers (231) to 1.3 N·m (12 lb. in.).
3. Bolt/screw (123).

Tighten

- Bolt/screw (123) to 1.3 N·m (12 lb. in.).
4. Bolt/screw (143, 168 or 225).

Tighten

- Bolt/screw (143, 168 or 225) to 1.5 N·m (13 lb. in.).

REAR SIDE DOOR SEALING STRIPS

Window Belt Outer Sealing Strip

The rear side door window belt outer sealing strip is part of the rear side door window belt reveal molding. For procedure, refer to "Rear Side Door Window Belt Molding" under "Rear Side Door Moldings" in this section.

Window Belt Sealing Strip

The window belt sealing strip is part of the rear side door window reveal molding. For service information refer to "Rear Side Door Window Reveal Moldings" (Sedan) or "Rear Side Door Window Reveal Molding" (Wagon) under "Rear Side Door Moldings" in this section.

Figure 72 - Rear Side Door Upper Front Auxiliary Weatherstrip

Rear Side Door Bottom Auxiliary Sealing Strip

The rear side door bottom auxiliary sealing strip is serviced the same way as the front side door bottom auxiliary sealing strip. For service procedure, refer to "Front Side Door Bottom Auxiliary Sealing Strip" in this section.

Rear Side Door Lower Rear Auxiliary Sealing Strip

BUICK SEDAN

Figure 73

↔ Remove or Disconnect

1. Bolts/screws (184 and 199).
2. Sealing strip (232).

→← Install or Connect

NOTICE: Refer to "Notice" on page 10-6-1 of this section.

1. Sealing Strip (232).
2. Bolt/screw (184).

⌚ Tighten

- Bolt/screw (184) to 1.3 N.m (12 lb. in.).
3. Bolt/screw (199).

⌚ Tighten

- Bolt/screw (199) to 1.3 N.m (12 lb. in.).

REAR SIDE DOOR WINDOW CHANNEL AND REAR SIDE DOOR WINDOW WEATHERSTRIP

Rear Side Door Window Front Channel

BUICK SEDAN

Figure 38

Procedure for rear side door window front channel is similar to that for the front side door window front channel. Refer to "Front Side Door Window Front Channel" in this section.

Rear Side Door Window Rear Channel

CHEVROLET SEDAN AND WAGON AND BUICK WAGON

Figure 74

↔ Remove or Disconnect

1. Rear door inner trim panel. Refer to "Rear Side Door Interior Trim," in this section.

Figure 73 - Rear Side Door Lower Rear Auxiliary Sealing Strip-(Buick Sedan)

2. Rear door armrest hanger plate, by removing rivets.
3. Peel back rear door water deflector to gain access.
4. Rear door reveal molding. Refer to "Rear Side Door Window Reveal Moldings," under "REAR DOOR EXTERIOR TRIM," in this section.
5. Lower window to access rivets connecting window regulator to rear door window sash.
6. Rivets connecting window regulator sash to rear door window sash.
7. Lower window to full down position.
8. Window weather stripping from rear window channel.
9. Bolt/screw (133).
10. Rear window channel.

→← Install or Connect

NOTICE: Refer to "Notice" on page 10-6-1 of this section.

1. Position rear window channel.
2. Bolt/screw (133).

⌚ Tighten

- Bolt/screw (133) to 11 N.m (97 lb. in.).
3. Window weather-stripping to rear channel.

Figure 74 - Removing Rear Side Door Window Rear Channel-(Chevrolet Sedan and Wagon, Buick Wagon)

4. Raise window to access window regulator sash and rear door window sash.
5. Rivet window regulator to rear door window sash.
6. Raise window to full up position.
7. Rear door reveal molding. Refer to "Rear Side Door Window Reveal Moldings," under "REAR DOOR EXTERIOR TRIM," in this section.
8. Reposition rear door water deflector.
9. Rivet rear door armrest hanger plate.
10. Rear door inner trim panel. Refer to "Rear Side Door Interior Trim," in this section.

Remove or Disconnect

1. Rear side door window channel. Refer to "Rear Side Door Window Front Channel" (Buick Sedan) or "Rear Side Door Window Rear Channel" (Chevrolet Sedan and Wagon and Buick Wagon) in this section.
2. Rear side door window. Refer to "Front Side Door Window" in this section.
3. Rear side door window weatherstrip (26 or 223).
 - Using finger pressure, squeeze weatherstrip (26 or 223) together and pull from rear side door window frame.

Install or Connect

1. Rear side door window weatherstrip (26 or 223).
 - A. Squeeze weatherstrip (26 or 223) together.
 - B. Working from position A forward, along upper header toward position B, seat weatherstrip (26 or 223) into rear side door window frame.
2. Rear side door window. Refer to "Front Side Door Window" in this section.
3. Rear side door window channel. Refer to "Rear Side Door Window Front Channel" (Buick Sedan) or "Rear Side Door Window Rear Channel" (Chevrolet Sedan and Wagon and Buick Wagon) in this section.
4. Seat rear side door window channel into weatherstrip.

Rear Side Door Stationary Window Division Channel

BUICK SEDAN

For rear side door stationary window division channel service procedure, refer to "Rear Side Door Vent Window and Rear Side Door Stationary Window Division Channel" in this section.

Rear Side Door Window Weatherstrip

Figure 78

Procedure for the rear side door window weatherstrip is similar to that for the front side door window weatherstrip.

Figure 75 - Removing Rear Side Door Window Weatherstrip

REAR SIDE DOOR SWITCHES

Rear Side Door Armrest Switch Mount Plate

BUICK

Figure 76

Replace spring clip (GM P/N 10221260) whenever the switch mount plate is removed from the door trim.

 Remove or Disconnect

CAUTION: Refer to "Caution" under "Disconnecting the Battery Negative Cable" in SECTION 0A.

1. Battery negative cable.
2. Switch mount plate (32).
 - A. Insert screwdriver under center of rearward edge of switch mount plate (32) to compress spring clip.
 - B. Slide up and rearward to remove switch mount plate (32).
3. Rear door power window connector from switch mount plate (32).
4. Window switch from switch mount plate (32).
 - Press on switch and insert screwdrivers between housing and switch on both sides.

Figure 76 - Removing Rear Side Door Armrest Switch Mounted Plate-(Buick)

10-6-68 DOORS

5. Spring clip from switch mount plate (32).
 - Insert screwdriver between inner edge of spring clip and bezel. Then pry off and discard.

Install or Connect

1. New spring clip to switch mount plate (32).
 - Slide clip into groove on bezel until fully seated.
2. Window switch to switch mount plate (32).
 - Snap into place.
3. Rear door power window connector to switch mount plate (32).
4. Switch mount plate (32) to rear side door armrest.
 - Slide forward and snap into place.
5. Battery negative cable.

Rear Side Door Window Switch

CHEVROLET

Figure 77

Remove or Disconnect

CAUTION: Refer to "Caution" under "Disconnecting the Battery Negative Cable" in SECTION 0A.

1. Battery negative cable.
2. Switch (125).
 - Insert flat-bladed tool between bottom edge of switch (125) and trim (366) to disengage.
3. Electrical connection.

Install or Connect

1. Electrical connection.
2. Switch (125) by engaging component clip to bottom of door trim panel cutout on each side.
3. Battery negative cable.

REAR SIDE DOOR WATER DEFLECTOR

The rear side door water deflector is serviced the same way as the front side door water deflector. For service procedure, refer to "Front Side Door Water Deflector" in this section.

REAR SIDE DOOR HANDLES

Rear side door handles are serviced the same way as the front side door handles. For service procedures, refer to "Front Side Door Handles" in this section.

REAR SIDE DOOR LOCKING SYSTEM MODULE

The rear side door locking system module is serviced the same way as the front side door locking system module. For service procedure, refer to "Front Side Door Locking System Module" in this section.

Figure 77 - Removing Rear Side Door Window Switch-Chevrolet

REAR SIDE DOOR SPECIAL EQUIPMENT OPTION

The rear door inside handle and door lock button are made inoperative as a special equipment option by disconnecting the inside handle rod and button pin from the lock module. For service procedures, refer to "Front Side Door Handles" and "Front Side Door Locking System Module" in this section.

REAR SIDE DOOR LATCH AND REAR SIDE DOOR LOCK STRIKER

The rear side door latch and rear side door lock striker are serviced the same way as those in the front side door. For service procedures, refer to "Front Side Door Latch and Front Side Door Lock Striker" in this section.

REAR SIDE DOOR LOCK ACTUATORS

The rear side door actuators are serviced the same way as the front side door actuators. For service procedures, refer to "Front Side Door Lock Actuators" in this section.

REAR SIDE DOOR LOCK ROD LEVER

The rear side door lock rod lever is serviced the same way as the front side door lock rod lever. For service procedure, refer to "Front Side Door Lock Rod Lever" in this section.

REAR SIDE DOOR UPPER AND LOWER HINGES

Figure 78

Tools Required:

J 36604 Door Hinge Spring Compressor
J 28500 Door Hinge Wrench

Remove or Disconnect

1. Support rear side door in full open position.
2. Mark position of hinge on body hinge pillar, and on door.
3. Spring (216) on lower hinge (213), using J 36604.
4. Nuts (217 or 218).
5. Bolts/screws (214 or 215), using J 28500.
6. Hinge (212 or 213).

Install or Connect

NOTICE: Refer to "Notice" on page 10-6-1 of this section.

NOTICE: Before installing a hinge, apply a coat of heavy-bodied sealer to the surface of the hinge that contacts the door and the hinge pillar to prevent corrosion damage.

1. Hinge (212 or 213).
 - Align hinge (212 or 213) with marks made before removing hinge (212 or 213).
2. Bolts/screws (214 or 215), using J 28500.
3. Nuts (217 or 218).

Tighten

- A. Bolts/screws (214 or 215) to 32 N·m (24 lb. ft.).
 - B. Nuts (217 or 218) to 32 N·m (24 lb. ft.).
4. Spring (216) on lower hinge (213).

Adjust

- Rear side door, if required. Refer to "Rear Side Door" in the following procedure.

REAR SIDE DOOR

Figure 78

Tool Required:

J 28500 Door Hinge Wrench

Remove or Disconnect

1. Rear side door trim. Refer to "Front Side Door Trim" in this section.
2. Move rear side door water deflector to access electrical connectors for door-mounted electrical components.

Figure 78 - Rear Side Upper and Lower Hinges

3. Electrical connectors from door-mounted components.
4. Wire harness and rubber conduit.
5. Support rear side door in full-open position.
6. Nuts (217 and 218).
7. Rear side door, with aid of helper.

Install or Connect

NOTICE: Refer to "Notice" on page 10-6-1 of this section.

1. Rear side door, with aid of helper.
2. Nuts (217 and 218).

Tighten

- Nuts (217 and 218) to 32 N·m (24 lb. ft.).
3. Rubber conduit and wire harness.
 4. Electrical connectors to door-mounted components.
 5. Reposition rear side door water deflector.
 6. Rear side door trim. Refer to "Front Side Door Trim" in this section.

Adjust

NOTICE: Refer to "Notice" on page 10-6-1 of this section.

10-6-70 DOORS

1. Rear side door, if required.
 - A. Mark position of rear side door lock striker.
 - B. Remove rear side door lock striker. Refer to "Front Side Door Lock Striker" in this section.
 - C. To adjust door up, down, forward or rearward, loosen bolts/screws (214 and 215).
 - D. To adjust door inboard or outboard, loosen nuts (217 and 218), using J 28500.
 - E. Move door to desired position.

Tighten

- Nuts (217 and 218) to 32 N·m (24 lb. ft.).
2. Rear side door lock striker. Refer to "Front Side Door Lock Striker Adjustment" in this section.
 3. If rear side door was adjusted rearward, replace door jamb switches. Refer to "Door Jamb Switches" in this section.

REAR SIDE DOOR WINDOW

The rear side door window is serviced the same way as the front side door window. For service procedure, refer to "Front Side Door Window" in this section.

Rear Side Door Vent Window and Rear Side Door Stationary Window Division Channel

BUICK SEDAN

Figure 79

Remove or Disconnect

1. Rear side door trim. Refer to "Front Side Door Trim" in this section.
2. Move rear side door water deflector to access rear side door stationary window division channel hardware.
3. Rear side door window. Refer to "Front Side Door Window" in this section.
4. Bolts/screws (126, 128 and 176) and spacer (175).
5. Weatherstrip (122) from channel (124).
6. Channel (124) from door.
7. Window (129).
8. Seal from window (129), if necessary.

Install or Connect

NOTICE: Refer to "Notice" on page 10-6-1 of this section.

1. Seal to window (129), if removed.
 - Seat with rubber mallet.

Figure 79 - Removing Rear Side Door Vent Window-(Buick Sedan)

2. Window (129).
3. Channel (124) to door.
4. Weatherstrip (122) to channel (124).
5. Spacer (175) and bolts/screws (126, 128 and 176).

Tighten

- A. Screws (126) to 1.9 N.m (17 lb. in.).
- B. Screws (128 and 176) to 10 N.m (89 lb. in.).
6. Rear side door window. Refer to "Front Side Door Window" in this section.
7. Rear side door trim. Refer to "Front Side Door Trim" in this section.

REAR SIDE DOOR WINDOW DOWN STOP BUMPER

Buick Sedan

Figure 80

The rear side door window down stop bumper is serviced the same way as the front side door window down stop bumper. For service procedure, refer to "Front Side Door Window Down Stop Bumper" in this section.

REAR SIDE DOOR WINDOW REGULATOR

Figure 81

Remove or Disconnect

1. Rear side door trim. Refer to "Front Side Door Trim" in this section.
2. Rear side door water deflector. Refer to "Front Side Door Water Deflector" in this section.

CAUTION: Tape rear side door window to rear side door frame. If rear side door window drops into rear side door, personal injury or rear side door window damage may result.

3. Support rear side door window in position needed to access rear side door window rivets, by taping it to front side door frame with cloth-backed body tape.
4. Rear side door locking system module. Refer to "Front Side Door Locking System Module" in this section.
5. Rear side door window rivets connecting rear side door window sash to window regulator sash, using drill and 5/16-inch bit.

Figure 80 - Rear Side Door Window Down Stop Bumper-(Buick Sedan)

Figure 81 - Rear Side Door Window Regulator

6. Bolts/screws (57) securing regulator cam to rear side door panel.
7. Electrical connector.
8. Rivets (56), using drill and 5/16-inch bit.
9. Reinforcement (264), if manual window regulator (Chevrolet).
10. Regulator (55).

Install or Connect

NOTICE: Refer to “Notice” on page 10-6-1 of this section.

1. Regulator (55).
2. Reinforcement (264), if manual window regulator (Chevrolet).
3. Rivets (56).
 - Secure upper rearmost, center rearmost, center foremost, then lower rearmost.
4. Electrical connector.
5. Bolts/screws (57).

Tighten

- Bolts/screws (57) to 11 N·m (97 lb. in.).
6. Rear side door window rivets connecting rear side door window sash to window regulator sash.
 7. Rear side door locking system module. Refer to “Front Side Door Locking System Module” in this section.
 8. Remove tape.

Inspect

- A. Regulator (55) operation.
- B. Rear side door window alignment.
 - Refer to “Front Side Door Window” in this section for adjustment procedure.
9. Rear side door water deflector. Refer to “Front Side Door Water Deflector” in this section.
10. Rear side door trim. Refer to “Front Side Door Trim” in this section.

REAR SIDE DOOR WINDOW REGULATOR MOTOR

Rear door window regulator and motor is serviced as a assembly, not separately.

SECTION 10-7

REAR QUARTERS

CAUTION: This vehicle is equipped with Supplemental Inflatable Restraint (SIR). Refer to CAUTIONS in Section 9J under "On-Vehicle Service" and the SIR Component and Wiring Location view in Section 9J before performing service on or around SIR components or wiring. Failure to follow CAUTIONS could result in possible air bag deployment, personal injury, or otherwise unneeded SIR system repairs.

NOTICE: Always use the correct fastener in the correct location. When you replace a fastener, use ONLY the exact part number for that application. General Motors will call out those fasteners that require a replacement after removal. General Motors will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

NOTICE: The theft deterrent label found on some major sheet metal must be masked prior to painting, rustproofing, undercoating, etc. The mask must be removed following the above operations. Failure to keep the label clean and readable may result in liability for violation of the Federal Vehicle Theft Prevention Standard, and subject the vehicle owner to possible suspicion that the part was stolen.

10-7-2 REAR QUARTERS

GENERAL DESCRIPTION

REAR QUARTERS

Figures 1, 2, 3 and 4

The information in this section provides service procedures that apply to all rear quarter components, as shown in (Figures 1, 2, 3 and 4).

ON-VEHICLE SERVICE

INTERIOR TRIM

Quarter Window Garnish Molding

CHEVROLET SEDAN

Figure 5

Remove or Disconnect

1. Grille (42) by pulling gently.
2. Garnish molding (37) and lace (43) from inner panel (1).
 - Disengage fasteners (38).
3. Lace (52) from garnish molding (2).

Install or Connect

1. Garnish molding (37) to inner panel (1).
 - A. Attach lace (43) to garnish molding (37).
 - B. Fasteners (38).
2. Grille (42).

Quarter Upper Trim

BUICK SEDAN

Figure 6

Tool Required:
J 24595-C Door Trim Pad and Garnish Clip Remover

Remove or Disconnect

NOTICE: Disengage quarter upper trim retainers carefully or damage to quarter upper trim may result.

- Trim (2) from inner panel (1).
 - Carefully disengage retainers (3) by inserting J 24595-C behind trim (2).

Install or Connect

- Trim (2) to inner panel (1).
 - Attach retainers (3) by pressing to inner panel (1).

Spare Tire Cover

WAGON

The passenger side quarter inner rear trim finish panel serves as the spare tire cover in the wagon. For removal and installation, refer to "Quarter Inner Rear Trim Finish Panel" (Wagon) in this section.

Figure 1 - Rear Quarter Components -(Chevrolet Sedan)

Figure 2 - Rear Quarter Components - (Buick Sedan)

Quarter Inner Rear Trim Finish Panel WAGON

Figure 7

↔ Remove or Disconnect

1. Retract luggage shade, if extended. Disengage from slots in back body pillar panel (16).
2. Turn slotted release button (81).
3. Top edge of trim panel (17) from groove in garnish molding (24).
4. Tabs on trim panel (17) from slots in lock pillar trim panel (21) by sliding trim (17) rearward.
5. Bottom edge of trim panel (17) from groove on load floor.
6. Trim panel (17).

→← Install or Connect

1. Trim panel (17).
2. Bottom edge of trim panel (17) to groove on load floor.
3. Tabs on trim panel (17) to slots in lock pillar trim panel (21) by sliding trim (17) forward.
4. Top edge of trim panel (17) to groove in garnish molding (24).
5. Turn slotted release button (81) on trim panel (17) to secure.
6. Extend luggage shade. Connect to slots in back body pillar panel (16).

Rear Side Door Lock Pillar Garnish Molding

CHEVROLET SEDAN

Figures 5 and 8

↔ Remove or Disconnect

1. Grille (42).
2. Garnish molding (37) from inner panel (1).
 - A. Disengage fasteners (38).
 - B. Remove lace (43) from garnish molding (37).
3. Rear seat. Refer to SECTION 10-10.
4. Bolts/screws (6).
5. Molding (5).

→← Install or Connect

NOTICE: Refer to "Notice" on page 10-7-1 of this section.

1. Molding (5).
 - Align star boss on back of molding (5) to slot in carpet retainer (7).
2. Bolts/screws (6).

Tighten

- Bolts/screws (6) to 1.3 N.m (12 lb. in.).

10-7-4 REAR QUARTERS

- 9 VALVE, BODY LOCK PILLAR PRESSURE RELIEF
- 11 MOLDING, REAR QUARTER TRANSFER LOWER FINISH

10-7-6 REAR QUARTERS

Figure 5 - Quarter Window Garnish Molding - (Chevrolet Sedan)

Figure 6 - Quarter Upper Trim - (Buick Sedan)

3. Rear seat. Refer to SECTION 10-10.
4. Garnish molding (37) to inner panel (1).
 - A. Attach lace (43) to garnish molding (37).
 - B. Attach fasteners (38) by pressing to inner panel (1).
5. Grille (42).

BUICK SEDAN

Figures 6 and 8

Tool Required:
J 24595-C Door Trim Pad and Garnish Clip Remover

↔ Remove or Disconnect

1. Trim (2) from inner panel (1).
 - Carefully disengage retainers (3) by inserting J 24595-C behind trim.
2. Rear seat. Refer to SECTION 10-10.
3. Bolts/screws (6).
4. Molding (5).

→ Install or Connect

NOTICE: Refer to "Notice" on page 10-7-1 of this section.

Figure 7 - Quarter Inner Rear Trim Finish Panel - (Wagon)

Tighten

- Bolts/screws (6) to 1.3 N·m (12 lb. in.).
- 3. Rear seat. Refer to SECTION 10-10.
- 4. Trim (2) to inner panel (1).
 - Attach retainers (3) by pressing to inner panel (1).

Body Lock Pillar Trim Finish Panel

WAGON

Figure 9

Remove or Disconnect

1. Luggage shade. Refer to SECTION 10-8.
2. Quarter inner rear trim finish panel. Refer to "Quarter Inner Rear Trim Finish Panel" (Wagon) in this section.
3. Radio quarter speaker grille and radio rear speaker. Refer to "Radio Quarter Speaker Grille and Radio Rear Speakers" (Wagon) in this section.
4. Bolts/screws (27).
5. Bolt/screw (54).
6. Rear seat folding outer retractor side belt bolt/screw. Refer to SECTION 10-1.
7. Unscrew rear seat release knob, if removing passenger side trim panel (21).
8. Bolt/screw (26).
9. Side edge of trim panel (21) from clips (28) on body lock pillar.
10. Top edge of trim panel (21) from groove in garnish molding (24).

Figure 8 - Rear Side Door Lock Pillar Garnish Molding - (Sedan)

1. Molding (5).
 - Align star boss on back of molding (5) to slot in carpet retainer (7).
2. Bolts/screws (6).

10-7-8 REAR QUARTERS

Figure 9 - Body Lock Pillar Trim Finish Panel -(Wagon)

11. Bottom edge of trim panel (21) from groove in load floor.
12. Trim panel (21).

Install or Connect

NOTICE: Refer to "Notice" on page 10-7-1 of this section.

1. Bottom edge of trim panel (21) to groove in load floor.
2. Trim panel (21).
 - Align slot in trim panel (21) to bracket (29).
3. Top edge of trim panel (21) to groove in garnish molding (24).
4. Side edge of trim panel (21) to clips (28) on body lock pillar.
5. Bolt/screw (26) attaching trim panel (21) to bracket (29).

Tighten

- Bolt/screw (26) to 48 N•m (35 lb. ft.).
6. Rear seat release knob, if removed.
 7. Rear seat folding outer retractor side bolt/screw. Refer to SECTION 10-11.
 8. Bolt/screw (54).
 9. Bolts/screws (27).

Tighten

- A. Bolts/screws (27) to 1.3 N•m (12 lb. in.).
- B. Bolt/screw (54) to 10 N•m (89 lb. in.).
10. Radio quarter speaker grille and radio rear speaker. Refer to "Radio Quarter Speaker Grilles and Speakers" (Wagon) in this section.
11. Quarter inner rear trim finish panel. Refer to "Quarter Inner Rear Trim Finish Panel" (Wagon) in this section.
12. Luggage shade. Refer to SECTION 10-8.

Radio Quarter Speaker Grille, Radio Rear Speakers

WAGON

Figure 10

Remove or Disconnect

1. Luggage shade. Refer to SECTION 10-8.
2. Quarter inner rear trim finish panel. Refer to "Quarter Inner Rear Trim Finish Panel" (Wagon) in this section.
3. Grille (23).
 - A. Pull to remove clips from slots in trim panel (21).
 - B. Remove star boss from slot in trim panel (21).
 - C. Pull top edge of grille (23) from groove in garnish molding.

Figure 10 - Radio Quarter Speaker Grille, Radio Rear Speakers - (Wagon)

- D. Belt (33) from slot in grille (23).
4. Bolts/screws (30).
5. Electrical connectors.
6. Speaker (22) from trim panel (21).
7. Electrical connectors.

Install or Connect

NOTICE: Refer to "Notice" on page 10-7-1 of this section.

1. Electrical connectors.
2. Speaker (22) to trim panel (21).
3. Remaining electrical connectors.
4. Bolts/screws (30).

Tighten

- Bolts/screws (30) to 1.9 N.m (17 lb. in.).
5. Grille (23).
 - A. Insert belt (33) into slot in grille (23).
 - B. Put top edge of grille (23) into groove in garnish molding.
 - C. Align star boss with slot in trim panel (21).
 - D. Push down firmly so clips on grille (23) lock into slots on trim panel (21).
 6. Quarter inner rear trim finish panel. Refer to "Quarter Inner Rear Trim Finish Panel" (Wagon) in this section.
 7. Luggage shade. Refer to SECTION 10-8.

Quarter Window Garnish Molding WAGON

Figure 11

Remove or Disconnect

1. Luggage shade. Refer to SECTION 10-8.
2. Quarter inner rear trim finish panel. Refer to "Quarter Inner Rear Trim Finish Panel" (Wagon) in this section.
3. Back body pillar finish panel and back body pillar assist (with courtesy lamp) handle. Refer to "Back Body Pillar Finish Panel and Back Body Pillar Assist (with Courtesy Lamp) Handle" (Wagon) in this section.
4. Radio quarter speaker grille and radio rear speaker. Refer to Radio Quarter Speaker Grille, Radio Rear Speakers. (Wagon) in this section.
5. Body lock pillar trim finish panel. Refer to "Body Lock Pillar Trim Finish Panel" (Wagon) in this section.
6. Nuts (34) from studs on quarter window.
7. Garnish molding (24).

Install or Connect

NOTICE: Refer to "Notice" on page 10-7-1 of this section.

Figure 11 - Quarter Window Garnish Molding -(Wagon)

1. Garnish molding (24).
2. Nuts (34) to studs on quarter window.

Tighten

- Nuts (34) to 2.4 N·m (21 lb. in.).
- 3. Body lock pillar trim finish panel. Refer to “Body Lock Pillar Trim Finish Panel” (Wagon) in this section.
- 4. Radio quarter speaker grille and radio rear speaker. Refer to Radio Quarter Speaker Grille, Radio Rear Speakers (Wagon) in this section.
- 5. Back body pillar finish panel and back body pillar assist (with Courtesy Lamp) handle. Refer to “Back Body Pillar Finish Panel and Back Body Pillar Assist (with Courtesy Lamp) Handle” (Wagon) in this section.
- 6. Quarter inner rear trim finish panel. Refer to “Quarter Inner Rear Trim Finish Panel” (Wagon) in this section.
- 7. Luggage shade. Refer to SECTION 10-8.

Back Body Pillar Finish Panel and Back Body Pillar Assist (with Courtesy Lamp) Handle

WAGON

Figure 12

Remove or Disconnect

1. Retract luggage shade, if extended. Disconnect from slots in back body pillar panel (16).
2. Quarter window latch from back body pillar finish panel. Refer to “Quarter Window and Quarter Window Latch” in this section.

3. Quarter inner rear trim finish panel. Refer to “Quarter Inner Rear Trim Finish Panel” (Wagon) in this section.
4. Cover (39) and lens (41) to expose bolts/screws (40).
5. Bolts/screws (36) connecting back body pillar panel (16) to inner panel (1).
6. Bolts/screws (40) from nuts (35) on inner panel (1).
7. Handle (25) from back body pillar panel (16).
8. Electrical connectors.
9. Back body pillar panel (16).

- A. Slide edge out of groove in garnish molding (24).
- B. Slide back body pillar panel (16) out from underneath endgate trim panel molding.

Install or Connect

NOTICE: Refer to “Notice” on page 10-7-1 of this section.

1. Back body pillar panel (16).
 - A. Insert edge of back body pillar panel (16) into groove in garnish molding (24).
 - B. Slide back body pillar panel (16) under endgate trim panel molding.
2. Handle (25) to back body pillar panel (16).
3. Electrical connectors.
4. Bolts/screws (40) to nuts (35) on inner panel (1).

Tighten

- Bolts/screws (40) to 10 N·m (89 lb. in.).
- 5. Bolts/screws (36) connecting back body pillar panel (16) to inner panel (1).

Figure 12 - Back Body Pillar Finish Panel and Back Body Pillar Assist (with Courtesy Lamp) Handle -(Wagon)

Tighten

- Bolts/screws (36) to 1.3 N·m (12 lb. in.).
- 6. Cover (39) and lens (41).
- 7. Quarter inner rear trim finish panel. Refer to "Quarter Inner Rear Trim Finish Panel" (Wagon) in this section.
- 8. Quarter window latch to back body pillar finish panel. Refer to "Quarter Window and Quarter Window Latch" in this section.
- 9. Extend luggage shade. Connect luggage shade to slots in back body pillar panel (16).

Body Lock Pillar Pressure Relief Valve

Figure 13

The body lock pillar pressure relief valve is on the rear door lock pillar. It allows air to exit the passenger compartment.

Figure 13 - Body Lock Pillar Pressure Relief Valve

10-7-12 REAR QUARTERS

↔ Remove or Disconnect

1. Bolt/screw (8).
2. Valve (9) from lock pillar (14).

↔ Install or Connect

NOTICE: Refer to "Notice" on page 10-7-1 of this section.

1. Valve (9) to lock pillar (14).
2. Bolt/screw (8).

🔧 Tighten

- Bolt/screw (8) to 1.5 N.m (13 lb. in.).

EXTERIOR TRIM

When removing or installing any outside molding, cover adjacent finishes with masking tape to prevent damage to the finish. Use proper tools and take care to prevent damage to the molding. Seal all holes for bolts/screws or clips in body panels with body caulking compound or presealed bolts/screws, nuts, or clips to prevent water entry into the body interior.

Molding Clip Replacement

If a weld stud on an outer panel becomes damaged or broken off, a replacement molding clip must be installed.

↔ Install or Connect

- Replacement molding clip.
 - A. Drill small hole in panel next to original weld stud location.
 - B. Insert self-sealing bolt/screw through original clip and into quarter outer panel, or replace stud with self-sealing bolt/screw-type weld stud.

Rear Wheel Opening Molding

SEDAN

Figures 14

↔ Remove or Disconnect

1. Bolts/screws (60).
2. Molding (44).

↔ Install or Connect

NOTICE: Refer to "Notice" on page 10-7-1 of this section.

1. Molding (44).
2. Bolts/screws (60).

🔧 Tighten

- Bolts/screws (60) to 1.3 N.m (12 lb. in.).

Figure 14 - Rear Wheel Opening Molding -(Chevrolet Sedan Shown, Chevrolet Wagon Similar)

Rear Quarter Center Molding Adhesive

BUICK SEDAN

Figure 15

The rear quarter center molding has changed from a screw and clip attachment type to an adhesively attached type.

↔ Remove or Disconnect

1. Molding by starting at one edge and peeling molding from rear quarter.
 - Application of heat to molding at point of removal aids removal operation.
2. All traces of adhesive residue from painted surfaces with a silicone, wax, and grease remover.

↔ Install or Connect

NOTICE: Always refer to manufacturer's packaged instructions to avoid damaged.

1. Prepare surface.

🧼 Clean

- A. Painted surface with silicone, wax, and grease remover.

Figure 15 - Rear Quarter Molding Adhesive - (Sedan)

- B. Area where molding will be applied with a 50-50 mixture of isopropyl alcohol and water.
- Wipe panel surface with a clean cloth while solvent is still wet and allow to dry.

2. Remove backing material of molding as necessary.
3. Molding to quarter.
 - For up/down location, see (Figures 2 and 3) for set-up dimensions.
 - For fore/aft location, place exterior center molding to trailing edge of outer door panel to provide the most door swing clearance at leading edge.

! Important

- Roll the molding with approximately 25 lb. of force over each adhesive contact point.
- Be certain that adhesive contact points make full contact on surface or molding will not adhere.

Rear Quarter Transfer Lower Finish Molding

WAGON

Figure 16

↔ Remove or Disconnect

1. Bolts/screws (47).
2. Bolt/screw (48).
3. Molding (11) from clips (46, 49 and 53).

↔ Install or Connect

NOTICE: Refer to "Notice" on page 10-7-1 of this section.

1. Molding (11) to clips (46, 49 and 53).
2. Bolt/screw (48).
3. Bolts/screws (47).

⌚ Tighten

- Bolts/screws (47 and 48) to 1.3 N.m (12 lb. in.).

Rear Quarter Transfer Upper Finish Molding

WAGON

Figure 17

↔ Remove or Disconnect

1. Molding (57) from clips (50).
 - Pull molding (57) gently until it disengages from clips (50).

↔ Install or Connect

1. Molding (57) to clips (50).
 - Molding (57) gently to secure to clips (50).

10-7-14 REAR QUARTERS

Figure 16 - Rear Quarter Transfer Lower Finish Molding - (Wagon)

Figure 17 - Rear Quarter Transfer Upper Finish Molding - (Wagon)

Rear Quarter Transfer Front Retainer

WAGON

Figure 18

Remove or Disconnect

1. Bolts/screws (51) connecting retainer (13) to lock pillar (14) and outer panel (15).
2. Retainer (13).

Install or Connect

NOTICE: Refer to "Notice" on page 10-7-1 of this section.

1. Retainer (13).

2. Bolts/screws (51) connecting retainer (13) to lock pillar (14) and outer panel (15).

Tighten

- Bolts/screws (51) to 1.3 N·m (12 lb. in.).

Rear Quarter Lower Front Molding

EXCEPT BUICK SEDAN

Figure 19

Remove or Disconnect

1. Bolts/screws (52).
2. Molding (12).

- 13 RETAINER, REAR QUARTER TRANSFER FRONT
- 14 PILLAR, LOCK
- 15 PANEL, REAR QUARTER OUTER
- 51 BOLT/SCREW, REAR QUARTER TRANSFER FRONT RETAINER, 1.3 N·m (12 LB. IN.)

Figure 18 - Rear Quarter Transfer Front Retainer - (Wagon)

- 12 MOLDING, REAR QUARTER LOWER FRONT
- 15 PANEL, REAR QUARTER OUTER
- 52 BOLT/SCREW, REAR QUARTER LOWER FRONT MOLDING, 1.3 N·m (12 LB. IN.)

Figure 19 - Rear Quarter Lower Front Molding -(Typical Wagon Shown, Chevrolet Sedan Similar)

Install or Connect

NOTICE: Refer to "Notice" on page 10-7-1 of this section.

1. Molding (12).
2. Bolts/screws (52).

Tighten

- Bolts/screws (52) to 1.3 N·m (12 lb. in.).

Rear Quarter Name Plates

BUICK

Figure 20

For service procedure on roof side name plate, refer to SECTION 10-9.

Remove or Disconnect

- Plate (55, 56 or 59).
 - A. Hold hot air gun 152 mm (6 inches) from surface of part to be removed.
 - B. Apply heat, using circular motion for about 30 seconds.
 - C. Use flat-bladed tool, being careful not to break plate (55, 56 or 59) or damage paint, and peel plate (55, 56 or 59) from panel surface.
 - D. Discard plate (55, 56 or 59).

10-7-16 REAR QUARTERS

Figure 20 - Rear Quarter Name Plate - (Buick)

Install or Connect

- New plate (55, 56 or 59).

Clean

- Area with suitable solvent of isopropyl alcohol 50-50 mixture by volume with water or high-flash naphtha.

- Remove backing from plate (55, 56 or 59).
- Body and part temperature at time of installation must be 26° C (80° F) minimum or 6° C (40° F) above air temperature in application area, whichever is higher but not exceeding 40° C (105° F).

NOTICE: Position the rear quarter name plate carefully on the vehicle.

- Plate (55, 56 or 59) cannot be removed without damage after contact with vehicle.
- Press plate (55, 56 or 59) into place.
- Refer to illustration for positioning.
- Apply constant pressure for 30 seconds.

FUEL TANK FILLER PIPE SHIELD

WAGON

Figure 21

The shield (20) is a plastic panel that bolts to the inner panel (1) and rear wheelhouse. It helps protect the fuel tank filler pipe neck from damage.

Remove or Disconnect

1. Raise and suitably support vehicle. Refer to SECTION 0A.
2. Tire and wheel. Refer to SECTION 3E.
3. Bolts/screws (42) from inner panel (1) and rear wheelhouse.
4. Shield (20).

Install or Connect

NOTICE: Refer to "Notice" on page 10-7-1 of this section.

1. Shield (20).
2. Bolts/screws (42) to inner panel (1) and rear wheelhouse.

Tighten

- Bolts/screws (42) to 1.6 N.m (14 lb. in.).
3. Tire and wheel. Refer to SECTION 3E.
 4. Lower vehicle.

Figure 21 - Fuel Tank Filler Pipe Shield - (Wagon)

FUEL TANK FILLER PIPE DOOR AND POCKET

WAGON

Figure 22

Remove or Disconnect

1. Open door (18) and remove cap.
2. Bolts/screws (45) connecting door (18) to pocket (19) and outer panel (15).
 - Drill out two rivets connecting door (18) to outer panel (15), using 1/4-inch drill bit.
3. Slide fuel tank filler door and bracket to rear of vehicle and pull out.
4. Bolts/screws (44) connecting pocket (19) to neck (43).
5. Pocket (19).

Install or Connect

NOTICE: Refer to "Notice" on page 10-7-1 of this section.

1. Pocket (19).
2. Bolts/screws (44) connecting pocket (19) to neck (43).

Tighten

- Bolts/screws (44) to 1.2 N·m (11 lb. in.).
3. Door (18).
 - Insert fuel tank filler door and bracket into outer panel (15) and slide toward front of vehicle.

Figure 22 - Fuel Tank Filler Pipe Door and Pocket - (Wagon)

10-7-18 REAR QUARTERS

4. Two 3/16 inch rivets connecting door (18) to outer panel (15).
5. Bolts/screws (45) connecting door (18) to pocket (19) and outer panel (15).

Tighten

- Bolts/screws (45) to 1.9 N.m (17 lb. in.).
6. Cap.
 7. Close door (18).

QUARTER WINDOW

CHEVROLET SEDAN

Figures 23 and 24

Tool Required:

J 24402-A Glass Sealant Remover Knife (Cold Knife) or J 24709-01 or J 24899-01 Urethane Glass Sealant Remover (Hot Knife).

The quarter window (65) is stationary and is made of solid tempered safety plate glass with the reveal molding and fastening studs attached. Quarter windows (65) are installed from the outside of the vehicle.

CAUTION: Approved safety glasses and gloves should be worn when performing this procedure to reduce the chance of personal injury.

Figure 23 - Quarter Window - (Chevrolet Sedan)

Figure 24 - Applying Primer and Adhesive to Quarter Window - (Chevrolet Sedan)

Remove or Disconnect

1. Radio rear speaker grille. Refer to SECTION 10-8.
2. Quarter window garnish molding. Refer to "Quarter Window Garnish Molding" (Sedan) in this section.
3. Rear seat and rear seatback cushions. Refer to SECTION 10-10.
4. Rear side door lock pillar garnish molding. Refer to "Rear Side Door Lock Pillar Garnish Molding" (Sedan) in this section.
5. Rear window panel trim. Refer to SECTION 10-8.
6. Nuts (66).
7. Window (65).
 - Cut out window (65) from inside using J 24402-A or J 24899-01.

Clean

- Window opening of any loose material. If original window (65) will be reinstalled, remove all adhesive from window (65) with alcohol-dampened cloth.

Install or Connect

NOTICE: Refer to "Notice" on page 10-7-1 of this section.

1. Window (65) into opening.
2. Masking tape over each edge of reveal molding (67) and adjacent body panels.
 - A. Slit tape at edge of reveal molding (67).
 - B. During installation, align tape on reveal molding (67) with tape on body.
3. Remove window (65).
4. Primer from urethane adhesive kit, GM P/N 12346284, or equivalent, in and around the perimeter of the seal track. Allow primer to dry five minutes.
 - Two primers are used in the urethane adhesive kit.
 - A. Clear primer is used in seal track prior to application of urethane adhesive. This primer acts as agent to bond urethane adhesive to window (65).
 - B. Black primer is used on flange if paint has been exposed during window removal or cleaning, or if painting or refinishing is required. This primer acts as agent to bond urethane adhesive to body surface.

Important

- Maximum body temperature must not exceed 49° C (120° F) at time of primer application.
5. Urethane adhesive from kit to primed seal track with cartridge caulking gun and nozzle.
 - Use smooth, continuous line of adhesive 6 mm (1/4-inch) wide and 13 mm (1/2-inch) high.

6. Window (65) into opening.
 - A. Use tape guides to align window (65) to flange.
 - B. Press window (65) firmly to pinch-weld surface to wet and set adhesive.
 - C. Avoid excessive squeezeout that would cause an appearance problem.
7. Using small, disposable brush or flat, soft fiberglass tool, paddle adhesive into gap between pinch-weld flange and reveal molding (67) for water-tight seal.
 - Paddle in additional adhesive to fill any voids in seal.
8. Water test vehicle with soft spray.
 - Use warm or hot water if available.
 - Do not direct hard stream of water at fresh adhesive.
 - Water applied on top of urethane adhesive will speed up cure of adhesive.

Inspect

- Window installation for leaks. Paddle in extra adhesive at leak point, using small disposable brush or flat, soft fiberglass tool.

9. Nuts (66).

Tighten

- Nuts (66) to 1.9 N·m (17 lb. in.).

10. Rear side door lock pillar garnish molding. Refer to "Rear Side Door Lock Pillar Garnish Molding" (Sedan) in this section.
11. Rear window panel trim. Refer to SECTION 10-10.
12. Rear seat and rear seatback cushions. Refer to SECTION 10-10.
13. Quarter window garnish molding. Refer to "Quarter Window Garnish Molding" (Sedan) in this section.
14. Radio rear speaker grille. Refer to SECTION 10-8.

WAGON

Figures 25 through 27

Tool Required:

J 24402-A Glass Sealant Remover Knife (Cold Knife) or J 24709-01 or J 24899-01 Urethane Glass Sealant Remover (Hot Knife)

This procedure is for replacing the whole quarter window (91), including both stationary and movable portions, and quarter window reveal molding (93). If only the movable portion needs replaced, refer to "Quarter Window and Quarter Window Latch" in this section.

The quarter window (91) is made of solid tempered safety plate glass with reveal molding (93) and fastening studs attached. It is installed from the outside of the vehicle.

10-7-20 REAR QUARTERS

Figure 25 - Quarter Window - (Wagon)

Figure 26 - Applying Primer and Adhesive to Quarter Window - (Wagon)

Figure 27 - Quarter Window Latch - (Wagon)

CAUTION: Approved safety glasses and gloves should be worn when performing this procedure to reduce the chance of personal injury.

Clean

- Window opening of any loose material. Remove all adhesive with an alcohol-dampened cloth.

Remove or Disconnect

1. Open window (193).
2. Body lock pillar applique (Buick). Refer to SECTION 10-6.
3. Pin (187) connecting latch (190) to bearing (192).
4. Quarter inner rear trim finish panel. Refer to "Quarter Inner Rear Trim Finish Panel" (Wagon) in this section.
5. Back body pillar finish panel. Refer to "Back Body Pillar Finish Panel and Back Body Pillar Assist (with Courtesy Lamp) Handle" (Wagon) in this section.
6. Body lock pillar trim finish panel. Refer to "Body Lock Pillar Trim Finish Panel" (Wagon) in this section.
7. Quarter window garnish molding. Refer to "Quarter Window Garnish Molding" (Wagon) in this section.
8. Headlining trim finish panel. Refer to SECTION 10-9.
9. Nuts (92) from studs.
10. Bolt/screw (90) (Buick).
11. Window (91).

- Cut out window (91) from inside using J 24402-A or J 24709-01 or J 24899-01.

Install or Connect

NOTICE: Refer to "Notice" on page 10-7-1 of this section.

1. Window (91) into opening.
2. Bolt/screw (90) (Buick).
3. Body lock pillar applique (Buick). Refer to SECTION 10-6.

Adjust

- Window (91) in opening.
4. Put masking tape over each edge of reveal molding (93) and adjacent body panels.
 - A. Slit tape at edge of reveal molding (93).
 - B. During installation, align tape on reveal molding (93) to tape on body.
 5. Remove body lock pillar applique (Buick). Refer to SECTION 10-6.
 6. Remove bolt/screw (90) (Buick).
 7. Remove window (91).
 8. Primer from urethane adhesive kit, GM P/N 12346284 or equivalent, in and around perimeter of seal track. Allow primer to dry five minutes.

10-7-22 REAR QUARTERS

- Urethane adhesive kit has two primers.
 - A. Clear primer is used in seal track prior to application of urethane adhesive. This primer acts as agent to bond urethane adhesive to window (91).
 - B. Black primer is used on window opening pinch-weld flange if paint has been exposed during window removal or cleaning, or if painting or refinishing is required. Primer acts as agent to bond urethane adhesive to body surface.

Important

- Maximum body temperature must not exceed 49° C (120° F) at time of primer application.
- 9. Urethane adhesive from kit to primed seal track with cartridge caulking gun and nozzle.
 - Use smooth, continuous line of adhesive 6 mm (1/4-inch) wide and 13 mm (1/2-inch) high.
- 10. Window (91) into opening.
 - A. Use tape guides to align window (91) to pinch-weld flange.
 - B. Press window (91) firmly to the pinch-weld surface to wet and set adhesive.
 - C. Avoid excessive squeezeout that would cause an appearance problem.
- 11. Bolt/screw (90) (Buick).
- 12. Using small, disposable brush or flat, soft fiberglass tool, paddle adhesive into gap between pinch-weld flange and reveal molding (93) for watertight seal.
 - Paddle in additional adhesive to fill any voids in seal.
- 13. Water test vehicle with soft spray.
 - Use warm or hot water if available.
 - Do not direct hard stream of water at fresh adhesive.
 - Water applied on top of urethane adhesive will speed up cure of adhesive.

Inspect

- Window installation for leaks. Paddle in extra adhesive at leak point, using small disposable brush or flat, soft fiberglass tool.

Tighten

- Bolt/screw (90) to 1.5 N·m (13 lb. in.).

14. Nuts (92).

Tighten

- Nuts (92) to 2.4 N·m (21 lb. in.).

15. Headlining trim finish panel. Refer to SECTION 10-9.

16. Quarter window garnish molding. Refer to "Quarter Window Garnish Molding" (Wagon) in this section.

17. Body lock pillar trim finish panel. Refer to "Body Lock Pillar Trim Finish Panel" (Wagon) in this section.
18. Back body pillar finish panel. Refer to "Back Body Pillar Finish Panel and Back Body Pillar Assist (with Courtesy Lamp) Handle" in this section.
19. Quarter inner rear trim finish panel. Refer to "Quarter Inner Rear Trim Finish Panel" (Wagon) in this section.
20. Pin (187) connecting latch (190) to bearing (192).
21. Body lock pillar applique (Buick). Refer to SECTION 10-2.

Quarter Window and Quarter Window Latch

Figure 27

Remove or Disconnect

1. Open window (193).
2. Pin (187) connecting latch (190) to bearing (192).
3. Pins (194) from window and vehicle hinge leaves.
 - A. Use small screwdriver or other flat-bladed tool.
 - B. Pry pins (194) from hinge leaves by pushing upward on heads of pins (194) with tool.
4. Window (193).
5. Latch (190) from back body pillar panel (16), if necessary.
 - Remove cover (196), bolts/screws (189), latch assembly (190) and shim (188).

Install or Connect

NOTICE: Refer to "Notice" on page 10-7-1 of this section.

1. Latch (190) to back body pillar panel (16), if removed.
 - Install shim (188) and latch (190) with bolts/screws (189) and cover (196).

Tighten

- Bolts/screws (189) to 2.6 N·m (23 lb. in.).
- 2. Window (193).
- 3. Pins (194) to window and vehicle hinge leaves.
 - Fit window hinge leaves to vehicle hinge leaves before installing pins (194).
- 4. Pin (187) connecting latch (190) to bearing (192) on window (193).
 - Install latch (190) to bearing (192) and drive pin (187) to secure.
- 5. Close window (193).

Parts

SECTION 10-8

BODY REAR END

NOTICE: Always use the correct fastener in the proper location. When you replace a fastener, use **ONLY** the exact part number for that application. General Motors will call out those fasteners that require a replacement after removal. General Motors will also call out the fasteners that require thread lockers or thread sealant. **UNLESS OTHERWISE SPECIFIED**, do not use supplemental coatings (paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

GENERAL DESCRIPTION

BODY REAR END

Figures 1 through 6

The service operations necessary for the removal, installation, adjustment and sealing of the components listed in figures 1 through 6 for the sedan and wagon are contained in this section.

ON-VEHICLE SERVICE

REAR COMPARTMENT LID

The rear compartment lid consists of an inner and outer panel that is hemmed around the perimeter and bonded together with structural adhesive. The compartment lid hinge is welded to the body and bolted to the rear compartment lid. All styles use torque rods for opening assistance.

Rear Compartment Lid Replacement

Figure 7

Prop rear compartment lid open and place protective covering along edges of rear compartment opening to prevent damage to painted surfaces.

Remove or Disconnect

1. Mark location of lid hinge (17) and bolts/screws (16).
2. Rear compartment wiring harness from lid (14).
3. Get assistance from helper to support rear compartment lid (14).
4. Bolts/screws (16).
5. Rear compartment lid (14).

Install or Connect

NOTICE: Refer to "Notice" on page 10-8-1 of this section.

1. Rear compartment lid (14).
 - A. Get assistance from helper to support rear compartment lid (14) in position.
 - B. Position rear compartment lid (14) to marked locations of lid hinge (17) and bolts/screws.

Tighten

- Bolts/screws (16) to 29 N.m (21 lb. ft.).
2. Rear compartment wiring harness to lid (14).

Torque Rods

Figure 8

Rear compartment torque rods are adjustable to increase or decrease operating effort. To increase assist, reposition the end of the torque rod to a higher torque rod bracket adjusting notch. To decrease assist, reposition the end of the torque rod to a lower torque rod bracket adjusting notch.

Remove or Disconnect

CAUTION: Prop lid in full-open position to keep rear compartment lid from falling when torque rods are disengaged from torque rod bracket. Personal injury or damage to vehicle could result if the rear compartment lid falls.

1. Torque rod (41) from brackets on hinges (17) using 1/2-inch inside diameter pipe.
 - Place pipe over torque rod end and lift up and out of bracket.
2. Hinge end of torque rod (41).
3. Repeat operation for other torque rod (41).

Install or Connect

1. Hinge end of torque rod (41).
2. Bracket end of torque rod (41) using 1/2-inch inside diameter pipe.
3. Repeat operation for other torque rod (41).

Adjust

- Bracket end of torque rod (41) as necessary.

Hinges

The rear compartment lid hinges are welded. They are precisely installed and spot-welded into the vehicle. Except for adjustment of the torque rods and removal of the rear compartment lid from the lid hinges, no other adjustments can be made.

REAR COMPARTMENT LOCK SYSTEM

Lock Cylinder

Figure 9

The cylinder is attached with a retainer which is secured by two rivets. It is necessary to remove the lock cylinder cover emblem prior to lock cylinder removal.

Figure 2 - Body Rear End-(Chevrolet Sedan)-Legend

↔ Remove or Disconnect

1. Open rear compartment lid (14).
2. Rear compartment lid lock cylinder cover emblem, if equipped. Refer to "Rear Compartment Lid Lock Cylinder Cover Emblem" in this section.
3. Rear license lamp. Refer to SECTION 8B.
4. Retainer rivets (26) by carefully drilling them out with a 3/16-inch drill bit.
5. Retainer (25) away from lock cylinder (24) to release.
6. Lock cylinder (24) and gasket (23) from rear compartment lid (14).

→ Install or Connect

1. Gasket (23) to lock cylinder (24).
2. Lock cylinder (24) through hole in rear compartment lid (14).

! Important

- Check to ensure that lock cylinder shaft engages with lock and gasket (23) mates properly with rear compartment lid (14) for a watertight seal.
 - Check operation of lock cylinder (24) with key.
3. Retainer (25) through slot in rear compartment lid (14) and secure to lock cylinder (24).

4. Retainer rivets (26) through hole in rear compartment lid (14) aligned to retainer (25).
5. Rear license lamp. Refer to SECTION 8B.
6. Rear compartment lid lock cylinder cover emblem, if equipped. Refer to "Rear Compartment Lid Lock Cylinder Cover Emblem" in this section.

Lid Lock

Figures 10 and 11

The rear compartment lid has an open face lock. Open face refers to the construction of a lock frame which does not completely encase the lock mechanism. The lock mechanism becomes encased by the panel or reinforcement to which it is attached. When the electric lid release option is specified, an actuator is bolted onto the existing lock.

The lid lock is used to adjust the quarter panel-to-rear compartment lid fit. By moving the lid lock up or down, the rear compartment lid can be positioned flush to the rear quarter panels.

↔ Remove or Disconnect

1. Mark location of lid lock (19).
2. Electrical connector from release actuator (20), if equipped.
3. Release actuator bolts/screws (22).
4. Release actuator (20) from lid lock (19).
5. Bolts/screws (18).
6. Lid lock (19) from rear compartment lid (14).

Install or Connect

NOTICE: Refer to "Notice" on page 10-8-1 of this section.

1. Lid lock (19) to rear compartment lid (14).
 - Position lid lock (19) to marked location.
 - If new lid lock (19) is installed, bend back the metal tab that covers the slot into which the actuator tab fits.
2. Bolts/screws (18).

Adjust

- If a new lid lock (19) is used, make sure bolts/screws (18) are finger tight, then move lid lock (19) to desired position and close rear compartment lid (14). If necessary, repeat procedure until lid lock (19) latches and rear compartment lid (14) is flush with rear quarter panels.

Tighten

- Bolts/screws (18) to 4 N·m (35 lb. in.).
3. Release actuator (20) to lid lock (19) by hooking actuator tab into lock slot.
 4. Actuator bolts/screws (22).

Tighten

- Actuator bolts/screws (22) to 2.5 N·m (22 lb. in.).
5. Electrical connector to release actuator (20), if equipped.

Inspect

- Close rear compartment lid (14) and check for proper rear compartment lid (14), lid lock (19) and key operation.
- Electric lid release for proper operation, if equipped.

Figure 6 - Body Rear End-(Buick Wagon)-Legend

Lid Lock Release Actuator

Figure 11

The rear compartment lid release allows the rear compartment lid to be unlocked from either the inside of the vehicle by means of a switch in the instrument panel compartment, or from the outside of the vehicle with the key or remote control door lock transmitter.

The rear compartment lid release consists of a release actuator and a wiring harness. The wiring harness is routed from the passenger compartment area to the rear compartment lid and connected to the release actuator. When the switch is pressed, the release actuator motor is energized, and the release lever pulls back and unlatches the rear compartment lid lock. The rear compartment lid then raises off the striker and may be raised to the open position.

The release actuator is internally protected against overheating by a plastic thermal coefficient device which is not serviceable.

Remove or Disconnect

1. Electrical connector from release actuator (20).
2. Actuator bolts/screws (22).
3. Switch bolt/screw (13), if Buick.
4. Switch (66), if Buick.
5. Actuator tab from slot in lid lock (19).

Install or Connect

NOTICE: Refer to "Notice" on page 10-8-1 of this section.

1. Actuator (20) to lid lock (19) by hooking actuator tab into lock slot.
 - If a new lid lock (19) is installed, bend back the metal tab that covers the slot into which the actuator tab fits.
2. Actuator bolts/screws (22).

Figure 7 - Rear Compartment Lid Replacement

Figure 9 - Rear Compartment Lid Lock Cylinder

Figure 8 - Removing or Adjusting the Rear Compartment Lid Hinge Torque Rod

Tighten

- Actuator bolts/screws (22) to 2.5 N·m (22 lb. in.).
- 3. Switch (66), if Buick.
- 4. Switch bolt/screw (13), if Buick.

Tighten

- Switch bolt/screw (13) to 1.6 N·m (14 lb. in.).
- 5. Electrical connector to actuator (20).

Lid Lock Striker

CHEVROLET

The lid lock striker is welded to a reinforcement and the rear end panel and is therefore not adjustable.

Figure 10 - Rear Compartment Lid Lock

BUICK

Figure 12

Remove or Disconnect

1. Open rear compartment lid.
2. Reposition rear compartment trim.
3. Nuts (77) from studs.
4. Lid lock striker (68).

Figure 12 - Lid Lock Striker-(Buick)

Install or Connect

NOTICE: Refer to "Notice" on page 10-8-1 of this section.

1. Lid lock striker (68).
2. Nuts (77) to studs.

Tighten

- Nuts (77) to 10 N-m (89 lb. in.).
3. Position rear compartment trim.
 4. Close rear compartment lid.

Pull-Down Actuator

BUICK

Figure 11

The rear compartment lid pull-down actuator allows the rear compartment lid to be closed with little effort from outside the vehicle.

Remove or Disconnect

1. Nuts (71) from pull-down actuator (70).
2. Electrical connector.
3. Pull-down actuator (70).

Install or Connect

NOTICE: Refer to "Notice" on page 10-8-1 of this section.

1. Pull-down actuator (70).
2. Electrical connector.
3. Nuts (71) to pull-down actuator (70).

Tighten

- Nuts (71) to 10 N-m (89 lb. in.).

REAR COMPARTMENT LID WEATHERSTRIP

Figure 13

A foam clinch type weatherstrip is used on all styles. The foam has an integral metal reinforced section which grips and seals the weatherstrip to the pinch-weld flange.

Remove or Disconnect

- Weatherstrip (27) by pulling from pinch-weld flange toward lower corners and then around complete opening.

Install or Connect

1. Weatherstrip (27).
 - A. Push centerline of weatherstrip (27) (marked with paint) on to the pinch-weld flange at the forward center line of the opening between the rear compartment lid hinges.
 - B. Use a rubber mallet to install weatherstrip (27) on the pinch-weld flange for proper seating.

Important

- Hit weatherstrip (27) square to pinch-weld flange.

Figure 13 - Rear Compartment Lid Weatherstrip

10-8-12 BODY REAR END

- C. Continue installation from the forward centerline in both directions toward the rear center of the rear compartment.

Inspect

- Weatherstrip clinch cavity for proper seating to pinch-weld flange around entire opening.
2. Watertest around weatherstrip (27) for waterleaks. Refer to SECTION 10-1.
 - If waterleaks are present, remove and dry off weatherstrip (27) and install weatherstrip adhesive to cavity of weatherstrip (27) and reinstall.

REAR COMPARTMENT EXTERIOR TRIM

Rear Quarter Taillamp Upper Molding

BUICK

Figure 14

Remove or Disconnect

1. Rear lamps. Refer to SECTION 8B.
2. Bolts/screws (44).
3. Rear quarter taillamp upper molding (42).

Install or Connect

NOTICE: Refer to "Notice" on page 10-8-1 of this section.

1. Rear quarter taillamp upper molding (42).
2. Bolts/screws (44).

Tighten

- Bolts/screws (44) to 1.3 N·m (12 lb. in.).
3. Rear lamps. Refer to SECTION 8B.

Rear Quarter Nameplate Decal

IMPALA SS

Figure 15

Remove or Disconnect

- Decal.
 - A. Apply heat for about 30 seconds using a heat gun, making sure heat gun is moved in a circular motion and is held at least 152 mm (6 inches) from decal.
 - B. Peel the decal from the rear compartment lid (14) with a plastic flat-bladed tool making sure not to damage the paint.

Clean

- Area with a suitable solvent of isopropyl alcohol 50-50 mixture by volume with water or high-flash naphtha, (Flammable Solvent).

Figure 14 - Body Rear End Moldings-(Buick)

Figure 15 - Rear Quarter Nameplate Decal and Rear Quarter Emblem Positioning-(Chevrolet)

Install or Connect

- New decal.
 - A. Remove backing.
 - B. Body and part temperature must be 26° C (80° F) minimum or 6° C (10° F) above the ambient air temperature, whichever is higher, but not to exceed 40° C (105° F) during installation.

Important

- Position the decal as noted in figure 15 carefully on vehicle. The decal cannot be removed after contact with the vehicle.
- C. Press decal into place and apply constant pressure for 30 seconds.

Rear Quarter Emblem

IMPALA SS

Figure 15

The emblem is serviced the same way as the rear quarter nameplate decal. Refer to "Rear Quarter Nameplate Decal" in this section.

Rear Compartment Lid Lower Molding

CHEVROLET

Figure 16

Remove or Disconnect

1. Open rear compartment lid (14).
2. Nuts (44).
3. Close rear compartment lid (14).

4. Rear compartment lid lower molding (4).

- Peel rear compartment lid lower molding (4) from rear compartment lid (14) with a flat-bladed tool, making sure not to damage the paint. A heat gun can be used to aid in removal.

Clean

- Area with a suitable solvent of isopropyl alcohol 50-50 mixture by volume with water or high-flash naphtha.

Install or Connect

NOTICE: Refer to "Notice" on page 10-8-1 of this section.

1. Rear compartment lid lower molding (4).

- A. Remove backing.
- B. Body and part temperature must be 26° C (80° F) minimum or 6° C (10° F) above the ambient air temperature, whichever is higher, but not to exceed 40° C (105° F) during installation.

2. Open rear compartment lid (14).

3. Nuts (44).

Tighten

- Nuts (44) to 4 N.m (35 lb. in.).

4. Close rear compartment lid (14).

BUICK

Figure 14

Remove or Disconnect

1. Open rear compartment lid (14).

2. Bolts/screws (45).

3. Rear compartment lid lower molding (46).

Install or Connect

NOTICE: Refer to "Notice" on page 10-8-1 of this section.

1. Rear compartment lid lower molding (46).

2. Bolts/screws (45).

Tighten

- Bolts/screws (45) to 1.3 N.m (12 lb. in.).

3. Close rear compartment lid (14).

Figure 16 - Rear Compartment Lid Lower Molding-(Chevrolet)

Rear Compartment Lid Spoiler

IMPALA SS

Figure 17

Remove or Disconnect

1. Nuts (33).
2. Spoiler (32) from compartment lid.
 - A. Use a mono-filament fishing line (60 lb. test or equivalent) using a sawing motion back and forth, cut the adhesive bond.
 - B. Be careful not to damage the paint, remove the spoiler from the compartment lid.

Clean

1. Old tape from compartment lid using a plastic flat bladed tool.
2. Area with soap and water. Wipe dry.
3. Area with 50/50 mix of alcohol and water.

Install or Connect

NOTICE: Refer to "Notice" on page 10-8-1 of this section.

1. Spoiler (32) to compartment lid.
 - A. If needed, warm compartment lid surface with heat lamp or heat gun to 21° C (70° F).

- B. Pre-start removal of carrier papers from all tapes. Confirm that 4 Pull Tabs are positioned beyond spoiler (not tucked under spoiler).

Important

- If spoiler is being re-used, an adhesive such as double coated foam tape (3M#-06380) must be used.
- C. Insert spoiler studs into holes in compartment lid. If compartment lid is new, drill holes to 5mm.
 - D. While holding spoiler at center, take tabs and remove protective paper from center first. Left to right direction. Don't let go of center.

Important

- Pull Backing Paper backwards on itself. Do not exceed a 45° angle.
- E. Using a soft cloth, hand wipe front tape down onto compartment lid. Starting from the center going out in each direction.
 - F. Pull end tabs next. Right hand first.
 - G. Using a soft cloth. Hand press end tapes down (15 lbs pressure). Wipe from top to bottom.

Tighten

- Nuts (33) to 6 N·m (53 lb. in.).

Figure 17 - Rear Compartment Lid Spoiler and Emblem-(Chevrolet)

! Important

- Be careful not to over tighten nuts (33) or spoiler may become warped. Foam tape will hold the spoiler in place. Nuts are only used for placement.

🧼 Clean

- Area with a suitable solvent of isopropyl alcohol 50-50 mixture by volume with water or high-flash naphtha, (Flammable Solvent).

➡ Install or Connect

- New nameplate (79 or 80).
 - A. Remove backing.
 - B. Body and part temperature must be 26° C (80° F) minimum or 6° C (10° F) above the ambient air temperature, whichever is higher, but not to exceed 40° C (105° F) during installation.

! Important

- Position the nameplate (79 or 80) carefully on vehicle. The nameplate (79 or 80) cannot be removed after contact with the vehicle. Refer to Figures 18 and 19.
- C. Press nameplate (79 or 80) into place and apply constant pressure for 30 seconds.

Rear Compartment Lid Nameplate

Figures 18 and 19

↔ Remove or Disconnect

- Nameplate (79 or 80).
 - A. Apply heat for about 30 seconds using a heat gun, making sure heat gun is moved in a circular motion and is held at least 152 mm (6 inches) from nameplate (79 or 80).
 - B. Peel the nameplate (79 or 80) from the rear compartment lid (14) with a flat-bladed tool making sure not to damage the paint.

Figure 19 - Rear Compartment Lid Nameplate and Lid Lock Cylinder Cover Emblem-(Buick)

Rear Compartment Lid Lock Cylinder Cover Emblem

EXCEPT IMPALA SS

Figures 18 and 19

A swivel emblem attached with rivets is installed over the lock cylinder for all sedans except Impala SS. The Impala SS emblem uses both press in nuts and adhesive backing. These emblems must be removed prior to lock cylinder replacement except Impala SS.

Remove or Disconnect

1. Rivets (65) by drilling out with 3/16-inch diameter drill bit.
2. Emblem (15) and gasket (64).

Install or Connect

1. Emblem (15) and gasket (64).
 - Align emblem (15) and gasket (64) with attaching holes in rear compartment lid (14).
2. Rivets (65).

Important

- For proper installation use special rivets, GM P/N 9432137 or equivalent.

IMPALA SS

Figure 18

Remove or Disconnect

1. Emblem (11).
 - A. Hold air gun 152 mm (6 inches) away from emblem surface.
 - B. Apply heat, using circular motion for about 30 seconds.
 - C. Use flat-bladed tool, being careful not to damage paint, and remove emblem (11) from door.
 - D. Discard emblem (11).
2. Nuts (58), if necessary.
 - Pry out.

Clean

1. Area with soap and water. Wipe dry.
2. Area with 50/50 mix of alcohol and water.

Install or Connect

NOTICE: Refer to "Notice" on page 10-8-1 of this section.

1. Nuts (58), if removed.
 - Press in.
2. Emblem (11).
 - A. If needed, warm Compartment Lid surface with heat lamp or heat gun to 21° C (70° F).

- B. Peel Paper from emblem (11).
 - Do not touch adhesive backing.
- C. Press emblem (11) to rear compartment lid to secure, aligning pins with nuts (58).

2. Bolts/screws (60).
3. Electrical connector from stoplamp (10).
 - Squeeze tab on electrical connector to release it from stoplamp (10).
4. Stoplamp (10).
5. Nuts (62) from rear shelf panel, if necessary.

Install or Connect

NOTICE: Refer to "Notice" on page 10-8-1 of this section.

1. Nuts (62) into rear shelf panel, if removed.
2. Stoplamp (10) to rear shelf panel.
3. Electrical connector to stoplamp (10).
4. Bolts/screws (60).

Figure 28 - High-Mount Stoplamp-(Chevrolet)

Figure 29 - High-Mount Stoplamp-(Buick)

**Tighten**

- Bolts/screws (60) to 1.5 N.m (13 lb. in.).
5. Stoplamp cover (61).
- Slide stoplamp cover (61) onto stoplamp (10) until clips engage.

TWO-WAY END GATE

The two-way end gate has a hinge and locking arrangement that allows the end gate to be operated as a door or gate when the end gate is closed but unlocked, and the window is raised. With power door locks, the end gate can be locked or unlocked by the

power door lock switch. The window can be unlatched by a switch on the instrument panel and, when equipped with manual door locks, this switch also locks or unlocks the end gate. A key turned in the end gate lock cylinder also unlocks the end gate and unlatches the window. Pressing the lock cylinder button will unlatch the window when the end gate is already unlocked. The end gate also has an inside locking knob.

To operate the end gate as a door, pull up on the end gate door release handle. To operate the end gate as a gate, pull up on the end gate handle. The end gate is counterbalanced by a torque rod that reduces the effort required to open or close the end gate.

TWO-WAY END GATE DIAGNOSIS

CONDITION	POSSIBLE CAUSE	CORRECTION
End gate does not open as a gate.	1. Lower right lock not latched. 2. Handle rod portion right upper lock rod, and/or left upper hinge gate side lock rod are disconnected.	1. Open as a door and slam it to latch. If the lock still is unlatched, the right lower latch striker should be adjusted. Open as a door, check operation of right lower lock by manually latching. Then activate end gate door release handle to unlatch. 2. This condition can be determined by trying to unlatch the upper locks. Either the right upper lock, the left upper hinge gate side lock or neither of the locks will unlatch. Open end gate as door and remove end gate handle trim cover and trim panel. NOTICE: Do not pull on left upper hinge gate side lock rod or the left upper hinge gate side lock will unlatch and drop end gate on rear bumper. • Close end gate as door. NOTICE: Be careful not to bend lock rod. Carefully pull the left upper hinge gate side lock rod toward the centerline of body, while activating the end gate release handle. Open to gate position. Synchronize locks and make lock synchronization check. Refer to "Two-Way End Gate Lock and Synchronization Check" in this section.

10-8-26 BODY REAR END

CONDITION	POSSIBLE CAUSE	CORRECTION
End gate does not open as a door, end gate is out of flush, or chucks at right upper corner.	1. Right upper latch striker too far rearward. 2. Left upper hinge gate side lock not latched. 3. Right upper to lower lock connector rod not engaged at upper and/or lower locks. 4. Cable disconnected from end gate door release handles.	1. This condition can prevent the left upper hinge gate side lock from latching. Readjustment of the right upper latch striker forward is necessary to allow both upper locks to latch. 2. Check for unlatched left upper hinge gate side lock by pulling on corner of end gate (end gate will chuck if unlatched). Open end gate and slam to latch. If the lock is still unlatched, the left upper hinge gate side lock will have to be adjusted forward. Refer to "Two-Way End Gate Adjustments" in this section. 3. Determine if rod is detached by visually inspecting with end gate open in the gate position and trim panel and access hole covers removed. 4. Connect or replace cable. NOTICE: Do not pull up on right upper-to-lower lock connector rod or the right lower lock will unlatch and drop the end gate on rear bumper. If right upper-to-lower lock connector rod is disconnected at either lock, attach right upper-to-lower lock connector rod and perform lock synchronization. Make lock synchronization check. Refer to "Two-Way End Gate Lock and Synchronization Check" in this section.
With end gate open as door and end gate release handle activated, left upper hinge gate side lock unlatches.	1. Improper synchronization of upper locks. 2. Bent upper horizontal lock rods.	1. Refer to "Two-Way End Gate Lock and Synchronization Check" in this section. 2. Replace rods and synchronize locks as outlined in "Two-Way End Gate Lock and Synchronization Check" in this section.
With end gate open as gate and end gate release handle activated, right lower lock unlatches.	1. Improper synchronization of right upper and lower locks. 2. Bent right upper-to-lower lock connector rod caused by using rod to unlock door.	1. Synchronize locks by following lock synchronization procedure. Refer to "Two-Way End Gate Lock and Synchronization Check" in this section. 2. Replace rods and synchronize locks as outlined in "Two-Way End Gate Lock and Synchronization Check" in this section.
End gate window will not open.	1. Defective lock switch on right upper lock, or solenoid or switch on window latch. 2. Broken shaft on lock cylinder.	1. Replace lock switch or window latch. 2. Replace lock cylinder.

TWO-WAY END GATE INTERIOR TRIM

Luggage Shade

Figure 30

↔ Remove or Disconnect

1. Luggage shade (52) from luggage shade supports (53).
2. Bolts/screws (125), if necessary.
3. Luggage shade supports (53), if necessary.

↔ Install or Connect

NOTICE: Refer to "Notice" on page 10-8-1 of this section.

1. Luggage shade supports (53), if removed.
2. Bolts/screws (125), if removed.

⌚ Tighten

- Bolts/screws (125) to 1.9 N.m (17 lb. in.).
3. Luggage shade (52) to luggage shade supports (53).

Convenience Net

Figures 5 through 8

For procedure refer to "Convenience Net" under "Rear Compartment Interior Trim" in this section.

Rear Seat #2 Footwell Carpet

Figures 5 through 6

↔ Remove or Disconnect

1. Folding rear seat #2 cushion, if necessary. Refer to SECTION 10-10.

Figure 30 - Luggage Shade

2. Rear seat #2 footwell carpet (47).

⌚ Clean

- Glue residue from floor pan using solvent-dampened cloth.

↔ Install or Connect

1. Glue to floor pan.
2. Fold rear seat #2 footwell carpet (47) prior to installing.
3. Rear seat #2 footwell carpet (47).
 - Position and smooth out third seat footwell carpet (47) to fit contours of floor pan.
4. Folding third seat cushion, if removed. Refer to SECTION 10-10.

Handle Trim Covers

Figure 31

↔ Remove or Disconnect

1. Trim cover bolts/screws (164 or 165).
2. End gate door release handle cover (174) or end gate handle trim cover (175).

↔ Install or Connect

NOTICE: Refer to "Notice" on page 10-8-1 of this section.

1. End gate door release handle cover (174) or end gate handle trim cover (175).
2. Trim cover bolts/screws (164 or 165).

⌚ Tighten

- Trim cover bolts/screws (164 or 165) to 1.9 N.m (17 lb. in.).

Trim Panel

Figure 32

Tool Required:

J 24595-C Door Trim Pad and Garnish Clip Remover

The end gate trim panel hangs over the inner panel across the top and is secured by plastic trim retainers across the top and bottom and down the sides.

↔ Remove or Disconnect

1. Handle trim covers. Refer to "Handle Trim Covers" in this section.
2. Unthread locking rod knob.
3. Bolts/screws (126).
4. Plastic retainers using J 24595-C.
5. Trim panel (92).

Figure 31 - Handle Trim Covers

Figure 32 - Trim Panel

Install or Connect

NOTICE: Refer to "Notice" on page 10-8-1 of this section.

1. Trim panel (92).
 - Hang trim panel (92) over top of end gate inner panel.

2. Plastic retainers using sufficient pressure to fully seat retainers.
3. Bolts/screws (126).

Tighten

- Bolts/screws (126) to 1.3 N·m (12 lb. in.).
4. Locking rod knob.

5. Handle trim covers. Refer to "Handle Trim Covers" in this section.

Locking Rod Knob

Figures 5 through 6

The locking rod knob (173) is removed by unthreading it from the locking rod (101).

Inner Panel Access Hole Covers

Figure 33

Remove or Disconnect

1. Trim panel. Refer to "Trim Panel" in this section.
2. Bolts/screws (133).
3. Inner panel access hole covers (91).

Install or Connect

NOTICE: Refer to "Notice" on page 10-8-1 of this section.

1. Inner panel access hole covers (91).
2. Bolts/screws (133).

Tighten

- Bolts/screws (133) to 1.5 N.m (13 lb. in.).
3. Trim panel. Refer to "Trim Panel" in this section.

TWO-WAY END GATE EXTERIOR TRIM

Nameplate

Figures 34 and 35

Remove or Disconnect

- Nameplate (117, 124 or 121).
 - A. Apply heat for about 30 seconds, using a heat gun, making sure heat gun is moved in a circular motion and is held at least 152 mm (6 inches) from nameplate (117, 124 or 121).
 - B. Peel the nameplate (117, 124 or 121) from the end gate (59) with a flat-bladed tool making sure not to damage the paint.

Clean

- Area with a suitable solvent of isopropyl alcohol 50-50 mixture by volume with water or high-flash naphtha.

Install or Connect

- New nameplate (117, 124 or 121).
 - A. Remove backing.
 - B. Body and part temperature must be 26° C (80° F) minimum or 6° C (10° F) above the ambient air temperature, whichever is higher, but not to exceed 40° C (105° F) during installation.

Important

- Position the nameplate (117, 124 or 121) carefully on vehicle. The nameplate (117, 124 or 121) cannot be removed after contact with the vehicle. Refer to Figures 35 and 36.

Figure 33 - Inner Panel Access Hole Covers

10-8-30 BODY REAR END

Figure 34 - End Gate Nameplates-(Chevrolet)

Figure 35 - End Gate Nameplate-(Buick)

- C. Press nameplate (117, 124 or 121) into place and apply constant pressure for 30 seconds.

Center Molding CHEVROLET

Figure 36

Remove or Disconnect

- Molding (119).
 - A. Hold hot air gun 152 mm (6 inches) away from molding surface.
 - B. Apply heat, using circular motion for about 30 seconds.
 - C. Use flat-bladed tool, being careful not to damage paint, and remove molding (119) from end gate.
 - D. Discard molding (119).

Install or Connect

- Molding (119).
 - A. Mark position of molding (119) with length of masking tape.

Clean

- Area with soap and water. Wipe dry.
- Area with oil-free naphtha or alcohol.
- B. If needed, warm end gate surface with heat lamp or heat gun to 21° C (70° F).

Figure 36 - Center Molding-(Chevrolet)

- C. Peel paper from molding (119).
 - Do not touch adhesive backing.
- D. Press molding (119) to end gate to secure.
- E. Hand-roll molding (119) to ensure proper adhesion.

Inspect

- Molding ends for bonding. Hand-roll loose ends.

Transfer Upper Finish Molding

BUICK

Figure 37

Remove or Disconnect

1. Bolts/screws (158).
2. Transfer upper finish molding (123).
 - Unsnap transfer upper finish molding (123) from clips.
3. Clips, if necessary.
 - Slide clips to left to disengage.

Install or Connect

NOTICE: Refer to "Notice" on page 10-8-1 of this section.

1. Clips, if removed.
 - Slide clips to right to engage.

Figure 37 - Transfer Upper and Lower Finish Moldings-(Buick)

10-8-32 BODY REAR END

2. Transfer upper finish molding (123).
 - Snap transfer upper finish molding (123) over clips.
3. Bolts/screws (158).

Tighten

- Bolts/screws (158) to 3 N.m (12 lb. in.).

Transfer Lower Finish Molding

BUICK

Figure 37

Remove or Disconnect

1. Bolt/screw (157).
2. Transfer lower finish molding (122).
 - Push upward on transfer lower finish molding (122) until top edge disengages from clips.
3. Clips, if necessary.
 - Slide clips to the right and down to disengage.
4. Nut (156), if necessary.

Install or Connect

NOTICE: Refer to "Notice" on page 10-8-1 of this section.

1. Nut (156), if removed.

2. Clips, if removed.
 - Place clip over lower stud and slide clip up. Engage clip with upper stud and slide clip left.
3. Transfer lower finish molding (122).
 - A. Align stud of transfer lower finish molding (122) to nut (156).
 - B. Engage bottom edge of transfer lower finish molding (122) to clips.
 - C. Push up on transfer lower finish molding (122) until top edge snaps over clips.
4. Bolt/screw (157).

Tighten

- Bolt/screw (157) to 1.3 N.m (12 lb. in.).

Upper Outer Finishing Moldings

Figure 38

Remove or Disconnect

1. Bolt/screw (129).
2. Upper outer finishing moldings (56 or 166).
 - Use flat-bladed tool to pry adhesive tape from end gate (59).

Clean

- Upper outer finishing molding (56 or 166), if reusing, and attaching surface with general purpose cleaner to remove adhesive tape residue.

Figure 38 - Upper Outer Finishing Moldings

Install or Connect

NOTICE: Refer to "Notice" on page 10-8-1 of this section.

1. Upper outer finishing molding (56 or 166).
 - A. Remove backing of adhesive tape or apply new adhesive tape.
 - B. Position upper outer finishing molding (56 or 166) to top of end gate (59) and press to secure.
2. Bolt/screw (129).

Tighten

- Bolt/screw (129) to 1.3 N·m (12 lb. in.).

Rear License Lamp Molding

Figure 39

Remove or Disconnect

1. Trim panel. Refer to "Trim Panel" in this section.
2. Nuts (130).
3. Rear license lamp molding (63).
4. Electrical connector.

Install or Connect

NOTICE: Refer to "Notice" on page 10-8-1 of this section.

1. Electrical connector.
2. Rear license lamp molding (63).
3. Nuts (130).

Tighten

- Nuts (130) to 6 N·m (53 lb. in.).
4. Trim panel. Refer to "Trim Panel" in this section.

Figure 39 - Rear License Lamp Molding

WEATHERSTRIP

End Gate Weatherstrip

Figure 40

Remove or Disconnect

1. Quarter inner rear trim finish panel. Refer to SECTION 10-7.
2. Caps (115) from bolts/screws (131).
3. Bolts/screws (131).
4. Weatherstrip (51).
 - Pull weatherstrip (51) from pinchweld and body pillar flanges.

Install or Connect

NOTICE: Refer to "Notice" on page 10-8-1 of this section.

1. Weatherstrip (51).
 - Position weatherstrip (51) to body pillar flanges at belt line.
2. Bolts/screws (131).

Tighten

- Bolts/screws (131) to 1.3 N·m (12 lb. in.).
3. Caps (115) onto bolts/screws (131).
 4. Corners of weatherstrip (51) onto pinch-weld flange.
 5. Engage rest of weatherstrip (51) on pinch-weld flange.
 - Use rubber mallet to tap weatherstrip (51) onto pinch-weld flange, if necessary.
 6. Quarter inner rear trim finish panel. Refer to SECTION 10-7.

Window Weatherstrip

Figure 41

Remove or Disconnect

1. Bolts/screws (132).
2. Window weatherstrip (55) by unseating retainers.

Install or Connect

NOTICE: Refer to "Notice" on page 10-8-1 of this section.

1. Window weatherstrip (55).
 - Push to secure retainers.
2. Bolts/screws (132).

Tighten

- Bolts/screws (132) to 1.3 N·m (12 lb. in.).

TWO-WAY END GATE HANDLES

Release Handles

Figure 42

↔ Remove or Disconnect

1. Handle trim cover. Refer to "Handle Trim Covers" in this section.
2. Handle rod, if removing end gate handle (76).
3. Bolts/screws (167 or 163).
4. Drill out rivets (172 or 134) using 5/16-inch drill bit.
5. End gate handle (76) or end gate door release handle (177).
6. Door release handle cable (99), if removing end gate door release handle (177).
 - Make sure door release handle cable (99) does not fall inside trim panel.

→→ Install or Connect

NOTICE: Refer to "Notice" on page 10-8-1 of this section.

1. Door release handle cable (99), if installing end gate door release handle (177).
2. End gate handle (76) or end gate door release handle (177).
3. Rivets (172 or 134).

Figure 41 - Window Weatherstrip

Figure 42 - Release Handles

4. Bolts/screws (167 or 163).

Tighten

- Bolts/screws (167 or 163) to 10 N·m (89 lb. in.).
5. Handle rod, if installing end gate handle (76).
 6. Handle trim cover. Refer to "Handle Trim Covers" in this section.

TWO-WAY END GATE LOCKS AND STRIKERS

Lock Cylinder and Sleeve

Figure 43

Remove or Disconnect

1. Trim panel. Refer to "Trim Panel" in this section.
2. Rear license lamp molding. Refer to "Rear License Lamp Molding" in this section.

3. Rivets (136) using a drill and 3/16-inch drill bit.
4. Lock cylinder rod (120) from clip on lock cylinder (162).
5. Lock cylinder (162).

Install or Connect

1. Lock cylinder (162).
 - Stem of lock cylinder (162) must be inserted into window latch.
2. Lock cylinder rod (120) to clip on lock cylinder (162).
3. Rivets (136).
4. Rear license lamp molding. Refer to "Rear License Lamp Molding" in this section.
5. Remove and discard shipping retainer if installing new lock cylinder (162).
6. Trim panel. Refer to "Trim Panel" in this section.

Figure 43 - Lock Cylinder and Sleeve Removal

Lock Cylinder Disassembly**Figure 44****Disassemble**

1. "Lock Cylinder and Case" from endgate. Refer to "Lock Cylinder and Case" in this section.

- Gently clamp bottom of cylinder and case into vise with cylinder face down.
- 1. Roll pin, tailpiece and spring with arm facing 12 o'clock.
- 2. Insert key, turn clockwise and depress button to expose tailpiece retainer pin hole in cylinder.
- 3. Carefully pull retaining clip from case to release washer and spring.

NOTICE: Extra care should be used when working with the large spring and washer under pressure.

- 4. Carefully pull work washer and spring out of case.
- 5. Pull Lock cylinder and sleeve from case.
- Gently clamp bottom of cylinder and sleeve into vise with cylinder face up.
- Hold unit shutter and springs in place using Kent Moore tool-BT8401-B.
- 6. Using a soft faced mallet, tap cylinder cap off of sleeve.

- 7. Remove unit shutter and springs from cylinder face.

**Install or Connect**

- 1. Code lock cylinder. Refer to SECTION 0A.
- 2. Lubricate lock cylinder with GM P/N 10528-64 and insert into lock sleeve without key.
 - Gently clamp bottom of cylinder and sleeve into vise with cylinder face up.
- 3. Hold shutter and springs in place using Kent Moore tool-BT8401-B.
- 4. Align dimples on cap, with grooves on the lock sleeve. Using a soft faced mallet, tap cylinder onto sleeve until fully seated.
- 5. Place large spring over cylinder and sleeve and place into rear of lock case.
 - Gently clamp lock case in vise, cylinder face down.

NOTICE: Extra care should be used when working with the large spring and washer under pressure.

- 6. Place retaining washer over the large spring with tabs up. Carefully work washer into lock case until retaining clip can be inserted through case from top to washer and spring in place.
- 7. Insert key, turn clockwise, and depress button to expose tailpiece retainer pin hole in cylinder.
- 8. Spring and tailpiece with arm facing 12 o'clock, roll pin.

- 1 LOCK CYLINDER
- 2 SLEEVE
- 3 ROLL PIN
- 4 SMALL SPRING
- 5 RETAINING CLIP
- 6 WASHER
- 7 LARGE SPRING
- 8 UNIT SHUTTER

5-22-94

9. Lock cylinder and case to endgate. Refer to "Lock Cylinder and Case" in this section.

Locking Rod Bellcrank

Figure 45

Remove or Disconnect

1. Trim panel. Refer to "Trim Panel" in this section.
2. Inner panel access hole covers. Refer to "Inner Panel Access Hole Covers" in this section.
3. Rivet (137) using drill and 5/16-inch drill bit.
4. Bellcrank (86).
5. Locking rod (101) from clip on upper lock (98).
6. Lock cylinder rod from bellcrank (86).
7. Locking rod (101) from bellcrank (86).

Install or Connect

1. Locking rod (101) to bellcrank (86).
2. Lock cylinder rod to bellcrank (86).
3. Locking rod (101) to clip on upper lock (98).
4. Bellcrank (86).
 - Insert tab of bellcrank (86) through slot in inner panel.
5. Rivet (137) attaching bellcrank (86) to inner panel.
6. Inner panel access hole covers. Refer to "Inner Panel Access Hole Covers" in this section.
7. Trim panel. Refer to "Trim Panel" in this section.

Figure 45 - Locking Rod Bellcrank

Upper Lock

RIGHT SIDE

Figures 5, 6, 45, 46, 47, and 48

Remove or Disconnect

1. Open end gate (59) as a door.
2. Trim panel. Refer to "Trim Panel" in this section.
3. Right inner panel access hole cover. Refer to "Inner Panel Access Hole Covers" in this section.
4. Upper lock rod (78) from upper lock (98).
5. Door release handle cable (99) from end gate door release handle (177).
6. Upper lock rod (78) from bellcrank (85).
7. Locking rod (101) from upper lock (98).
8. Electrical connector from lock switch (100).
9. Lock actuator rivets attaching lock actuator (94) to inner panel using a drill and 5/16-inch drill bit.
10. Electrical connector from lock actuator (94).
11. Upper-to-lower lock connector rod (96) from lower lock (95) by removing retaining clip.
 - Reinstall retaining clip on lower lock (95).
12. Bolts/screws (139).
13. Upper lock (98) and lock actuator rod (97) with lock actuator (94).
14. Lock actuator rod (97) with lock actuator (94) from upper lock (98).

Install or Connect

NOTICE: Refer to "Notice" on page 10-8-1 of this section.

Important

- All locks must be installed in the latched position for proper lock synchronization. Service replacement locks will have a synchronization wire installed and will be in the latched position when received. The synchronization wire must be removed after lock installation and synchronization for proper lock operation.

1. Open end gate (59) as a door.
2. Lock actuator rod (97) with lock actuator (94) to upper lock (98).
3. Upper lock (98) and lock actuator rod (97) with lock actuator (94).
4. Bolts/screws (139).

Tighten

- Bolts/screws (139) to 8 N.m (71 lb. in.).
5. Electrical connector to lock actuator (94).
 6. Lock actuator rivets attaching lock actuator (94) to inner panel.
 7. Electrical connector to upper lock switch (100).
 8. Locking rod (101) to lock (98).

Figure 46 - Upper Lock (Right Side)

Figure 47 - Manually Latching Locks (Right Side)

9. Upper lock rod (78) to bellcrank (85).
10. Door release handle cable (99) to end gate door release handle (177).
11. Disengage upper hinge gate side lock rod (180) from bellcrank (85) by removing retaining clip.
 - Reinstall retaining clip on bellcrank (85).
12. Manually latch lower lock (95).

CAUTION: With end gate open in the door position and the right upper and lower locks manually engaged, the end gate has been placed in a vulnerable position and could drop from the left upper lock if the synchronization locking rod is activated by pulling it inboard. When making swivel nut adjustment on left upper hinge gate side lock rod, do not pull on rod. Personal injury and/or damage to the end gate could result.

Adjust

- A. Swivel nut on upper hinge gate side lock rod (180) until it aligns with hole in bellcrank (85). Insert swivel end through hole in bellcrank (85) and engage retaining clip.
- B. Swivel nut on upper-to-lower lock connector rod (96) until it aligns with hole in right lower lock (95). Insert swivel end through hole in lower lock (95) and engage retaining clip.
13. Upper lock rod (78) to upper lock (98).
14. Remove and discard synchronization wire from upper lock (98) and unlatch lower and upper locks (95 and 98) by actuating end gate door release handle (177). Perform synchronization checks. Refer to "Lock Synchronization Checks" under "Two-Way End Gate Lock and Synchronization Check" in this section.
15. Right inner panel access hole cover. Refer to "Inner Panel Access Hole Covers" in this section.
16. Trim panel. Refer to "Trim Panel" in this section.

Figure 48 - Lower Lock-(Right Side)

Lower Lock**RIGHT SIDE****Figures 5, 6, 47 and 48****↔ Remove or Disconnect**

1. Open end gate as a door.
2. Trim panel. Refer to "Trim Panel" in this section.
3. Right inner panel access hole cover. Refer to "Inner Panel Access Hole Covers" in this section.
4. Upper-to-lower lock connector rod (96) from lower lock (95) by removing retaining clip.
 - Reinstall retaining clip on lower lock (95).
5. Electrical connector from end gate ajar switch lead-in wire on lower lock (95).
6. Bolts/screws (140).
7. Lower lock (95).

↔ Install or Connect

NOTICE: Refer to "Notice" on page 10-8-1 of this section.

! Important

- All locks must be installed in the latched position for proper lock synchronization. Service replacement locks will have a synchronization wire installed and will be in

the latched position when received. The synchronization wire must be removed after lock installation and synchronization for proper lock operation.

1. Lower lock (95).
2. Bolts/screws (140).

⌚ Tighten

- Bolts/screws (140) to 8 N.m (71 lb. in.).
3. Electrical connector to end gate ajar switch lead-in wire on lower lock (95).
 4. Manually latch right upper lock.

CAUTION: With end gate open in the door position and the right upper and lower locks manually engaged, the end gate has been placed in a vulnerable position and could drop from the left upper lock if the synchronization locking rod is activated by pulling it inboard. When making swivel nut adjustment on left upper hinge gate side lock rod, do not pull on rod as personal injury and/or damage to the end gate could result.

🔑 Adjust

- Swivel nut on upper-to-lower lock connector rod (96) until it aligns with hole in lower lock (95). Insert swivel end in hole in lower lock (95) and engage retaining clip.

5. Remove and discard synchronization wire from lower lock (95) and unlatch right upper and lower locks (95 and 98) by actuating end gate door release handle (177). Perform synchronization checks. Refer to "Lock Synchronization Checks" under "Two-Way End Gate Lock and Synchronization Check" in this section.
6. Right inner panel access hole cover. Refer to "Inner Panel Access Hole Covers" in this section.
7. Trim panel. Refer to "Trim Panel" in this section.

Upper Hinge Gate Side Lock

LEFT SIDE

Figures 5, 6, 47, 49 and 50

↔ Remove or Disconnect

1. Open end gate as a gate and suitably support.
2. Trim panel. Refer to "Trim Panel" in this section.
3. Left inner panel access hole cover. Refer to "Inner Panel Access Hole Covers" in this section.
4. Upper hinge gate side lock rod (180) from upper hinge gate side lock (82).
 - Pull upper hinge gate side lock rod (180) from clips (160) on end gate inner panel, if necessary.
5. Lock upper lock (98) with locking rod knob (173).
6. Mark a line around outer edge of upper hinge gate side lock (82).

Figure 50 - Manually Latching Upper Hinge Gate Side Lock-(Left Side)

Figure 49 - Upper Hinge Gate Side Lock-(Left Side)

10-8-42 BODY REAR END

7. Manually latch upper lock (98) and upper hinge gate side lock (82).
8. Bolt/screw (141).
9. Support (168).
10. Nuts (142).
11. Upper hinge gate side lock (82).

Install or Connect

NOTICE: Refer to "Notice" on page 10-8-1 of this section.

Important

- The upper hinge gate side lock (82) must be installed in the latched position for proper lock synchronization. Service upper hinge gate side locks (82) will have a plastic synchronization pin installed when received. This synchronization pin must be removed after upper hinge gate side lock (82) is installed and end gate has been synchronized.

1. Align upper hinge gate side lock (82) to lines marked on end gate (59).
2. Nuts (142).

Tighten

- Nuts (142) to 29 N·m (21 lb. ft.).
3. Support (168).
 4. Bolt/screw (141).
 - Bolt/screw (141) to 12 N·m (106 lb. in.).
 5. Disconnect upper hinge gate side lock rod (180) from bellcrank (85) by removing retaining clip.
 - Reinstall retaining clip on bellcrank (85).
 6. Upper hinge gate side lock rod (180) to upper hinge gate side lock (82).

Adjust

- Swivel nut on upper hinge gate side lock rod (180) until it aligns with hole in bellcrank (85).
7. Upper hinge gate side lock rod (180) to bellcrank (85) and engage retaining clip.
 - Install upper hinge gate side lock rod (180) to clips (160) in end gate inner panel, if removed.
 8. Remove and discard synchronization pin.
 9. Operate end gate handle. Perform synchronization checks. Refer to "Lock Synchronization Checks" under "Two-Way End Gate Lock and Synchronization Check" in this section.
 10. Left inner panel access hole cover. Refer to "Inner Panel Access Hole Covers" in this section.
 11. Trim panel. Refer to "Trim Panel" in this section.

Upper Hinge Striker

LEFT SIDE

Figure 51

Remove or Disconnect

1. Left quarter inner rear trim finish panel. Refer to SECTION 10-7.
2. Open end gate as a gate and suitably support.
3. Bolt/screw (141).
4. Support (168) and support spring (67).
5. Mark location of upper hinge striker (169) on body.
6. Nuts (145).
7. Upper hinge striker (169).

Install or Connect

NOTICE: Refer to "Notice" on page 10-8-1 of this section.

1. Upper hinge striker (169).
 - Align upper hinge striker (169) to location marked on body.
2. Nuts (145).

Tighten

- Nuts (145) to 50 N·m (37 lb. ft.).

Figure 51 - Upper Hinge Striker-(Left Side)

3. Support spring (67) and support (168).
4. Bolt/screw (141).

 Tighten

- Bolt/screw (141) to 12 N.m (106 lb. in.).
5. Left quarter inner rear trim finish panel. Refer to SECTION 10-7.

Latch Strikers

RIGHT SIDE

Figure 52

 Remove or Disconnect

1. Open end gate as a door.
2. Latch striker (49).
3. Washer (50), if necessary.

 Install or Connect

NOTICE: Refer to "Notice" on page 10-8-1 of this section.

1. Washer (50), if removed, to latch striker (49).
2. Latch striker (49).

 Tighten

- Latch striker (49) to 53 N.m (39 lb. ft.).

 Adjust

- Latch striker (49), as necessary, to engage with right upper or lower locks.

Figure 52 - Latch Strikers-(Right Side)

Lock Switch

Figure 53

 Remove or Disconnect

1. Trim panel. Refer to "Trim Panel" in this section.
2. Right inner panel access hole cover. Refer to "Inner Panel Access Hole Covers" in this section.

4. Upper hinge gate side lock rod (180) from clips (160) on end gate inner panel.
5. Upper hinge gate side lock rod (180) at bellcrank (85).
 - Reinstall retaining clip on bellcrank (85).
6. Upper lock rod (78) at bellcrank (85).
7. Rivets (135) using drill and 5/16-inch drill bit.
8. Bellcrank (85).

↔ Install or Connect

1. Bellcrank (85).
2. Rivets (135).
3. Upper lock rod (78) at bellcrank (85).
4. Upper hinge gate side lock rod (180) at bellcrank (85).
 - Spin nut on threaded upper hinge gate side lock rod (180) to align nut to hole in bellcrank (85) and engage retaining clip.
5. Upper hinge gate side lock rod (180) to clips (160) on end gate inner panel.

Figure 55 - Bellcrank

6. Handle rod to end gate handle.
7. Synchronize left and right upper locks. Refer to "Lock Synchronization Procedure" under "Two-Way End Gate Lock and Synchronization Check" in this section.
8. Left inner panel access hole cover. Refer to "Inner Panel Access Hole Covers" in this section.
9. Trim panel. Refer to "Trim Panel" in this section.

Two-Way End Gate Lock and Synchronization Check

The lock system on the two-way end gate is designed to perform the following blockout functions:

- Allow the end gate to be opened and closed as a door with glass opened and, at the same time, prevent accidental operation of the left upper hinge gate side lock (which allows the end gate to be opened as a gate).
- Allow the end gate to be opened and closed as a gate with glass opened and, at the same time, prevent accidental operation of the right lower lock (which allows the end gate to be opened as a door).

These blockout functions are accomplished by levers in the right upper lock. To assure that the right lock levers perform the blockout functions properly, the right upper lock and locking rod system must be synchronized with the rest of the end gate lock system (right lower lock and left upper hinge gate side lock). This synchronization is required to prevent accidental operation of the left upper hinge gate side lock when the end gate is opened as a door and to prevent accidental operation of the right lower lock when the end gate is opened as a gate.

LOCK SYNCHRONIZATION CHECKS

1. Synchronization check for right lower lock.

NOTICE: Place a protective support beneath the end gate to prevent damage if the end gate becomes disengaged from the right latch striker.

- A. Open end gate as a gate.
 - B. Allow end gate to open about halfway. Actuate end gate door release handle with moderate pressure rearward. Let go of release handle and close end gate. Open and close end gate as a door.
 - C. Repeat above two procedures five times. If right lower lock does not become disengaged, synchronization of the right lower lock is correct. If end gate becomes disengaged at right lower lock, reinstall end gate on right lower lock and proceed with Synchronization Procedure. Refer to "Lock Synchronization Procedure" below.
2. Synchronization check for right upper lock and left upper hinge gate side lock.

NOTICE: Place a protective support under the right side of the end gate to prevent damage in the event that the end gate becomes disengaged from the left upper hinge gate side lock.

- A. Open end gate as a door.
- B. Actuate end gate handle with moderate pressure. Let go of release handle and close end gate. Open and close end gate as a gate.
- C. Repeat above two procedures five times. If left upper hinge gate side lock does not become disengaged, the right upper lock and left upper hinge gate side lock are synchronized. If end gate becomes disengaged at the left upper hinge gate side lock, reinstall end gate on left upper hinge gate side lock and proceed with Synchronization Procedure. Refer to "Lock Synchronization Procedure" below.

LOCK SYNCHRONIZATION PROCEDURE

Figures 5, 6, 48 and 49

Remove or Disconnect

1. Open end gate (59) as a gate, then close securely.
2. Open end gate (59) as a door.
3. Trim panel. Refer to "Trim Panel" in this section.
4. Inner panel access hole covers. Refer to "Inner Panel Access Hole Covers" in this section.
5. Upper hinge gate side lock rod (180) from hole in bellcrank (85) by removing retaining clip.
 - A. Reinstall retaining clip on bellcrank (85).
 - B. Pull upper hinge gate side lock rod (180) from clip (160) on end gate inner panel, if necessary.
6. Upper-to-lower lock connector rod (96) from lower lock (95) by removing retaining clip.
 - Reinstall retaining clip on lower lock (95).

Install or Connect

CAUTION: With end gate open in the door position and the right upper and lower locks manually engaged, the end gate has been placed in a vulnerable position and could drop from the left upper hinge striker if the left upper hinge gate side lock rod is activated by pulling it inboard. When making swivel nut adjustment on left upper hinge gate side lock rod, do not pull on rod as personal injury and/or damage to the end gate could result.

1. Manually latch lower and upper locks (95 and 98) on end gate (59) using a wide blade screwdriver. Locks (95 and 98) must be fully engaged.
2. Align swivel nut on upper hinge gate side lock rod (180) with hole in bellcrank (85). Insert swivel end through hole in bellcrank (85) and engage retaining clip.

10-8-46 BODY REAR END

3. Reinstall upper hinge gate side lock rod (180) to clips (160) on end gate inner panel, if removed.
4. Align swivel nut on upper to lower lock connector rod (96) with hole in lower lock (95). Insert swivel end through hole in lower lock (95) and engage retaining clip.
5. Unlatch upper and lower locks (98 and 95) by actuating end gate door release handle (177).
6. Perform "Lock Synchronization Checks" under "Two-Way End Gate Lock and Synchronization Check" in this section.
7. Inner panel access hole covers. Refer to "Inner Panel Access Hole Covers" in this section.
8. Trim panel. Refer to "Trim Panel" in this section.

TWO-WAY END GATE HINGES

Lower Hinge

(Left Side)

Figure 56

Remove or Disconnect

1. End gate. Refer to "Two-Way End Gate" in this section.
2. Trim panel. Refer to "Trim Panel" in this section.
3. Inner panel access hole covers. Refer to "Inner Panel Access Hole Covers" in this section.
4. Nuts (143).
5. Lower hinge (72).
 - Mark location of lower hinge (72).

Install or Connect

NOTICE: Refer to "Notice" on page 10-8-1 of this section.

Figure 56 - Lower Hinge-(Left Side)

1. Lower hinge (72).
 - Align lower hinge (72) to lines marked on body.
2. Nuts (143).

Tighten

- Nuts (143) to 29 N·m (21 lb. ft.).
3. Inner panel access hole covers. Refer to "Inner Panel Access Hole Covers" in this section.
 4. Trim panel. Refer to "Trim Panel" in this section.
 5. End gate. Refer to "Two-Way End Gate" in this section.

TORQUE ROD AND TORQUE ROD LINK

Figure 57

Remove or Disconnect

1. End gate. Refer to "Two-Way End Gate" in this section.
2. Trim panel. Refer to "Trim Panel" in this section.
3. Place end gate on a covered work bench to protect painted surface.
4. Bolt/screw (147) and torque rod retainer (88) from right side of end gate.
5. Drill out rivet (148) using a 1/4-inch drill bit.
6. Torque rod grommet (90).
7. Torque rod (89) from end gate.

Install or Connect

NOTICE: Refer to "Notice" on page 10-8-1 of this section.

1. Torque rod (89) to end gate.
2. Torque rod grommet (90) and rivet (148).
3. Torque rod retainer (88) and bolt/screw (147) to right side of end gate.

Adjust

- Bolt/screw (147) to 12 N·m (106 lb. in.).
4. Trim panel. Refer to "Trim Panel" in this section.
 5. End gate. Refer to "Two-Way End Gate" in this section.

TWO-WAY END GATE

Figures 5, 6, 51, 56 and 57

Remove or Disconnect

1. Open end gate as a door until tension on torque rod (89) has been relieved.
2. Torque rod link bolts/screws (146).
3. Torque rod link (171) and torque rod link retainer (170).
4. Disengage torque rod link (171) from torque rod (89).

Figure 57 - Torque Rod and Torque Rod Link

10-8-48 BODY REAR END

5. Close end gate.
6. Open end gate as a gate and suitably support.
7. Left quarter inner rear trim finish panel. Refer to SECTION 10-7.
8. Electrical connectors.
9. Bolts/screws retaining wiring harness to body.

CAUTION: With end gate open in the gate position and the left upper hinge gate side lock manually engaged, the end gate has been placed in a vulnerable position and could drop from the right lower lock if the locking rod and/or end gate door release handle is activated. Do not pull on rod or activate end gate door release handle as personal injury and/or damage to the end gate could result.

10. Manually latch upper hinge gate side lock (82).

Important

- The aid of a helper will be required to help support the end gate.
11. Bolt/screw (141), support (168) and support spring (67).
 12. Lower body side hinge nuts (144).
 - Mark location of lower hinge (72).
 13. End gate from lower right latch striker (49) by activating the end gate door release handle (177) and lifting upward and rearward.

Install or Connect

NOTICE: Refer to "Notice" on page 10-8-1 of this section.

1. End gate to lower right latch striker (49).
2. Lower body side hinge nuts (144).

Tighten

- Nuts (144) to 29 N.m (21 lb. ft.).
3. Support spring (67), support (168), and bolt/screw (141).

Tighten

- Bolt/screw (141) to 12 N.m (106 lb. in.).
4. Wiring harness and bolts/screws to body.
 5. Electrical connectors.
 6. Left quarter inner rear trim finish panel. Refer to SECTION 10-7.
 7. Close end gate.
 8. Open end gate as a door so that torque rod (89) will not be under tension.
 9. Engage torque rod (89) and torque rod link (171).
 10. Torque rod link (171) to torque rod link retainer (170).
 11. Torque rod link bolts/screws (146).

Tighten

- Torque rod link bolts/screws (146) to 12 N.m (106 lb. in.).

TWO-WAY END GATE ADJUSTMENTS

Figures 5, 6, 49 and 56

Before performing any adjustments, mark the original position of the hinge, lock or striker to be adjusted.

Proper diagnosis of a misaligned condition can eliminate performing unnecessary adjustments. To properly evaluate a misaligned end gate, remove the upper right latch striker (49). If the end gate, when opened as a door, rides up or is pulled down by the lower right latch striker (49), the lower right latch striker (49) should be adjusted.

The left hinges allow adjustment of the end gate's position in the body opening, flush alignment of the end gate (59) with adjacent panels, and proper lock operation.

Important

- The right upper and lower latch strikers (49) should be removed before performing any other hinge or lock adjustment. Refer to "Latch Strikers (Right Side)" in this section.
- Improper adjustment of right lower latch striker (49) may cause "GATE AJAR" lamp and roof rail courtesy and reading lamps to illuminate.

Adjust

1. Left lower hinge (72) at the body attachment up or down and from side to side.
 - A. To gain access to lower body side hinge nuts (144), remove left quarter inner rear trim finish panel. Refer to SECTION 10-7. Loosen lower body side hinge nuts (144) and adjust lower hinge (72) up, down, sideways, or rotate as required.
 - B. Rotating the lower hinge (72) slightly will raise or lower the right side of the end gate. This can be accomplished by loosening the lower body side hinge nuts (144). Then, with the end gate open as a door, support the right side of the end gate in the desired position and tighten the lower body side hinge nuts (144) to 29 N.m (21 lb. ft.). If this adjustment is performed or if the end gate is moved sideways, it may be necessary to also adjust the upper hinge striker (169).
 - C. If the lower hinge (72) is adjusted upward or downward, clearance between the upper hinge gate side lock (82) on the end gate and the upper hinge striker (169) on the body pillar should be checked. Clearance should be 8 mm (5/16-inch). The upper hinge gate side lock (82) should be adjusted as needed to meet this specification.

2. Lower hinge (72) at end gate attachment forward or rearward.
 - A. Forward and rearward adjustment of lower hinge (72) at the end gate attachment is primarily for flush alignment of the end gate (59) with adjacent panels in the area of the lower hinge (72).
 - B. The lower gate side hinge nuts (143) are located inside the end gate (59). To loosen nuts (143) for adjustment of end gate (59) on lower hinge (72), remove trim panel and left inner panel access hole cover to gain access to lower gate side hinge nuts. Refer to "Trim Panel" and "Inner Panel Access Hole Covers" in this section. Adjust end gate (59) on lower hinge (72) as required, then tighten nuts (143) to 29 N.m (21 lb. ft.) and replace previously removed parts.
3. Upper hinge gate side lock (82) forward and rearward.
 - A. The forward and rearward adjustment of the upper hinge gate side lock (82) is available to provide a flush alignment of the end gate (59) with adjacent body panels in the area of the upper hinge gate side lock (82).
 - B. Before adjusting upper hinge gate side lock (82), mark original position of lock on end gate (59). Two of the upper hinge gate side lock nuts (142) are located outside the end gate (59), one inside. To loosen inside nut (142), remove trim panel and inner panel access hole cover. Refer to "Trim Panel" and "Inner Panel Access Hole Covers" in this section. Then loosen nuts (142). Adjust lock as required, replace all previously removed parts, and tighten nuts (142) to 29 N.m (21 lb. ft.).
 - C. After any adjustment of the upper hinge gate side lock (82), synchronization of the lock system should be checked and, where required, the lock system should be synchronized, as described in "Two-Way End Gate Lock and Synchronization Check" in this section.
4. Upper hinge striker (169) up or down, and side to side. The up or down adjustment is to provide 8 mm (5/16-inch) clearance between the bottom of the upper hinge gate side lock (82) (on end gate) and the top of the upper hinge striker (169).
 - A. To check clearance, open end gate as a door and measure distance between the upper surface of the left upper hinge pin and upper hinge striker (169) and the lower surface of the upper hinge gate side lock (82).
 - B. To make necessary adjustment, remove left quarter inner rear trim finish panel to gain access to attachments. Refer to SECTION 10-7 for trim removal. Loosen striker nuts and reposition upper hinge striker (169) as required.

! Important

- A. This adjustment allows proper engagement of the upper hinge striker (169) with the upper hinge gate side lock (82). This adjustment is

not intended as a means of raising or lowering the left or right side of the end gate (59).

- B. To find the correct adjustment, open the end gate as a gate; then, while closing the end gate, carefully observe how the left upper striker pin engages in the slot in the bottom surface of the upper hinge gate side lock (82). The striker pin should enter into the slot with side pressure.
5. Upper and lower latch strikers (49) forward or rearward, up or down, and side to side by using spacers.

! Important

- A. Do not use upper and lower latch strikers (49) to align right side of end gate (59) up or down in body opening.
- B. The upper and lower lock strikers (49) should be removed before performing any other hinge or lock adjustment.
- C. To adjust the upper or lower latch strikers (49), open the end gate as a door and remove latch striker (49). Check alignment of end gate in body opening. The end gate (59) should be aligned with the upper hinge gate side lock (82) before adjustment of latch strikers (49). Install latch striker (49) slightly more than finger tight. Then carefully close end gate to allow latch striker (49) to self-align. Carefully open end gate and tighten latch striker (49) to 53 N.m (39 lb. ft.).
- D. Operate end gate both as a door and a gate and check flush alignment of outer panels in area of latch striker (49). If any further minor adjustment is required, mark position of latch striker (49) on body pillar, loosen latch striker (49) and make required adjustment from marked position and tighten latch striker (49) to 53 N.m (39 lb. ft.).

TWO-WAY END GATE WINDOW

Window

Figures 5, 6, 58 and 59

↔ Remove or Disconnect

1. Open and raise window (105).

! Important

- The aid of a helper will be required to support the window (105) while removing window struts (104 and 107).
2. Electrical connectors, if equipped.
 3. Window struts (104 and 107) from window strut window side studs (108) by unsnapping.
 4. Lower window (105) but do not engage window latch (84).
 5. Trim panel molding. Refer to SECTION 10-9.
 6. Nuts (149).

10-8-50 BODY REAR END

Figure 58 - Removing Window

7. Window (105).
8. High-mount stoplamp, if necessary. Refer to "End Gate High-Mount Stop-lamp" in this section.
9. Window strut window side stud (108), if necessary.
 - Unscrew to remove window strut window side stud (108), window strut spacer (109) and window strut nut (110).
10. Wiper blade stop (106), if necessary.
 - Unscrew nut (150) to remove wiper blade stop (106).
11. Window hinge (102), if necessary.
 - Unscrew bolt/screw (151) to remove window hinge (102) and window side hinge gasket (103).

Install or Connect

NOTICE: Refer to "Notice" on page 10-8-1 of this section.

1. Window side hinge gasket (103), window hinge (102) and bolt/screw (151), if removed.

Tighten

- Bolt/screw (151) to 9 N·m (80 lb. in.).
2. Wiper blade stop (106) and nut (150), if removed.

Figure 59 - Disassembling Window

Tighten

- Nut (150) to 2 N.m (18 lb. in.).
- 3. Window strut spacer (109), window strut nut (110) and window strut window side stud (108), if removed.

Tighten

- Window strut window side stud (108) to 9 N.m (80 lb. in.).
- 4. High-mount stoplamp, if removed. Refer to "End Gate High-Mount Stop-lamp" in this section.
- 5. Window (105).
- 6. Nuts (149).
- 7. Close window (105) gently.

Inspect

- Engagement of high-mount stoplamp pin and loop to locator (83) and window latch (84). Adjust as necessary. Refer to "Window Latch Adjustment" in this section.

Tighten

- Nuts (149) to 8 N.m (71 lb. in.).
- 8. Trim panel molding. Refer to SECTION 10-9.
- 9. Open window (105).
- 10. Window struts (104 and 107) to window (105).
 - Snap window struts (104 and 107) on to window strut window side studs (108) to secure.
- 11. Electrical connectors, if equipped.

Window Struts

Figures 5 through 6 and 60

Remove or Disconnect

1. Open window (105).
2. Electrical connectors, if equipped.
3. Window strut (104 or 107) from window strut body side stud (48).
4. Window strut (104 or 107) from window strut window side stud (108) by unsnapping.
5. Window strut body side stud (48), if necessary.
 - Unscrew.

Install or Connect

NOTICE: Refer to "Notice" on page 10-8-1 of this section.

1. Open window (105) and support.
2. Window strut body side stud (48), if removed.

Tighten

- Window strut body side stud (48) to 12 N.m (106 lb. in.).

Figure 60 - Window Struts

3. Window strut (104 or 107) to window strut window side stud (108).
 - Snap window strut (104 or 107) on to window strut window side stud (108) to secure.
4. Window strut (104 or 107) to window strut body side stud (48).
5. Electrical connectors, if equipped.
6. Close window (105).

Window Latch

Figures 5, 6 and 61

Remove or Disconnect

1. Lock cylinder. Refer to "Lock Cylinder" in this section.
2. Actuator bumper (116).
3. Electrical connectors.
4. Loosen nuts (93) on locator (83) and slide locator (83) out of way.
5. Nuts (138).
6. Window latch (84).

Install or Connect

NOTICE: Refer to "Notice" on page 10-8-1 of this section.

1. Window latch (84).
2. Nuts (138) finger tight.
3. Electrical connectors.
4. Close window (105) gently.
5. Slide locator (83) left or right to accept pin on high-mount stoplamp (111).
6. Slide window latch (84) left or right to accept loop on high-mount stoplamp (111).

BS061108

Figure 61 - Window Latch

7. Latch the window (105).
8. Move window latch (84) forward until window (105) is tightly sealed.

Tighten

- Nuts (93) to 6 N·m (53 lb. in.).
 - Nuts (138) to 6 N·m (53 lb. in.).
9. Actuator bumper (116).
 - Remove adhesive backing from actuator bumper (116) and insert between window latch (84) and inner reinforcement.
 - Make sure actuator bumper (116) does not interfere with window latch moving parts or hole for license plate attachment.
 10. Lock cylinder. Refer to "Lock Cylinder" in this section.

Window Latch Adjustment

Figures 61 and 62

Remove or Disconnect

1. Trim panel. Refer to "Trim Panel" in this section.
2. Loosen nuts (93).
3. Close window (105) gently.

Adjust

1. Slide locator (83) left or right to accept pin on high-mount stoplamp (111).

2. Slide window latch (84) left or right to accept loop on high-mount stoplamp (111).

Install or Connect

NOTICE: Refer to "Notice" on page 10-8-1 of this section.

1. Latch the window (105).
2. Move window latch (84) forward until window (105) is tightly sealed.

Tighten

- Nuts (93) to 6 N·m (53 lb. in.).
3. Trim panel. Refer to "Trim Panel" in this section.

Window Striker Bezel

Figures 5 and 6

To remove the window striker bezel (57), pull from opening on end gate (59).

END GATE HIGH-MOUNT STOP-LAMP

Figure 62

Remove or Disconnect

1. Open window (105).
2. Bolts/screws (153).

Figure 62 - High-Mount Stop-lamp

3. High-mount stoplamp (111).
4. Window striker gasket (112), window handle (114), and window handle gasket (113).

Install or Connect

NOTICE: Refer to "Notice" on page 10-8-1 of this section.

1. Window striker gasket (112) and high-mount stoplamp (111) to window (105).
 - Make sure arrow on window striker gasket (112) points toward top of window (105).
2. Window handle gasket (113) and window handle (114) to window (105).
3. Bolts/screws (153).

Tighten

- Bolts/screws (153) to 9 N-m (80 lb. in.).

Adjust

- Window latch to accept high-mount stoplamp loop and pin, if necessary. Refer to "Window Latch" in this section.

High-Mount Stop-lamp Contact

Figures 5 and 6

Remove or Disconnect

1. Trim panel. Refer to "Trim Panel" in this section.
2. Electrical connectors.
3. Rivets using 1/4-inch drill bit and drill.
4. High-mount stoplamp contact (161) from end gate (59).

Install or Connect

1. High-mount stoplamp contact (161) to end gate (59).
2. Rivets.
3. Electrical connectors.
4. Trim panel. Refer to "Trim Panel" in this section.

SECTION 10-9

ROOF

NOTICE: Always use the correct fastener in the proper location. When you replace a fastener, use **ONLY** the exact part number for that application. General Motors will call out those fasteners that require a replacement after removal. General Motors will also call out the fasteners that require thread lockers or thread sealant. **UNLESS OTHERWISE SPECIFIED**, do not use supplemental coatings (paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

GENERAL DESCRIPTION

ROOF

Figures 1 through 6

The information in this section provides service procedures that apply to all roof components.

ON-VEHICLE SERVICE

HEADLINING PANEL

Figures 7 through 9

The headlining panel is partially held in place with retainers (2). When the interior moldings and bolts/screws, sunshade brackets, dome lamp base, assist straps, coat hooks, roof rail courtesy and reading lamps are installed, the headlining panel is completely held in place.

Remove or Disconnect

1. Dome lamp (Chevrolet). Refer to "Dome Lamp" in this section.
2. Sunshades. Refer to "Sunshade" in this section.
3. Roof rail assist straps, if sedan. Refer to "Roof Rail Assist Strap" in this section.
4. Coat hook or roof rail courtesy and reading lamp. Refer to "Coat Hook and Roof Rail Courtesy and Reading Lamp" in this section.
5. Quarter window garnish moldings or quarter upper trim, if sedan. Refer to SECTION 10-7.
6. Body lock pillar trim finish panel and back body pillar finish panel, if wagon. Refer to SECTION 10-7.
7. Windshield garnish moldings. Refer to "Windshield Garnish Molding" in this section.
8. Center pillar upper trim finish panels. Refer to SECTION 10-6.
9. Endgate trim panel molding, if wagon. Refer to "Endgate Trim Panel Molding" in this section.
10. Roof stationary window garnish molding, if Buick wagon. Refer to "Roof Stationary Window Garnish Molding and Sunshade" in this section.

10-9-2 ROOF

11. Retainer (47), if wagon.
12. Headlining panel (83, 3 or 4).
 - A. Recline front seats, if sedan.
 - B. Unfasten headlining panel (83, 3 or 4) from retainers (2).
 - C. Remove headlining panel (83, 3 or 4) from vehicle through passenger door, if sedan or endgate opening if wagon.
13. Sunshade rod retainer nut (50) from hole in windshield header, if necessary.

Install or Connect

1. Sunshade rod retainer nut (50) to hole in windshield header, if removed.
2. Headlining panel (83, 3 or 4).
 - A. Recline front seats, if sedan.
 - B. Place headlining panel (83, 3 or 4) in vehicle through passenger door, if sedan or endgate opening if wagon.
 - C. Pull electrical connectors through openings.
 - Make sure rearview mirror wiring harness connector will extend beyond front edge of headlining panel (83, 3 or 4).
 - D. Align headlining panel (83, 3 or 4) to retainers (2) and door openings.
 - E. Press headlining panel (83, 3 or 4) to secure.
3. Retainer (47), if wagon.
4. Roof stationary window garnish molding, if Buick wagon. Refer to "Roof Stationary Window Garnish Molding and Sunshade" in this section.
5. Endgate trim panel molding, if wagon. Refer to "Endgate Trim Panel Molding" in this section.
6. Center pillar upper trim finish panels. Refer to SECTION 10-6.
7. Windshield garnish moldings. Refer to "Windshield Garnish Molding" in this section.
8. Body lock pillar trim finish panel and back body pillar finish panel, if wagon. Refer to SECTION 10-7.
9. Quarter window garnish moldings or quarter upper trim, if sedan. Refer to SECTION 10-7.
10. Coat hook or roof rail courtesy and reading lamps. Refer to "Coat Hook and Roof Rail Courtesy and Reading Lamp" in this section.
11. Roof rail assist straps, if sedan. Refer to "Roof Rail Assist Strap" in this section.
12. Sunshades. Refer to "Sunshade" in this section.

SUNSHADE AND VANITY MIRRORS

Sunshade

Figure 10

Remove or Disconnect

1. Bolts/screws (8).
2. Sunshade (13).
3. Electrical connector from sunshade connector, if equipped.

Install or Connect

NOTICE: Refer to "Notice" on page 10-9-1 of this section.

1. Electrical connector to sunshade connector, if equipped.
2. Sunshade (13).
 - Position sunshade support bracket to hole in headlining panel (83, 3 or 4).
3. Bolts/screws (8).

Tighten

- Bolts/screws (8) to 2.8 N.m (25 lb. in.).

Vanity Mirror

Figure 10

Remove or Disconnect

1. Lower sunshade (13) and raise mirror door.
2. Vanity mirror (12).
 - A. Using small screwdriver, unsnap bottom edge of vanity mirror (12).
 - B. Pull to unsnap upper edge of vanity mirror (12).

Install or Connect

1. Vanity mirror (12).
 - A. Snap in upper edge of vanity mirror (12).
 - B. Snap in lower edge of vanity mirror (12).
2. Lower mirror door and raise sunshade (13).

Bulb Replacement

Remove or Disconnect

1. Lens (11).
 - Insert small screwdriver at bottom edge of lens (11) to unsnap.
2. Bulb (10).

Install or Connect

1. Bulb (10).
2. Lens (11).
 - Insert top of lens (11) and snap in bottom.

ROOF RAIL ASSIST STRAP

SEDAN

Figures 11 and 12

Remove or Disconnect

1. Cover (45) from roof rail assist strap (43) (Chevrolet).
2. Bolts/screws (44 or 53).
3. Roof rail assist strap (43) or (51).
4. Nuts (52), if necessary.

Install or Connect

NOTICE: Refer to “Notice” on page 10-9-1 of this section.

1. Nuts (52), if removed.
 - Snap into place to secure.
2. Roof rail assist strap (43) or (51) to nuts (52) in roof rail inner panel.
3. Bolts/screws (44 or 53).

Tighten

- Bolts/screws (44) to 3.8 N·m (34 lb. in.).
 - Bolts/screws (53) to 1.9 N·m (17 lb. in.).
4. Covers (45) to roof rail assist strap (43) (Chevrolet). Snap in place to secure.

INTERIOR LIGHTING

Coat Hook and Roof Rail Courtesy and Reading Lamp

Figure 13

Remove or Disconnect

1. Bolt/screw (16).
2. Coat hook or roof rail courtesy and reading lamp (15).
3. Electrical connector.
4. Nut (14), if necessary.

Install or Connect

NOTICE: Refer to “Notice” on page 10-9-1 of this section.

1. Nut (14), if removed.
2. Electrical connector.
3. Coat hook or roof rail courtesy and reading lamp (15).
4. Bolt/screw (16).

Tighten

- Bolt/screw (16) to 1.3 N·m (12 lb. in.).

LAMP

Dome Lamp

Figure 14

Some police and taxi vehicles have an extra dome lamp located in the center of the headlining panel between the sunshades.

Remove or Disconnect

1. Lens 66
 - Carefully squeeze lens 66 at front and rear, or at sides if police and taxi vehicle, to disengage and remove.
2. Bulb 69 from terminal socket or clips.
3. Retainers (20) or bolts/screws (67), if police or taxi vehicle.
4. Electrical connector.
5. Dome lamp housing (23 or 68).

Figure 4 - Roof Components - (Buick Sedan) - Legend

Install or Connect

NOTICE: Refer to "Notice" on page 10-9-1 of this section.

1. Dome lamp housing (23 or 68).
2. Electrical connector.
3. Ground wire and bolt/screw (67) to dome lamp housing (68) and secure with retainer (46), if police or taxi vehicle.
4. Retainers (20) if gap appears between domelamp and headliner push domelamp to fully seats and gap is gone.
5. Retainers (20) or bolts/screws (67), if police or taxi vehicle.

Tighten

- Bolt/screw (67) to 1.5 N·m (13 lb. in.).
6. Bulb 69 to terminal socket or clips.
 7. Lens 66.
- Carefully squeeze sides of lens (66) to engage edge of lens to (68) housing, if police or taxi vehicle.

INTERIOR MOLDINGS

Windshield Garnish Molding

Figure 15

Remove or Disconnect

1. Spotlamp, if equipped. Refer to SECTION 8B.
2. Windshield garnish molding (24) by disengaging clips from slots in pillar.

Install or Connect

1. Windshield garnish molding (24).
 - A. Engage clips to slots in pillar.
 - B. Apply pressure to secure.
2. Spotlamp, if removed. Refer to SECTION 8B.

Endgate Trim Panel Molding

Figure 16

Remove or Disconnect

1. Retainers (48).
2. Endgate trim panel molding (42).
 - Bow endgate trim panel molding (42) enough to disengage tabs from back body pillar panels.

Install or Connect

1. Endgate trim panel molding (42).
 - Bow endgate trim panel molding (42) enough to interlock tabs with back body pillar panels.
2. Retainers (48).

Roof Stationary Window

BUICK

For roof stationary window, refer to SECTION 10-2.

Roof Stationary Window Garnish Molding and Sunshade

(BUICK)

Figure 17

Remove or Disconnect

1. Roof stationary window garnish molding (84) by unseating retainers.
2. Sunshade from roof stationary window garnish molding (84), if necessary.
3. Hooks and bolts/screws from sunshade, if necessary.

Install or Connect

1. Hooks and bolts/screws to sunshade, if removed.
 - Tighten bolts/screws securely.
2. Sunshade by engaging hooks to clips on roof stationary window garnish molding (84).
3. Roof stationary window garnish molding (84) by engaging retainers.

NAMEPLATE AND OPERA LAMPS

BUICK

Figure 18

Remove or Disconnect

1. Reposition rear compartment trim to access one nut (30 or 31).
2. Quarter upper rear trim finish panel to access second nut (30 or 31). Refer to SECTION 10-7.

3. Nuts (30 or 31) from bezel studs.
4. Nameplate (28) or opera lamp (22) from body.
5. Washers (35 or 29) from bezel studs.
6. Nameplate (28) or opera lamp (22) from bezel (27 or 21).
7. Electrical connector, if equipped.

Important

- Tape opera lamp electrical connector to quarter panel to prevent connector from falling into the quarter panel.

Install or Connect

NOTICE: Refer to "Notice" on page 10-9-1 of this section.

1. Electrical connector, if equipped.
2. Nameplate (28) or opera lamp (22) to bezel (27 or 21).
3. Washers (35 or 29) to bezel studs.
4. Nameplate (28) or opera lamp (22) to body.
5. Nuts (30 or 31) to bezel studs.

Tighten

- Nuts (30 or 31) to 3 N-m (27 lb. in.).
6. Quarter upper rear trim finish panel. Refer to SECTION 10-7.
 7. Position rear compartment trim.

ENDGATE WINDOW AIR DEFLECTOR

Figure 19

Remove or Disconnect

1. Rear window wiper and washer. Refer to SECTION 8E1.
2. Endgate trim panel molding. Refer to "Endgate Trim Panel Molding" in this section.
3. Right and left luggage carrier side rails. Refer to "Luggage Carrier" in this section.
4. Nuts (49).
5. Endgate window air deflector (36).

Install or Connect

NOTICE: Refer to "Notice" on page 10-9-1 of this section.

1. Endgate window air deflector (36).
2. Nuts (49).

Tighten

- Nuts (49) to 2.3 N·m (20 lb. in.).
3. Right and left luggage carrier side rails. Refer to "Luggage Carrier" in this section.
 4. Endgate trim panel molding. Refer to "Endgate Trim Panel Molding" in this section.
 5. Rear window wiper and washer. Refer to SECTION 8E1.

LUGGAGE CARRIER

Figures 20 and 21

Remove or Disconnect

1. Headlining panel. Refer to "Headlining Panel" in this section.
2. Bolts/screws (70) (Buick).
3. Luggage carrier outer slat caps (57 and 58) (Buick).
4. Luggage carrier rear rail (89 or 56).
 - Raise lever arms on luggage carrier rear rail (89 or 56) and slide rearward.
5. Bolts/screws (6 or 73).
6. Nuts (75).
7. Luggage carrier side rails (85 and 87 or 55 and 59).
8. Nuts (74), if necessary.
9. Nuts (79) (Buick).
10. Bolts/screws (88 or 77).
11. Luggage carrier outer slat cap (38) (Buick).
12. Luggage carrier front rail (34 or 80).
13. Nuts (76) (Buick), if necessary.
14. Bolts/screws (71).
15. Luggage carrier center slats (81).
16. Nuts (72), if necessary.

Install or Connect

NOTICE: Refer to "Notice" on page 10-9-1 of this section.

1. Nuts (72), if removed.
2. Luggage carrier center slats (81).
3. Bolts/screws (71).

Tighten

- Bolts/screws (71) to 1.2 N·m (11 lb. in.).
4. Nuts (76), if removed.
 5. Luggage carrier front rail (34 or 80).
 6. Bolts/screws (88 or 77).

Tighten

- Bolts/screws (88) to 1.5 N·m (13 lb. in.).
 - Bolts/screws (77) to 1.9 N·m (17 lb. in.).
7. Nuts (79), if removed.

Tighten

- Nuts (79) to 2.8 N·m (25 lb. in.).
8. Nuts (74), if removed.
 9. Luggage carrier side rails (85 and 87 or 55 and 59).
 10. Nuts (75).
 11. Bolts/screws (6 or 73).

Figure 14 - Removing Dome Lamp - (Chevrolet)

Figure 15 - Removing Windshield Garnish Molding

Figure 16 - Endgate Trim Panel Molding - (Wagon)

 Tighten

- Bolts/screws (6) to 6 N.m (53 lb. in.).
 - Bolts/screws (73) to 1.9 N.m (17 lb. in.).
12. Luggage carrier rear rail (89 or 56).
- Raise lever arms and align rollers on luggage carrier rear rail (89 or 56) and slide forward.

13. Luggage carrier outer slat caps (57 and 58) (Buick).
14. Bolts/screws (70), if removed.

 Tighten

- Bolts/screws (70) to 4.5 N.m (40 lb. in.).
15. Headlining panel. Refer to "Headlining Panel" in this section.

WEATHER-STRIP

Figures 22 and 23

 Remove or Disconnect

1. Bolt/screw (54), if Buick sedan.
 2. Weather-strip (25).
- Pull weather-strip (25) to remove from roof rail pinch-weld flange.

 Install or Connect

NOTICE: Refer to "Notice" on page 10-9-1 of this section.

1. Weather-strip (25).
- Position weather-strip center pillar cutout to center pillar.
2. Apply pressure to secure rear upper header of weather-strip (25) to roof rail pinch-weld flange.

Figure 17 - Roof Stationary Window Garnish Molding - (Buick Wagon)

Figure 18 - Nameplate and Opera Lamps - (Buick Sedan)

3. Apply pressure to secure weather-strip (25) toward front of dash to roof rail pinch-weld flange.
4. It may be necessary to tap weather-strip (25) with rubber mallet.

Important

- Hit weather-strip (25) square to roof rail pinch-weld flange.

5. Use rolling tool to ensure proper engagement of weather-strip (25) to roof rail pinch-weld flange.

- Make sure bottom edge of weather-strip (25) extends underneath edge of door weather-strip (26).

6. Bolt/screw (54), if Buick sedan.

Tighten

- Bolt/screw (54) to 1.3 N·m (12 lb. in.).

ROOF PANEL COVER

Roof Panel Cover Moldings

BUICK SEDAN

Figure 24

Remove or Disconnect

1. Roof panel upper moldings (61).
 - A. Protect painted surface with tape.
 - B. Use a block of wood and rubber mallet to strike roof panel upper moldings (61) rearward at each clip location.
2. Roof panel quarter moldings (60).
 - Slide roof panel quarter moldings (60) upward to disengage from roof panel quarter molding clips (65).
3. Roof panel upper molding clips (64) and roof panel quarter molding clips (65).

Figure 19 - Endgate Window Air Deflector - (Wagon)

Figure 20 - Installing Luggage Carrier - (Chevrolet Wagon)

Install or Connect

1. Roof panel upper molding clips (64) and roof panel quarter molding clips (65).
2. Roof panel quarter moldings (60).
 - Insert bottom edge of roof panel quarter moldings (60) over top roof panel quarter molding clips (65) and slide down to secure.

NOTICE: Lower edges of roof panel quarter moldings (60) must lay on top of lower edge of roof panel cover material or damage to material may result.

3. Roof panel upper moldings (61).
 - Slide front edge of roof panel upper moldings (61) under front edge of roof panel upper molding clips (64) and roof panel quarter moldings (60). Then snap rear edge of roof panel upper moldings (61) over rear edge of roof panel upper molding clips (64) and roof panel quarter moldings (60).

Roof Panel Cover

Figure 24

Remove or Disconnect

1. Roof panel upper and quarter moldings. Refer to "Roof Panel Cover Moldings" in this section.
2. Raise rear compartment lid.
3. Bolts/screws (63).
4. Nameplate or opera lamps. Refer to "Nameplate and Opera Lamps" in this section.
 - Tape opera lamp electrical connector to quarter panel to prevent connector from falling into the quarter panel.

NOTICE: Roof panel cover upper front corners are secured with adhesive. Be careful not to separate outer covering from pad during removal or damage will result.

5. Lift upper front corners of roof panel cover (62) just enough to allow removal of roof panel cover (62).

6. Place protective covering over rear compartment lid to prevent possible damage to painted surface.
7. Roof panel cover (62) with aid of helper.

Install or Connect

NOTICE: Refer to "Notice" on page 10-9-1 of this section.

1. Roof panel cover (62) with aid of helper.
 - Position roof panel cover (62) to body, aligning holes on top and sides with studs.
2. Nameplate or opera lamps. Refer to "Nameplate and Opera Lamps" in this section.
3. Raise rear compartment lid.
4. Bolts/screws (63) on rear shelf panel clips.

Tighten

- Bolts/screws (63) to 1.9 N.m (17 lb. in.).
5. Apply vinyl trim adhesive to upper front corners of roof panel cover (62).
 6. Roof panel upper and quarter moldings. Refer to "Roof Panel Cover Moldings" in this section.

Weld Stud Replacement

Refer to SECTION 10-1 for weld stud replacement.

NOTICE: Always use the correct fastener in the proper location. When you replace a fastener, use **ONLY** the exact part number for that application. General Motors will call out those fasteners that require a replacement after removal. General Motors will also call out the fasteners that require thread lockers or thread sealant. **UNLESS OTHERWISE SPECIFIED**, do not use supplemental coatings (paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

GENERAL DESCRIPTION

FRONT SEAT

Chevrolet

Figure 1

There are two styles of Chevrolet front seats: 55-45 split bench and 45-45 split (for police and Impala SS vehicles). Seat covers may be cloth, leather, or vinyl (for police vehicles). All split style seats have manual recliners and either manual or power adjusters. Front seats may have armrests.

Buick

Figure 2

The Buick front seat is a 55-45 split style with head restraints on both sides and a driver's side armrest. On some vehicles the armrest may also function as a storage compartment. Seat covers may

be cloth or leather. Front seats are equipped with either manual or power recliners and either manual or power adjusters. Front seats may also be equipped with power lumbar supports.

REAR SEAT

Figures 3 and 4

The rear seat on the wagon was formerly called the second seat, and the second seat #2 was formerly called the third seat. The sedan and wagon rear seat are held by stops and hooks. The sedan rear seat may have a center armrest held onto the seat with attaching bolts/screws. The wagon has a folding rear (second) seat.

REAR SEAT #2

Figure 5

The rearward facing rear seat #2 has a remote seatback cushion latch at the lower right side of the seatback cushion. When the seatback cushion latch is

Figure 5 - Rear Seat #2

released by lifting the seatback cushion latch release handle under the right side of the load floor rear panel, the third seatback can be lowered.

The folding rear seat #2 seatback is attached to a panel that becomes the load floor front panel when the seatback is folded down or when the rear seat #2 is absent. The seatback cushion is held onto the panel with wire loops on the lower seatback frame that hook through holes in the panel. The top of the seatback is held onto the panel with bolts/screws.

The luggage compartment front panel is attached to the luggage compartment rear panel through a hinge. The hinge is covered with vinyl trim.

The rear seat #2 module, or luggage compartment when the rear seat #2 is absent, has rails and rubber bumpers at the sides and rear. The rails are held with bolts/screws and rivets and the bumpers have retainers that snap into holes in the rails.

FLOOR CARPET

All floor carpets consist of a molded one-piece carpet over both front and rear floor panels.

DIAGNOSIS

MANUAL FRONT SEAT ADJUSTER

1. Adjusters will not lock or will not unlock.
 - Linking wire may be too loose, too tight or disconnected.
 - Return spring may be disconnected or damaged.
 - Lock bar may be sticking or damaged. Replace adjuster.
2. One adjuster locks and the other adjuster does not lock.
 - One adjuster may be forward or rearward of other adjuster. Make adjustments at the floor panel attachments.
3. Seat is hard to move forward or rearward.
 - Adjusters may be new. Move seat forward and rearward several times to work tightness out of channels.
 - Adjusters may not be properly lubricated.
 - Adjuster channels may be damaged. Replace adjuster.
 - Adjuster may not be parallel. Make adjustments at the floor pan attachments.

POWER FRONT SEAT ADJUSTER

Power Front Seat Adjuster without Power Recline

The following symptoms refer to mechanical operation of the power seat adjusters. For electrical diagnosis, refer to SECTION 8A.

1. One adjuster reaches maximum horizontal or vertical position before the other adjuster.
 - Adjusters may be out of phase.
2. Seat does not move smoothly.
 - Adjuster shoes and channels may not be properly lubricated.

- Adjuster horizontal actuator gear may be too tight.

3. One adjuster will not move forward and backward.
 - Horizontal drive cable may be disconnected or damaged.
 - Adjuster horizontal actuator may be damaged.
4. One adjuster will not move up or down.
 - Vertical drive cable may be disconnected or damaged.
 - Vertical actuator may be damaged.

Power Front Seat Adjuster with Power Recline

Buick

The following symptoms refer to mechanical operation of power seat adjusters with power recline. For electrical diagnosis, refer to SECTION 8A.

1. One adjuster reaches maximum horizontal position before the other adjuster.
 - Adjusters may be out of phase.
2. Seat does not move smoothly.
 - Adjusters may not be properly lubricated.
 - Drive shafts may not be inserted in motor or drives properly.
 - Drive shafts may be crimped.
3. One adjuster will not move forward and backward.
 - Drive shafts may be disconnected or damaged.

ON-VEHICLE SERVICE

FRONT SEAT

Figures 6, 7 and 8

Remove or Disconnect

NOTICE: Before removing the seat, place a protective shield over nearby paint and trim to avoid damage.

1. Operate seat to full-forward position.
2. Bolts/screws (3 or 5) from rear trim covers (1 or 4).
3. Rear trim covers (1 or 4).
4. Adjuster nuts (2) and washers (42) from rear anchor plate studs.
5. Operate seat to full-rearward position.
6. Bolts/screws (6 or 8) from front trim covers (7 or 9).
7. Front trim covers (7 or 9).
8. Adjuster nuts (2) and washers (42) from front anchor plate studs.
9. Electrical connectors from front seats with any electrical equipment, such as 6-way power adjusters, or power lumbar support.
10. Front seat with aid of a helper.

Figure 6 - Removing Front Seat Adjuster Trim Covers

Figure 7 - Removing Front Seat - (Chevrolet)

Figure 8 - Removing Front Seat - (Buick)

10-10-10 SEATS AND CARPET

- Guide seat belt through the slot in the seat cushion.

Install or Connect

CAUTION: Replace belts, retractors, and hardware in use during all but a minor collision. Also, restraint systems should be replaced and anchorages properly repaired if they were in areas damaged by a collision, whether the belt was in use or not. If there is any question, replace the belt system. Damage, whether visible or not, could result in serious personal injury in the event of an accident.

NOTICE: Refer to "Notice" on page 10-10-1 of this section.

1. Front seat with aid of a helper.
 - Guide seat belt through slot in the seat cushion.
2. Electrical connectors on front seats with power seat adjusters or power lumbar support.
3. Adjuster nuts (2) and washers (42) to front anchor plate studs.

Tighten

- Adjuster nuts (2) to 25 N.m (18 lb. ft.).
4. Front trim covers (7 or 9).
 5. Bolts/screws (6 or 8) to front trim covers (7 or 9).

Tighten

- Bolts/screws (6) to 1.9 N.m (17 lb. in.).
 - Bolts/screws (8) to 5.8 N.m (51 lb. in.).
6. Move seat to full-forward position.
 7. Adjuster nuts (2) and washers (42) to rear anchor plate studs.

Tighten

- Adjuster nuts (2) to 25 N.m (18 lb. ft.).
8. Rear trim covers (1 or 4).
 9. Bolts/screws (3 or 5) to rear trim covers (1 or 4).

Tighten

- Bolts/screws (3) to 5.8 N.m (51 lb. in.).
- Bolts/screws (5) to 1.9 N.m (17 lb. in.).

COVERS AND PADS

Front seat and seatback cushions have formed foam pads that fit the contour of the seat cushion and seatback frames. The covers are either cloth or leather.

Front Seat Covers

MANUAL RECLINE

Figures 9 and 10

Tool Required:
J 9886-01 Door Handle Clip Remover

Remove or Disconnect

1. Head restraint. Refer to "Head Restraint" in this section.

Important

- If only the seatback cover is being removed, then the entire seat does not have to be removed. Skip steps 2 through 6 and 13.
2. Front seat. Refer to "Front Seat" under "On-Vehicle Service" in this section.
 3. Front seat armrest with support. Refer to "Front Seat Armrest" in this section.

Figure 9 - Disassembling Manual Front Seats

Figure 10 - Removing Front Seat and Seatback Covers (Typical)

4. Pull seat belt down through slot in seat cushion (78).
5. Recliner handle (18), using J 9886-01.
 - Use a screwdriver to unsnap back plate from recliner handle (18).
 - Release spring clip by pushing J 9886-01 between the recliner handle (18) and seat cushion (78).
6. Move seatback cushion cover (23) and foam enough to expose lock or support hardware.
7. Bolt/screw (14).
8. Bushing (13).
9. Retainer (15) from pin (16).
10. Pin (16) connecting seatback (71) to recliner.
11. Seatback (71).
12. Seatback cover (22).
 - A. Disengage J-retainers.
 - B. Disengage hook and loop fasteners.
 - C. Pull seatback cover (22) over pad.
13. Seat cushion cover (23).
 - A. Disengage J-retainers and push-in fasteners from bottom perimeter of seat frame.
 - B. Turn seat cushion cover facings up from pad.
 - C. Disengage hook and loop fasteners.

Install or Connect

NOTICE: Refer to "Notice" on page 10-10-1 of this section.

1. Seat cushion cover (23).
 - A. Turn seat cushion cover facings over edge of pad.
 - B. Engage J-retainers and push-in retainers around perimeter of seat frame.
 - C. Engage hook and loop fasteners from center to outer edges by pressing seat cushion cover (23) to pad to avoid wavy pattern.
2. Seatback cover (22).
 - A. Pull seatback cover (22) over foam pad.
 - B. Fold J-retainer into J-retainer and press to lock.
 - C. Engage hook and loop fasteners from center to outer edges by pressing seatback covers (22) to pad to avoid wavy pattern.
3. Seatback (71).
 - Align seatback (71) to seat cushion (78).
4. Move seat cushion cover (23) and pad enough to access lock or support hardware.
5. Pin (16) connecting seatback (71) to recliner.
6. Retainer (15).
 - Push onto pin (16).
7. Bushing (13).
8. Bolt/screw (14).

Tighten

- Bolt/screw (14) to 24 N.m (18 lb. ft.).
9. Move seat cushion cover (23) and foam back into place.
 10. Recliner handle (18).
 - Push recliner handle (18) with spring clip and back plate onto spindle to secure.
 11. Armrest and support. Refer to "Front Seat Armrest" in this section.
 12. Push seat belt back up through slot in seat cushion (78).
 13. Seat. Refer to "Front Seat" under "On-Vehicle Service and Unit Repair" in this section.
 14. Head restraint. Refer to "Head Restraint" in this section.

POWER RECLINE

Figures 11 and 12

Remove or Disconnect

1. Armrest and support. Refer to "Front Seat Armrest" in this section.

Important

- If only the seatback cover and pads are being removed, then the entire seat does not have to be removed. Skip steps 3, 4 and 12 through 14.
2. Head restraint. Refer to "Head Restraint" in this section.
 3. Bolts/screws (194).
 4. Panel (156).

5. Panel (195).
 - Disengage plastic retainers (196), using a flat-bladed tool to pry panel (195) away.
6. Pull seat belt down through slot in seat cushion (197).
7. Front seat. Refer to "Front Seat" under "On-Vehicle Service" in this section.
8. Rear upper J-retainers.
9. Pull rear lower J-retainer under seatback and carefully pull seatback cover (22) upward until lower retaining rings on front of seatback are exposed.
10. Retaining rings.
11. Repeat steps 9 and 10 for upper retaining rings on front of seatback (73).
12. Continue pulling seatback cover (22) upward until J-retainer in seatback cover headrest opening is exposed, and remove J-retainer.
13. Pull seatback cover (22) free.
14. Seatback pad (12).
 - A. Remove foam extrusion from top of seatback and pull wire on top of split style seatback pad (12) away from wire on top of seatback frame (74).
 - B. Remove retaining rings on back of seatback frame (74).
 - C. Remove J-retainer.
15. Lumbar support switch (68).
 - A. Remove bolts/screws (153).
- B. Disconnect electrical connectors and push them back through holes in seat cushion cover (75).
16. J-retainers holding seat cushion cover (75) to flange of seat frame (77).
17. Seat cushion (197) from seat frame (77).
18. Seat cushion cover (75) from seat pad (76).
 - A. Pull back seat cushion cover (75) until retaining rings are exposed, and then remove them.
 - B. Pull seat cushion cover (75) free of seat pad (76).

**Install or Connect**

NOTICE: Refer to "Notice" on page 10-10-1 of this section.

1. Seat cushion cover (75).
 - A. Lay seat cushion cover (75) over seat pad (76) and fold seat cushion cover (75) back to expose a horizontal trench in the seat pad (76) on the passenger and driver sides, and a vertical trench on the driver side only. Locate tie-down retainer in seat cushion cover (75) to wire in trench, aligning hole in seat cushion cover (75) to workline in seat pad (76) and attach with retaining rings.
 - B. Pull seat cushion cover (75) over sides of seat pad (76).

10-10-14 SEATS AND CARPET

2. Seat cushion (197) to seat frame (77).
 - A. Place electrical connectors through holes in seat cushion covers (75).
 - B. Attach J-retainers on bottom of seat cushion cover (75) to flange around seat frame (77).
3. Lumbar support switch (68).
 - A. Connect electrical connectors to lumbar support switch (68).
 - B. Install bolts/screws (153).

Tighten

- Bolts/screws (153) to 10.5 N.m (93 lb. in.).
4. Seatback pad (12).
 - A. Place seatback pad (12) on seatback frame (74) and attach J-retainer to wire on back of seatback frame (74).
 - B. Secure seatback pad (12) to seatback frame (74) with retaining rings on the back of seatback frame (74).
 - C. Place wire on top of seatback pad (12) behind wire on top of seatback frame (74) and then place foam extrusion on top of both wire tops when assembled.
 5. Inside out seatback cover (22) over seatback pad (12).
 6. J-retainer from seatback cover headrest opening to seatback frame (74).
 7. Pull seatback cover (22) down over seatback pad (12) and position upper tie-down retainer to trench in seatback pad (12), aligning hole in seatback cover (22) to workline in seatback pad (12). Attach seatback cover (22) with retaining rings. Continue to pull seatback cover (22) down and do the same when lower tie-down retainer is positioned to trench.
 8. Rear upper J-retainers.
 9. Pull seat belt up through slot in seat cushion (197).
 10. Front seat. Refer to "Front Seat" under "On-Vehicle Service" in this section.
 11. Panel (195).
 12. Panel (156).
 13. Bolts/screws (194).

Tighten

- Bolts/screws (194) to 11 N.m (97 lb. in.).
14. Head restraint. Refer to "Head Restraint" in this section.
 15. Armrest and support. Refer to "Front Seat Armrest" in this section.

Head Restraint Cover

Figure 13

Remove or Disconnect

1. Arrow retainer from J-retainer.
2. Head restraint cover (24).

Install or Connect

1. Head restraint cover (24) over pad.
 - Align cutouts to head restraint posts.
2. Fold arrow retainer into J-retainer.
 - Press to lock.

Armrest Cover

Figure 14

Remove or Disconnect

1. Armrest and support. Refer to "Front Seat Armrest" in this section.
2. Bolts/screws (27) from support (29) and support cover (28).
3. Armrest and washers (26) from support (29) and support cover (28).
4. Washers (26) from armrest.
5. Center armrest cover (25).
 - Unzip to remove.

Install or Connect

NOTICE: Refer to "Notice" on page 10-10-1 of this section.

1. Center armrest cover (25).
 - Zip closed.
2. Washers (26) to armrest.
3. Armrest and washers (26) to support (29) and support cover (28).
4. Bolts/screws (27).

Tighten

- Bolts/screws (27) to 11 N.m (97 lb. in.).

Figure 13 - Head Restraint Cover

Figure 14 - Removing Front Seat Armrest Support and Cover (Typical)

5. Armrest and support to seat frame. Refer to "Front Seat Armrest" in this section.

Head Restraint

Figures 15 and 16

All front seats have head restraints. The head restraints are designed so they cannot be removed from the seatback without first inserting a flat tool inside the head restraint guides to release the lock clips. The head restraints can be raised or lowered for proper positioning.

Two head restraint lock-releasing tools must be fabricated locally from flexible steel strap (Figure 15). The flat surfaces of these tools will release the spring lock tab.

Remove or Disconnect

1. Raise head restraint (30) to full-up position.
2. Insert head restraint lock-releasing fabricated tools down left-hand side of both guides (31).
3. Push head restraint (30) and tools down simultaneously to disengage post detentes from tabs.
4. Lift head restraint (30) out.

Install or Connect

1. Posts into guides (31).

Figure 15 - Head Restraint Lock Releasing Fabricated Tool

2. Push head restraint (30) into full-down position.
3. Raise head restraint (30) to ensure head restraint (30) stops at post detents.

Front Seat Armrest

Figure 17

Both the standard armrest and the storage armrest are removed the same way. The storage armrest is not serviceable. If damaged it must be replaced.

Remove or Disconnect

1. Position seat in full-forward and full-up position.
2. J-retainer on front seat cushion cover from frame.
3. Nuts (34) from studs.
4. Armrest (32) and support from front seat.

Install or Connect

NOTICE: Refer to "Notice" on page 10-10-1 of this section.

1. Armrest (32) and support to front seat.
2. Nuts (34) onto studs.

Tighten

- Nuts (34) to 11 N.m (97 lb. in.).
3. J-retainer on front seat cushion cover to frame.

Figure 16 - Removing Head Restraint

Figure 17 - Removing Front Seat Armrest - (Typical)

Manual Reclining Seatback

Some seats are equipped with driver and passenger manual reclining seatbacks. The seatbacks can be reclined to several positions by exerting slight pressure against the seatback and lifting the front of the recliner handle located at the front outboard side of the seat cushion. When the recliner handle is lifted, the spring-loaded recliner support is released, allowing the seatback to be pushed rearward. Lifting the recliner handle also allows the spring-loaded recliner support to bring the seatback forward from the reclined position.

The manual recliner is attached with pins to the outboard seat pivots. It is covered by the seat covers.

Manual Recliner Check

Inspect

1. Front seat manual recliner.
 - A. Pull upward on recliner handle and push seatback to rear. Move seatback into full-reclined position, checking ease of handle operation and seatback movement.
 - B. Release recliner handle and ensure it returns to normal position without assistance. Seatback should remain fully reclined.
 - C. Pull upward on recliner handle and allow seatback to move forward to a middle reclined position. Release recliner handle.
 - D. Push upper seatback to rear to check for recliner locking action.

- E. Pull upward on recliner handle and allow seatback to return to normal position, checking ease of handle operation and seatback full return. Release recliner handle.
 - F. Push upper seatback to rear to check for recliner locking action.
2. If recliner does not operate correctly, replace recliner support.

Manual Recliner Support

Figures 9, 10 and 18

Tool Required:
J 9886-01 Door Handle Clip Remover

↔ Remove or Disconnect

1. Front seat and place on clean, protected surface. Refer to "Front Seat" under "On-Vehicle Service" in this section.
2. Recliner handle (18), using J 9886-01.
 - A. Use a screwdriver to unsnap back plate from recliner handle (18).
 - B. Release spring clip by pushing J 9886-01 between the recliner handle (18) and seat cushion (78).
3. Disengage J-retainers from side of seat cushion (78).
4. Push the seat cushion cover (23) and pad enough to gain access to the front and rear pins (16 and 20) and retainers (15 and 19).
5. Front and rear retainers (15 and 19).
6. Front and rear pins (16 and 20).
7. Recliner support (35) from seat cushion frame (36).

→→ Install or Connect

1. Recliner support (35) to seat cushion frame (36).
2. Front and rear pins (16 and 20).
 - Push the seat cushion cover (23) and foam pad enough to gain access to front and rear holes for pins (16 and 20).
3. Front and rear retainers (15 and 19) to front and rear pins (16 and 20).
4. Engage J-retainers to side of seat cushion (78).
5. Recliner handle (18).
 - Push recliner handle (18) with spring clip and back plate onto spindle to secure.
6. Front seat. Refer to "Front Seat" under "On-Vehicle Service and Unit Repair" in this section.

Power Reclining Seatback

Buick

Some front seats may be equipped with a power reclining seatback feature. The controls are located on the side of both seat cushions.

Figure 18 - Removing Manual Recliner Support

Seatback Frame Removal

Figure 19

↔ Remove or Disconnect

1. Seatback cover and pads from seatback frame. Refer to "Power Recline Seat Cushion and Seatback Cover and Pads" under "Cover and Pads" in this section.
2. Seatback lumbar. Refer to "Seatback Lumbar" in this section.
3. Bolts/screws (159).
4. Bolt/screw (160).
5. Seatback frame (74).

→→ Install or Connect

NOTICE: Refer to "Notice" on page 10-10-1 of this section.

1. Seatback frame (74).
2. Bolt/screw (160).

Figure 19 - Power Reclining Seatback - (Buick)

3. Bolts/screws (159).

Tighten

- Bolt/screw (160) to 29 N.m (21 lb. ft.).
- Bolts/screws (159) to 32 N.m (24 lb. ft.).

4. Seatback Lumbar support. Refer to "Seatback Lumbar Support" in this section.

5. Seatback pad and covers to seatback frame. Refer to "Power Recline Seat Cushion and Seatback Cover Pads" under "Cover and Pads" in this section.

Power Recliner

Figure 20

Remove or Disconnect

Important

- To remove recliner motor or cable housings only, it is not necessary to remove entire recliner. Skip steps 3 through 5.

1. Operate seat to full-up position.
2. Seat. Refer to "Front Seat" under "On-Vehicle Service" in this section.
3. Electrical connector.
4. Seatback cover and pads. Refer to "Power Recline Seat Cushion and Seatback Cover and Pads" under "Cover and Pads" in this section.

Figure 20 - Power Recliner - (Buick)

5. Bolts/screws (183).
6. Bolts/screws (159).
7. Power recliner (170).
8. Bolts/screws (164) attaching bracket (165) to gearbox (166), note bracket (165) attachment to gearbox (166).
9. Cable housing (167) from gearbox (166), being careful not to crimp cable housing (167).
10. Bolts/screws (169), if replacing motor (168).
11. Motor (168) from bracket (165), if replacing motor (168).

Install or Connect

NOTICE: Refer to "Notice" on page 10-10-1 of this section.

1. Motor (168) to bracket (165), if removed.
2. Bolts/screws (169), if removed.
 - Tighten securely.
3. Cable housing (167) to gearbox (166), being careful that cable housing (167) fits correctly and does not crimp.
4. Bracket (165) to gearbox (166), being careful to attach bracket (165) properly.
5. Bolts/screws (164).
 - Tighten securely.
6. Recliner (170).
7. Bolts/screws (183).
8. Bolts/screws (159).

Tighten

- Bolts/screws (183 and 159) to 32 N.m (24 lb. ft.).
9. Seatback cover and pads. Refer to "Power Recline Seat Cushion and Seatback Cover and Pads" under "Cover and Pads" in this section.
 10. Electrical connector.
 11. Front seat. Refer to "Front Seat" under "On-Vehicle Service and Unit Repair" in this section.

MANUAL FRONT SEAT ADJUSTER

Front seats may have manual seat adjuster attached to the seat cushion. An adjuster actuator lever is located at the lower front edge of the seat cushion. When the lever is moved to the left, the seat adjusters unlock. The seat can then be moved forward and backward. The seat locks in place when the lever is released.

The seat adjusters are held onto the seat cushion frame with bolts/screws and to the floor pan with nuts and washers installed over studs.

Floor Pan Attachment Adjustment

Figures 6 and 21

A small amount of forward and rearward or side adjustment is possible at the seat adjuster floor pan attaching points. The adjustment can be used to align the seat adjusters with each other.

Figure 21 - Removing Manual Adjuster

10-10-20 SEATS AND CARPET

↔ Remove or Disconnect

NOTICE: Refer to "Notice" on page 10-10-1 of this section.

1. Bolts/screws (3, 5, 6 or 8) from adjuster rear or front trim covers (1, 4, 7 or 9).
2. Adjuster rear or front trim covers (1, 4, 7 or 9).

🔑 Adjust

1. Loosen adjuster nuts (2).
2. Align seat adjusters (10).
 - A. Make sure seat adjusters (10) are lined up front to rear.
 - B. Make sure seat adjusters (10) are parallel to each other.

🔩 Tighten

- Adjuster nuts (2) to 25 N.m (18 lb. ft.).

↔ Install or Connect

1. Adjuster rear or front trim covers (1, 4, 7 or 9).
2. Bolts/screws (3, 5, 6 or 8) to adjuster rear or front trim covers (1, 4, 7 or 9).

🔍 Inspect

- Floor pan attachment by moving seat all the way forward and rearward, locking it in several positions.
 - A. Both seat adjusters (10) should lock at each position.
 - B. Seat should move easily forward and rearward.

Adjuster Replacement

Figure 21

↔ Remove or Disconnect

1. Front seat. Refer to "Front Seat" under "On-Vehicle Service" in this section.
2. Return spring (40) from the seat adjuster (10) being removed.
3. Linking wire (39).

- Slide retainer spring back to reveal end of linking wire (39).

4. Bolts/screws (37).
5. Seat adjuster (10) from seat.
6. Spacers (38), if necessary.

- If spacers (38) are installed between the adjuster (10) and the seat frame, note the location of the spacers (38).

↔ Install or Connect

NOTICE: Refer to "Notice" on page 10-10-1 of this section.

1. Spacers (38), if necessary.
2. Seat adjuster (10) to seat.
3. Bolts/screws (37).

🔩 Tighten

- Bolts/screws (37) to 24 N.m (18 lb. ft.).
4. Linking wire (39).
 - A. Hook ends of linking wire (39) through hole in lock bar and adjuster actuator lever.
 - B. Slide retainer spring over end of linking wire (39).
 5. Return spring (40) to the seat adjuster (10).
 6. Front seat. Refer to "Front Seat" under "On-Vehicle Service" in this section.

Adjuster Actuator Lever Knob Replacement

Figure 22

Adjuster actuator lever knob fits over the end of the adjuster actuator lever that comes out from under the seat cushion. The knob can generally be removed and reinstalled several times without becoming too loose.

↔ Remove or Disconnect

- Knob (41) from adjuster actuator lever.
 - A. Place a protective covering over the nearby trim.

Figure 22 - Adjuster Actuator Lever Knob

- B. Draw a pencil line on the adjuster actuator lever 25 mm (1 inch) from the end as a guide for full-depth fit of the knob (41).
- C. Clamp locking pliers on to adjuster actuator lever below the pencil line.
- D. Using a body spoon, pry downward to remove the knob (41).

Install or Connect

- Knob (41) onto the adjuster actuator lever. Gate marks on the knob (41) must face to the rear. Press the knob (41) firmly onto the adjuster actuator lever. Use a rubber mallet, if necessary.

Important

- While installing the knob, take care not to bend the adjuster actuator lever.

POWER FRONT SEAT ADJUSTER

Six-way power seat adjusters are available on front seats. The adjusters use three 12-volt, reversible, permanent-magnet motors controlled by a switch on the door trim. The motors are held on to the adjusters with a support. Drive cables connect the motors to the vertical and horizontal actuators. The seats can be moved forward and backward by one motor, up and down in the front with the second, and up and down in the rear with the third.

Adjuster Horizontal Actuator Adjustment

Figure 23

With seat adjuster installed, chucking or jerking can be corrected by tightening or loosening the adjuster horizontal actuator and pinion gear to the adjuster lower track rack gear.

Figure 23 - Adjuster Horizontal Actuator

Adjust

- Adjuster horizontal actuator (44).
 - A. Operate seat to full-up position and about 3/4-forward position.
 - B. Loosen bolts/screws (43).
 - C. Using a large screwdriver, apply 67 to 111 N (15 to 25 pounds) of outward pressure on adjuster horizontal actuator (44). At the same time, use the horizontal switch to move seat slightly forward and backward, helping to tightly fit the adjuster horizontal actuator pinion gear teeth to the lower track rack gear teeth to eliminate any free play between gear teeth.
 - D. While maintaining pressure against adjuster horizontal actuator (44), tighten bolts/screws (43).

Adjuster Phase Adjustment

When one adjuster reaches either maximum horizontal or maximum vertical travel before the other, the adjusters are out of phase. Out-of-phase adjusters can occur over time or when the seats are serviced.

Adjust

1. Horizontal phase.
 - A. Operate horizontal switch until one adjuster reaches full-forward position.
 - B. Detach horizontal drive cable from the full-forward adjuster.
 - C. Operate horizontal switch until the other adjuster reaches full-forward position.
 - D. Connect horizontal drive cable.

Inspect

- Horizontal travel.
2. Vertical phase.
 - A. Operate vertical switch until one adjuster has reached fully raised position at both the front and rear.
 - B. Disconnect both front and rear vertical drive cables from the fully raised adjuster.
 - C. Operate vertical switch until the other adjuster reaches fully raised position at both front and rear.
 - D. Connect vertical drive cables.

Inspect

- Vertical travel.

Adjuster Replacement

Figures 1, 2, 24 and 25

Remove or Disconnect

1. Front seat. Refer to "Front Seat" under "On-Vehicle Service" in this section.
2. Drive cables (49).

Figure 24 - Power Adjuster Components

Figure 25 - Adjuster Horizontal and Vertical Actuator

3. Nut (46) securing motor support (47) with motors (48) attached.
4. Motor support (47) with motors (48) attached.
5. Bolts/screws (37).
6. Adjuster (45).
7. Upper and lower adjuster cover bolts/screws, if necessary.
8. Upper and lower adjuster covers (79 and 80), if necessary.

Disassemble

CAUTION: Failure to place the power adjuster in a bench vise before removing the rear vertical actuator will cause ejection of the compressed assist spring and possible personal injury.

1. Rear adjuster nut (55).
 - A. Place adjuster (45) in a bench vise and remove the rear adjuster nut (55).
 - B. Open the vise slowly to relieve assist spring compression and remove the adjuster (45) from the vise.
2. Vertical assist spring (51).
3. Front adjuster nut (54).
4. Bolts/screws (43) from adjuster horizontal actuator (44).
5. Adjuster horizontal actuator (44).
6. Adjuster bolts/screws (56).

7. Rear vertical actuator (52).
8. Front vertical actuator (50).

Assemble

1. Front vertical actuator (50).
2. Rear vertical actuator (52).
3. Adjuster bolts/screws (56).
4. Adjuster horizontal actuator (44).
5. Bolts/screws (43) to adjuster horizontal actuator (44).
6. Front adjuster nut (54).
7. Vertical assist spring (51).
8. Rear adjuster nut (55).
 - A. Place adjuster (45) into a bench vise.
 - B. Carefully compress the vertical assist spring (51) and install the rear adjuster nut (55).
 - C. Remove power adjuster (45) from the bench vise.

Install or Connect

NOTICE: Refer to "Notice" on page 10-10-1 of this section.

1. Upper and lower adjuster covers (79 and 80), if removed.
2. Upper and lower adjuster cover bolts/screws, if removed.

Tighten

- Upper and lower adjuster cover bolts/screws to 1.5 N.m (13 lb. in.).
3. Adjuster (45).
 4. Bolts/screws (37).

Tighten

- Bolts/screws (37) to 24 N.m (18 lb. ft.).
5. Motor support (47) with motors (48) attached.
 6. Nut (46) securing motor support (47).
 7. Drive cables (49).
 8. Front seat. Refer to "Front Seat" under "On-Vehicle Service" in this section.

Motor Replacement

Figure 24

Remove or Disconnect

1. Front seat. Refer to "Front Seat" under "On-Vehicle Service" in this section.
2. Drive cables (49).
3. Nut (46).
4. Motor support (47) with motors (48) attached.
5. Electrical connectors from motors (48).
6. Motors (48) from motor support (47).
 - Grind off ends of grommet to separate the motors (48) from the motor support (47).

Install or Connect

1. Motors (48) to the motor support (47).
 - A. Drill out top end of grommet, using a 3/16-inch drill bit.
 - B. Secure motors (48) to motor support (47) with 3/16-inch rivets.
2. Electrical connectors to motors (48).
3. Motor support (47) with motors (48) attached.
4. Nut (46).
5. Drive cables (49).
6. Front seat. Refer to "Front Seat" under "On-Vehicle Service" in this section.

Seat Track and Seat Track Motors

Figures 11, 19, 20 and 26 through 28

Remove or Disconnect

Important

- If only the motor (172) is being removed, skip steps 3 through 10.

1. Operate seat to full-up position.
2. Front seat. Refer to "Front Seat" under "On-Vehicle Service" in this section.
3. Bolts/screws (194).
4. Panel (156).
5. Electrical connectors from motor (172).
6. Bolts/screws (160).
7. Bolts/screws (159).
8. Hitch pins from pivot pins (184).
9. Pivot pins (184).
10. Seat track (185).
11. Place seat track (185) facing up (as installed in vehicle).
12. Motor (172) and bracket (178).
 - A. Remove bolts/screws (173 and 186).
 - B. Remove motor (172) by carefully pulling up. Be careful not to crimp flex shafts and cable housings as motor (172) is pulled away from them.

Install or Connect

NOTICE: Refer to "Notice" on page 10-10-1 of this section.

1. Motor (172) and bracket (178).
 - A. Lower motor (172) into seat track (185), being careful to properly insert cable housings and flex shafts into motor (172).
 - B. Install bolts/screws (173 and 186).
 - Tighten securely.
2. Frame (77) to seat track (185).
3. Pivot pins (184).
4. Hitch pins to pivot pins (184).
5. Seatback (73) to seat cushion (197).

Figure 26 - Power Reclining Seat Track and Seat Track Motor

6. Bolts/screws (159).

7. Bolts/screws (160).

Tighten

• Bolts/screws (159) to 32 N.m (24 lb. ft.).

• Bolts/screws (160) to 29 N.m (21 lb. ft.).

8. Recliner motor electrical connectors to motor (172).

9. Panel (156).

10. Bolts/screws (194).

Tighten

• Bolts/screws (194) to 11 N.m (97 lb. in.).

11. Front seat. Refer to "Front Seat" under "On-Vehicle Service" in this section.

POWER LUMBAR COMPONENTS

The power lumbar unit consists of a motor, cable assembly and a strap. The power lumbar unit can only be serviced as a complete assembly.

Seatback Lumbar

Figure 28

Remove or Disconnect

1. Make seatback lumbar support is in full back (relaxed) position before removal.
2. Head restraint. Refer to "Headrest Restraint" under "Front Seat" in this section.
3. Seatback. Refer to "Power Reclining Seatback" under "Front Seat" in this section.
4. Seatback cover and pad. Refer to "Power Recline Seat Cushion and Seatback Cover and Pad" under "Cover and Pad" in this section.
5. Disconnect lumbar strap (179) from seatback frame (74).
 - A. Pull center of strap forward until the end is oriented 90° from frame bracket.
 - B. Slide strap ends from frame bracket, one at a time.
6. Electrical connector.
 - Cut straps from frame to release.

Figure 27 - Seat Track Motor Mounting

7. Bolts/screws and washers from motor and gear (180).
8. Seatback lumbar.

Install or Connect

NOTICE: Refer to "Notice" on page 10-10-1 of this section.

1. Seatback lumbar.
2. Bolts/screws and washers from motor and gear (180).
3. Electrical connector.
4. Lumbar strap (179) to seatback frame (74).
 - A. Orient end of strap so that it is 90° from seatback bracket.
 - B. Slide end of strap into bracket.
 - C. Repeat for opposite side.
5. Seatback cover and pad. Refer to "Power Recline Seatback Cushion and Seatback Cover and Pad" under "Cover and Pad" in this section.
6. Seatback. Refer to "Power Reclining Seatback" under "Front Seat" in this section.
7. Head restraint. Refer to "Headrest Restraint" under "Front Seat" in this section.

MEMORY SEAT COMPONENTS

Memory Module

Figure 29

Remove or Disconnect

1. Operate seat to full-up position.
2. Driver seat. Refer to "Front Seat" under "On-Vehicle Service" in this section.
3. Electrical connector from memory module (60).
4. Retaining bolt from memory module (60).
5. Memory module (60).

Install or Connect

1. Memory module (60).
2. Retaining bolt to memory module (60).
 - Tighten securely.
3. Electrical connector to memory module (60).
4. Driver seat. Refer to "Front Seat" in this section.

HEATED SEAT COMPONENTS

Heating Element

Figures 2 and 30

Important

- When replacing heating elements, the attached pads must also be replaced.

Remove or Disconnect

1. Front seat. Refer to "Front Seat" under "On-Vehicle Service" in this section.
2. Seat cushion cover (23 or 75). Refer to "Power Recline Seat Cushion and Seatback Cover and Pads" under "Cover and Pads" in this section.
3. Electrical connectors from heating element (8 or 13).
4. Heating element (8 or 13) with attached pad (9 or 14) from seat cushion frame (36 or 77).

Install or Connect

1. Heating element (8 or 13).
 - A. Peel backing paper from new heating element (8 or 13) and attach to new pad (9 or 14).
 - B. Align cutout in heating element (8 or 13) to hook and loop strip on new pad (9 or 14).
2. Heating element (8 or 13) with attached pad (9 or 14) to seat cushion frame (36 or 77).
3. Electrical connectors to heating element (8 or 13).
4. Seat cushion cover (23 or 75). Refer to "Power Recline Seat Cushion and Seatback Cover and Pads" under "Cover and Pads" in this section.
5. Front seat. Refer to "Front Seat" under "On-Vehicle Service" in this section.

Figure 28 - Power Lumbar Components

Heater Module**Figures 11 and 29 and 30****↔ Remove or Disconnect**

1. Operate seat to full-up position.
2. Front seat. Refer to "Front Seat" under "On-Vehicle Service" in this section.
3. Switch bolts/screws (68).
 - Pull switch (68) outward to access electrical connectors.
4. Electrical connector from heater switch.
5. Electrical connectors from heating elements (8 or 13).
6. Retainers.
7. Module (61).

→ Install or Connect

1. Module (61).
2. Retainers.

Figure 29 - Seat Track and Seat Track Motors

3. Electrical connectors to heating elements (8 or 13).
4. Electrical connector to heater switch.
 - Position switch (68) against seat.
5. Switch bolts/screws (68).

⌚ Tighten

- Bolts/screws (68) to 10.5 N·m (93 lb. in.).
6. Front seat. Refer to "Front Seat" under "On-Vehicle Service" in this section.

REAR SEAT**Figures 31 and 32**

The middle or second seat on the wagon is known as the "Rear Seat". The last or third seat on the wagon is known as the "Rear Seat #2". For service procedure on the third seat, refer to "Rear Seat #2" under "On-Vehicle Service" in this section.

The sedan and wagon rear seat cushions are held in place by dome stops on the floor pan. The dome stops hook over frame wires on the seat cushion.

Figure 30 - Heating Element

5-20-94
 BS0311010

Figure 31 - Removing Rear Seat (Typical)

Figure 32 - Second Seatback

The sedan rear seatback is held by hooks on the seatback panel. Frame wires in the seatback cushion hang over the hooks. The bottom of the seatback cushion is held by the rear seat retractor-side belt bolts/screws.

The wagon rear seat #2 seatback is held by a link at the back and at the floor pan by seatback supports on the seatback panel. The seatback panel is attached to the seatback with hooks at the upper edge and bolts/screws at the lower edge.

Remove or Disconnect

1. Push lower front edge of seat cushion (58) rearward.
2. Frame wire from the dome stops by lifting upward and pulling forward on frame.
3. Seat cushion (58).

4. Rear seatback cushion (57 or 122).

- Sedan rear seatback cushion (57).
 - A. Remove bolts/screws (59).
 - B. Lift rear seatback cushion (57) off the hooks on seatback panel.
- Wagon rear seatback cushion (122).
 - A. Lower rear seatback cushion (122).
 - B. Remove bolts/screws (123) from each side of rear seatback cushion (122).
 - C. Remove bolts/screws (124) from bottom edge of rear seatback cushion (122).
 - D. Raise rear seatback cushion (122) enough to pull lower edge forward.
 - E. Lift upward to release upper edge of rear seatback cushion (122) from the hooks on seatback cushion panel (121) and remove rear seatback cushion (122).

 Install or Connect

CAUTION: Replace belts, retractors, and hardware in use during all but a minor collision. Also, restraint systems should be replaced and anchorages properly repaired if they were in areas damaged by a collision, whether the belt was in use or not. If there is any question, replace the belt system. Damage, whether visible or not, could result in serious personal injury in the event of an accident.

NOTICE: Refer to “Notice” on page 10-10-1 of this section.

1. Rear seatback cushion (57 or 122).
 - Sedan rear seatback cushion (57).
 - A. Hang seatback cushion (57) over the hooks on the seatback panel.
 - B. Install bolts/screws (59) through seat belt anchor plate and wire loop in bottom of seat frame.

 Tighten

- Bolts/screws (59) to 48 N.m (35 lb. ft.).
- Wagon rear seatback cushion (122).
- A. Hang rear seatback cushion (122) over the hooks on the seatback cushion panel (121).
- B. Install bolts/screws (123 and 124).

 Tighten

- Bolts/screws (123) to 29 N.m (21 lb. ft.).
 - C. Raise rear seatback cushion (122).
2. Seat cushion (58) by sliding it rearward, pressing down.
 - The frame wire in the seat cushion (58) should slide into the dome stops.

TRIM AND COVERS

Rear Seatback Panel (Wagon)

Figure 32

 Remove or Disconnect

1. Rear seatback cushion. Refer to “Rear Seats” under “On-Vehicle Service” in this section.
2. Bolts/screws (123).
3. Nuts (125) from studs.
4. Seatback cushion panel (121).

 Disassemble

- Support bolt/screw (127) and support (128) from seatback cushion panel (121).

 Install or Connect

NOTICE: Refer to “Notice” on page 10-10-1 of this section.

- Support (128) and support bolt/screw (127) to seatback cushion panel (121).

 Tighten

- Support bolt/screw (127) to 29 N.m (21 lb. ft.).

 Install or Connect

NOTICE: Refer to “Notice” on page 10-10-1 of this section.

1. Seatback cushion panel (121).
2. Nuts (125) to studs.

 Tighten

- Nuts (125) to 34 N.m (25 lb. ft.).
3. Bolts/screws (123).

 Tighten

- Bolts/screws (123) to 29 N.m (21 lb. ft.).
4. Rear seatback cushion. Refer to “Rear Seats” under “On-Vehicle Service” in this section.

Rear Seat Covers

Figures 33 and 34

Rear seat and seatback cushions have formed foam pads that fit the contour of the seat frames. The covers are either vinyl, cloth or leather and are held by trim retainer rings.

 Remove or Disconnect

1. Rear Seats. Refer to “Rear Seats” under “On-Vehicle Service” in this section.
2. Rear seatback panel, if necessary. Refer to “Rear Seatback Panel (Wagon)” in preceding procedure.
3. Armrest and support, if equipped. Refer to “Rear Seat Armrest” in this section.
4. Trim retainer rings.
 - Note position of trim retainer rings.
5. Rear seatback cover (61) and rear seat cushion cover (62) for sedan, or rear seatback cover (87) and rear seat cushion cover (88) for wagon.
 - Pull to disengage hook and loop fastener on front face, if sedan.

 Install or Connect

1. Rear seatback cover (61) and rear seat cushion cover (62) for sedan, or rear seatback cover (87) and rear seat cushion cover (88) for wagon.

Figure 33 - Installing Rear Seat Cushion and Seatback Covers (Sedan)

Figure 34 - Rear Seat and Seatback Covers (Wagon)

- Press to engage hook and loop fastener on front face, if sedan.

- Trim retainer rings.
- Armrest and support, if equipped. Refer to "Rear Seat Armrest" in this section.
- Rear seatback panel. Refer to "Rear Seatback Panel (Wagon)" in preceding procedure.
- Rear Seats. Refer to "Rear Seats" under "On-Vehicle Service" in this section.

Rear Seat Armrest Cover

Figure 35

↔ Remove or Disconnect

- Armrest and support. Refer to "Rear Seat Armrest" in this section.
- Bolts/screws (65).
- Supports (64 and 67).
- Washers (66).
- Trim retainer ring connecting rear side flaps.
- Trim retainer rings connecting rear forward and rear flaps.
- Rear seat armrest cover (63).

→→ Install or Connect

- Rear seat armrest cover (63) over foam pad.
- Trim retainer rings joining rear forward and rear flaps.

Figure 35 - Removing Rear Seat Armrest Cover

3. Trim retainer ring joining rear side flaps.
4. Washers (66).
5. Supports (64 and 67).
6. Bolts/screws (65).
2. Bolts/screws (68) securing supports (64 and 67) to frame.

Tighten

- Bolts/screws (65) to 11 N.m (97 lb. in.).
7. Armrest and support. Refer to "Rear Seat Armrest" in this section.

Rear Seat Armrest

Figure 36

Remove or Disconnect

1. Rear seatback cushion. Refer to "Rear Seats" under "On-Vehicle Service" in this section.
2. Trim retainer rings.
3. Armrest curtain from upper wire.
4. Bolts/screws (68).
5. Rear seat armrest (69).

Install or Connect

NOTICE: Refer to "Notice" on page 10-10-1 of this section.

1. Rear seat armrest (69).

Tighten

- Bolts/screws (68) to 4 N.m (35 lb. in.).
3. Armrest curtain.
 - Install over front of middle wire and attach to upper wire.
 4. Trim retainer rings.
 5. Rear seatback cushion. Refer to "Rear Seats" under "On-Vehicle Service" in this section.

REAR SEAT LINKAGES AND LATCHES (WAGON)

Rear Seatback Filler Panel Link

Figure 32

Remove or Disconnect

1. Place rear seatback cushion (122) in an unlocked position.
2. Bolt/screw (123).
3. Lower rear seatback cushion (122).
4. Link rings (129).
5. Cable (130) from filler panel link (131).
6. Filler panel link (131).

Figure 36 - Removing Rear Seat Armrest

Install or Connect

NOTICE: Refer to "Notice" on page 10-10-1 of this section.

1. Filler panel link (131).
 - Be sure washer (126) is installed before filler panel link (131), if necessary.
2. Cable (130) to filler panel link (131).
3. Link rings (129).
4. Raise rear seatback cushion (122) part way.
5. Bolt/screw (123).

Tighten

- Bolt/screw (123) to 29 N.m (21 lb. ft.).
6. Lock rear seatback cushion (122) in position.

Rear Seatback Latch

Figure 37

The wagon rear seat has a seatback latch located on the upper right side of the wheelhouse. The rear seatback cushion can be folded down by pushing the lock button rearward and pulling the seatback cushion down.

Remove or Disconnect

1. Lower rear seatback cushion.
2. Unscrew button (89).
3. Body lock pillar trim finish panel. Refer to SECTION 10-7.
4. Mark position of the seatback latch (90).
5. Bolts/screws (91).
6. Seatback latch (90).

Install or Connect

NOTICE: Refer to "Notice" on page 10-10-1 of this section.

1. Seatback latch (90) to position marked during removal.

Figure 37 - Rear Seatback Latch (Wagon)

10-10-34 SEATS AND CARPET

2. Bolts/screws (91).

Tighten

- Bolts/screws (91) to 24 N.m (18 lb. ft.).
3. Body lock pillar trim finish panel. Refer to SECTION 10-7.
 4. Hand tighten button (89).

Rear Seatback Latch Striker

Figure 4

Remove or Disconnect

1. Unlatch rear seatback cushion.
2. Latch striker (135).

Install or Connect

NOTICE: Refer to "Notice" on page 10-10-1 of this section.

1. Latch striker (135).

Tighten

- Latch striker (135) to 60 N.m (44 lb. ft.).

Rear Seatback Cable

Figure 38

Remove or Disconnect

1. Unlock and lower rear seatback cushion.
2. Link ring (129).
3. Cable (130) from stud.
4. Cable (130) from cable pin (92) by unscrewing cable (130).

Install or Connect

1. Cable (130) to cable pin (92) by screwing cable (130) into cable pin (92).
 - If installing new cable (130), measure 167 mm (6 9/16 inches) from the end of the luggage compartment rail to the center of the cable loop.
2. Cable (130) to stud.
3. Link ring (129).

REAR SEAT #2

The rearward facing rear seat #2 has a remote seatback latch at the lower right side of the seatback. When the rear seat #2 seatback latch is released by lifting the seat latch release handle under the right side of the luggage compartment rear panel, the seatback cushion can be lowered.

The rear seat #2 seatback cushion is attached to a panel that becomes the load floor front panel when the seatback cushion is folded down or when the seat

06-01-95
BT0251010

Figure 38 - Rear Seatback Load Floor Cable (Wagon)

is absent. The seatback cushion is held onto the panel with wire loops on the lower seatback frame that hook through holes in the panel. The top of the seatback cushion is held onto the panel with bolts/screws.

The load floor front panel is attached to the load floor rear panel through a hinge. The hinge is covered with vinyl trim.

The rear seat #2 module, or load floor when the seat is absent, has side rails, a rear bar, and rubber bumper strips at the sides and rear. The rails are held with bolts/screws and rivets and the bumper strips have retainers that snap into holes in the rails.

Rear Seat #2 Module

Figures 32 and 39

Remove or Disconnect

1. Retract luggage shade, if necessary.
2. Unhook convenience net if necessary.
3. Filler panel link bolts/screws (123).
4. Body lock pillar trim finish panels. Refer to SECTION 10-7.
5. Stationary panel bolts/screws (97) along front flange of filler and stationary panels.
6. Load floor bumper strips and panels. Refer to "Strips, Rails, Bar and Panels" under "Trim and Covers" in this section.
7. Position seatback cushion in unlatched position by releasing the rear seat #2 seatback cushion latch.
8. Bolts/screws (96).
9. Release cable from handle. Refer to "Rear Seat #2 Seatback Cable" in this section.
10. Open end gate as a gate.
11. Bolts/screws (95) along side and rear rails.
12. Rear seat #2 module from vehicle.

Install or Connect

NOTICE: Refer to "Notice" on page 10-10-1 of this section.

1. Rear seat #2 module into vehicle.
2. Bolts/screws (95) along side and rear rails.

Tighten

- Bolts/screws (95) to 1.3 N.m (12 lb. in.).
3. Release cable to handle. Refer to "Rear Seat #2 Seatback Cable" in this section.
 4. Bolts/screws (96).

Tighten

- Bolts/screws (96) to 12 N.m (106 lb. in.).
5. Latch seatback cushion.
 6. Bumper strips and panels. Refer to "Strips, Rails, Bar and Panels" under "Trim and Covers" in this section.
 7. Stationary panel bolts/screws (97).

Tighten

- Stationary panel bolts/screws (97) to 1.3 N.m (12 lb. in.).
8. Body lock pillar trim finish panels. Refer to SECTION 10-7.
 9. Filler panel link bolts/screws (123).

Tighten

- Filler panel link bolts/screws (123) to 29 N.m (21 lb. ft.).
10. Convenience net, if removed.

Rear Seat #2 Seatback Cushion

Figure 40

Remove or Disconnect

1. Curtain retainers (99).
2. Bolts/screws (100).
3. Lift and pull on seatback cushion (98) to release the wire loops from the holes in the seatback panel.

Install or Connect

1. Hang seatback cushion (98) by inserting the wire loops into the holes in the seatback panel.
2. Bolts/screws (100).

Tighten

- Bolts/screws (100) to 3 N.m (27 lb. in.).
- 3. Curtain retainers (99).

Rear Seat #2 Seat Cushion

The seat cushion is held in place and removed the same way as other rear seat cushions. Refer to "Rear Seats" under "On-Vehicle Service" in this section.

Trim and Covers

Rear seat #2 seat covers are serviced the same way as rear seat covers. Refer to "Rear Seat #2 Seatback" and "Rear Seat #2 Seat Cushion" for seat removal, and "Trim and Covers" under "Rear Seats" for seat cover replacement.

Strips, Rails, Bar and Panels

Figures 5 and 41

Remove or Disconnect

Tool Required:

J 24595-C Door Trim Pad and Garnish Clip Remover

1. Bumper strip (101, 138 or 139) using J 24595-C.
2. Rear Seat #2 module. Refer to "Rear Seat #2 Module" in this section.
 - To remove only the rear bar (140), do not remove module.
3. Drill out rivets (102) using 1/4-inch drill bit.
4. Rail (93 or 141) or bar (140) and reinforcement (104 or 142).
5. Panel (103, 143 or 144) using J 24595-C.

Install or Connect

1. Panel (103, 143 or 144).
2. Reinforcement (104 or 142) and rail (93 or 141) or bar (140).
3. Rivets (102).

4. Rear Seat #2 module. Refer to "Rear Seat #2 Module" in this section.

5. Bumper strip (101, 138 or 139).

Torque Rod

Figure 42

Remove or Disconnect

1. Rear seat #2 seatback panel. Refer to "Load Floor Panels" in this section.
2. Drill out rivets (72) from torque rod retainers (109) using 1/4-inch drill bit.
3. Torque rod retainers (109).
4. Pivot support anchor plate (132) from torque rod (111).
5. Torque rod (111) by sliding it from front panel pivot support (110).

Install or Connect

1. Torque rod (111) by sliding it into front panel pivot support (110).
2. Pivot support anchor plate (132) over torque rod (111) and position against front panel pivot support (110).
3. Torque rod retainers (109).
4. Rivets (72) to torque rod retainers (109).
5. Rear seat #2 seatback panel. Refer to "Load Floor Panels" in this section.

7. Rear panel handle (117).

Install or Connect

1. Rear panel handle (117).
2. Nuts (116) to rear panel handle (117).

Tighten

- Nuts (116) to 1.3 N·m (12 lb. in.).
3. Lock cylinder (118).
 4. Retainer (119).
 5. Lock cylinder arm.
 6. Lock cylinder arm retainer.

Figure 45 - Lock Cylinder

Load Floor Lock Striker

Figure 5

Remove or Disconnect

1. Open load floor rear panel.
2. Bolts/screws.
3. Load floor lock striker (151).

Install or Connect

1. Load floor lock striker (151).
2. Bolts/screws.

Adjust

- Load floor lock striker (151) to accept rear panel handle (117).

Tighten

- Bolts/screws to 6 N·m (53 lb. in.).

FLOOR PANEL INSULATORS

Floor panel insulators have been designed for the high floor panel temperatures caused by the catalytic converter in the exhaust system. When servicing a vehicle in the field, it is essential that any floor panel insulators that have been disturbed or removed be reinstalled in the original sequence and location. If replacement of a floor panel insulator is necessary, the material specified for that particular location on the floor panel must be used. The types of materials are listed below. Types 1 and 2 are rolled stock, and are ordered by linear foot and cut to fit. Type 3 is sheet stock and also cut to fit.

10-10-42 SEATS AND CARPET

CAUTION: All of the materials below must meet Motor Vehicle Safety Standard No. 302 for flammability or vehicle damage and personal injury could result.

- Floor panel insulator (cerma blanket thermal) - consists of 10 mm (3/8-inch) thick aluminum silica (type 1).
- Floor panel insulator (amberlite) - consists of 10 mm thick (3/8-inch) thick resinated fibers (type 2).
- Floor panel insulator sheet (phenolic bonded fiberglass) 305 mm x 457 mm (12 inches x 18 inches) cut to size (type 3).

CAUTION: Any insulator service repair or replacement should be the same thickness, size and location as the original installation in the vehicle or vehicle damage and personal injury could result.

When servicing or replacing interior insulators, the following instructions must be observed:

- Insulators must be installed in original position and sequence. Pieces should be butted together to avoid gapping or overlapping.
- If it is necessary to replace an insulator, specified material must be used.
- Use original part to determine the amount of replacement material and as a template for cutting and fitting new piece to floor panel.
- When installing an insulator, do not enlarge cutouts or holes used for attachment of interior components such as seats or seat belts.
- Crossbody harness for interior components such as power seats, seat belt warning lamp and alarm or rear speakers must be routed over floor panel insulators in the original location and clipped in place.
- Spray-on deadeners and trim adhesives should not be applied to the top of the floor panel at the area directly over the Three Way + Oxidation catalytic converters or mufflers.

Floor Carpet

All floor carpets consist of a molded one-piece carpet over both front and rear floor panel.

Remove or Disconnect

1. Front seat. Refer to "Front Seat" under "On-Vehicle Service" in this section.
2. Front seat belts. Refer to SECTION 10-11.
3. Center pillar upper trim finish panel. Refer to SECTION 10-6.
4. Rear seat cushion. Refer to "Rear Seats" under "On-Vehicle Service" in this section.
5. Body hinge pillar trim panels. Refer to SECTION 10-5.
6. Rear side door lock pillar garnish molding. Refer to SECTION 10-7.
7. Floor carpet retainers. Refer to SECTION 10-6.
8. Floor air outlet. Refer to SECTION 8C.
9. Floor carpet.

Install or Connect

1. Floor carpet.
2. Floor air outlet. Refer to SECTION 8C.
3. Floor carpet retainers. Refer to SECTION 10-6.
4. Rear side door lock pillar garnish molding. Refer to SECTION 10-7.
5. Body hinge pillar trim panels. Refer to SECTION 10-5.
6. Rear seat cushion. Refer to "Rear Seats" under "On-Vehicle Service" in this section.
7. Center pillar upper trim finish panel. Refer to SECTION 10-6.
8. Front seat belts. Refer to SECTION 10-11.
9. Front seat. Refer to "Front Seat" under "On-Vehicle Service" in this section.

SPECIAL TOOLS

SECTION 10-11

SEAT BELTS

CAUTION: Replace belts, retractors, and hardware in use in all but a minor collision. Also, restraint systems should be replaced and anchorages properly repaired if they were in areas damaged by a collision, whether the belt was in use or not. If there is any question, replace the belt system. Damage, whether visible or not, could result in serious personal injury in the event of an accident.

NOTICE: Always use the correct fastener in the proper location. When you replace a fastener, use **ONLY** the exact part number for that application. General Motors will call out those fasteners that require a replacement after removal. General Motors will also call out the fasteners that require thread lockers or thread sealant. **UNLESS OTHERWISE SPECIFIED**, do not use supplemental coatings (paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

GENERAL DESCRIPTION

RESTRAINT SYSTEM

Seat belts are the primary means of occupant restraint. Seat belts help keep the occupant inside the passenger compartment and ride down the crash forces more gradually during the following events:

- Frontal impact type crashes.
- Rear impact type crashes.
- Side impact type crashes.
- Roll-over type crashes.

All seat belts with retractors have emergency locks in the retractors. During normal operation, the retractors remain unlocked to allow free movement of the occupant's upper body under normal driving conditions. The seat belt webbing is locked into

position by pendulum that causes a locking bar to engage a cog on the spool of the retractor mechanism under the following conditions:

- The rapid extraction of the seat belt webbing from the retractor.
- The speed of the vehicle changes abruptly.
- The direction of the vehicle changes abruptly.
- The vehicle is on a steep upgrade or a downgrade.

The front and rear seat belts are also equipped with a dual-mode latchplate that has the ability to lock or cinch itself along the webbing. This feature eliminates the need for a locking clip when securing a child seat.

In conjunction with the seat belts, this vehicle is equipped with a Supplemental Inflatable Restraint (SIR) System. Refer to SECTION 9J for more information about the SIR (air bag) system.

10-11-2 SEAT BELT

Front Seat Belt System

SEDAN OR WAGON

The front seat belt system includes the following components.

- The driver and passenger seat retractor side belts are attached to center lock pillar.
- The driver and passenger seat buckle side belts are attached to floor panel at center of bench seat.
- The front seat center belts are attached to floor panel at center of bench seat.

The driver's seat belt system includes a seat belt switch in the driver seat buckle side belt which controls a reminder lamp and a tone alarm. When the driver seat belt is buckled, the driver's door is closed, and the ignition switch is turned "ON," the following events will occur:

- The tone alarm will not operate.
- The reminder lamp will not operate.

When the driver's seat belt is not buckled, the driver's door is closed, and the ignition switch is in "RUN," the following events will occur:

- The tone alarm will operate for 4 to 8 seconds and then go "OFF".
- The reminder lamp will operate until the driver seat belt is buckled.

To diagnose a failure of the reminder lamp or tone alarm, refer to SECTION 8A-76.

Rear Seat Belt System

SEDAN

The rear seat belt system includes the following components:

- The rear seat center and buckle side belts are attached to the floor panel inboard of the rear seat.
- The rear seat outer retractor side belts are attached to the rear window panel under a trim cover, which is also shared with rear speaker grille covers.

WAGON

The rear seat belt system includes the following components:

- The rear seat center and buckle side belts are attached to the floor panel inboard of the rear seat.
- The rear seat outer retractor side belts are attached to the quarter panel lock pillar which is under the rear the quarter inner finish trim.

Rear Seat #2 Belt System

WAGON

The rear seat #2 belt system includes the following components:

- The rear seat #2 buckle/latch belts are attached to the floor panel under seat.

Child Seat Restraint System Belt

CHILD SEAT

CAUTION: A child in a rear facing child restraint, can be seriously injured if the right front passenger's air bag inflates. This is because the back of a rear-facing child restraint would be very close to the inflating air bag. It is always better to secure a child restraint in the rear seat. If a forward facing child seat is suitable for your child, ALWAYS move front passenger seat as far back as it will go and then install the child restraint. Be sure the child restraint position does not conflict with any additional requirements provided by the manufacturer. For more information, refer to the vehicle owners manual and the instructions that came with the child restraint.

The child seat may only be used in a forward facing seating location. The child seat should be installed and secured according to the manufacturer's directions. If the child seat has a top strap it will need to be anchored, refer to "ON-VEHICLE SERVICE" in this section. Passenger should not be allowed to sit at locations where the seat belts are being used to secure the child seat.

ON-VEHICLE SERVICE

CAUTION: Replace belts, retractors, and hardware when used in all but a minor collision. Also, restraint systems should be replaced and anchorage's properly repaired if they were in area damaged by a collision, whether the belt was in use or not. If there is any question, replace the belt system. Damage, whether visible or not, could result in serious personal injury in the event of an accident.

GENERAL SERVICE INSTRUCTIONS

- Do not bleach or dye seat belts webbing. Clean only with a mild soap and water solution and a soft brush or cloth.
- Keep sharp edges and damaging objects away from seat belts. Avoid bending or damaging any part of the seat belt buckle or latch plate. Replace any seat belts which are cut or damaged in any way.
- Use only the correct seat belt anchor bolts/screws and tighten to the correct torque value, refer to "SPECIFICATIONS" in this section. When installing seat belt anchor bolts, start the bolt by hand to ensure that the bolt is threaded straight.
- Front Seat Center Belts, Rear Seat Center Belts, and Rear Seat #2 Belts are to be serviced as a set with service replacement parts only. Do not attempt to make repairs to the individual components which are only serviced as a set.

- Verify that the replacement part number is correct for the vehicle at that seating position. Do not substitute a seat belt from a different seating position.

OPERATIONAL AND FUNCTIONAL CHECKS

Seat Belt System

1. Begin in the driver seat. Turn the ignition switch to "RUN" and verify proper operation of the seat belt reminder lamp with the belt buckled and unbuckled, refer to "General Description" Front Seat Belt System.
2. Inspect the shoulder belt guide. Check that the guide swivels freely, the seat webbing is seated flat in the guide slot that the webbing doesn't bind.
3. Check that seat belt buckle faces inboard and is accessible.
4. Check that the seat belt retractor units are securely attached.
5. Check the seat belt anchor bolts to verify that they are secure.
6. Fully extend the seat belt webbing and check that there are no twists or tears in the webbing.
7. Allow the seat belt webbing to retract and check that the webbing returns freely and completely back in the retractor.
8. Snap seat belt latch plate into buckle.
9. Tug sharply on the seat belt latch plate and buckle, check that it remains locked.
10. Push the button on buckle. The seat belt latch plate must release from the buckle easily and the button must return to its original position.
11. Repeat steps 2 through 10 for the front passenger seat.
12. Check that center belts are accessible and that there are no twists or tears in the webbing.
13. Snap seat belt latch plate into buckle.
14. Tug sharply on the seat belt latch and buckle, check that it remains locked.
15. Push the button on buckle. The seat belt latch plate must release from buckle easily and the button must return to its original position.
16. Repeat steps 2 through 10 for the rear seats, for (Sedan and Wagon). To remove seats or seat cushions, refer to SECTION 10-10.
17. Repeat steps 12 through 15 for the rear seat center belts. To remove seats or seat cushions, refer to SECTION 10-10.
18. Repeat steps 12 through 15 for the rear seat #2 belts (Wagon). To remove seats or seat cushions, refer to SECTION 10-10.

Emergency Locking Retractors

Figure 1

CAUTION: Perform this test in an area clear of other vehicles or obstructions. Do not conduct this test on open road. A large, empty parking lot is suitable. Failure to observe this precaution may result in damage to the vehicle and possible personal injury.

1. Fasten the seat belts. An assistant is needed when the retractor under test is not part of the driver seat belt.
2. Accelerate the vehicle slowly to 16 km/h (10 mph) and apply the brakes firmly.
3. Verify that the seat belt webbing locks when braking firmly.
4. If the seat belt doesn't lock, proceed with steps 5 through 8.
5. Remove seat belt assembly from vehicle.
6. Tilt the seat belt retractor slowly.
7. Check that the seat belt webbing can be pulled from the retractor at an inclination of 15 degrees or less and cannot be pulled from retractor at an inclination of 45 degrees or more. Refer to Figure 1.
8. If the seat belt retractor doesn't operate as described, replace the seat belt.

FRONT SEAT BELTS

Driver and Passenger Seat Retractor Side Belts

Figure 2 and 3

↔ Remove or Disconnect

1. Bolt/screw (1) from center pillar (2).
2. Floor carpet retainer and center pillar upper trim finish panel. Refer to SECTION 10-6.

Figure 1-Seat Belt Retractor (Typical)

10-11-4 SEAT BELT

3. Driver and passenger seat retractor side belts.
 - Pull driver and passenger seat retractor side belts anti-rotation tab up and out from center pillar tee slot.
 - Retractor tab will indicate "RIGHT" for right-hand side and "LEFT" for left-hand side. Verify part replacement is correct.
4. Driver and passenger seat retractor side belt from vehicle.

Install or Connect

NOTICE: Refer to "Notice" on page 10-11-1 of this section.

1. Driver and passenger seat retractor side belt to vehicle (24).
2. Driver and passenger seat retractor side belt.
 - Ensure that retractor tab marked "RIGHT" is installed on right-hand side and retractor tab marked "LEFT" is installed on left-hand side.
 - Insert anti-rotation tab into center pillar tee slot and pull down on retractor.
3. Bolt/screw (1) tab and center pillar (2).

Tighten

- Bolt/screw (1 and 14) to 42 N.m (31 lb. ft.).
4. Floor carpet retainer and center pillar upper trim finish panel. Refer to SECTION 10-6.

Front Seat Center and Buckle Side Belts (SEDAN AND WAGON)

Figure 4

Remove or Disconnect

1. Move front seat full forward for access.
2. Sleeve plug (4).
 - Remove by twisting out.
3. Bolt/screw (3).
4. Electrical connector, when removing driver side front seat center belt (7) or driver's seat buckle side belt (5).
5. Front seat center belts (7 and 8) or buckle side belts (5 and 6).

Install or Connect

NOTICE: Refer to "Notice" on page 10-11-1 of this section.

1. Front seat center belts (7 and 8) or buckle side belts (5 and 6).
2. Electrical connector, when installing driver side front seat center belt (7) or driver's seat buckle side belt (5).
3. Bolt/screw (3).

Figure 2-Driver and Passenger Seat Retractor Side Belts (Sedan)

Tighten

- Bolt/screw (3) to 42 N.m (31 lb. ft.).
4. Sleeve plug (4).

REAR SEAT BELTS

Rear Seat Center and Buckle Side Belts (SEDAN AND WAGON)

Figure 5 and 8

Remove or Disconnect

1. Rear seat cushion. Refer to SECTION 10-10.
 - Rear seat center belts must be removed from slots in rear seat cushion.
2. Bolt/screw (15) from rear seat center belts. (Sedan.)
3. Bolt/screw (28) from rear seat center belts. (Wagon.)

Install or Connect

NOTICE: Refer to "Notice" on page 10-11-1 of this section.

1. Bolt/screw (28) to rear seat center belts. (Wagon)
2. Bolt/screw (15) to rear seat center belts. (Sedan)

Figure 3-Driver and Passenger Seat Retractor Side (Center Pillar Typical)

**Tighten**

- Bolt/screw (15 or 28) to 42 N·m (31 lb. ft.).
- 3. Rear seat cushion. Refer to SECTION 10-10.
- Rear seat center belts must be routed through slots in rear seat cushion.

Rear Seat Outer Retractor Side Belts

(SEDAN)

Figure 6**Remove or Disconnect**

1. Rear seat cushion. Refer to SECTION 10-10.
 - Rear seat center belts must be removed from slots in rear seat cushion.
2. Bolt/screw (15) from anchor plate end of belt and rear seatback lower attachment loop.
3. Rear speaker grille (18) (Chevrolet only).
 - Pull up on rear speaker grille (18) to disengage from rear window panel trim (19).
4. Quarter upper trim and rear window panel trim, if necessary. Refer to SECTION 10-8.
5. Bolt/screw (16) rear seat outer retractor.
6. Rear seat outer retractor side belt located at rear window panel (40). Refer to Figure 6.
7. Rear seat outer retractor side belt (17).

Figure 6-Rear Seat Outer Retractor Side Belts (Sedan)

Install or Connect

NOTICE: Refer to "Notice" on page 10-11-1 of this section.

1. Rear seat outer retractor side belt (17).
2. Rear seat outer retractor side belt to rear window panel (40).
 - Use locator pin on bottom of retractor as a guide.
3. Bolt/screw (16) to retractor and rear window panel (40).

Tighten

- Bolt/screw (16) to 42 N.m (31 lb. ft.).
4. Quarter upper trim and rear window panel trim, if removed. Refer to SECTION 10-8.
 5. Rear speaker grille (18).
 - Push down on rear speaker grille (18) to engage clips to rear window panel trim (19).
 6. Bolt/screw (15) to anchor plate end of belt and rear seatback lower attachment loop.

Tighten

- Bolt/screw (15) to 42 N.m (31 lb. ft.).
7. Rear seat cushion. Refer to SECTION 10-10.
 - Rear seat center and buckle side belts must be routed through slots in rear seat cushion.

Rear Seat Outer Retractor Side Belts (WAGON)

Figure 7

Remove or Disconnect

1. Folding rear seat-back cushion. Refer to SECTION 10-10.
2. Radio quarter speaker grille (wagon) and body lock pillar trim finish panel. Refer to SECTION 10-7.
3. Bolt/screw (33) connecting rear seat outer retractor side belt (34) to floor of vehicle.
4. Lift up guide loop cover to access bolt/screw (37).
5. Bolt/screw (37) and guide bracket trim cover (38) from rear seat belt bracket on body lock pillar.
6. Nuts (36) connecting rear seat outer retractor to studs.
7. Washers (41) from studs.
8. Rear seat outer retractor-side belt (34).

Install or Connect

NOTICE: Refer to "Notice" on page 10-11-1 of this section.

1. Rear seat outer retractor-side belt (34).
 - Position rear seat retractor belt on studs.

Figure 7-Rear Seat Outer Retractor Side Belts (Wagon)

10-11-8 SEAT BELT

2. Washers (41) on studs.
3. Nuts (36) connecting rear seat outer retractor belts to studs.

Tighten

- Nuts (36) to 25 N.m (18 lb. ft.).
4. Bolt/screw (37) and guide bracket trim cover (38) to seat belt bracket on body lock pillar.
 - Close guide bracket trim cover (38) over bolt/screw (37).

Tighten

- Bolt/screw (37) to 42 N.m (31 lb. ft.).
5. Bolt/screw (33) connecting rear seat outer retractor-side belt (34) to floor of vehicle.

Tighten

- Bolt/screw (33) to 42 N.m (31 lb. ft.).
6. Body lock pillar trim panel and radio quarter speaker grille. Refer to SECTION 10-7.
 7. Folding rear seatback cushion. Refer to SECTION 10-10.

Rear Seat #2 Belts

FOLDING THIRD SEAT-(WAGON)

Figure 8

Remove or Disconnect

1. Rear seat #2 cushion. Refer to SECTION 10-10.
2. Anchor plate bolts/screws (28) attaching rear seat #2 belts (27) and retainers (26) to load floor.
3. Rear seat #2 belts (27) and retainers (26).

Install or Connect

NOTICE: Refer to "Notice" on page 10-11-1 of this section.

1. Retainers (26) and rear seat #2 belts (27).
2. Anchor plate bolts/screws (28) attaching rear seat #2 belts (27) and retainers (26) to load floor.

Tighten

- Anchor plate bolts/screws (28) to 42 N.m (31 lb. ft.).
3. Rear seat #2 cushion. Refer to SECTION 10-10.

CHILD SEAT RESTRAINT SYSTEM BELT

CHILD SEAT (WAGON)

Figure 8

The child seat should be used only in a forward facing seating location. When the child seat is used in the front seat location, it is easily installed by connecting the child seat tether to the center seat belt. The child seat can use the latch of the rear seat center belts or the outboard belt latches if they are fully extended. Occupants should not be allowed to sit at locations where the seat belts are being used for the child seat.

CAUTION: The child seat tether anchor is intended for use only on the left or right outboard rear seat or rear seat #2 seat. Installation at any other seating position could result in system failure, leading to injury in the event of a collision.

Figure 8-Rear Seat #2 Belts (Folding Third Seat)

CHILD SEAT TETHER ANCHOR**(SEDAN)**

If a child seat that requires a top strap is to be used in the rear seat position on the sedan, a special dealer installed anchor must be used to anchor the child tether to the rear window panel. In order to assure the correct child seat tether angle, the child seat is only to be used at the seating position for which the anchor is installed.

If an anchor bracket is being installed for the first time, use the following procedure.

Child Seat Restraint System Belt Installation**TOP STRAP ANCHOR INITIAL INSTALLATION****Figure 9****Install or Connect**

1. From inside rear compartment, select desired rear seat installation position and locate appropriate existing 10 mm (13/32-inch) hole on underside of rear window panel (40).
2. From inside passenger compartment, locate existing 10 mm (13/32-inch) hole in rear window panel trim backing by running fingers across rear window panel trim (19).
3. Once the 10 mm (13/32-inch) hole is located, cut an "X" spanning a 20 mm (25/32-inch) circle in trim (19) at marked spot.
4. Insert child seat tether bolt/screw (20) through anchor bracket (21) and spacer (22). Push through "X" cut in trim (19) and hole in rear window panel (40) and thread into J-clip (23).

Figure 9-Child Seat Tether Anchorage Installation (Sedan)

Tighten

- Bolt/screw (20) to 42 N.m (31 lb. ft.).

CHILD SEAT TETHER ANCHOR REPLACEMENT

If the anchor bracket (21) becomes damaged, it must be replaced.

Remove or Disconnect

1. Bolt/screw (20), anchor bracket (21) and spacer (22).
2. J-clip (23) from inside rear compartment, if damaged or if permanently removing child seat top strap anchor bracket (21).

CAUTION: All bolt/screw holes to the exterior of the vehicle must be sealed completely to prevent carbon monoxide from entering the vehicle. Apply a sealant between the anchor bolt/screw washer and sheet metal to prevent carbon monoxide from entering the vehicle. In the event that the child seat anchorage assembly is removed, all bolt/screw holes penetrating to the exterior of the vehicle must be resealed. Breathing carbon monoxide can cause carbon monoxide poisoning and may be fatal.

3. Seal hole if permanently removing anchor bracket (21).

CHILD SEAT TETHER ANCHORAGE

(SEDAN)

Figure 9

Remove or Disconnect

1. Assembled bolt/screw (20), anchor bracket (21) and spacer (22).
2. J-clip (23) from inside rear compartment, if damaged or if permanently removing child seat top strap anchor bracket (21).
3. Seal hole if permanently removing anchor bracket (21).

Install or Connect

NOTICE: Refer to “Notice” on page 10-11-1 of this section.

1. J-clip (23) from inside rear compartment, if removed.
2. Bolt/screw (20), anchor bracket (21) and spacer (22).

Tighten

- Bolt/screw (20) to 42 N.m (31 lb. ft.).

CHILD SEAT BELT

(WAGON)

Figure 8

If a child seat with a tether is installed in the rear seat #2, child seat belts should be installed to the anchor plate bolts/screws, attached to the load floor.

CAUTION: When installing child seat belt in the rear seat #2 of a wagon do not use existing anchor plate bolts/screws. Installation anchor bolts/screws must be six millimeters longer than existing anchor bolts/screws to secure seat belts to vehicle load floor. Use of existing anchor bolts/screws may cause seat belts to work loose. This could result in personal injury.

Remove or Disconnect

1. Rear seat #2 cushion. Refer to SECTION 10-10.
2. Anchor plate bolts/screws (28).
3. Child seat belts (29) and rear seat #2 belts (27).
4. Retainers (26) in outside positions.

Install or Connect

NOTICE: Refer to “Notice” on page 10-11-1 of this section.

1. Retainers (26) in outside positions.
2. Rear Seat #2 belts (27) and child seat belts (29).
3. Anchor plate bolts/screws (28).

Tighten

- Anchor plate bolts/screws (28) to 42 N.m (31 lb. ft.).
4. Rear seat #2 cushion. Refer to SECTION 10-10.

1996 Chevrolet Caprice, Impala SS/Buick Roadmaster/ Chevrolet Wagon and Buick Wagon Service Manual

Book 2

Foreword

This manual provides information on the diagnosis, the service procedures, the adjustments, and the specifications for the 1996 Chevrolet Caprice, Impala SS/Buick Roadmaster/Chevrolet Wagon and Buick Wagon.

BOOK 1 contains all sections EXCEPT Engine Controls (Section 6E), Automatic Transaxle Diagnosis (Section 7A) and Electrical Diagnosis (Section 8A).

BOOK 2 contains Engine Controls (Section 6E), Automatic Transaxle Diagnosis (Section 7A) and Electrical Diagnosis (Section 8A).

This service manual replaces the 1996 Caprice, Impala SS/Buick Roadmaster Preliminary Service Manual (GMP/96-B-2P).

Information on unit repair (overhaul) can be found in the 1996 Transmission/Transaxle/Transfer Case Unit Repair Manual (TURM), GMPT/96-TURM, available separately. The TURM manual contains information on automatic and manual transmissions and transaxles, and transfer cases for all GM passenger cars and light duty trucks, including the fluid flow and circuit description information.

The technicians who understand the material in this manual and in the appropriate Dealer Service Bulletins better serve the vehicle owners.

When this manual refers to a brand name, a number, or a specific tool, you may use an equivalent product in place of the recommended item. All information, illustrations and specifications in this manual are based on the latest product information available at the time of publication approval. General Motors reserves the right to make changes at any time without notice.

GENERAL MOTORS SERVICE MANUAL COMMENTS

If you find an error, omission, or have a suggestion on any General Motors Service Manual, we want to hear from you.

United States and Canada - (General Motors Dealer Employees Only)

1-800-828-6860

(Monday - Thursday 8:00 AM to 8:00 PM EST)

(Friday 8:00 AM to 6:00 PM EST)

Fax #: 810-265-9327

Canada French Speaking - (General Motors Dealer Employees Only)

1-800-503-3222

(Monday - Friday 8:00 AM to 6:00 PM EST)

Fax #: 810-265-9327

International English Speaking - (General Motors Dealer Employees Only)

810-265-0840

(Monday - Friday 8:00 AM to 6:00 PM EST)

Fax #: 810-265-9327

These phone numbers can be called Monday through Friday. Be prepared to give the following information:

- Your name
- Your dealership's name

- Your phone number
- Model year and vehicle line
- Publication part number (if present)
- Vehicle Identification Number of vehicle being worked on.
- Section and page number(s)
- Description of problem

This phone number cannot provide technical assistance. Contact your regular technical assistance source.

The personnel answering this phone number will provide the author of the information with your comments and will follow-up until an answer is given.

If you wish to send examples or marked-up pages, the person who takes your call will tell you how to do that.

United States and Canadian Vehicle Owner/Operator

If you are the owner or operator of the vehicle, please give your comments to the applicable Customer Assistance Center. The phone number and address are in your Owner's Manual.

Warm Up cycle w/o Non-Emis. Faults	B,D,F,Y	Eng 2	Counts	0-40

Engine Scan Tool Data Definitions

The Engine Scan Tool Data Definitions contains a brief description of all engine related parameters that are available on the scan tool. The list is arranged in alphabetical order. A given parameter may appear in any one of the data lists, and in some cases may appear more than once, or in more than one data list in order to group certain related parameters together.

1-4 Shift Sol.: Scan Tool Displays Enabled or Disabled (Y Car Only). When the PCM enables the 1-4 shift solenoid, the scan tool will display Enabled.

A/C Clutch: Scan Tool Displays On or Off. Represents the commanded state of the A/C clutch control relay. The A/C clutch should be engaged when ON is indicated on the scan tool.

A/C Evap. Temp.: Scan Tool Range -18°C to 53°C (0°F to 128°F) (F Car Only). The scan tool will display the A/C evaporator temperature. This sensor is used by the PCM to cycle the A/C compressor clutch. This sensor is also used to prevent A/C evaporator freeze-up.

A/C High Side: Scan Tool Displays 15-452psi/0.00-5.00 Volts. Represents the A/C refrigerant pressure sensor signal. The amount of pressure indicates the amount of load that the A/C compressor is placing on the engine. The PCM uses this information to adjust idle and to control the cooling fans.

A/C Request: Scan Tool Displays Yes or No. Indicates the state of the A/C request input circuit from the HVAC controls. The PCM uses the A/C request signal to determine whether A/C compressor operation is being requested.

A/C Status: Scan Tool Displays On or Off. The scan tool will display ON when voltage is applied to the A/C compressor clutch.

A/T Perf. Mode: Scan Tool Displays Normal or Perf (F Car Only). This parameter is the actual state of the performance mode control program within the PCM. The scan tool will display Perf. when the performance mode is enabled (Performance Shift Calibration). The scan tool will display Normal when the performance mode is disabled (Normal Shift Calibration).

A/T Perf. Switch: Scan Tool Displays Inactive or Active (F Car Only). This parameter indicates the position of the performance mode switch. The scan tool will display Active when the switch is depressed and then Inactive when the switch is released.

AIR Pump: Scan Tool Displays Disabled or Enabled. When the PCM enables the Secondary Air Injection (AIR) pump the scan tool will indicate ENABLED. When the PCM turns the AIR pump off, the scan tool will indicate DISABLED.

ASR/TCS Spark Retard: Scan Tool Displays No or Yes (If so equipped). When the traction control system requires reduced engine torque, the PCM will retard the engines' timing. When this occurs, the scan tool will display Yes.

BARO: Scan Tool Range 10-105 kPa/0.00-5.00 Volts. The Barometric Pressure reading is determined from the MAP sensor signal monitored during key up and Wide-Open Throttle (WOT) conditions. The Barometric Pressure is used to compensate for altitude differences.

CKP Engine Speed: Scan Tool Range 0-9999 RPM. The crankshaft engine speed is computed by the PCM from the crankshaft position sensor signal. The CKP engine speed should remain close to actual engine speed.

CKP:Lo Res Angle: Scan Tool Range +60 to -30° Dev. This parameter is the actual timing relationship between the crankshaft and the camshaft in degrees. Ideally the value would be zero indicating that the cam is neither advanced or retarded relative to the crank. Under normal operation, this value can be expected to fluctuate slightly above or below zero. As timing chain wear increases, the deviation will increase.

Cold Start Up: Scan Tool Displays Yes or No. When the engine coolant temperature and intake air temperatures are less than 50°C (122°F) and are within 3°C (5°F) of each other at start-up, is consider a cold start-up. When these temperatures are in the range, the scan tool will indicate YES. When the scan tool displays YES, indicates a cold start-up was detected.

Current Gear: Scan Tool Displays 1, 2, 3, or 4. The PCM looks at Trans Range position and the gear commanded by the PCM. The actual forward gear that the transmission is in will be the lower of the two because the manual valve can override the PCM commanded gear.

Cycles of Misfire Data: Scan Tool Range 0-100. Counts the number of Misfire tests during 200 revolutions.

Cyl. Mode Misfire Index: Scan Tool Range 0-65535. This parameter displays the amount of crankshaft decelerations. When an engine is operating without a misfire, the scan tool will display less then 1000 counts. When an engine misfire occurs, the counter will be greater then 1000 counts.

Desired Idle: Scan Tool Range 0-3187 RPM. The idle speed that is commanded by the PCM. The PCM will compensate for various engine loads based on engine coolant temperature to keep the engine at the desired speed.

DTC: Scan Tool Range P0001-P1999. This parameter indicates what DTC is stored within freeze frame and/or Failure Records buffer.

DTC Set This Ign.: Scan Tool Displays Yes or No. This parameter indicates if a Diagnostic Trouble Code has set on the current ignition cycle.

ECT: Scan Tool Range -40°C to 151°C (-40°F to 304°F). The Engine Coolant Temperature (ECT) sensor is mounted in the coolant pump. The PCM applies 5 volts to the ECT sensor circuit. The sensor is a thermistor which changes internal resistance as temperature changes. When the sensor is cold (internal resistance high), the PCM monitors a high signal voltage and interprets it as a cold engine. As the sensor warms (internal resistance decreases), the voltage signal will decrease and the PCM will interpret the lower voltage as a warm engine.

EGR Duty Cycle: Scan Tool Range 0%–100% (L99 and LT1 Only). The PCM turns the EGR on and off. The ON time of the EGR solenoid valve is the duty cycle. This ON time is expressed as a percent. The amount of the percent is the amount of time the EGR valve is open.

Engine Load: Scan Tool Range 0%–100%. Engine load is calculated by the PCM from engine speed and MAF sensor readings. Engine Load should increase with an increase in RPM or airflow.

Engine Oil Temp.: Scan Tool Range -40°C to 164°C (-40°F to 327°F) (Y Car Only). The scan tool will display the Engine Oil Temperature. The engine oil temperature is used by the PCM to control the cooling fans.

Engine Run Time: Scan Tool Displays Seconds, Minutes, Hours. This indicates the amount of time the engine has been operating. When the ignition is cycled off the timer will be set to zero.

Engine Speed: Scan Tool Range 0–20000 RPM. Engine speed is computed by the PCM from the low resolution signal. It should remain close to desired idle under various engine loads with engine idling.

EVAP Purge: Scan Tool Range 0%–100%. Represents the PCM commanded PWM duty cycle of the EVAP Purge Solenoid valve. 0% displayed indicates no purge; 100% displayed indicates full purge.

EVAP Vacuum SW.: Scan Tool Displays Purge or No Purge. The EVAP purge vacuum switch is a normally closed switch positioned in the purge line between the canister and the EVAP purge solenoid. The EVAP purge vacuum switch will open when vacuum increases to greater than 5 inches of water in the purge line. The EVAP Purge Vacuum Switch is used by the PCM to monitor EVAP canister purge solenoid operation and purge system integrity. The EVAP Purge Vacuum Switch should be closed to ground with no vacuum present (0% EVAP Purge PWM). With EVAP Purge PWM at 25% or greater, the EVAP Purge Vacuum Switch should open and purge should be indicated.

Fail Counter: Scan Tool Range 0–255. When a MIL is requested or a history DTC is stored, the PCM will count and store the amount times a diagnostic test failed. This information will be stored in Freeze Frame or Failure records. Only one DTC can be stored in each Freeze Frame and/or Failure Records buffers.

FC Relay 1: Scan Tool Displays On or Off. When the PCM commands a coolant fan ON, the scan tool will indicate ON. Some vehicles are equipped with a three relay configuration. When the PCM commands the fan one relay control ON, both fans will be enabled on low speed.

FC Relay 2: Scan Tool Displays On or Off (B and D Car without Heavy Duty Cooling). When the PCM commands a coolant fan ON, the scan tool will indicate ON.

FC Relay 2 and 3: Scan Tool Displays On or Off (F and Y Car Only). When the PCM commands a coolant fan ON, the scan tool will indicate ON.

Fuel Trim Cell: Scan Tool Range 0–255. This parameter indicates what Fuel trim cell is currently active.

Fuel Trim Learn: Scan Tool Displays No or Yes. When conditions are appropriate for enabling long term fuel trim corrections, Fuel Trim Learn will display YES. This indicates that the long term fuel trim is responding to the short term fuel trim. If the Fuel Trim Learn displays NO, then long term fuel trim will not respond to changes in short term fuel trim.

High Res. Signal: Scan Tool Displays Inactive or Active. This signal is generated by the ignition control module. When the PCM detects a high resolution signal, the scan tool display will change from inactive to active.

HO2S Bn1 and Bn2 Sen. 1: Scan Tool Range 0–1107 mV. Represents the fuel control exhaust oxygen sensor output voltage. Should fluctuate constantly within a range between 10 mV (lean exhaust) and 1000 mV (rich exhaust) while operating in 'Closed Loop.'

HO2S Bn1 and Bn2 Sen. 2: Scan Tool Range 0–1107 mV. Represents the fuel control exhaust oxygen sensor output voltage. Should fluctuate constantly within a range between 10 mV (lean exhaust) and 1000 mV (rich exhaust) while operating in 'Closed Loop.'

IAC Learned: Scan Tool Range 0–255. IAC learned is an internal PCM parameter. Each time the vehicle is driven the IAC system learns how many counts is required to produce a given desired idle.

IAC Position: Scan Tool Range 0–255. Displays the commanded position of the idle air control pintle in counts. A larger number of counts means that more air is being commanded through the idle air passage. Idle air control should respond fairly quickly to changes in engine load to maintain desired idle RPM.

IAT: Scan Tool Range -40°C to 151°C (-40°F to 304°F). The PCM converts the resistance of the intake air temperature sensor to degrees. Intake Air Temperature (IAT) is used by the PCM to adjust fuel delivery and spark timing according to incoming air density.

Ignition Volts: Scan Tool Range 0.0–25.5 volts. This parameter is the battery ignition voltage input to the PCM.

Inj. Avg. PWM Bn1 and Bn2: Scan Tool Range 0–1000 m/sec. Indicates the amount of time the PCM is commanding each injector ON during each engine cycle. A longer injector pulse width will cause more fuel to be delivered. Injector Pulse Width should increase with increased engine load.

Knock Retard: Scan Tool Range 0.0°–16°. Indicates the amount of spark the PCM is removing from IC spark advance in response to the signal from the Knock sensors.

KS Activity: Scan Tool Displays Yes or No. Indicates whether or not a KS activity is being detected by the PCM. With the engine idling, the scan tool should indicate NO.

LT FT Avg. Bn1 and Bn2: Scan Tool Displays Counts/Percentage. This parameter indicates the average of all long term fuel trim cells. The short term fuel trim cells are rated (Weighted) for the amount of which they are used. For example, an idle cell will be rated higher than a wide open cell. If a fueling malfunction is occurring in the idle cell and the wide open cell, the average would be more affected by the idle cell than the wide open cell. A negative value significantly below 128/0% indicates that the fuel system is rich and fuel delivery is being reduced (decreased injector pulse width). A positive value significantly greater than 128/0% indicates that a lean condition exists and the PCM is compensating by adding fuel (increased injector pulse width). When the average of the cells reach a predetermined high or low, a fuel trim DTC will set.

Long Term FT Bn1 and Bn2: Scan Tool Displays Percentage/Counts. Long Term Fuel Trim is derived from the Short Term Fuel Trim value and represents a long-term correction of fuel delivery. A value of 0%/128 indicates that fuel delivery requires no compensation to maintain the PCM commanded air/fuel ratio. A negative value significantly below 0%/128 indicates that the fuel system is rich and fuel delivery is being reduced (decreased injector pulse width). A positive value significantly greater than 0%/128 indicates that a lean condition exists and the PCM is compensating by adding fuel (increased injector pulse width). Because Long Term Fuel Trim tends to follow Short Term Fuel Trim; a value in the negative range due to canister purge at idle should not be considered unusual. Fuel trim values at maximum authority may indicate an excessively rich or lean system.

Loop Status: Scan Tool Displays Open or Closed. Closed Loop indicates that the PCM is controlling fuel delivery according to oxygen sensor voltage. In Open Loop, the PCM ignores the oxygen sensor voltage and bases the amount of fuel to be delivered on TP sensor, engine coolant, and MAF sensor inputs only.

Low Res. Signal: Scan Tool Range 0.0–332.7 m/sec. This signal is generated by the ignition control module. This signal indicates the time between low resolution signal pulses. The PCM uses this signal to determine engine position and engine speed.

MAF: Scan Tool Range 0.0–655 gm/s. MAF (Mass Air Flow) is the MAF Input Frequency converted to grams of air per second. This indicates the amount of air entering the engine.

MAP: Scan Tool Range 10–105 kPa/0.00–5.0 Volts. The Manifold Absolute Pressure (MAP) sensor measures the change in the intake manifold pressure from engine load, EGR flow (L99 and LT1 only), and speed changes. As intake manifold pressure increases, intake vacuum decreases resulting in a higher MAP sensor voltage and kPa reading. The MAP sensor signal is used for the following: (1) To monitor intake manifold pressure changes during the EGR flow test (L99 and LT1 only); (2) To update the BARO reading; (3) Enabling factor for several of the diagnostics.

Mileage Since First Failure: Scan Tool Displays km and miles. This parameter indicates the mileage at which a emission Diagnostic Trouble Code failed for the first time. This mileage will be stored in the Freeze Frame and Failure records buffers.

Mileage Since Last Failure: Scan Tool Displays km and miles. This parameter indicates the mileage at the time the PCM detected the last test ran and failed for a DTC that is stored in the Failure Records buffer only.

Mileage Since MIL Request: Scan Tool Displays km and miles. The PCM will store the mileage of the vehicle at the time a MIL has been requested for an emission DTC. This mileage will be stored in the Freeze Frame buffer only.

Misfire Cur. #1 – Misfire Cur. #8: Scan Tool Range 0–255 Counts. The Misfire Current counters increment at a rate according to the number of possible misfires being detected on each cylinder during the last 200 cylinder firing events. The counters may normally display some activity, but the activity should be nearly equal for all the cylinders.

Misfire Failures: Scan Tool Range 0–65535 Counts. Indicates the number of 200 crankshaft revolution sample periods during which the level of misfire was sufficiently high to report a fail.

Misfire Hist. #1 – Misfire Hist. #8: Scan Tool Range 0–65535 Counts. The Misfire History counters display the total level of misfire that has been detected on each cylinder. The Misfire History counters will not update or show any activity until a misfire DTC (P0300) has become active. The Misfire History counters will update every 200 cylinder firing events.

Misfire Passes: Scan Tool Range 0–65535 Counts. Indicates the number of 200 crankshaft revolution sample periods during which the misfire diagnostic reported a pass.

Misfire Per Cycle Status: Scan Tool Displays Prim. Cyl # 0–8 and Sec. Cyl # 0–8. When a multiple misfire occurs, the scan tool will display the cylinder with the most significant misfire under Prim. Cyl. The scan tool will display the least significant misfire under Sec. Cyl.

MPH km/h: Scan Tool Range 0–255 km/h (0–158 mph). The vehicle speed sensor signal is converted into km/h and mph for display.

MSF Rev. Status: Scan Tool Displays Accept or Rejected. The scan tool will display Rejected when the PCM detects a misfire that is out of the normal misfire range. When rejected is displayed, indicates the PCM did not use the last 200 revolution test.

Not Run Counter: Scan Tool Range 0–255 Counts—When a MIL is requested or a history DTC is stored, the PCM will count and store the amount times a diagnostic test did not run. This information will be stored in Freeze Frame buffer only. Only one DTC can be stored in each Freeze Frame and/or Failure Records buffers.

Oil Level: Scan Tool Displays OK or Low (B and D Car Only). This parameter indicates when the engine oil level is low. The scan tool will display Low when the PCM detects the engine oil level is low.

Pass Counter: Scan Tool Range 0–255. When a MIL is requested or a history DTC is stored, the PCM will count and store the amount times a diagnostic test passed. This information will be stored in Freeze Frame buffer. Only one DTC can be stored in the Freeze Frame buffer.

Pass Key Fuel: Scan Tool Displays Disabled or OK (Except Y Car). The Theft Deterrent Fuel Enable circuit is an input from the Vehicle Theft Deterrent Control Module that signals the PCM to enable the injectors if the proper signal is received. The scan tool will normally display OK. If the Vehicle Theft Deterrent Control Module does not send the correct Theft Deterrent Fuel Enable signal to the PCM, the display will switch to DISABLED and the fuel system may be disabled.

PCM Reset: Scan Tool Displays Yes or No. This parameter indicates when an internal PCM reset has occurred. The scan tool will display YES when an internal PCM reset occurred.

PNP: Scan Tool Displays –ROD21 or P–N – – – –. This parameter will indicate if the transmission gear selector lever is in park or neutral, or the transmission gear selector is in reverse or any forward gear.

PSP Switch: Scan Tool Displays High Press or Normal (B and D Car Only). This parameter indicates when power steering load is present. The scan tool will display High Press when the PCM detects a power steering load is present (Parking Lot Maneuvers).

Reverse Inhibit: Scan Tool Displays Enabled or Disabled (F Car Only). When vehicle speed is below 4 mph, the PCM will enable the reverse inhibit solenoid and the scan tool will indicate Enabled.

Revs W/Misfire: Scan Tool Range 0–200 counts. This parameter displays the amount of misfire within 200 cycles.

ST FT Avg. Bn1 and Bn2: Scan Tool Displays Counts/Percentage. This parameter indicates the average of the short term fuel trim cells. The short term fuel trim cells are rated (Weighted) for the amount of which they are used. For example, an idle cell will be rated higher than a wide open cell. If a fueling malfunction is occurring in the idle cell and the wide open cell, the average would be more affected by the idle cell than the wide open cell. A negative value significantly below 128/0% indicates that the fuel system is rich and fuel delivery is being reduced (decreased injector pulse width). A positive value significantly greater than 128/0% indicates that a lean condition exists and the PCM is compensating by adding fuel (increased injector pulse width). When the average of the cells reach a predetermined high or low, a fuel trim DTC will set.

Shrt Term FT Bn1 and Bn2: Scan Tool Displays Percentage/Counts. Short Term Fuel Trim represents a short-term correction to fuel delivery by the PCM in response to the amount of time the fuel control oxygen sensor voltage spends above or below the 450 mV threshold. If the oxygen sensor voltage has mainly remained less than 450 mV, indicating a lean air/fuel mixture, short term fuel trim will increase into the positive range above 0%/128 and the PCM will add fuel. If the oxygen sensor voltage stays mainly above the threshold, short term fuel trim will decrease below 0%/128 into the negative range while the PCM reduces fuel delivery to compensate for the indicated rich condition. Under certain conditions such as extended idle and high ambient temperatures, canister purge may cause Short Term Fuel Trim to read in the negative range during normal operation. Fuel trim values at maximum authority may indicate an excessively rich or lean system.

Skip Shift Sol.: Scan Tool Displays Enabled or Disabled (F Car Only). When the PCM enables the skip shift solenoid, the scan tool will display Enabled.

Spark: Scan Tool Range -64° to 64°. Displays the amount of spark advance being commanded by the PCM on the IC circuit. The PCM computes the desired spark advance using the following: (1) Engine coolant temperature; (2) Engine speed (RPM); (3) Load; (4) Vehicle speed. This distributor ignition system is a net build distributor (No timing adjustment). All timing adjustments are completed by the PCM.

Start Up ECT: Scan Tool Range -40°C to 151°C (-40°F to 304°F). Indicates the Engine Coolant Temperature at the time that the vehicle was started. Used by the HO2S diagnostic to determine if the last startup was a cold start.

TCC Brake Switch: Scan Tool Displays Applied or Released. This parameter indicates the state of the TCC brake switch circuit input. Open indicates 0.0 voltage input (brake switch open, brake pedal applied). Closed indicates a B+ voltage input (brake switch closed, brake pedal released).

TCC Duty Cycle: Scan Tool Displays Disabled or Enabled. This parameter is the commanded state of the TCC PWM solenoid. The scan tool will indicate Enabled when the commanded state of the solenoid is ON. When the solenoid is not on the scan tool will display Disabled.

TCC Enable: Scan Tool Displays Engaged or Disengaged. Represents the PCM commanded state of the transmission torque converter clutch.

TCC Stator Temp.: Scan Tool Displays Normal or High (B and D Car with LT1). This parameter indicates the state of the TCC fluid temperature switch input. When the PCM detects the transmission temperature above a predetermined temperature, the scan tool will display High.

Total Misfire: Scan Tool Range 0–255. Indicates the total number of cylinder firing events that were detected as being misfires during the last 200 crankshaft revolution sample period.

TP Angle: Scan Tool Range 0%–100%. TP Angle is computed by the PCM from the TP Sensor voltage. TP Angle should display 0% at idle and 100% at wide open throttle.

TP Sensor: Scan Tool Range 0.00–5.00 Volts. This signal is used by the PCM to determine the amount of throttle demanded by the driver. The display should be between 0.36–0.96 volts at idle and greater than 4.0 volts at wide open throttle.

TR Switch: Scan Tool Displays INVALID, PARK/NEUTRAL, REVERSE, DRIVE 4/OD, DRIVE 3/D, DRIVE 2, or DRIVE 1. Trans Range represents the decoded status of the three transmission range pressure switch inputs from the Transmission Range Pressure Switch Assembly. The combination of transmission range inputs indicates the position of the transmission manual valve.

Traction Control: Scan Tool Displays Active or Inactive (If so equipped). When the traction control system is active the scan tool will display Active.

Warm Up Cycles w/o Emis. Faults: Scan Tool Range 0–40. This parameter counts the number of warm up cycles without an emission fault present. The counter will increment to 40 and roll back to 0 unless a fault occurs. If a fault occurs, the counter will revert back to 0 until the fault is corrected. Clearing information with a scan tool or a loss of power to the PCM will also reset the counter to 0.

Warm Up Cycles w/o Non – Emis. Faults: Scan Tool Range 0–40. This parameter counts the number of warm up cycles without a non-emission fault present. The counter will increment to 40 and roll back to 0 unless a fault occurs. If a fault occurs, the counter will revert back to 0 until the fault is corrected. Clearing information with a scan tool or a loss of power to the PCM will also reset the counter to 0.

Diagnostic Information and Procedures

Strategy Based Diagnostic Flow

6508

The strategy based diagnostic is a uniform approach to repair all Electrical and Electronic (E/E) systems. Resolve an E/E system problem using the diagnostic flow. The diagnostic flow is also a starting point when repairs are necessary. The steps below are defined in order to instruct the technician how to proceed with a diagnosis.

Verify the Customer Complaint

In order to verify the customer complaint the technician should know the normal operation of the system.

Preliminary Checks

Perform the following steps:

1. Conduct a thorough visual inspection
2. Review the service history
3. Detect unusual sounds or odors
4. Gather diagnostic trouble code information in order to achieve an effective repair

Check Bulletins and Other Service Information

This should include videos, newsletters, and Pulsat programs.

Service Information System Checks

A system may not be supported by one or more DTCs. System checks verify the proper operation of the system. This will lead the technician in an organized approach to diagnostics.

Service Diagnostics (Paper and Electronic)

1. DTC Stored - Follow the designated DTC Table exactly to make an effective repair.
2. No DTC - Select the symptom from the symptom tables and follow the diagnostic paths or suggestions to complete the repair, or refer to the applicable component/system check.
3. No Matching Symptom - Analyze the complaint. Develop a plan for diagnostics. Utilize the wiring diagrams and theory of operation.
4. Intermittents - Conditions that are not always present are intermittent. In order to resolve Intermittents, perform the following steps:
 - 4.1. Observe the history DTCs, the DTC modes and, the freeze frame data.
Call technical assistance for similar cases where repair history may be available. Combine the technician knowledge with efficient use of the available service information.
 - 4.2. Evaluate the symptoms and conditions described by the customer.
 - 4.3. Use a check sheet or other method in order to identify the circuit or electrical system component.
 - 4.4. Follow the suggestions for intermittent diagnosis found in the service documentation.

4.5. The Tech 1, Tech 2 and Fluke 87 scan tools have data capturing capabilities that can assist in detection of Intermittents.

5. Vehicle operates as designed/No trouble found
6. Call technical assistance for similar cases where repair history may be available. Combine technician knowledge with efficient use of the available service information.
 - 6.1. This condition exists when the vehicle is found to operate normally.
 - 6.2. The condition described by the customer may be normal. Verify against another vehicle that is operating normally.
 - 6.3. The condition may be intermittent. Verify the complaint under the conditions described by the customer before releasing the vehicle.

Re-Examine the Complaint

When the complaint cannot be successfully found or isolated, a reevaluation is necessary. The complaint should be re-verified and could be intermittent or normal.

Repair and Verification Tests

After isolating the cause, the repairs should be made. Then validate for proper operation and verify that the symptom has been corrected. This may involve road testing the vehicle in order to verify that the complaint has been resolved.

Powertrain OBD System Check

30388

Description

The Powertrain OBD system check is an organized approach to identifying a problem created by an electronic engine control system malfunction. The Powertrain OBD system check must be the starting point for any driveability complaint diagnosis. The Powertrain OBD system check directs the service technician to the next logical step in diagnosing a complaint. *Do not perform this check if no driveability complaint exists.* Understanding the table and using it correctly will reduce diagnostic time and prevent the replacement of good parts.

Important: This vehicle is equipped with a Powertrain Control Module (PCM) utilizing an Electrically Erasable Programmable Read Only Memory (EEPROM). When diagnostics call for replacement of the PCM, the new PCM must be programmed.

Refer to *PCM Replacement/Programming* Refer to *Data Link Connector* for schematic.

Test Description

Number(s) below refer to step numbers on the diagnostic table.

1. The diagnostic tables in this section are designed for use with a scan tool. If the scan tool is inoperative, this must be corrected before beginning any other diagnostic procedures. DO NOT Clear Info unless instructed by a diagnostic procedure.
3. If multiple DTCs are stored, diagnose in the following order of priority:
 1. PCM failure DTCs (P0601, P0602).
 2. System Voltage DTCs.

3. Component level DTCs (Sensors, Solenoids, Relays etc.). Multiple DTCs within this category should be diagnosed in numerical order starting with the lowest numbered DTC.
4. System level DTCs (Misfire, Fuel Trim, etc.).

Always Diagnose Last Tst Fail before History.

For Transmission DTCs, Refer to the Transmission Section 7A-14A.

Important: Checking for applicable service bulletins before proceeding with diagnosis is recommended

4. If a DTC is only in history, it may be beneficial to review Frez Frme Data and/or Fail Records. Use the odometer information and the fail counter to determine how frequently and how recently the DTC set. This information and the other operating conditions when the DTC set may help diagnose an intermittent problem. This is explained further in *Symptoms*.

5. Capturing stored info will preserve data that will be lost when instructed to Clear Info at the end of a diagnostic table, or if a PCM disconnect or replacement occurs during a diagnostic procedure. The data is stored in the scan tools memory. The captured info should be reviewed at the end of the diagnostic table to catch the next DTC in the event multiple DTCs were stored. Follow the order of priority as listed for Step 3 above.

6. Compare actual control system data with the values in the *Engine Scan Tool Data List* to determine if any parameter is not within limits. Keep in mind that a base engine problem (i.e. advanced cam timing) may substantially alter sensor values. If the actual data does not correspond with the values in the *Engine Scan Tool Data List* refer to the appropriate system/component diagnostic aids or test descriptions.

Powertrain OBD System Check

Step	Action	Value(s)	Yes	No
1	1. Connect a scan tool to the Data Link Connector (DLC). 2. Turn the ignition ON, engine OFF. Does the scan tool display data?	—	Go to Step 2	Go to No Scan Tool Data
2	Does the engine start and run?	—	Go to Step 3	Go to Engine Cranks but Does Not Run
3	Using the scan tool, select Eng DTC, DTC Info, Last Tst Fail. Are any DTCs displayed?	—	Go to Step 5	Go to Step 4
4	Using the scan tool, select Eng DTC, DTC Info, History. Are any DTCs displayed?	—	Go to Step 5	Go to Step 6
5	Using the scan tool, select Capture Info, then Store Info (this option will only be displayed if there is no previously captured data) or Refresh Info (to overwrite older data with current info). Is the action complete?	—	Go to the applicable DTC table	—
6	Compare the scan tool data with the values shown in the <i>Engine Scan Tool Data List</i> . Are the values normal or within typical ranges?	—	Go to Symptoms	Go to Diagnostic Aids and Test Descriptions

No Scan Tool Data

30388

Circuit Description

The diagnostic tables in this section are designed for use with a scan tool. If the scan tool is inoperative, this must be corrected before beginning any other diagnostic procedures. DO NOT Clear Info unless instructed by a diagnostic procedure.

Important: This vehicle is equipped with a Powertrain Control Module (PCM) utilizing an Electrically Erasable Programmable Read Only Memory (EEPROM). When diagnostics call for replacement of the PCM, the new PCM must be programmed. Refer to *PCM Replacement/Programming*

For schematic, refer to *Data Link Connector*

Test Description

Number(s) below refer to the step number(s) on the Diagnostic Table.

10. Some older scan tools are powered through a separate power cord from the cigar lighter. If this type of scan tool is being used, and the tool will not power up, check for a poor connection, or a malfunctioning lighter socket. Refer to *Repair Procedures in Electrical Diagnosis (8A, Cell 114, Cigar Lighter)* for circuit details.
14. Before trying a different scan tool, check for poor connections between the DLC and the scan tool cable. A faulty Vehicle Interface Module (VIM) can also cause loss of communication.

15. If there is no communication between the PCM and the scan tool, no data will be displayed. Class 2 Serial Data is shut down when system voltage is below 9.0 Volts or above 16.0 Volts. A scan tool will not display data if system voltage is outside this range. If no data is displayed with the engine running, but data is displayed with the ignition ON, engine OFF, high system voltage (overcharging) may be at fault. If this is the case, the scan tool should display DTC P0563 System Voltage High with the ignition ON, engine OFF.

18. Before trying a different scan tool, check for poor connections between the DLC and the scan tool cable. A faulty Vehicle Interface Module (VIM) can also cause loss of communication.

Some older scan tools are powered through a separate power cord from the cigar lighter, but the VIM gets its power and ground through the DLC connector. If this type of scan tool is being used, and the tool powers up but no data is displayed, proceed to Step 10.

No Scan Tool Data

Step	Action	Value(s)	Yes	No
1	Was the Powertrain On-Board Diagnostic (OBD) System Check performed?	—	Go to Step 2	Go to Powertrain OBD System Check
2	With the scan tool connected to the DLC connector and the ignition ON, engine OFF, is the scan tool powered up?	—	Go to Step 3	Go to Step 10
3	Does the engine start and run?	—	Go to Step 15	Go to Step 4
4	1. Turn the ignition OFF. 2. Disconnect the PCM. 3. Turn the ignition ON. 4. Using the test light J 34142-B connected to ground, probe the PCM battery and the ignition feed circuits in the PCM harness connectors. 5. Does the test light illuminate on each circuit?	—	Go to Step 5	Go to Step 7
5	Using the DVM J 39200, measure the resistance between the chassis ground and the PCM ground circuits in the PCM harness connectors. Does the DVM display the specified value (or lower) on each circuit?	5 Ω	Go to Step 6	Go to Step 8
6	Check for faulty connections at the PCM. Was a problem found and corrected?	—	Go to Powertrain OBD System Check	Go to Step 9
7	Repair the circuit that did not illuminate the test light. Is the action complete?	—	Go to Powertrain OBD System Check	—
8	Repair the faulty PCM ground circuit(s). Is the action complete?	—	Go to Powertrain OBD System Check	—
9	Important: Replacement PCM must be programmed. Refer to <i>PCM Replacement/Programming</i> . Replace the PCM. Is the action complete?	—	Go to Powertrain OBD System Check	—
10	1. Disconnect the scan tool from the DLC. 2. Using the test light J 34142-B connected to chassis ground, probe DLC terminal 16. 3. Does the test light illuminate?	—	Go to Step 11	Go to Step 12
11	Using DVM J 39200, measure the resistance between DLC terminals 4 and 5 and chassis ground. Does the DVM display the value shown (or lower)?	5 Ω	Go to Step 14	Go to Step 13

No Scan Tool Data (cont'd)

Step	Action	Value(s)	Yes	No
12	Repair the B+ circuit to DLC terminal 16. Refer to <i>Electrical Diagnosis, Data Link Connector (DLC)</i> . Is the action complete?	—	Go to Powertrain OBD System Check	—
13	Repair the ground circuit to DLC terminals 4 and 5. Refer to <i>Electrical Diagnosis, Data Link Connector (DLC)</i> . Is the action complete?	—	Go to Powertrain OBD System Check	—
14	Replace the faulty scan tool. Is the action complete?	—	Go to Powertrain OBD System Check	—
15	Using the DVM J 39200, measure the resistance between DLC terminals 4 and 5 and chassis ground. Does the DVM display the specified value (or lower)?	5 Ω	Go to Step 16	Go to Step 17
16	Check the Class 2 Serial Data circuit for being open, shorted to power or ground. Refer to <i>Electrical Diagnosis, Data Link Connector (DLC)</i> . Was a problem found and corrected?	—	Go to Powertrain OBD System Check	Go to Step 18
17	Repair the ground circuit to DLC terminals 4 and 5. Refer to <i>Electrical Diagnosis, Data Link Connector (DLC)</i> . Is the action complete?	—	Go to Powertrain OBD System Check	—
18	Verify the scan tool operation on another vehicle. Does the scan tool display data?	—	Go to Step 19	Go to Step 20
19	Important: Replacement PCM must be programmed. Refer to <i>PCM Replacement/Programming</i> . Replace the PCM. Is the action complete?	—	Go to Powertrain OBD System Check	—
20	Replace the faulty scan tool. Is the action complete?	—	Go to Powertrain OBD System Check	—

Engine Cranks but Does Not Run

30389

Description

This table assumes that battery condition and engine cranking speed are OK. If not, refer to *Engine Electrical* for diagnosis. Also, make sure that there is adequate fuel in the tank.

Diagnostic Aids

- An EGR valve sticking open can cause a low air/fuel ratio during cranking.
- Unless the engine enters Clear Flood at the first indication of a flooding condition, a no start may result.
- Check the duct work between the Mass Air Flow (MAF) sensor and the throttle body for air leaks.

- A malfunctioning MAF sensor may cause a no start or a stall after start. If this is suspected, disconnect the MAF sensor. The PCM will default to speed density (MAP, IAT, RPM) to calculate load and air flow. If this corrects the condition and the connections are OK, replace the MAF sensor.

If the steps above check OK, refer to *Symptoms*.

Test Description

Number(s) below refer to step numbers on the diagnostic table.

- If no RPM was indicated on the scan tool during cranking, the power and ground to the distributor from the PCM are both OK, and DTC P1371-DI Low Resolution Circuit is not set, Replace the PCM.

Engine Cranks but Does Not Run

Step	Action	Value(s)	Yes	No
1	Was the Powertrain On-Board Diagnostic (OBD) System Check performed?	—	Go to Step 2	Go to Powertrain OBD System Check
2	Using the scan tool, select ENG DTC, DTC Info, LAST TST FAIL. Are any of the following DTCs displayed: P0100, P0200, P0601, P0602, P1351, P1361, P1371?	—	Go to the applicable DTC table	Go to Step 3
3	Using the scan tool, check Pass Key status. Does the scan tool indicate OK?	—	Go to Step 4	Go to Theft Deterrent System
4	Using the scan tool, check Eng Cool Temp. Is the Eng Cool Temp on the scan tool close to the actual engine temperature?	—	Go to Step 5	Go to DTC P0118 ECT Sensor Circuit High Voltage
5	Using the scan tool, check Throttle Angle at a closed throttle. Is the Throttle Angle at the specified value?	0%	Go to Step 6	Go to DTC P0122 TP Sensor Circuit Low Voltage
6	Using the scan tool, check the Engine Speed while cranking the engine. Is RPM indicated on the scan tool?	—	Go to Step 7	Go to Step 11
7	Using Spark Tester J 26792 (ST-125), check for spark while cranking the engine (check 2 wires). Is spark present?	—	Go to Step 8	Basic ignition problem. Go to Distributor Ignition System Check
8	Using the scan tool, enable the fuel pump. Does the fuel pump operate?	—	Go to Step 9	Go to Fuel Pump Relay Circuit Diagnosis
9	1. Turn the ignition OFF. 2. Install a fuel pressure gauge and note the fuel pressure. 3. Turn the ignition ON. Is the fuel pressure within the specified range?	283–325 kPa (41–47 psi)	Go to Step 10	Go to Fuel System Diagnosis
10	Perform the following additional checks: - An EGR valve sticking open can cause a low air/fuel ratio during cranking. - Unless the engine enters Clear Flood at the first indication of a flooding condition, a no start may result. - Check the duct work between the Mass Air Flow (MAF) sensor and the throttle body for air leaks. - A malfunctioning MAF sensor may cause a no start or a stall after start. If this is suspected, disconnect the MAF sensor. The PCM will default to speed density (MAP, IAT, RPM) to calculate load and air flow. If this corrects the condition and the connections are OK, replace the MAF sensor. Was a problem found and corrected?	—	Go to Step 21	Go to Hard Start for diagnosis.
11	1. Turn the ignition OFF. 2. Disconnect the distributor electrical connector. 3. Turn the ignition ON. 4. Probe terminal C of the harness connector with a test light to ground. Does the test light illuminate?	—	Go to Step 12	Go to Step 13

Engine Cranks but Does Not Run (cont'd)

Step	Action	Value(s)	Yes	No
12	Using DVM J 39200 measure resistance from harness connector terminal D to ground. Does the DVM display the specified value (or lower)?	5 Ω	Go to Step 21	Go to Step 15
13	1. Turn the ignition OFF. 2. Disconnect the PCM connector C2. 3. Using DVM J 39200, check continuity of the ignition feed circuit from the distributor connector to the PCM connector. Does the DVM display the specified value (or lower)?	5 Ω	Go to Step 14	Go to Step 16
14	Using DVM J 39200, measure the resistance from the distributor connector terminal C to ground. Does the DVM display infinite resistance?	—	Go to Step 20	Go to Step 17
15	1. Turn the ignition OFF. 2. Disconnect the PCM connector C2. 3. Using DVM J 39200, check the continuity of the distributor reference low signal circuit from the distributor connector to the PCM connector. Does the DVM display the specified value (or lower)?	5 Ω	Go to Step 20	Go to Step 18
16	Repair the open ignition feed circuit to the distributor. Is the action complete?	—	Go to Step 22	—
17	Repair the short to ground in the ignition feed circuit to the distributor. Is the action complete?	—	Go to Step 22	—
18	Repair the distributor reference low circuit (ground). Is the action complete?	—	Go to Step 22	—
19	Replace the distributor. Refer to <i>Ignition System</i> . Is the action complete?	—	Go to Step 22	—
20	Check the connections at the PCM. Was a problem found and corrected?	—	Go to Step 22	Go to Step 21
21	Important: Replacement PCM must be programmed. Refer to <i>PCM Replacement/Programming</i> . Replace the PCM. Is the action complete?	—	Go to Step 22	—
22	1. Using the scan tool, select DTC, Clear Info. 2. Attempt to start the engine. Does the engine start and continue to run?	—	Go to Step 23	Go to Step 2
23	1. Allow engine to idle until normal operating temperature is reached. 2. Select DTC, Fail This Ign. Are any DTCs displayed?	—	Go to the applicable DTC table	Go to Step 24
24	Using the scan tool, select Capture Info, Review Info. Are any DTCs displayed that have not been diagnosed?	—	Go to the applicable DTC table	System OK

Fuel Pump Relay Circuit Diagnosis

Circuit Description

When the ignition switch is turned ON, the PCM will activate the in-tank fuel pump. The fuel pump will remain ON as long as the PCM is receiving reference pulses from the distributor ignition system. If there are no reference pulses, the PCM will turn the fuel pump OFF after about 2–3 seconds. The pump will deliver fuel to the fuel rail and injectors, then to the pressure regulator, where the system pressure is controlled at 284–325 kPa (41–47 psi). Excess fuel is returned to the fuel tank. When the engine is stopped, the fuel pump can be turned ON with a scan tool.

- Improper fuel system pressure will result in one or many of the following symptoms:
- Cranks but will not run.

- Cuts out, may feel like an ignition problem.
- Poor fuel economy.
- Loss of power.
- Hesitation.
- DTCs.

Diagnostic Aids

The following conditions may have caused the fuel pump fuse to open:

- The fuse was faulty
- There is an intermittent short in the fuel pump power feed circuit.
- The fuel pump has an intermittent internal problem. Refer to *Symptoms*.

Test Description

Number(s) below refer to step numbers on the diagnostic table.

12. If the fuse is open, this circuit should be checked for a possible short to ground. Refer to *Repair Procedures in Electrical Diagnosis (8A Cell 5)* for circuit details.

Fuel Pump Relay Circuit Diagnosis

Step	Action	Value(s)	Yes	No
1	Was the Powertrain On-Board Diagnostic (OBD) System Check performed?	—	Go to Step 2	Go to Powertrain OBD System Check
2	Check the fuel pump fuse. Is the fuse open?	—	Go to Step 9	Go to Step 3
3	1. Disconnect the fuel pump relay. 2. Probe the battery feed circuit in the fuel pump relay harness connector with test light J 34142-B connected to ground. Does the test light illuminate?	—	Go to Step 4	Go to Step 12
4	Probe the ground circuit in the fuel pump relay harness connector with test light J 34142-B connected to B+. Does the test light illuminate?	—	Go to Step 5	Go to Step 13
5	1. Probe the control circuit in the fuel pump relay harness connector with test light J 34142-B connected to ground. 2. Using a scan tool, enable the fuel pump. Does the test light illuminate?	—	Go to Step 6	Go to Step 11
6	Using a fused jumper wire, jumper the battery feed circuit to the fuel pump circuit in the fuel pump relay harness connector. Does the fuel pump run?	—	Go to Step 18	Go to Step 7
7	1. Leave the fused jumper wire connected. 2. Disconnect the fuel pump harness connector at the fuel pump. 3. Probe the power feed circuit in the fuel pump harness connector with test light J 34142-B connected to ground. Does the test light illuminate?	—	Go to Step 8	Go to Step 14
8	1. Leave the fused jumper wire connected. 2. Connect the test light J 34142-B between the power feed circuit and the ground circuit in the fuel pump harness connector. Does the test light illuminate?	—	Go to Step 20	Go to Step 15
9	1. Turn the ignition OFF. 2. Remove the fuel pump fuse. 3. Disconnect the fuel pump harness connector at the fuel pump. 4. Probe the power feed circuit in the fuel pump harness connector with test light J 34142-B connected to B+. Does the test light illuminate?	—	Go to Step 16	Go to Step 10

Fuel Pump Relay Circuit Diagnosis (cont'd)

Step	Action	Value(s)	Yes	No
10	1. Reconnect the fuel pump. 2. Install a new fuel pump fuse. 3. Turn the ignition ON. 4. Recheck the fuel pump fuse. Is the fuse open?	—	Go to Step 20	Go to Diagnostic Aids - Table A-5 Fuel Pump Circuit
11	1. Turn the ignition OFF. 2. Disconnect the PCM connector C1. 3. Using DVM J 39200, check continuity of the fuel pump relay control circuit from the relay harness connector to the PCM connector. Does the DVM display the specified value (or lower)?	5 Ω	Go to Step 22	Go to Step 17
12	Repair the open relay battery feed circuit. Is the action complete?	—	Go to Step 24	—
13	Repair the open relay ground circuit. Is the action complete?	—	Go to Step 24	—
14	Repair the open fuel pump feed circuit. Is the action complete?	—	Go to Step 24	—
15	Repair the open fuel pump ground circuit. Is the action complete?	—	Go to Step 24	—
16	Repair the short to ground in the fuel pump feed circuit. Is the action complete?	—	Go to Step 24	—
17	Repair the fuel pump relay control circuit. Is the action complete?	—	Go to Step 24	—
18	Check for poor connections at the relay. Was a problem found and corrected?	—	Go to Step 24	Go to Step 19
19	Replace the relay. Is the action complete?	—	Go to Step 24	—
20	Check the fuel pump harness for damage. Was a problem found and corrected?	—	Go to Step 24	Go to Step 21
21	Replace the fuel pump. Refer to <i>Engine Fuel</i> . Is the action complete?	—	Go to Step 24	—
22	Check for poor connections at the PCM. Was a problem found and corrected?	—	Go to Step 24	Go to Step 23
23	Important: Replacement PCM must be programmed. Refer to <i>PCM Replacement/Programming</i> . Replace the PCM. Is the action complete?	—	Go to Step 24	—
24	1. Using the scan tool, select DTC, Clear Info. 2. Attempt to start the engine. Does the engine start and continue to run?	—	Go to Step 25	Go to Step 2
25	1. Allow engine to idle until normal operating temperature is reached. 2. Select DTC, Fail This Ign. Are any DTCs displayed?	—	Go to the applicable DTC table	Go to Step 26
26	Using the scan tool, select Capture Info, Review Info. Are any DTCs displayed that have not been diagnosed?	—	Go to the applicable DTC table	System OK

Fuel System Diagnosis

Legend

- (1) J 34730-1A Fuel Pressure Gauge
- (2) Fuel Pressure Gauge Bleed Hose
- (3) Feed Pipe
- (4) Return Pipe
- (5) J 37287 Fuel Line Shut-off Adapters

Circuit Description

When the ignition switch is turned ON, the Powertrain Control Module (PCM) will turn ON the in-tank fuel pump. The in-tank fuel pump will remain ON as long as the engine is cranking or running and the PCM is receiving reference pulses. If there are no reference pulses, the PCM will turn the in-tank fuel pump OFF 2 seconds after the ignition switch is turned ON or 2 seconds after the engine stops running.

The in-tank fuel pump is an electric pump within an integral reservoir. The in-tank fuel pump supplies fuel through an in-pipe fuel filter to the fuel rail assembly. The fuel pump is designed to provide fuel at a pressure above the pressure needed by the fuel injectors. A fuel pressure regulator, attached to the fuel rail, keeps the fuel available to the fuel injectors at a regulated pressure. Unused fuel is returned to the fuel tank by a separate fuel return pipe. The fuel pump test connector is located near the A/C accumulator.

Test Description

Number(s) below refer to the step number(s) on the Diagnostic Table.

2. When the ignition switch is ON and the fuel pump is running, the fuel pressure indicated by the fuel pressure gauge should be 284–325 kPa (41–47 psi). This pressure is controlled by spring pressure inside the fuel pressure regulator.
3. A fuel system that can not maintain a constant fuel pressure has a leak in one or more of the following areas:
 - The fuel pump check valve.
 - The fuel pump feed hose.
 - The valve or valve seat within the fuel pressure regulator.
 - The fuel injector(s).

4. Fuel pressure that drops-off during acceleration, cruise or hard cornering may cause a lean condition. A lean condition can cause a loss of power, surging, or misfire. A lean condition can be diagnosed using a scan tool. If an extremely lean condition occurs, the heated oxygen sensors(s) will stop toggling. The heated oxygen sensor output voltage(s) will drop below 300 mV. Also, the fuel injector pulse width will increase.

Important: Make sure the fuel system is not operating in the Fuel Cut-Off Mode. This can cause false indications by the scan tool.

7. When the engine is at idle, the manifold pressure is low (high vacuum). This low pressure (high vacuum) is applied to the fuel pressure regulator diaphragm. The low pressure (high vacuum) will offset the pressure being applied to the fuel pressure regulator diaphragm by the spring inside the fuel pressure regulator. When this happens, the result is lower fuel pressure. The fuel pressure at idle will vary slightly as the barometric pressure changes, but the fuel pressure at idle should always be less than the fuel pressure noted in Step 2 with the engine OFF.
12. A rich condition may result from the fuel pressure being above 325 kPa (47 psi). A rich condition may cause DTC P0132, DTC P0152, DTC P0172 or DTC P0175 to set. Driveability conditions associated with rich conditions can include hard starting (followed by black smoke) and a strong sulfur smell in the exhaust.
13. This test determines if the high fuel pressure is due to a restricted fuel return pipe or if the high fuel pressure is due to a faulty fuel pressure regulator.
16. A lean condition may result from the fuel pressure being below 284 kPa (41 psi). A lean condition may cause DTC P0131, DTC P0151, DTC P0171 or DTC P0174 to set. Driveability conditions associated with lean conditions can include hard starting (when the engine is cold), hesitation, poor driveability, lack of power, surging, and misfiring.

17. Restricting the fuel return pipe with the J 37287 fuel pipe shut-off adapter causes the fuel pressure to rise above the regulated fuel pressure. Using a scan tool to pressurize the system, the fuel pressure should rise above 325 kPa (47 psi) as the valve on the fuel pipe shut-off adapter connected to the fuel return pipe becomes partially closed.

Notice: Do not allow the fuel pressure to exceed 414 kPa (60 psi). Fuel Pressure in excess of 414 kPa (60 psi) may damage the fuel pressure regulator.

23. Check the spark plug associated with a particular fuel injector for fouling or saturation in order to determine if that particular fuel injector is leaking. If checking the spark plug associated with a particular fuel injector for fouling or saturation does not determine that a particular fuel injector is leaking, use the following procedure:

1. Remove the fuel rail, but leave the fuel pipes connected to the fuel rail. Refer to Fuel Rail Assembly.
2. Lift the fuel rail just enough to leave the fuel injector nozzles in the fuel injector ports.

Caution: In order to reduce the risk of fire and personal injury that may result from fuel spraying on the engine, verify that the fuel rail is positioned over the fuel injector ports, and verify that the fuel injector retaining clips are intact.

Pressurize the fuel system by using the scan tool fuel pump enable.

3. Visually and physically inspect the fuel injector nozzles for leaks.
25. The fuel pressure regulator filter screen is designed to trap any contaminants introduced during engine assembly. If the fuel pressure regulator screen is dirty, it can be removed with a small pick and discarded without potential harm to the fuel pressure regulator.

Fuel System Diagnosis

Step	Action	Value(s)	Yes	No
1	Was the Powertrain On-Board Diagnostic (OBD) System Check performed?	—	Go to Step 2	Go to Powertrain OBD System Check
2	1. Turn the ignition OFF. 2. Turn the air conditioning system OFF. Caution: In order to reduce the risk of fire and personal injury, wrap a shop towel around the fuel pressure connection. The towel will absorb any fuel leakage that occurs during the connection of the fuel pressure gauge. Place the towel in an approved container when the connection of the fuel pressure gauge is complete. 3. Install the J34730 fuel pressure gauge (refer to 1 in the illustration). 4. Place the bleed hose (refer to 2 in the illustration) of the fuel pressure gauge into an approved gasoline container. 5. Turn the ignition ON. 6. Bleed the air out of the fuel pressure gauge. 7. Turn the ignition OFF for 10 seconds. 8. Turn the ignition ON. Important: The fuel pump will run for approximately 2 seconds. Cycle the ignition as necessary in order to achieve the highest possible fuel pressure. 9. Observe the fuel pressure with the fuel pump running. Is the fuel pressure within the specified limits?	284–325 kPa (41–47 psi)	Go to Step 3	Go to Step 12
3	Important: The fuel pressure may vary slightly when the fuel pump stops running. After the fuel pump stops running the fuel pressure should stabilize and remain constant. After the fuel pump stops running, does the fuel pressure remain constant?	—	Go to Step 4	Go to Step 9
4	Is the fuel pressure suspected of dropping-off during acceleration, cruise, or hard cornering.	—	Go to Step 5	Go to Step 7
5	Visually and physically inspect the following items for a restriction: • The fuel filter. • The fuel feed pipe (refer to (3) in the illustration). Was a restriction found?	—	Go to Step 26	Go to Step 6
6	1. Remove the fuel sender assembly. Refer to Fuel Sender Assembly Replacement. 2. Visually and physically inspect the following items: • The fuel pump strainer for a restriction. • The fuel pump feed hose for leaks. • Verify the fuel pump is the correct fuel pump for this vehicle. Was a problem found in any of these areas?	—	Go to Step 26	Go to Step 20

Fuel System Diagnosis (cont'd)

Step	Action	Value(s)	Yes	No
7	1. Start the engine. 2. Allow the engine to idle at normal operating temperature. Does the fuel pressure drop by the amount specified?	21–69 kPa (3–10 psi)	Go to <i>Symptoms</i>	Go to <i>Step 8</i>
8	1. Disconnect the vacuum hose from the fuel pressure regulator. 2. With the engine idling, apply 12–14 inches of vacuum to the fuel pressure regulator manifold vacuum hose connection. Does the fuel pressure drop by the amount specified?	21–69 kPa (3–10 psi)	Go to <i>Step 21</i>	Go to <i>Step 22</i>
9	1. Relieve the fuel pressure. Refer to the Fuel Pressure Relief Procedure. 2. Disconnect the fuel feed pipe (refer to (3) in the illustration) and the fuel return pipe (refer to (4) in the illustration) from the fuel rail. Refer to Servicing Quick-Connect Fittings. 3. Install the J 37287 fuel pipe shut-off adapters (refer to (5) in the illustration) between the fuel feed pipe and the fuel return pipe and the fuel rail. 4. Open the valves on the fuel pipe shut-off adapters. 5. Turn the ignition OFF. 6. Using a 10 amp fused jumper, connect the fuel pump test connector to B+. 7. Place the bleed hose (refer to (2) in the illustration) of the fuel pressure gauge (refer to (1) in the illustration) into an approved gasoline container. 8. Bleed the air out of the fuel pressure gauge. 9. Wait for the fuel pressure to build. 10. Disconnect the 10 amp fused jumper. 11. Close the valve in the fuel pipe shut-off adapter that is connected to the fuel feed pipe. Does the fuel pressure remain constant?	—	Go to <i>Step 10</i>	Go to <i>Step 11</i>
10	1. Remove the fuel sender assembly. Refer to Fuel Sender Assembly Replacement. 2. Visually and physically inspect the fuel pump feed hose. Is the fuel pump feed hose leaking?	—	Go to <i>Step 20</i>	Go to <i>Step 20</i>
11	1. Open the valve in the fuel pipe shut-off adapter (refer to (5) in the illustration) that is connected to the fuel feed pipe (refer to (3) in the illustration). 2. Using a 10 amp fused jumper, connect the fuel pump test connector to B+. 3. Wait for the fuel pressure to build. 4. Disconnect the 10 amp fused jumper. 5. Close the valve in the fuel pipe shut-off adapter that is connected to the fuel return pipe (refer to (4) in the illustration). Does the fuel pressure remain constant?	—	Go to <i>Step 22</i>	Go to <i>Step 23</i>
12	Is the fuel pressure above the specified limit?	325 kPa (47 psi)	Go to <i>Step 13</i>	Go to <i>Step 16</i>

Fuel System Diagnosis (cont'd)

Step	Action	Value(s)	Yes	No
13	1. Relieve the fuel pressure. Refer to the Fuel Pressure Relief Procedure. 2. Disconnect the fuel return pipe (refer to (4) in the illustration) from the fuel rail. Refer to Servicing Quick-Connect Fittings. 3. Attach a length of flexible fuel hose to the fuel rail outlet passage. 4. Place the open end of the flexible fuel hose into an approved gasoline container. 5. Turn the ignition OFF for 10 seconds. 6. Turn the ignition ON. 7. Observe the fuel pressure with the fuel pump running. Is the fuel pressure within the specified limits?	284–325 kPa (41–47 psi)	Go to Step 24	Go to step 14
14	Visually and physically inspect the fuel rail outlet passages for a restriction. Was a restriction found?	—	Go to Step 26	Go to Step 15
15	1. Remove the fuel pressure regulator. Refer to Fuel Pressure Regulator Assembly. 2. Visually and physical inspect the fuel pressure regulator filter screen for a restriction. Was a restriction found?	—	Go to Step 25	Go to Step 22
16	Is the fuel pressure above the specified value?	0 kPa (0 psi)	Go to Step 17	Go to Step 18
17	1. Relieve the fuel pressure. Refer to the Fuel Pressure Relief Procedure. 2. Disconnect the fuel return pipe (refer to (4) in the illustration) from the fuel rail. Refer to Servicing Quick-Connect Fittings. 3. Install the J 37287 fuel pipe shut-off adapter (refer to (5) in the illustration) between the fuel return pipe and the fuel rail. 4. Open the valve on the fuel pipe shut-off adapter. 5. Turn the ignition OFF. 6. Using a 10 amp fused jumper, connect the fuel pump test connector to B+. 7. Place the bleed hose (refer to (2) in the illustration) of the fuel pressure gauge (refer to (1) in the illustration) into an approved gasoline container. 8. Bleed the air out of the fuel pressure gauge. Notice: Do not allow the fuel pressure to exceed 414 kPa (60 psi). Fuel Pressure in excess of 414 kPa (60 psi) may damage the fuel pressure regulator. 9. Slowly close the valve in the fuel pipe shut-off adapter that is connected to the fuel return pipe. Does the fuel pressure rise above the specified value?	325 kPa (47 psi)	Go to Step 22	Go to Step 6
18	Refer to Fuel Pump Relay Circuit to diagnose the fuel pump electrical circuit. Was a problem found with the fuel pump electrical circuit?	—	Go to Step 26	Go to Step 19

Fuel System Diagnosis (cont'd)

Step	Action	Value(s)	Yes	No
19	Visually and physically inspect the following items: • The fuel filter for obstructions. • The fuel feed pipe (refer to (3) in the illustration) for a restriction. • The fuel pump strainer for obstructions. • The fuel pump feed hose for leaks. Was a problem found in any of these areas?	—	Go to Step 26	Go to Step 20
20	Replace the fuel pump. Is the action complete?	—	System OK	—
21	Locate and repair the loss of vacuum to the fuel pressure regulator. Is the action complete?	—	System OK	—
22	Replace the fuel pressure regulator. Is the action complete?	—	System OK	—
23	Locate and replace any leaking fuel injector(s). Is the action complete?	—	System OK	—
24	Locate and correct the restriction in the fuel return pipe (refer to (4) in the illustration). Is the action complete?	—	System OK	—
25	1. Remove the fuel pressure regulator filter screen. 2. Discard the fuel pressure regulator filter screen. Is the action complete?	—	System OK	—
26	Repair the problem as necessary. Is the action complete?	—	System OK	—

DTC P0100 MAF Sensor Circuit Insufficient Activity

30411

Circuit Description

The Mass Air Flow (MAF) sensor measures the amount of air that is ingested by the engine. Direct measurement of air entering the engine is more accurate than calculating airflow from MAP, IAT and RPM (speed/density). The MAF sensor has a battery feed, ground and signal circuit.

The MAF sensor used on this vehicle is a hot wire type and is used to measure air flow rate. The MAF output frequency is a function of the power required to keep the air flow sensing elements (hot wires) at a fixed temperature above ambient temperature. Air flowing through the sensor cools the sensing elements. The amount of cooling is proportional to the amount of air flow. As air flow increases, a greater amount of current is required to maintain the hot wires at a constant temperature. The MAF sensor converts the changes in current draw to a frequency signal read by the PCM. The PCM calculates air flow (grams per second) based on this signal.

The PCM monitors the MAF sensor frequency and can determine if the sensor is stuck low, stuck high, not providing the airflow value expected for a given operating condition, or that the signal appears to be

stuck based on a lack of signal variation expected during normal operation. This diagnostic checks for a stuck MAF sensor signal. If the MAF sensor frequency varies less than a predetermined minimum amount, this DTC will set.

Conditions for Setting the DTC

- Engine running.
- Engine speed greater than 50 RPM.
- Ignition voltage greater than 10 volts.
- Mass Air Flow frequency varies less than a predetermined minimum amount.
- All conditions met for 1 second.

Action Taken When the DTC Sets

- The PCM will illuminate the Malfunction Indicator Lamp (MIL) when the diagnostic runs and fails.
- The PCM will use speed density (RPM, MAP, IAT) for fuel management.
- The PCM will record operating conditions at the time the diagnostic fails. This information will be stored in the Freeze Frame and/or Failure Records.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL OFF after three consecutive drive trips that the diagnostic runs and does not fail.
- A last test failed (Current DTC) will clear when the diagnostic runs and does not fail.
- A History DTC will clear after forty consecutive warm-up cycles, if no failures are reported by this or any other emission related diagnostic.
- PCM battery voltage is interrupted.
- Using a Scan tool.

Diagnostic Aids:

- An intermittent may be caused by the following:
 - Mis-routed harness.
 - Rubbed through wire insulation.
 - Broken wire inside the insulation.

For intermittents, refer to *Symptoms*.

- Any un-metered air may cause this DTC to set. Check for the following:
 - An engine vacuum leak.
 - The PCV system for vacuum leaks.
 - An incorrect PCV valve.
 - The engine oil dip stick not fully seated.
 - The engine oil fill cap loose or missing.

Test Description

Number(s) below refer to step numbers on the diagnostic table.

1. Monitoring MAF sensor grams per second (gm/s) will determine if the fault is present or the malfunction is intermittent. For any test

that requires back probing the PCM or component harness connectors, must use the Connector Test Adapter Kit J 35616-A. Using this kit will prevent any damage to the harness connector terminals.

2. Using Freeze Frame and/or Failure Records data may aid in locating an intermittent condition. If the DTC cannot be duplicated, the information included in the Freeze Frame and/or Failure Records data can be useful in determining how many miles since the DTC set. The Fail Counter and Pass Counter can also be used to determine how many ignition cycles the diagnostic reported a pass and/or a fail. Operate vehicle within the same freeze frame conditions (RPM, load, vehicle speed, temperature etc.) that were noted. This will isolate when the DTC failed.
3. This checks whether the signal circuit is open, grounded or shorted to a voltage.
4. Verifies whether a ground circuit is available.
5. Verifies B+ supply to the MAF sensor.
6. Checks whether a good connection is present.
7. Disconnecting the PCM will allow using the DVM (J 39200) to check continuity of the circuits. This will aid in locating an open or shorted circuit.

GM Restoration
Parts

DTC P0100 MAF Sensor Circuit Insufficient Activity

Step	Action	Value(s)	Yes	No
1	Was the Powertrain On-Board Diagnostic (OBD) System Check performed?	—	Go to Step 2	Go to Powertrain OBD System Check
2	1. Start and idle the engine. 2. With the engine idling, monitor MAF gm/s display on the Engine 1 Data List of the scan tool. Is MAF gm/s below the specified value?	3.9 gm/s	Go to Step 4	Go to Step 3
3	1. Turn the ignition ON, engine OFF, review Freeze Frame and/or Failure Records data for this DTC and note parameters. 2. Turn the ignition OFF for 15 seconds. 3. Start the engine and operate the vehicle within the conditions required for this diagnostic to run, and as close to the conditions recorded in Freeze Frame/Failure Records as possible. Special operating conditions that need to be met before the PCM will run this diagnostic, where applicable, are listed in Conditions for Setting the DTC. 4. Using the scan tool, select DTC, Specific, then enter the DTC number which was set. Does the scan tool indicate that this diagnostic failed this ignition?	—	Go to Step 4	Go to Diagnostic Aids - DTC P0100 (MAF) Insufficient Activity
4	1. Turn the ignition OFF. 2. Disconnect the MAF sensor connector. 3. Turn the ignition ON, engine OFF. 4. Using a DVM (J 39200), measure the voltage between the MAF signal circuit and the battery ground. Is the voltage near the specified value?	5 V	Go to Step 5	Go to Step 8
5	Connect a test light (J 34142-B) between the MAF sensor ignition feed circuit and the ground circuit at the MAF sensor harness connector. Is the test light on?	—	Go to Step 7	Go to Step 6
6	Connect a test light (J 34142-B) between MAF sensor ignition feed circuit and the battery ground. Is the test light on?	—	Go to Step 9	Go to Step 10
7	1. Check for a poor connection at the MAF sensor harness terminals. 2. If a poor connection is found, replace faulty terminal(s). Was a poor connection found?	—	Go to Step 13	Go to Step 11
8	1. Disconnect the PCM. 2. Check the MAF signal circuit between the PCM and the MAF sensor for the following: • An open circuit • A short to ground • A short to the MAF sensor ground circuit • A short to voltage 3. If the MAF signal circuit is open or shorted, repair it as necessary. Refer to <i>Repair Procedures in Electrical Diagnosis (8A Cell 5)</i> . Was the MAF sensor signal circuit open or shorted?	—	Go to Step 13	Go to Step 12

DTC P0100 MAF Sensor Circuit Insufficient Activity (cont'd)

Step	Action	Value(s)	Yes	No
9	Locate and repair the open in the ground circuit to the MAF sensor. Refer to <i>Repair Procedures in Electrical Diagnosis (8A Cell 5)</i> . Is the action complete?	—	Go to Step 13	—
10	Locate and repair the open in the ignition feed circuit to the MAF sensor. Refer to <i>Repair Procedures in Electrical Diagnosis (8A Cell 5)</i> . Is the action complete?	—	Go to Step 13	—
11	Replace the MAF sensor. Refer to <i>MAF Sensor</i> . Is the action complete?	—	Go to Step 13	—
12	Important: Replacement PCM must be programmed. Refer to <i>PCM Replacement/Programming</i> . Replace the PCM. Is the action complete?	—	Go to Step 13	—
13	1. Using the scan tool, select DTC, Clear Info. 2. Start engine and idle at normal operating temperature. 3. Select DTC, Specific, then enter the DTC number which was set. 4. Operate vehicle within the conditions for setting this DTC as specified in the supporting text, if applicable. Does the scan tool indicate that this test ran and passed?	—	Go to Step 14	Go to Step 2
14	Using the scan tool, select Capture Info, Review Info. Are any DTCs displayed that have not been diagnosed?	—	Go to the applicable DTC table	System OK

DTC P0101 Mass Air Flow System Performance

30411

Circuit Description

The Mass Air Flow (MAF) sensor measures the amount of air that is ingested by the engine. Direct measurement of air entering the engine is more accurate than calculating airflow from MAP, IAT and RPM (speed/density). The MAF sensor has a battery feed, ground and signal circuit.

The MAF sensor used on this vehicle is a hot wire type and is used to measure air flow rate. The MAF output frequency is a function of the power required to keep the air flow sensing elements (hot wires) at a fixed temperature above ambient temperature. Air flowing through the sensor cools the sensing elements. The amount of cooling is proportional to the amount of air flow. As air flow increases, a greater amount of current is required to maintain the hot wires at a constant temperature. The MAF sensor converts the changes in current draw to a frequency signal read by the PCM. The PCM calculates air flow (grams per second) based on this signal.

The PCM monitors the MAF sensor frequency and can determine if the sensor is stuck low, stuck high, not providing the airflow value expected for a given operating condition, or that the signal appears to be

stuck based on a lack of signal variation expected during normal operation. This diagnostic checks the range/performance of the MAF sensor. The MAF system performance or rationality diagnostic uses MAP, IAT and RPM to calculate an expected airflow rate that is then compared to the actual measured airflow from the MAF sensor. The actual MAF value and the calculated value are only compared during conditions where they are likely to match. If the actual MAF reading is not within a predetermined range of the calculated reading, this DTC will set.

Conditions for Setting the DTC

- DTCs P0100, P0102, P0103, P0122, P0123, P0107, P0108 not set.
- Engine running.
- Engine speed greater than 50 RPM but less than 2800 RPM.
- TP sensor angle less than 50% when engine vacuum (MAP) is greater than 40 kPa.
- Ignition voltage greater than 10 volts.
- Actual MAF reading does not match calculated MAF reading (speed density).
- All above conditions stable for entire MAF test.
- All conditions met for 5 seconds.

Action Taken When the DTC Sets

- The PCM will illuminate the Malfunction Indicator Lamp (MIL) when the diagnostic runs and fails.
- The PCM will utilize speed density (RPM, MAP, IAT) for fuel management.
- The PCM will record operating conditions at the time the diagnostic fails. This information will be stored in the Freeze Frame and/or Failure Records.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL OFF after three consecutive drive trips that the diagnostic runs and does not fail.
- A last test failed (Current DTC) will clear when the diagnostic runs and does not fail.
- A History DTC will clear after forty consecutive warm-up cycles, if no failures are reported by this or any other emission related diagnostic.
- PCM battery voltage is interrupted.
- Using a Scan tool.

Diagnostic Aids

- An intermittent may be caused by the following:
 - Mis-routed harness.
 - Rubbed through wire insulation.
 - Broken wire inside the insulation.

For intermittents, refer to *Symptoms*.

- Any un-metered air may cause this DTC to set. Check for the following:
 - An engine vacuum leak.
 - The PCV system for vacuum leaks.
 - An incorrect PCV valve.
 - The engine oil dip stick not fully seated.

Test Description

Number(s) below refer to step numbers on the diagnostic table.

2. The MAF system performance or rationality diagnostic uses the MAP sensor signal along with other inputs to calculate an expected

airflow rate that is then compared to the actual measured airflow from the MAF sensor. The first few steps of this table verify that the MAP sensor is working properly. Any MAP sensor DTC should be corrected first. The value shown for the MAP sensor will vary with altitude. The value will decrease by approximately 3 kPa for every 1000 feet of altitude. 100 kPa is the approximate value displayed at or near sea level.

6. Using Freeze Frame and/or Failure Records data may aid in locating an intermittent condition. If the DTC cannot be duplicated, the information included in the Freeze Frame and/or Failure Records data can be useful in determining how many miles since the DTC set. The Fail Counter and Pass Counter can also be used to determine how many ignition cycles the diagnostic reported a pass and/or a fail. Operate vehicle within the same freeze frame conditions (RPM, load, vehicle speed, temperature etc.) that were noted. This will isolate when the DTC failed. For any test that requires back probing the PCM or component harness connectors, must use the Connector Test Adapter Kit J 35616-A. Using this kit will prevent any damage to the harness connector terminals.
7. Any un-metered air may cause this DTC to set. Check PCV system for vacuum leaks. Also inspect dip stick for being pulled out. Check oil fill cap for being loose.
8. Verifies the signal circuit from the MAF sensor electrical connector to the PCM.
9. Verifies whether a ground and B+ circuit is available.
10. Checks for a signal circuit for an open.
11. Checks for a signal circuit shorted to B+.

DTC P0101 Mass Air Flow System Performance

Step	Action	Value(s)	Yes	No
1	Was the Powertrain On-Board Diagnostic (OBD) System Check performed?	—	Go to Step 2	Go to Powertrain OBD System Check
2	Important: If any MAP DTCs are set, refer to the applicable DTC before proceeding. This value will vary with altitude. Refer to <i>Test Description</i>. 1. Turn the ignition ON, engine OFF. 2. Using a scan tool, select MAP from the Engine 1 Data List. Is the value displayed greater than the value shown?	100 kPa	Go to Step 3	Go to Step 19
3	1. Remove the MAP sensor from the intake manifold but leave the electrical harness connected. 2. Connect a hand operated vacuum pump to the MAP sensor. 3. Observe the MAP display while slowly applying vacuum up to 20 inch Hg as indicated on the pump gauge. Each 1 inch of vacuum applied should result in a 3 to 4 kPa drop in the MAP sensor value on the scan tool and the value should change smoothly with each increase in vacuum. Did the MAP value change smoothly through the entire range of the test without any erratic readings?	—	Go to Step 19	Go to Step 4
4	With 20 inch Hg vacuum applied to the MAP sensor. Is the MAP sensor reading the same or less than the specified value?	34 kPa	Go to Step 5	Go to Step 19
5	Disconnect the vacuum source from the MAP sensor. Does the MAP sensor reading return to the original value?	—	Go to Step 6	Go to Step 19
6	1. Turn the ignition ON, engine OFF, review Freeze Frame and/or Failure Records data for this DTC and note parameters. 2. Turn the ignition OFF for 15 seconds. 3. Start the engine and operate the vehicle within the conditions required for this diagnostic to run, and as close to the conditions recorded in Freeze Frame/Failure Records as possible. Special operating conditions that need to be met before the PCM will run this diagnostic, where applicable, are listed in Conditions for Setting the DTC. 4. Using the scan tool, select DTC, Specific, then enter the DTC number which was set. Does the scan tool indicate that this diagnostic failed this ignition?	—	Go to Step 7	Go to Diagnostic Aids - DTC P0101 (MAF) System Performance
7	1. Check for the following conditions: • Objects blocking the MAF sensor inlet screen • Intake manifold vacuum leaks • Vacuum leaks at throttle body • Vacuum leaks at EGR valve flange and pipes • Crankcase ventilation valve faulty, missing, or incorrectly installed 2. If a problem is found, repair as necessary. Was a problem found?	—	Go to Step 21	Go to Step 8

DTC P0101 Mass Air Flow System Performance (cont'd)

Step	Action	Value(s)	Yes	No
8	1. Turn the ignition OFF. 2. Disconnect the MAF sensor connector. 3. Turn the ignition ON, engine OFF. 4. Using DVM J 39200, measure voltage between the MAF sensor signal circuit and chassis ground. Is the voltage near the specified value?	5.0V	Go to Step 9	Go to Step 10
9	Connect a test light (J 34142-B) between the MAF sensor ignition feed and the ground circuit at the MAF sensor harness connector. Is the test light ON?	—	Go to Step 13	Go to Step 12
10	Is the voltage less than the specified value?	4.5V	Go to Step 14	Go to Step 11
11	1. Turn the ignition OFF, disconnect the PCM. 2. Turn the ignition ON, engine OFF. 3. Measure the voltage between the MAF signal circuit and ground. Does the voltage measure near the specified value?	0.0V	Go to Step 20	Go to Step 17
12	Connect a test light (J 34142-B) between MAF sensor ignition feed circuit and chassis ground. Is the test light ON?	—	Go to Step 15	Go to Step 16
13	1. Check for a poor connection at the MAF sensor. 2. If a poor connection is found, replace faulty terminal(s). Refer to <i>Repair Procedures in Electrical Diagnosis (8A Cell 5)</i> . Was a poor connection found?	—	Go to Step 21	Go to Step 18
14	1. Check the MAF signal circuit between the PCM and the MAF sensor for the following: • An open circuit • A short to ground • A short to the MAF ground circuit. 2. If the MAF signal circuit is open or shorted, repair it as necessary. Was the MAF signal circuit open or shorted?	—	Go to Step 21	Go to Step 20
15	Locate and repair the open in the ground circuit to the MAF sensor. Refer to <i>Repair Procedures in Electrical Diagnosis (8A Cell 5)</i> . Is the action complete?	—	Go to Step 21	—
16	Locate and repair the open in the ignition feed circuit to the MAF sensor. Refer to <i>Repair Procedures in Electrical Diagnosis (8A Cell 5)</i> . Is the action complete?	—	Go to Step 21	—
17	Locate and repair the short to voltage in the MAF signal circuit. Refer to <i>Repair Procedures in Electrical Diagnosis (8A Cell 5)</i> . Is the action complete?	—	Go to Step 21	—
18	Replace the MAF sensor. Refer to <i>MAF Sensor</i> . Is the action complete?	—	Go to Step 21	—
19	Replace the MAP sensor. Refer to <i>MAP Sensor</i> . Is the action complete?	—	Go to Step 21	—

DTC P0101 Mass Air Flow System Performance (cont'd)

Step	Action	Value(s)	Yes	No
20	Important: Replacement PCM must be programmed. Refer to <i>PCM Replacement/Programming</i> . Replace the PCM. Is the action complete?	—	Go to Step 21	—
21	1. Using the scan tool, select DTC, Clear Info. 2. Start the engine and idle at normal operating temperature. 3. Select DTC, Specific, then enter the DTC number which was set. 4. Operate the vehicle within the conditions for setting this DTC as specified in the supporting text, if applicable. Does the scan tool indicate that this test ran and passed?	—	Go to Step 22	Go to Step 2
22	Using the scan tool, select Capture Info, Review Info. Are any DTCs displayed that have not been diagnosed?	—	Go to the applicable DTC table	System OK

DTC P0102 MAF Sensor Circuit Low Frequency

30411

Circuit Description

The Mass Air Flow (MAF) sensor measures the amount of air that is ingested by the engine. Direct measurement of air entering the engine is more accurate than calculating airflow from MAP, IAT and RPM (speed/density). The MAF sensor has a battery feed, ground and signal circuit.

The MAF sensor used on this vehicle is a hot wire type and is used to measure air flow rate. The MAF output frequency is a function of the power required to keep the air flow sensing elements (hot wires) at a fixed temperature above ambient temperature. Air flowing through the sensor cools the sensing elements. The amount of cooling is proportional to the amount of air flow. As air flow increases, a greater amount of current is required to maintain the hot wires at a constant temperature. The MAF sensor converts the changes in current draw to a frequency signal read by the PCM. The PCM calculates air flow (grams per second) based on this signal.

The PCM monitors the MAF sensor frequency and can determine if the sensor is stuck low, stuck high, not providing the airflow value expected for a given

operating condition, or that the signal appears to be stuck based on a lack of signal variation expected during normal operation. This diagnostic checks for too low an airflow rate. When the PCM detects that the MAF sensor grams per second is below a predetermined value, this DTC will set.

Conditions for Setting the DTC

- Engine running.
- Engine speed greater than 50 RPM.
- Ignition voltage greater than 10 volts.
- Mass Air Flow less than 3.9 grams per second.
- All conditions met for 1 second.

Action Taken When the DTC Sets

- The PCM will illuminate the Malfunction Indicator Lamp (MIL) when the diagnostic runs and fails.
- The PCM will utilize speed density (RPM, MAP, IAT) for fuel management.
- The PCM will record operating conditions at the time the diagnostic fails. This information will be stored in the Freeze Frame and/or Failure Records.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL OFF after three consecutive drive trips that the diagnostic runs and does not fail.
- A last test failed (Current DTC) will clear when the diagnostic runs and does not fail.
- A History DTC will clear after forty consecutive warm-up cycles, if no failures are reported by this or any other emission related diagnostic.
- PCM battery voltage is interrupted.
- Using a Scan tool.

Diagnostic Aids

- An intermittent may be caused by the following:
 - Mis-routed harness.
 - Rubbed through wire insulation.
 - Broken wire inside the insulation.

For intermittents, refer to *Symptoms*.

- Any un-metered air may cause this DTC to set. Check for the following:
 - An engine vacuum leak.
 - The PCV system for vacuum leaks.
 - An incorrect PCV valve.
 - The engine oil dip stick not fully seated.
 - The engine oil fill cap loose or missing.

Test Description

Number(s) below refer to step numbers on the diagnostic table.

- Monitoring MAF sensor grams per second (gm/s) will determine if the fault is present or the malfunction is intermittent. For any test that requires back probing the PCM or component harness connectors, must use the Connector Test Adapter Kit J 35616-A. Using this kit will prevent any damage to the harness connector terminals.
- Using Freeze Frame and/or Failure Records data may aid in locating an intermittent condition. If the DTC cannot be duplicated, the information included in the Freeze Frame and/or Failure Records data can be useful in determining how many miles since the DTC set. The Fail Counter and Pass Counter can also be used to determine how many ignition cycles the diagnostic reported a pass and/or a fail. Operate vehicle within the same freeze frame conditions (RPM, load, vehicle speed, temperature etc.) that were noted. This will isolate when the DTC failed.
- This checks whether the MAF signal circuit is open or shorted to ground. If 5.0 volts is present indicates the circuit is OK.
- This checks whether the B+ supply and ground circuit are OK.
- This checks whether B+ is available at the MAF sensor.

DTC P0102 MAF Sensor Circuit Low Frequency

Step	Action	Value(s)	Yes	No
1	Was the Powertrain On-Board Diagnostic (OBD) System Check performed?	—	Go to Step 2	Go to Powertrain OBD System Check
2	1. Start the engine and idle. 2. With the engine idling, monitor MAF gm/s display on the Engine 1 Data List of the scan tool. Is MAF gm/s below the specified value?	3.9 gm/s	Go to Step 4	Go to Step 3
3	1. Turn the ignition ON, engine OFF, review Freeze Frame and/or Failure Records data for this DTC and note parameters. 2. Turn the ignition OFF for 15 seconds. 3. Start the engine and operate the vehicle within the conditions required for this diagnostic to run, and as close to the conditions recorded in Freeze Frame/Failure Records as possible. Special operating conditions that need to be met before the PCM will run this diagnostic, where applicable, are listed in Conditions for Setting the DTC. 4. 14	Using the scan tool, select Capture Info, Review Info. Are any DTCs displayed that have not been diagnosed?	—	Go to the applicable DTC table	System OK

DTC P0103 MAF Sensor Circuit High Frequency

30411

Circuit Description

The Mass Air Flow (MAF) sensor measures the amount of air that is ingested by the engine. Direct measurement of air entering the engine is more accurate than calculating airflow from MAP, IAT and RPM (speed/density). The MAF sensor has a battery feed, ground and signal circuit.

The MAF sensor used on this vehicle is a hot wire type and is used to measure air flow rate. The MAF output frequency is a function of the power required to keep the air flow sensing elements (hot wires) at a fixed temperature above ambient temperature. Air flowing through the sensor cools the sensing elements. The amount of cooling is proportional to the amount of air flow. As air flow increases, a greater amount of current is required to maintain the hot wires at a constant temperature. The MAF sensor converts the changes in current draw to a frequency signal read by the PCM. The PCM calculates air flow (grams per second) based on this signal.

The PCM monitors the MAF sensor frequency and can determine if the sensor is stuck low, stuck high, not providing the airflow value expected for a given operating condition, or that the signal appears to be

stuck based on a lack of signal variation expected during normal operation. This diagnostic checks for too high an airflow rate. When the PCM detects that the MAF sensor grams per second is above a predetermined value, this DTC will set.

Conditions for Setting the DTC

- Engine running.
- Engine speed greater than 50 RPM.
- Ignition voltage greater than 10 volts.
- Mass Air Flow greater than 300 grams per second.
- All conditions met for 1 second.

Action Taken When the DTC Sets

- The PCM will illuminate the Malfunction Indicator Lamp (MIL) when the diagnostic runs and fails.
- The PCM will utilize speed density (RPM, MAP, IAT) for fuel management.
- The PCM will record operating conditions at the time the diagnostic fails. This information will be stored in the Freeze Frame and/or Failure Records.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL OFF after three consecutive drive trips that the diagnostic runs and does not fail.
- A last test failed (Current DTC) will clear when the diagnostic runs and does not fail.
- A History DTC will clear after forty consecutive warm-up cycles, if no failures are reported by this or any other emission related diagnostic.
- PCM battery voltage is interrupted.
- Using a Scan tool.

Diagnostic Aids

- Water entering the air intake system that reaches the MAF sensor could cause this DTC to set. The water rapidly cools the hot wires in the sensor, causing a false indication of excessive airflow. Check the following areas for evidence (witness marks) of water intrusion:
- AIR system.
 - Poor connections.
 - Mis-routed harness.
 - Rubbed through wire insulation.
 - Broken wire inside the insulation.

For intermittents, refer to *Symptoms*.

Test Description

Number(s) below refer to step numbers on the diagnostic table.

- Monitoring MAF sensor grams per second (gm/s) will determine if the fault is present or the malfunction is intermittent. For any test that requires back probing the PCM or component harness connectors, must use the Connector Test Adapter Kit J 35616-A. Using this kit will prevent any damage to the harness connector terminals.
- Using Freeze Frame and/or Failure Records data may aid in locating an intermittent condition. If the DTC cannot be duplicated, the information included in the Freeze Frame and/or Failure Records data can be useful in determining how many miles since the DTC set. The Fail Counter and Pass Counter can also be used to determine how many ignition cycles the diagnostic reported a pass and/or a fail. Operate vehicle within the same freeze frame conditions (RPM, load, vehicle speed, temperature etc.) that were noted. This will isolate when the DTC failed.
- This checks for electro-magnetic interference on the MAF sensor signal circuit. There should be no signal indicated on the scan tool with the sensor disconnected.

DTC P0103 MAF Sensor Circuit High Frequency

Step	Action	Value(s)	Yes	No
1	Was the Powertrain On-Board Diagnostic (OBD) System Check performed?	—	Go to Step 2	Go to Powertrain OBD System Check

DTC P0106 MAP System Performance

30394

Circuit Description

The Manifold Absolute Pressure (MAP) sensor is mounted to the top of the intake manifold. The MAP sensor measures pressure changes within the intake manifold which are an indication of engine load. The MAP sensor has a 5.0 volt reference circuit, a ground and a signal circuit.

The PCM compares the MAP sensor signal activity with throttle angle and RPM. If the PCM detects a large MAP change without sensing a change in throttle angle and RPM, this DTC will set.

Conditions for Setting the DTC

- DTCs P0107, P0108, P0121, P0122 and P0123 not set.
- Engine operating.
- ASR/TCS not in a traction event (If so equipped).
- Engine speed does not change more than 100 RPM.
- TP sensor angle does not change more than 5%.
- EGR position does not change more than 25%.
- IAC position, at a steady state.

- No change (steady state) in A/C clutch, power steering signal, brake signal, and transmission position.
- PCM detects a substantial change in MAP, without being preceded by a large change in throttle angle and RPM.
- All conditions stable for 0.5 second.
- All conditions met for 4.5 seconds.

Action Taken When the DTC Sets

- The PCM will illuminate the Malfunction Indicator Lamp (MIL) on the second consecutive drive trip that the diagnostic runs and fails.
- The PCM will record operating conditions at the time the diagnostic fails. The first time the diagnostic fails, this information will be stored in Failure Records. If the diagnostic reports a failure on the second consecutive drive trip, the operating conditions at the time of failure will be written to Freeze Frame and the Failure record will be updated.
- The PCM will use TP sensor values to calculate MAP.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL OFF after three consecutive drive trips that the diagnostic runs and does not fail.
- A History DTC will clear after forty consecutive warm-up cycles, if no failures are reported by this or any other emission related diagnostic.
- PCM battery voltage is interrupted.
- Using a Scan tool.

Diagnostic Aids

An intermittent may be caused by the following:

- Mis-routed harness.
- Rubbed through wire insulation.
- Broken wire inside the insulation.

For intermittents, refer to *Symptoms*.

Test Description

Number(s) below refer to step numbers on the diagnostic table.

- Erratic engine vacuum caused by a base engine problem or a misfire condition should be diagnosed first.

- When moving related connectors, visually/physically inspect connectors for the following:
 - Poor mating of the connector halves or a terminal not fully seated in the connector body (backed out).
 - Improperly formed or damaged terminals. All connector terminals in the related circuits should be carefully reformed or replaced to insure proper contact tension.
 - Poor terminal to wire connection. Inspect for poor crimps, crimping over wire insulation rather than the wire.
 - Dirt or corrosion on terminals. Inspect connector seals for being there and for being damaged.

DTC P0106 MAP System Performance

Step	Action	Value(s)	Yes	No
1	Was the Powertrain On-Board Diagnostic (OBD) System Check performed?	—	Go to Step 2	Go to Powertrain OBD System Check
2	Is DTC P0300 also set?	—	Go to DTC P0300 Engine Misfire Detected	Go to Step 3
3	1. Start and idle the engine. 2. Using a scan tool, select MAP from the Engine 1 Data List. Is MAP varying more than the specified amount?	6.3 kPa	Go to Step 4	Go to Step 9
4	1. Turn the ignition ON, engine OFF. 2. Move the MAP sensor electrical connector, the harness and the PCM connectors (by hand only) while observing the scan tool display. Is the MAP value affected by moving the harness or connectors?	—	Go to Step 12	Go to Step 5
5	Important: This value will vary with altitude. Refer to <i>Test Description</i> . Does the scan tool display the MAP value shown?	100 kPa	Go to Step 6	Go to Step 13

DTC P0106 MAP System Performance (cont'd)

Step	Action	Value(s)	Yes	No
6	1. Remove the MAP sensor from the intake manifold but leave the electrical harness connected. 2. Connect a hand operated vacuum pump to the MAP sensor. 3. Observe the MAP display while slowly applying vacuum up to 20 inch Hg as indicated on the pump gauge. Each 1 inch of vacuum applied should result in a 3 to 4 kPa drop in the MAP sensor value on the scan tool and the value should change smoothly with each increase in vacuum. Did the MAP value change smoothly through the entire range of the test without any erratic readings?	—	Go to Step 13	Go to Step 7
7	Apply 20 inch Hg vacuum to the MAP sensor. Is the MAP sensor reading the same or less than the specified value?	34 kPa	Go to Step 8	Go to Step 13
8	Disconnect the vacuum source from the MAP sensor. Does the MAP sensor reading return to its original value?	—	Go to Step 9	Go to Step 13
9	1. Turn the ignition ON, engine OFF, review Freeze Frame and/or Failure Records data for this DTC and note parameters. 2. Turn the ignition OFF for 15 seconds. 3. Start the engine and operate the vehicle within the conditions required for this diagnostic to run, and as close to the conditions recorded in Freeze Frame/Failure Records as possible. Special operating conditions that need to be met before the PCM will run this diagnostic, where applicable, are listed in Conditions for Setting the DTC. 4. Using the scan tool, select DTC, Specific, then enter the DTC number which was set. Does the scan tool indicate that this diagnostic failed this ignition?	—	Go to Step 10	Go to Diagnostic Aids - DTC P0106 MAP System Performance
10	1. Check the MAF sensor harness for incorrect routing. 2. Near secondary ignition or components. 3. Other high voltage components. 4. Solenoids, relays, motors. 5. If incorrect routing is found, correct harness routing. Was a problem found and corrected?	—	Go to Step 16	Go to Step 11
11	Check for a plugged or leaking vacuum supply to the MAP sensor. Was a problem found and corrected?	—	Go to Step 13	Go to Step 14
12	Check for the following conditions and repair as necessary: • Electrical connector terminals for poor connections, improper contact tension or poor terminal to wire connection. • Rubbed through wire insulation. • Broken wire inside the insulation. • Mis-routed harness. Is action complete?	—	Go to Step 16	Go to Step 10
13	Replace the MAP sensor. Is action complete?	—	Go to Step 16	—

DTC P0106 MAP System Performance (cont'd)

17	Using the scan tool, select Capture Info, Review Info. Are any DTCs displayed that have not been diagnosed?	—	Go to the applicable DTC table	System OK

DTC P0107 MAP Sensor Circuit Low Voltage

30394

Circuit Description

The Manifold Absolute Pressure (MAP) sensor is mounted to the top of the intake manifold. The MAP sensor measures pressure changes within the intake manifold which are an indication of engine load. The MAP sensor has a 5.0 volt reference, a ground and a signal circuit.

The MAP sensor contains a diaphragm which changes resistance based on pressure. When manifold pressure is low (high vacuum) sensor output voltage is low. When manifold pressure is high (low vacuum) sensor output voltage is high.

MAP sensor voltage (depending on altitude) can range from 1.0–1.5 volts at idle (high vacuum) to 4.0 – 4.9 volts at wide open throttle (low vacuum).

When the PCM senses a signal voltage lower than the normal operating range of the sensor, this DTC will set.

Conditions for Setting the DTC

- No TP sensor DTCs set.
- TP Angle greater than 15%.
- MAP is less than 0.24 volts.
- All conditions met for 4.5 seconds.

Action Taken When the DTC Sets

- The PCM will illuminate the Malfunction Indicator Lamp (MIL) on the second consecutive drive trip that the diagnostic runs and fails.
- The PCM will record operating conditions at the time the diagnostic fails. The first time the diagnostic fails, this information will be stored in Failure Records. If the diagnostic reports a failure on the second consecutive drive trip, the operating conditions at the time of failure will be written to Freeze Frame and the Failure record will be updated.
- The PCM will use TP sensor values to calculate MAP.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL OFF after three consecutive drive trips that the diagnostic runs and does not fail.
- A last test failed (Current DTC) will clear when the diagnostic runs and does not fail.
- A History DTC will clear after forty consecutive warm-up cycles, if no failures are reported by this or any other emission related diagnostic.

- PCM battery voltage is interrupted.
- Using a Scan tool.

Diagnostic Aids:

- An intermittent may be caused by the following:
 - Mis-routed harness.
 - Rubbed through wire insulation.
 - Broken wire inside the insulation.
- If other DTCs are set that share the same ground and/or 5.0 volt reference circuit, check for faulty connections and for faulty wiring.
- The PCM 5 volt reference circuits are internally connected within the PCM. If all the MAP sensor circuits check to be OK, inspect related 5.0 volt reference circuits.
- If it is determined that the DTC occurs intermittently, performing the DTC P1107 diagnostic table may isolate the cause of the fault.

For intermittents, refer to *Symptoms*.

Test Description

Number(s) below refer to step numbers on the diagnostic table.

2. Determines if the malfunction is present. For any test that requires back probing the PCM or

component harness connectors, must use the Connector Test Adapter Kit J 35616–A. Using this kit will prevent any damage to the harness connector terminals.

3. Using Freeze Frame and/or Failure Records data may aid in locating an intermittent condition. If the DTC cannot be duplicated, the information included in the Freeze Frame and/or Failure Records data can be useful in determining how many miles since the DTC set. The Fail Counter and Pass Counter can also be used to determine how many ignition cycles the diagnostic reported a pass and/or a fail. Operate vehicle within the same freeze frame conditions (RPM, load, vehicle speed, temperature etc.) that were noted. This will isolate when the DTC failed.
4. If the scan tool displays 5.0 volts, indicates that the MAP sensor signal, 5.0 volt reference circuit and PCM are OK.
5. If the scan tool displays 5.0 volts, indicates that the MAP sensor signal circuit and PCM are OK.
6. Disconnecting the PCM will allow using the DVM (J 39200) to check continuity of the circuits. This will aid in locating an open or shorted circuit.

DTC P0107 MAP Sensor Circuit Low Voltage

Step	Action	Value(s)	Yes	No
1	Was the Powertrain On-Board Diagnostic (OBD) System Check performed?	—	Go to Step 2	Go to Powertrain OBD System Check
2	1. Install the scan tool. 2. Start and idle the engine, monitor MAP voltage on Engine 1 Data List on the scan tool. Is MAP voltage below the specified value?	0.24 V	Go to Step 4	Go to Step 3
3	1. Turn the ignition ON, engine OFF, review Freeze Frame and/or Failure Records data for this DTC and note parameters. 2. Turn the ignition OFF for 15 seconds. 3. Start the engine and operate the vehicle within the conditions required for this diagnostic to run, and as close to the conditions recorded in Freeze Frame/Failure Records as possible. Special operating conditions that need to be met before the PCM will run this diagnostic, where applicable, are listed in Conditions for Setting the DTC. 4. Using the scan tool, select DTC, Specific, then enter the DTC number which was set. Does the scan tool indicate that this diagnostic failed this ignition?	—	Go to Step 4	Go to Diagnostic Aids - DTC P0107 (MAP) Sensor Circuit Low Voltage
4	1. Disconnect the MAP sensor electrical connector. 2. Jumper the 5 volt reference circuit and the MAP signal circuit together at the MAP sensor harness connector. 3. Observe the MAP voltage display on the scan tool. Is MAP voltage at the specified value?	5.0V	Go to Step 10	Go to Step 5

DTC P0107 MAP Sensor Circuit Low Voltage (cont'd)

Step	Action	Value(s)	Yes	No
5	1. Connect a test light (J 34142-B) between B+ and the MAP sensor signal circuit at the MAP sensor harness connector. 2. Observe the MAP voltage display on the scan tool. Is MAP voltage at the specified value?	5.0 V	Go to Step 6	Go to Step 8
6	1. Turn the ignition OFF. 2. Disconnect the PCM and check the 5 volt reference circuit for an open or short to ground. 3. If the 5 volt reference circuit is open or shorted to ground, repair it as necessary. Was the 5 volt reference circuit open or shorted to ground?	—	Go to Step 12	Go to Step 7
7	Check the 5 volt reference circuit for a poor connection at the PCM and replace the terminal if necessary. Refer to <i>Repair Procedures in Electrical Diagnosis (8A Cell 5)</i> . Did the terminal require replacement?	—	Go to Step 12	Go to Step 11
8	1. Turn the ignition OFF. 2. Disconnect the PCM, and check the MAP signal circuit the following: • Open circuit. • Short to ground. • Short to sensor ground circuit. 3. If the MAP sensor signal circuit is open or shorted to ground, repair it as necessary. Refer to <i>Repair Procedures in Electrical Diagnosis (8A Cell 5)</i> . Was the MAP signal circuit open or shorted to ground?	—	Go to Step 12	Go to Step 9
9	Check the MAP sensor signal circuit for a poor connection at the PCM and replace the terminal if necessary. Refer to <i>Repair Procedures in Electrical Diagnosis (8A Cell 5)</i> . Did the terminal require replacement?	—	Go to Step 12	Go to Step 11
10	Replace the MAP sensor. Refer to <i>MAP Sensor</i> . Is the action complete?	—	Go to Step 12	—
11	Important: Replacement PCM must be programmed. Refer to <i>PCM Replacement/Programming</i> . Replace the PCM. Is the action complete?	—	Go to Step 12	—
12	1. Using the scan tool, select DTC, Clear Info. 2. Start the engine and idle at normal operating temperature. 3. Select DTC, Specific, then enter the DTC number which was set. 4. Operate the vehicle within the conditions for setting this DTC as specified in the supporting text, if applicable. Does the scan tool indicate that this test ran and passed?	—	Go to Step 13	Go to Step 2
13	Using the scan tool, select Capture Info, Review Info. Are any DTCs displayed that have not been diagnosed?	—	Go to the applicable DTC table	System OK

DTC P0108 MAP Sensor Circuit High Voltage

30394

Circuit Description

The Manifold Absolute Pressure (MAP) sensor is mounted to the top of the intake manifold. The MAP sensor measures pressure changes within the intake manifold which are an indication of engine load. The MAP sensor has a 5.0 volt reference, a ground and a signal circuit.

The MAP sensor contains a diaphragm which changes resistance based on pressure. When manifold pressure is low (high vacuum) sensor output voltage is low. When manifold pressure is high (low vacuum) sensor output voltage is high.

MAP sensor voltage (depending on altitude) can range from 1.0–1.5 volts at idle (high vacuum) to 4.0–4.9 volts at wide open throttle (low vacuum).

When the PCM senses a signal voltage higher than the normal operating range of the sensor, this DTC will set.

Conditions for Setting the DTC

- DTCs P0122 and P0123 not set.
- Engine Operating.

- TP sensor angle less than 3% when RPM is greater than 1000 RPM.
- TP sensor angle 0% when engine speed is below 1000 RPM.
- MAP voltage is greater than 4.2 volts.
- All conditions met for 3 seconds.

Action Taken When the DTC Sets

- The PCM will illuminate the Malfunction Indicator Lamp (MIL) on the second consecutive drive trip that the diagnostic runs and fails.
- The PCM will record operating conditions at the time the diagnostic fails. The first time the diagnostic fails, this information will be stored in Failure Records. If the diagnostic reports a failure on the second consecutive drive trip, the operating conditions at the time of failure will be written to Freeze Frame and the Failure record will be updated.
- The PCM will use TP sensor values to calculate MAP.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL OFF after three consecutive drive trips that the diagnostic runs and does not fail.
- A last test failed (Current DTC) will clear when the diagnostic runs and does not fail.
- A History DTC will clear after forty consecutive warm-up cycles, if no failures are reported by this or any other emission related diagnostic.
- PCM battery voltage is interrupted.
- Using a Scan tool.

Diagnostic Aids

- An intermittent may be caused by the following:
 - Mis-routed harness.
 - Rubbed through wire insulation.
 - Broken wire inside the insulation.
- If other DTCs are set that share the same ground and/or 5.0 volt reference circuit, check for faulty connections and for faulty wiring.
- The PCM 5 volt reference circuits are internally connected within the PCM. If all the MAP sensor circuits check to be OK, inspect related 5.0 volt reference circuits.
- If it is determined that the DTC occurs intermittently, performing the DTC P1106 diagnostic table may isolate the cause of the fault.

For intermittents, refer to *Symptoms*.

Test Description

Number(s) below refer to step numbers on the diagnostic table.

2. Determines if the malfunction is present. For any test that requires back probing the PCM or component harness connectors, must use the Connector Test Adapter Kit J 35616-A. Using this kit will prevent any damage to the harness connector terminals.
3. Using Freeze Frame and/or Failure Records data may aid in locating an intermittent condition. If the DTC cannot be duplicated, the information included in the Freeze Frame and/or Failure Records data can be useful in determining how many miles since the DTC set. The Fail Counter and Pass Counter can also be used to determine how many ignition cycles the diagnostic reported a pass and/or a fail. Operate vehicle within the same freeze frame conditions (RPM, load, vehicle speed, temperature etc.) that were noted. This will isolate when the DTC failed.
4. This checks whether the signal circuit is shorted to a voltage.
5. This checks whether a ground circuit is available at the MAP sensor.
8. Remove the MAP sensor and check if vacuum is available to the sensor. Also inspect MAP sensor seal for nicks and cuts. A vacuum leak at the seal will cause P0108 to set.

DTC P0108 MAP Sensor Circuit High Voltage

Step	Action	Value(s)	Yes	No
1	Was the Powertrain On-Board Diagnostic (OBD) System Check performed?	—	Go to Step 2	Go to Powertrain OBD System Check
2	1. If the engine idle is rough, unstable or incorrect, repair the idle problem before using this table; refer to <i>Symptoms</i> . 2. Install the scan tool. 3. With the engine idling, monitor MAP voltage on Engine 1 Data List on the scan tool. Is the MAP voltage above the specified value?	4.2V	Go to Step 4	Go to Step 3

DTC P0108 MAP Sensor Circuit High Voltage (cont'd)

Step	Action	Value(s)	Yes	No
3	1. Turn the ignition ON, engine OFF, review Freeze Frame and/or Failure Records data for this DTC and note parameters. 2. Turn the ignition OFF for 15 seconds. 3. Start the engine and operate the vehicle within the conditions required for this diagnostic to run, and as close to the conditions recorded in Freeze Frame/Failure Records as possible. Special operating conditions that need to be met before the PCM will run this diagnostic, where applicable, are listed in Conditions for Setting the DTC. 4. Using the scan tool, select DTC, Specific, then enter the DTC number which was set. Does the scan tool indicate that this diagnostic failed this ignition?	—	Go to Step 4	Go to Diagnostic Aids - DTC P0108 MAP Sensor Circuit High Voltage
4	1. Disconnect the MAP sensor electrical connector. 2. Note the MAP sensor voltage displayed on the scan tool. Is the MAP sensor voltage below the specified value?	1.0V	Go to Step 5	Go to Step 6
5	Probe the sensor ground circuit with a test light (J 34142-B) to B+. Is the test light ON?	—	Go to Step 7	Go to Step 9
6	1. Check the MAP signal circuit for a short to voltage or a short to the 5 volt reference circuit. 2. If the MAP sensor signal circuit is shorted, repair circuit as necessary. Refer to <i>Repair Procedures in Electrical Diagnosis (8A Cell 5)</i>. Was the MAP sensor signal circuit shorted?	—	Go to Step 15	Go to Step 11
7	Using a DVM (J 39200), measure the voltage at the 5.0 volt reference circuit to ground. Is the voltage greater than the specified value?	5.0V	Go to Step 14	Go to Step 8
8	Check for a plugged or leaking vacuum supply to the MAP sensor. Is the vacuum supply OK?	—	Go to Step 12	Go to Step 13
9	1. Check for a poor sensor ground terminal connection at the PCM. 2. If a problem is found, replace the faulty terminal. Refer to <i>Repair Procedures in Electrical Diagnosis (8A Cell 5)</i>. Did the terminal require replacement?	—	Go to Step 15	Go to Step 10
10	1. Check continuity of the MAP sensor ground circuit. 2. If the MAP sensor ground circuit measures over the specified value, repair open or poor connection. Refer to <i>Repair Procedures in Electrical Diagnosis (8A Cell 5)</i>. Was a condition found and corrected?	5 Ω	Go to Step 15	Go to Step 11
11	Important: Replacement PCM must be programmed. Refer to <i>PCM Replacement/Programming</i>. Replace the PCM. Is the action complete?	—	Go to Step 15	—

DTC P0108 MAP Sensor Circuit High Voltage (cont'd)

Step	Action	Value(s)	Yes	No
12	Replace the MAP sensor. Refer to <i>MAP Sensor</i> . Is the action complete?	—	Go to Step 15	—
13	Repair the faulty vacuum supply. Is the action complete?	—	Go to Step 15	—
14	Repair the 5.0 volt reference circuit for a short to voltage. Is the action complete?	—	Go to Step 15	—
15	1. Using the scan tool, select DTC, Clear Info. 2. Start the engine and idle at normal operating temperature. 3. Select DTC, Specific, then enter the DTC number which was set. 4. Operate the vehicle within the conditions for setting this DTC as specified in the supporting text, if applicable. Does the scan tool indicate that this test ran and passed?	—	Go to Step 16	Go to Step 2
16	Using the scan tool, select Capture Info, Review Info. Are any DTCs displayed that have not been diagnosed?	—	Go to the applicable DTC table	System OK

DTC P0112 IAT Sensor Circuit Low Voltage

30393

Circuit Description

The Intake Air Temperature (IAT) sensor contains a semiconductor device which changes resistance based on temperature (a thermistor). The IAT sensor is located in the air intake passage of the engine air induction system. The IAT sensor has a signal circuit and a ground circuit. The PCM applies a voltage (about 5.0 volts) on the signal circuit to the sensor. The PCM monitors changes in this voltage caused by changes in the resistance of the sensor to determine intake air temperature.

When the intake air is cold, the sensor (thermistor) resistance is high, and the PCM's signal voltage is only pulled down a small amount through the sensor to ground. Therefore, the PCM will sense a high signal voltage (low temperature). When the intake air

is warm, the sensor resistance is low, and the signal voltage is pulled down a greater amount. This causes the PCM to sense a low signal voltage (high temperature).

When the PCM senses a signal voltage lower than the normal operating range of the sensor, this DTC will set.

Conditions for Setting the DTC

- DTCs P0100, P0102, P0103, P0117, P0118, P0502, P0503 not set.
- Engine operating longer than 30 seconds.
- Vehicle speed greater than 40 km/h (25 mph).
- Intake Air Temperature greater than 150°C (302°F).
- All conditions met for 4.5 seconds.

Action Taken When the DTC Sets

- The PCM will illuminate the Malfunction Indicator Lamp (MIL) on the second consecutive drive trip that the diagnostic runs and fails.
- The PCM will record operating conditions at the time the diagnostic fails. The first time the diagnostic fails, this information will be stored in Failure Records. If the diagnostic reports a failure on the second consecutive drive trip, the operating conditions at the time of failure will be written to Freeze Frame and the Failure record will be updated.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL OFF after three consecutive drive trips that the diagnostic runs and does not fail.
- A last test failed (Current DTC) will clear when the diagnostic runs and does not fail.
- A History DTC will clear after forty consecutive warm-up cycles, if no failures are reported by this or any other emission related diagnostic.
- PCM battery voltage is interrupted.
- Using a Scan tool.

Diagnostic Aids

- An intermittent may be caused by the following:
 - Mis-routed harness
 - Rubbed through wire insulation
 - Broken wire inside the insulation.
- If other DTCs are set that share the same ground and/or 5.0 volt reference circuit, check for faulty connections and for faulty wiring.

- If the engine has been allowed to sit overnight, the engine coolant temperature and engine intake air temperature values should display within a few degrees of each other. If the temperatures are not within 3°C (5°F), refer to *Temperature Vs Resistance Table*
- If it is determined that the DTC occurs intermittently, performing the P1112 diagnostic table may isolate the cause of the fault.

For intermittents, refer to *Symptoms*.

Test Description

Number(s) below refer to step numbers on the diagnostic table.

2. Determines if the malfunction is present.
3. Using Freeze Frame and/or Failure Records data may aid in locating an intermittent condition. If the DTC cannot be duplicated, the information included in the Freeze Frame and/or Failure Records data can be useful in determining how many miles since the DTC set. The Fail Counter and Pass Counter can also be used to determine how many ignition cycles the diagnostic reported a pass and/or a fail. Operate vehicle within the same freeze frame conditions (RPM, load, vehicle speed, temperature etc.) that were noted. This will isolate when the DTC failed.
4. If the intake air temperature goes below -30°C (-22°F), indicates the PCM and IAT wiring are OK.
5. Disconnecting the PCM will allow using the DVM (J 39200) to check continuity of the circuits. This will aid in locating an open or shorted circuit.

DTC P0112 IAT Sensor Circuit Low Voltage

Step	Action	Value(s)	Yes	No
1	Was the Powertrain On-Board Diagnostic (OBD) System Check performed?	—	Go to Step 2	Go to Powertrain OBD System Check
2	1. Install the scan tool. 2. Turn the ignition ON, engine OFF. 3. Monitor the IAT display on the Engine 1 Data List of the scan tool. Is the IAT above the specified value?	150 °C (302 °F)	Go to Step 4	Go to Step 3
3	1. Turn the ignition ON, engine OFF, review Freeze Frame and/or Failure Records data for this DTC and note parameters. 2. Turn the ignition OFF for 15 seconds. 3. Start the engine and operate the vehicle within the conditions required for this diagnostic to run, and as close to the conditions recorded in Freeze Frame/Failure Records as possible. Special operating conditions that need to be met before the PCM will run this diagnostic, where applicable, are listed in Conditions for Setting the DTC. 4. 5	1. Turn the ignition OFF. 2. Disconnect the PCM, and check the IAT signal circuit for a short to ground. 3. If the IAT sensor signal circuit is grounded, repair it as necessary. Refer to <i>Repair Procedures in Electrical Diagnosis (8A Cell 5)</i> . Was the IAT signal circuit grounded?	—	Go to Step 8	Go to Step 7
6	Replace the IAT sensor. Refer to <i>IAT Sensor</i> . Is the action complete?	—	Go to Step 8	—
7	Important: Replacement PCM must be programmed. Refer to <i>PCM Replacement/Programming</i> . Replace the PCM. Is the action complete?	—	Go to Step 8	—
8	1. Using the scan tool, select DTC, Clear Info. 2. Start the engine and idle at normal operating temperature. 3. Select DTC, Specific, then enter the DTC number which was set. 4. Operate the vehicle within the conditions for setting this DTC as specified in the supporting text, if applicable. Does the scan tool indicate that this test ran and passed?	—	Go to Step 9	Go to Step 2
9	Using the scan tool, select Capture Info, Review Info. Are any DTCs displayed that have not been diagnosed?	—	Go to the applicable DTC table	System OK

DTC P0113 IAT Sensor Circuit High Voltage

30393

Circuit Description

The Intake Air Temperature (IAT) sensor contains a semiconductor device which changes resistance based on temperature (a thermistor). The IAT sensor is located in the air intake passage of the engine air induction system. The IAT sensor has a signal circuit and a ground circuit. The PCM applies a voltage (about 5.0 volts) on the signal circuit to the sensor. The PCM monitors changes in this voltage caused by changes in the resistance of the sensor to determine intake air temperature.

When the intake air is cold, the sensor (thermistor) resistance is high, and the PCM's signal voltage is only pulled down a small amount through the sensor to ground. Therefore, the PCM will sense a high signal voltage (low temperature). When the intake air is warm, the sensor resistance is low, and the signal

voltage is pulled down a greater amount. This causes the PCM to sense a low signal voltage (high temperature).

When the PCM senses a signal voltage higher than the normal operating range of the sensor, this DTC will set.

Conditions for Setting the DTC

- DTC(s) P0100, P0102, P0103, P0117, P0118, P0500, P0502, P0503 not set.
- Engine operating longer than 100 seconds.
- Engine Coolant Temperature greater than 0°C (32°F).
- Intake Air Temperature is less than -35°C (-31°F).
- Vehicle speed less than 11 km/h (7 mph).

- Mass Air Flow less than 15 grams per second.
- All conditions met for 4.5 seconds.

Action Taken When the DTC Sets

- The PCM will illuminate the Malfunction Indicator Lamp (MIL) on the second consecutive drive trip that the diagnostic runs and fails.
- The PCM will record operating conditions at the time the diagnostic fails. The first time the diagnostic fails, this information will be stored in Failure Records. If the diagnostic reports a failure on the second consecutive drive trip, the operating conditions at the time of failure will be written to Freeze Frame and the Failure record will be updated.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL OFF after three consecutive drive trips that the diagnostic runs and does not fail.
- A last test failed (Current DTC) will clear when the diagnostic runs and does not fail.
- A History DTC will clear after forty consecutive warm-up cycles, if no failures are reported by this or any other emission related diagnostic.
- PCM battery voltage is interrupted.
- Using a Scan tool.

Diagnostic Aids

- An intermittent may be caused by the following:
 - Mis-routed harness.
 - Rubbed through wire insulation.
 - Broken wire inside the insulation.
- If other DTCs are set that share the same ground and/or 5.0 volt reference circuit, check for faulty connections and for faulty wiring.
- If the engine has been allowed to sit overnight, the engine coolant temperature and intake air temperature values should display within a few degrees of each other. If the temperatures are not within 3°C (5°F), refer to *Temperature Vs Resistance Table*.

- If it is determined that the DTC occurs intermittently, performing the P1111 diagnostic table may isolate the cause of the fault.

For intermittents, refer to *Symptoms*.

Test Description

Number(s) below refer to step numbers on the diagnostic table.

2. Determines if the malfunction is present. For any test that requires probing the PCM or component harness connectors, must use the Connector Test Adapter Kit J 35616-A. Using this kit will prevent any damage to the harness connector terminals.
3. Using Freeze Frame and/or Failure Records data may aid in locating an intermittent condition. If the DTC cannot be duplicated, the information included in the Freeze Frame and/or Failure Records data can be useful in determining how many miles since the DTC set. The Fail Counter and Pass Counter can also be used to determine how many ignition cycles the diagnostic reported a pass and/or a fail. Operate vehicle within the same freeze frame conditions (RPM, load, vehicle speed, temperature etc.) that were noted. This will isolate when the DTC failed.
4. If the intake air temperature goes above 150°C (302°F), indicates the PCM and IAT wiring are OK.
5. If the intake air temperature goes above 150°C (302°F), indicates the PCM and IAT signal circuit is OK.
7. Disconnecting the PCM will allow using the DVM (J 39200) to check continuity of the circuits. This will aid in locating an open or shorted circuit.
8. Disconnecting the PCM will allow using the DVM (J 39200) to check continuity of the circuits. This will aid in locating an open or shorted circuit.

DTC P0113 IAT Sensor Circuit High Voltage

Step	Action	Value(s)	Yes	No
1	Was the Powertrain On-Board Diagnostic (OBD) System Check performed?	—	Go to Step 2	Go to Powertrain OBD System Check
2	1. Install the scan tool. 2. Turn the ignition ON, engine OFF. 3. Monitor the IAT display on the Engine 1 Data List of the scan tool. Is the IAT at the specified value?	-40°C (-40°F)	Go to Step 4	Go to Step 3
3	1. Turn the ignition ON, engine OFF, review Freeze Frame and/or Failure Records data for this DTC and note parameters. 2. Turn the ignition OFF for 15 seconds. 3. Start the engine and operate the vehicle within the conditions required for this diagnostic to run, and as close to the conditions recorded in Freeze Frame/Failure Records as possible. Special operating conditions that need to be met before the PCM will run this diagnostic, where applicable, are listed in Conditions for Setting the DTC. 4. Using the scan tool, select DTC, Specific, then enter the DTC number which was set. Does the scan tool indicate that this diagnostic failed this ignition?	—	Go to Step 4	Go to Diagnostic Aids - DTC P0113 IAT Sensor Circuit High Voltage
4	1. Disconnect the IAT Sensor electrical connector. 2. Jumper the IAT harness terminals together. 3. Observe IAT parameter on the scan tool. Is the IAT at the specified value?	151°C (304°F)	Go to Step 9	Go to Step 5
5	Jumper the IAT signal circuit to a known good ground. Is the IAT at the specified value?	151°C (304°F)	Go to Step 8	Go to Step 6
6	1. Turn the ignition OFF. 2. Disconnect the PCM electrical connectors. 3. Check the IAT sensor signal circuit for an open. Is the IAT sensor signal circuit open?	—	Go to Step 7	Go to Step 11
7	Repair the IAT sensor signal circuit. Refer to <i>Repair Procedures in Electrical Diagnosis (8A Cell 5)</i> . Is the action complete?	—	Go to Step 12	—
8	1. Turn the ignition OFF. 2. Disconnect the PCM electrical connectors. 3. Check the IAT sensor ground circuit for an open. Is the IAT sensor ground circuit open?	—	Go to Step 10	Go to Step 11
9	Replace the IAT sensor. Refer to <i>IAT Sensor</i> . Is the action complete?	—	Go to Step 12	—
10	Repair the IAT sensor ground circuit. Refer to <i>Repair Procedures in Electrical Diagnosis (8A Cell 5)</i> . Is the action complete?	—	Go to Step 12	—

DTC P0113 IAT Sensor Circuit High Voltage (cont'd)

11	Important: Replacement PCM must be programmed. Refer to <i>PCM Replacement/Programming</i> . Replace the PCM. Is the action complete?	—	Go to Step 12	—
12	1. Using the scan tool, select DTC, Clear Info. 2. Start the engine and idle at normal operating temperature. 3. Select DTC, Specific, then enter the DTC number which was set. 4. Operate the vehicle within the conditions for setting this DTC as specified in the supporting text, if applicable. Does the scan tool indicate that this test ran and passed?	—	Go to Step 13	Go to Step 2
13	Using the scan tool, select Capture Info, Review Info. Are any DTCs displayed that have not been diagnosed?	—	Go to the applicable DTC table	System OK

DTC P0117 ECT Sensor Circuit Low Voltage

30394

Circuit Description

The Engine Coolant Temperature (ECT) sensor contains a semiconductor device which changes resistance based on temperature (a thermistor). The ECT sensor is mounted in the engine coolant pump housing. The ECT sensor has a signal circuit and a ground circuit. The PCM applies a voltage (about 5.0 volts) on the signal circuit to the sensor. The PCM monitors changes in this voltage caused by changes in the resistance of the sensor to determine coolant temperature.

When the coolant is cold, the sensor (thermistor) resistance is high, and the PCM's signal voltage is only pulled down a small amount through the sensor to ground. Therefore, the PCM will sense a high signal voltage (low temperature). When the coolant is warm, the sensor resistance is low, and the signal voltage is pulled down a greater amount. This causes the PCM to sense a low signal voltage (high temperature). At normal operating temperature, the voltage should measure about 1.5–2.0 volts at the PCM.

When the PCM senses a signal voltage lower than the normal operating range of the sensor, this DTC will set.

Conditions for Setting the DTC

- Engine operating longer than 20 seconds.
- The PCM indicates Engine Coolant Temperature greater than 151 °C (304 °F).
- All conditions met for 4.5 seconds.

Action Taken When the DTC Sets

- The PCM will illuminate the Malfunction Indicator Lamp (MIL) on the second consecutive drive trip that the diagnostic runs and fails.
- The PCM will record operating conditions at the time the diagnostic fails. The first time the diagnostic fails, this information will be stored in Failure Records. If the diagnostic reports a failure on the second consecutive drive trip, the operating conditions at the time of failure will be written to Freeze Frame and the Failure record will be updated.
- The PCM will use a default engine coolant temperature.
- Transmission torque converter clutch (TCC) will apply early.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL OFF after three consecutive drive trips that the diagnostic runs and does not fail.
- A History DTC will clear after forty consecutive warm-up cycles, if no failures are reported by this or any other emission related diagnostic.
- A last test failed (Current DTC) will clear when the diagnostic runs and does not fail.
- PCM battery voltage is interrupted.
- Using a Scan tool.

Diagnostic Aids

- An intermittent may be caused by the following:
 - Mis-routed harness
 - Rubbed through wire insulation
 - Broken wire inside the insulation.
- If other DTCs are set that share the same ground and/or 5.0 volt reference circuit, check for faulty connections and for faulty wiring.
- If the engine has been allowed to sit overnight, the engine coolant temperature and intake air temperature values should display within a few degrees of each other. If the temperatures are not within 3°C (5°F), refer to *Temperature Vs Resistance Table*
- If it is determined that the DTC occurs intermittently, performing the P1114 diagnostic table may isolate the cause of the fault.

For intermittents, refer to *Symptoms*.

Test Description

Number(s) below refer to step numbers on the diagnostic table.

- Determines if the malfunction is present.
- Using Freeze Frame and/or Failure Records data may aid in locating an intermittent condition. If the DTC cannot be duplicated, the information included in the Freeze Frame and/or Failure Records data can be useful in determining how many miles since the DTC set. The Fail Counter and Pass Counter can also be used to determine how many ignition cycles the diagnostic reported a pass and/or a fail. Operate vehicle within the same freeze frame conditions (RPM, load, vehicle speed, temperature etc.) that were noted. This will isolate when the DTC failed.
- If the engine coolant temperature goes below -30°C (-22°F), indicates the PCM and ECT wiring are OK.
- Disconnecting the PCM will allow using the DVM (J 39200) to check continuity of the circuits. This will aid in locating an open or shorted circuit.

DTC P0117 ECT Sensor Circuit Low Voltage

Step	Action	Value(s)	Yes	No
1	Was the Powertrain On-Board Diagnostic (OBD) System Check performed?	—	Go to Step 2	Go to Powertrain OBD System Check
2	Important: If the vehicle is overheating, the overheating condition must be corrected before proceeding with this table. 1. Install the scan tool. 2. Turn the ignition ON, engine OFF. 3. Monitor the ECT display on the Engine 1 Data List of the scan tool. Is the ECT above the specified value?	150°C (302°F)	Go to Step 4	Go to Step 3

DTC P0117 ECT Sensor Circuit Low Voltage (cont'd)

Step	Action	Value(s)	Yes	No
3	1. Turn the ignition ON, engine OFF, review Freeze Frame and/or Failure Records data for this DTC and note parameters. 2. Turn the ignition OFF for 15 seconds. 3. Start the engine and operate the vehicle within the conditions required for this diagnostic to run, and as close to the conditions recorded in Freeze Frame/Failure Records as possible. Special operating conditions that need to be met before the PCM will run this diagnostic, where applicable, are listed in Conditions for Setting the DTC. 4. Using the scan tool, select DTC, Specific, then enter the DTC number which was set. Does the scan tool indicate that this diagnostic failed this ignition?	—	Go to Step 4	Go to Diagnostic Aids - DTC P0117 ECT Sensor Circuit Low Voltage
4	1. Disconnect the ECT sensor electrical connector. 2. Observe the ECT display on the scan tool. Is ECT below the specified value?	-30°C (-22°F)	Go to Step 6	Go to Step 5
5	1. Turn the ignition OFF. 2. Disconnect the PCM, and check the ECT sensor signal circuit for a short to ground. 3. If the ECT sensor signal circuit is grounded, repair it as necessary. Refer to <i>Repair Procedures in Electrical Diagnosis (8A Cell 5)</i> . Was the ECT signal circuit grounded?	—	Go to Step 8	Go to Step 7
6	Replace the ECT sensor. Refer to <i>ECT Sensor</i> . Is the action complete?	—	Go to Step 8	—
7	Important: Replacement PCM must be programmed. Refer to <i>PCM Replacement/Programming</i> . Replace the PCM. Is the action complete?	—	Go to Step 8	—
8	1. Using the scan tool, select DTC, Clear Info. 2. Start the engine and idle at normal operating temperature. 3. Select DTC, Specific, then enter the DTC number which was set. 4. Operate the vehicle within the conditions for setting this DTC as specified in the supporting text, if applicable. Does the scan tool indicate that this test ran and passed?	—	Go to Step 9	Go to Step 2
9	Using the scan tool, select Capture Info, Review Info. Are any DTCs displayed that have not been diagnosed?	—	Go to the applicable DTC table	System OK

DTC P0118 ECT Sensor Circuit High Voltage

30394

Circuit Description

The Engine Coolant Temperature (ECT) sensor contains a semiconductor device which changes resistance based on temperature (a thermistor). The ECT sensor is mounted in the engine coolant pump housing. The ECT sensor has a signal circuit and a ground circuit. The PCM applies a voltage (about 5.0 volts) on the signal circuit to the sensor. The PCM monitors changes in this voltage caused by changes in the resistance of the sensor to determine coolant temperature.

When the coolant is cold, the sensor (thermistor) resistance is high, and the PCM's signal voltage is only pulled down a small amount through the sensor to ground. Therefore, the PCM will sense a high signal voltage (low temperature). When the coolant is warm, the sensor resistance is low, and the signal voltage is pulled down a greater amount. This causes the PCM to sense a low signal voltage (high temperature). At normal operating temperature, the voltage should measure about 1.5–2.0 volts at the PCM.

When the PCM senses a signal voltage higher than the normal operating range of the sensor, this DTC will set.

Conditions for Setting the DTC

- Engine operating longer than 20 seconds.
- The PCM indicates Engine Coolant Temperature less than -40°C (-40°F)
- All conditions met for 4.5 seconds.

Action Taken When the DTC Sets

- The PCM will illuminate the Malfunction Indicator Lamp (MIL) on the second consecutive drive trip that the diagnostic runs and fails.
- The PCM will record operating conditions at the time the diagnostic fails. The first time the diagnostic fails, this information will be stored in Failure Records. If the diagnostic reports a failure on the second consecutive drive trip, the operating conditions at the time of failure will be written to Freeze Frame and the Failure record will be updated.
- The PCM will use a default engine coolant temperature.
- Transmission torque converter clutch (TCC) will apply early.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL OFF after three consecutive drive trips that the diagnostic runs and does not fail.
- A History DTC will clear after forty consecutive warm-up cycles, if no failures are reported by this or any other emission related diagnostic.
- A last test failed (Current DTC) will clear when the diagnostic runs and does not fail.
- PCM battery voltage is interrupted.
- Using a Scan tool.

Diagnostic Aids

- An intermittent may be caused by the following:
 - Poor Connections.
 - Mis-routed harness.
 - Rubbed through wire insulation.
 - Broken wire inside the insulation.
- If other DTCs are set that share the same ground and/or 5.0 volt reference circuit, check for faulty connections and for faulty wiring.
- If the engine has been allowed to sit overnight, the engine coolant temperature and intake air temperature values should display within a few degrees of each other. If the temperatures are not within 3°C (5°F), refer to *Temperature Vs Resistance Table*
- If it is determined that the DTC occurs intermittently, performing the P1115 diagnostic table may isolate the cause of the fault.

For intermittents, refer to *Symptoms*.

Test Description

Number(s) below refer to step numbers on the diagnostic table.

2. Determines if the malfunction is present. For any test that requires probing the PCM or a component harness connector, must use the Connector Test Adapter Kit J 35616-A. Using this kit will prevent damage to the harness connector terminals.
3. Using Freeze Frame and/or Failure Records data may aid in locating an intermittent condition. If the DTC cannot be duplicated, the information included in the Freeze Frame and/or Failure Records data can be useful in determining how many miles since the DTC set. The Fail Counter and Pass Counter can also be used to determine how many ignition cycles the diagnostic reported a pass and/or a fail. Operate vehicle within the same freeze frame conditions (RPM, load, vehicle speed, temperature etc.) that were noted. This will isolate when the DTC failed. Refer to *Symptoms*.
4. If the engine coolant temperature goes above 150°C (302°F), indicates the PCM and ECT wiring is OK.
5. If the engine coolant temperature goes above 150°C (302°F), indicates the PCM and ECT signal circuit is OK.
6. Disconnecting the PCM will allow using the DVM (J 39200) to check continuity of the circuits. This will aid in locating an open or shorted circuit.
8. Disconnecting the PCM will allow using the DVM (J 39200) to check continuity of the circuits. This will aid in locating an open or shorted circuit.

DTC P0118 ECT Sensor Circuit High Voltage

Step	Action	Value(s)	Yes	No
1	Was the Powertrain On-Board Diagnostic (OBD) System Check performed?	—	Go to Step 2	Go to Powertrain OBD System Check
2	1. Install the scan tool. 2. Turn the ignition ON, engine OFF. 3. Monitor the ECT display on the Engine 1 Data List of the scan tool. Is the ECT at the specified value?	-40°C (-40°F)	Go to Step 4	Go to Step 3
3	1. Turn the ignition ON, engine OFF, review Freeze Frame and/or Failure Records data for this DTC and note parameters. 2. Turn the ignition OFF for 15 seconds. 3. Start the engine and operate the vehicle within the conditions required for this diagnostic to run, and as close to the conditions recorded in Freeze Frame/Failure Records as possible. Special operating conditions that need to be met before the PCM will run this diagnostic, where applicable, are listed in Conditions for Setting the DTC. 4. Using the scan tool, select DTC, Specific, then enter the DTC number which was set. Does the scan tool indicate that this diagnostic failed this ignition?	—	Go to Step 4	Go to Diagnostic Aids - DTC P0118 ECT Sensor Circuit High Voltage
4	1. Disconnect the ECT Sensor electrical connector. 2. Jumper the ECT harness terminals together. 3. Observe the engine coolant temperature parameter on the scan tool. Is the ECT at the specified value?	151°C (304°F)	Go to Step 9	Go to Step 5
5	Jumper the ECT signal circuit to a known good ground. Is the ECT at the specified value?	151°C (304°F)	Go to Step 8	Go to Step 6
6	1. Turn the ignition OFF. 2. Disconnect the PCM electrical connectors. 3. Check the ECT sensor signal circuit for an open. Is the ECT sensor signal circuit open?	—	Go to Step 7	Go to Step 11
7	Repair the ECT sensor signal circuit. Refer to <i>Repair Procedures in Electrical Diagnosis (8A Cell 5)</i> . Is the action complete?	—	Go to Step 12	—
8	1. Turn the ignition OFF. 2. Disconnect the PCM electrical connectors. 3. Check the ECT sensor ground circuit for an open. Is the ECT sensor ground circuit open?	—	Go to Step 10	Go to Step 11
9	Replace the ECT sensor. Refer to <i>ECT Sensor</i> . Is the action complete?	—	Go to Step 12	—
10	Repair the ECT sensor ground circuit. Is the action complete?	—	Go to Step 12	—
11	Important: Replacement PCM must be programmed. Refer to <i>PCM Replacement/Programming</i> . Replace the PCM. Is the action complete?	—	Go to Step 12	—

DTC P0118 ECT Sensor Circuit High Voltage (cont'd)

12	1. Using the scan tool, select DTC, Clear Info. 2. Start the engine and idle at normal operating temperature. 3. Select DTC, Specific, then enter the DTC number which was set. 4. Operate the vehicle within the conditions for setting this DTC as specified in the supporting text, if applicable. Does the scan tool indicate that this test ran and passed?	—	Go to Step 13	Go to Step 2
13	Using the scan tool, select Capture Info, Review Info. Are any DTCs displayed that have not been diagnosed?	—	Go to the applicable DTC table	System OK

DTC P0121 TP Sensor Circuit Insufficient Activity

30393

Circuit Description

The Throttle Position (TP) sensor is a potentiometer. The TP sensor is mounted to the right side of the throttle body. The TP sensor provides a voltage signal that changes relative to throttle blade angle. This signal voltage is one of the most important inputs used by the PCM. The TP sensor has a 5.0 volt reference, a ground and a signal circuit.

TP sensor Signal voltage should be about 0.6 volt at idle. The TP sensor voltage should increase to above 4.0 volts at wide open throttle (WOT).

This diagnostic compares actual throttle position from the TP sensor to a predicted throttle position value. The predicted throttle position is calculated from engine speed and other inputs. If the PCM detects the predicted throttle position is below the actual TP sensor value, this DTC will set.

Conditions for Setting the DTC

- No MAP sensor DTCs set and no other TP sensor DTCs set.
- MAP less than 60 kPa.
- TP steady.
- Predicted throttle angle is less than actual throttle angle.
- All conditions present for 38 seconds.

Action Taken When the DTC Sets

- The PCM will illuminate the Malfunction Indicator Lamp (MIL) on the second consecutive drive trip that the diagnostic runs and fails.

- The PCM will record operating conditions at the time the diagnostic fails. The first time the diagnostic fails, this information will be stored in Failure Records. If the diagnostic reports a failure on the second consecutive drive trip, the operating conditions at the time of failure will be written to Freeze Frame and the Failure record will be updated.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL OFF after three consecutive drive trips that the diagnostic runs and does not fail.
- A last test failed (Current DTC) will clear when the diagnostic runs and does not fail.
- A History DTC will clear after forty consecutive warm-up cycles, if no failures are reported by this or any other emission related diagnostic.
- PCM battery voltage is interrupted.
- Using a Scan tool.

Diagnostic Aids

- An intermittent may be caused by the following:
 - Mis-routed harness.
 - Rubbed through wire insulation.
 - Broken wire inside the insulation.
- If other DTCs are set that share the same ground and/or 5.0 volt reference circuit, check for faulty connections and for faulty wiring.
- The PCM 5 volt reference circuits are internally connected within the PCM. If all the TP sensor circuits check to be OK, inspect related 5.0 volt reference circuits.

- If it is determined that the DTC occurs intermittently, performing the DTC P1121 diagnostic table may isolate the cause of the fault.

For intermittents, refer to *Symptoms*.

Test Description

Number(s) below refer to step numbers on the diagnostic table.

2. This checks if the fault is present.
3. Using Freeze Frame and/or Failure Records data may aid in locating an intermittent condition. If the DTC cannot be duplicated, the information included in the Freeze Frame and/or Failure Records data can be useful in determining how many miles since the DTC set. The Fail Counter and Pass Counter can also be used to determine how many ignition cycles the diagnostic reported a pass and/or a fail. Operate vehicle within the same freeze frame conditions (RPM, load, vehicle speed, temperature etc.) that were noted. This will isolate when the DTC failed.
4. If the TP sensor voltage drops indicates that there is no malfunction with the TP sensor wiring or the PCM.
5. This checks the 5.0 volt reference circuit, signal circuit and the PCM. If the scan tool displayed 5.0 volts indicates the TP sensor circuits are OK.

DTC P0121 TP Sensor Circuit Insufficient Activity

Step	Action	Value(s)	Yes	No
1	Was the Powertrain On-Board Diagnostic (OBD) System Check performed?	—	Go to Step 2	Go to Powertrain OBD System Check
2	1. Turn the ignition ON, engine OFF. 2. Using a scan tool on the Engine 1 data list, monitor the TP sensor voltage while moving accelerator pedal from a closed throttle to a wide open throttle. Does the TP sensor voltage go from below the specified value to above the specified value?	Below 1.0 V to above 4.0 V	Go to Step 3	Go to Step 4
3	1. Turn the ignition ON, engine OFF, review Freeze Frame and/or Failure Records data for this DTC and note parameters. 2. Turn the ignition OFF for 15 seconds. 3. Start the engine and operate the vehicle within the conditions required for this diagnostic to run, and as close to the conditions recorded in Freeze Frame/Failure Records as possible. Special operating conditions that need to be met before the PCM will run this diagnostic, where applicable, are listed in Conditions for Setting the DTC. 4. Using the scan tool, select DTC, Specific, then enter the DTC number which was set. Does the scan tool indicate that this diagnostic failed this ignition?	—	Go to Step 4	Go to Diagnostic Aids - DTC P0121 TP Sensor Insufficient Activity
4	1. Disconnect the TP sensor. 2. Observe the TP sensor reading on the scan tool. Is the TP sensor voltage near the specified value?	0.0 V	Go to Step 5	Go to Step 7
5	Using a fused jumper wire, jump the TP sensor 5.0 volt reference circuit to the TP sensor signal circuit. Is the TP sensor voltage near the specified value?	5.0 V	Go to Step 6	Go to Step 8
6	Replace the TP sensor. Refer to <i>TP Sensor</i> . Is the action complete?	—	Go to Step 10	—
7	Check for the following conditions: - TP signal circuit for a short to voltage. - TP sensor ground circuit for high resistance between the PCM and the TP sensor. - TP sensor ground circuit for a poor connection. If a problem is found, repair wiring harness as necessary. Refer to <i>Repair Procedures in Electrical Diagnosis (8A Cell 5)</i> . Was a problem found?	—	Go to Step 10	Go to Step 9
8	Check for the following conditions: - TP signal circuit or 5 volt reference circuit for a poor connection. - TP signal circuit or 5 volt reference circuit for high resistance between the PCM and the TP sensor. If a problem is found, repair wiring harness as necessary. Refer to <i>Repair Procedures in Electrical Diagnosis (8A Cell 5)</i> . Was a problem found?	—	Go to Step 10	Go to Step 9

DTC P0121 TP Sensor Circuit Insufficient Activity (cont'd)

Step	Action	Value(s)	Yes	No
9	Important: Replacement PCM must be programmed. Refer to <i>PCM Replacement/Programming</i> . Replace the PCM. Is the action complete?	—	Go to Step 10	—
10	1. Using the scan tool, select DTC, Clear Info. 2. Start the engine and idle at normal operating temperature. 3. Select DTC, Specific, then enter the DTC number which was set. 4. Operate the vehicle within the conditions for setting this DTC as specified in the supporting text, if applicable. Does the scan tool indicate that this test ran and passed?	—	Go to Step 11	Go to Step 2
11	Using the scan tool, select Capture Info, Review Info. Are any DTCs displayed that have not been diagnosed?	—	Go to the applicable DTC table	System OK

DTC P0122 TP Sensor Circuit Low Voltage

30393

Circuit Description

The Throttle Position (TP) sensor is a potentiometer. The TP sensor is mounted to the right side of the throttle body. The TP sensor provides a voltage signal that changes relative to throttle blade angle. This signal voltage is one of the most important inputs used by the PCM. The TP sensor has a 5.0 volt reference, a ground and a signal circuit. TP sensor Signal voltage should be about 0.6 volt at idle. The TP sensor voltage should increase to above 4.0 volts at wide open throttle (WOT). When the PCM senses a signal voltage lower than the normal operating range of the sensor, this DTC will set.

Conditions for Setting the DTC

- TP sensor signal voltage is less than 0.2 volts.
- Condition present for 1 second.

Action Taken When the DTC Sets

- The PCM will illuminate the Malfunction Indicator Lamp (MIL) when the diagnostic runs and fails.
- The PCM will record operating conditions at the time the diagnostic fails. This information will be stored in the Freeze Frame and/or Failure Records.
- The PCM will use a default TP sensor value.
- Transmission TCC will not apply.
- High transmission line pressure.
- Fixed transmission shift points, hard shifts and no fourth gear in hot mode.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL OFF after three consecutive drive trips that the diagnostic runs and does not fail.
- A History DTC will clear after forty consecutive warm-up cycles, if no failures are reported by this or any other emission related diagnostic.
- A last test failed (Current DTC) will clear when the diagnostic runs and does not fail.
- PCM battery voltage is interrupted.
- Using a Scan tool.

Diagnostic Aids

- An intermittent may be caused by the following:
 - Mis-routed harness.
 - Rubbed through wire insulation.
 - Broken wire inside the insulation.
- If other DTCs are set that share the same ground and/or 5.0 volt reference circuit, check for faulty connections and for faulty wiring.
- The PCM 5 volt reference circuits are internally connected within the PCM. If all the TP sensor circuits check to be OK, inspect related 5.0 volt reference circuits.
- If it is determined that the DTC occurs intermittently, performing the DTC P1122 diagnostic table may isolate the cause of the fault.

For intermittents, refer to *Symptoms*.

Test Description

Number(s) below refer to step numbers on the diagnostic table.

2. This checks if the fault is present.
3. Using Freeze Frame and/or Failure Records data may aid in locating an intermittent condition. If the DTC cannot be duplicated, the information included in the Freeze Frame and/or Failure Records data can be useful in determining how many miles since the DTC set. The Fail Counter and Pass Counter can also be used to determine how many ignition cycles the diagnostic reported a pass and/or a fail. Operate vehicle within the same freeze frame conditions (RPM, load, vehicle speed, temperature etc.) that were noted. This will isolate when the DTC failed.
4. Vehicles equipped with traction control will have to disconnect the EBTM. This will determine if the short is caused from the EBTM. After repairs are made, reconnect the EBTM, clear any DTCs that may have been set when the EBTM was disconnected.
6. This checks whether the ground circuit is available to the TP sensor. Check for poor electrical connections at the TP sensor. Refer to *Repair Procedures in Electrical Diagnosis (8A Cell 5)*.

GM Restoration Parts

DTC P0122 TP Sensor Circuit Low Voltage

Step	Action	Value(s)	Yes	No
1	Was the Powertrain On-Board Diagnostic (OBD) System Check performed?	—	Go to Step 2	Go to Powertrain OBD System Check
2	1. Install the scan tool. 2. Turn the ignition ON, engine OFF. 3. With the throttle closed, observe the TP sensor voltage and percentage display on the Engine 1 Data List of the scan tool. Is the TP sensor voltage or the Throttle Angle above the specified values?	4.7V, 0%	Go to Step 4	Go to Step 3
3	1. Turn the ignition ON, engine OFF, review Freeze Frame and/or Failure Records data for this DTC and note parameters. 2. Turn the ignition OFF for 15 seconds. 3. Start the engine and operate the vehicle within the conditions required for this diagnostic to run, and as close to the conditions recorded in Freeze Frame/Failure Records as possible. Special operating conditions that need to be met before the PCM will run this diagnostic, where applicable, are listed in Conditions for Setting the DTC. 4. Using the scan tool, select DTC, Specific, then enter the DTC number which was set. Does the scan tool indicate that this diagnostic failed this ignition?	—	Go to Step 4	Go to Diagnostic Aids - DTC P0123 TP Sensor Circuit High Voltage
4	Important: This step is only for D and Y cars. Proceed to step 5 if the vehicle is not a D or Y car. 1. Turn the ignition OFF. 2. Disconnect the EBCM. 3. Turn the ignition ON. Is the TP sensor voltage above the specified value?	4.7V	Go to Step 5	Go to Section 5E2 for further diagnosis of the EBCM
5	1. Disconnect the sensor electrical connector. 2. Observe the TP sensor voltage display on the scan tool. Is the TP sensor voltage below the specified value?	0.20V (200mV)	Go to Step 6	Go to Step 9
6	Probe the sensor ground circuit at the TP sensor harness connector with a test light (J 34142-B) connected to B+. Is the test light ON?	—	Go to Step 7	Go to Step 10
7	Using a DVM (J 3920) measure the voltage at the 5 volt reference circuit to ground. Is the voltage greater than the specified value?	5.0V	Go to Step 13	Go to Step 8
8	Replace the TP sensor with a new TP Sensor. Is the action complete?	—	Go to Step 14	—
9	1. Turn the ignition OFF and disconnect the PCM. 2. Turn the ignition OFF. 3. Check for a short to ground on the TP sensor signal circuit; also check for short circuit between the TP sensor signal circuit and the EBCM. 4. If the TP sensor signal circuit is shorted, repair it as necessary. Refer to Air Procedures in Electrical Diagnosis (8A Cell). Was the TP sensor signal circuit shorted?	—	Go to Step 14	Go to Step 12

DTC P0122 TP Sensor Circuit Low Voltage (cont'd)

Step	Action	Value(s)	Yes	No
10	1. Turn the ignition OFF, disconnect the PCM. 2. Check the TP sensor ground circuit for a good connection at the PCM. 3. If a poor connection is found at the PCM, replace the terminal as necessary. Refer to <i>Repair Procedures in Electrical Diagnosis (8A Cell 5)</i> . Was a poor connection found at the PCM?	—	Go to Step 14	Go to Step 11
11	1. Check for an open TP sensor ground circuit. 2. If the TP sensor ground circuit is open, repair it as necessary. Refer to <i>Repair Procedures in Electrical Diagnosis (8A Cell 5)</i> . Was the TP sensor ground circuit open?	—	Go to Step 14	Go to Step 12
12	Important: Replacement PCM must be programmed. Refer to <i>PCM Replacement/Programming</i> . Replace the PCM. Is the action complete?	—	Go to Step 14	—
13	Repair the 5 volt reference circuit for a short to voltage. Refer to <i>Repair Procedures in Electrical Diagnosis (8A Cell 5)</i> . Is the action complete?	—	Go to Step 14	—
14	1. Using the scan tool, select DTC, Clear Info. 2. Start the engine and idle at normal operating temperature. 3. Select DTC, Specific, then enter the DTC number which was set. 4. Operate the vehicle within the conditions for setting this DTC as specified in the supporting text, if applicable. Does the scan tool indicate that this test ran and passed?	—	Go to Step 15	Go to Step 2
15	Using the scan tool, select Capture Info, Review Info. Are any DTCs displayed that have not been diagnosed?	—	Go to the applicable DTC table	System OK

DTC P0123 TP Sensor Circuit High Voltage

Circuit Description

The Throttle Position (TP) sensor is a potentiometer. The TP sensor is mounted to the right side of the throttle body. The TP sensor provides a voltage signal that changes relative to throttle blade angle. This signal voltage is one of the most important inputs used by the PCM. The TP sensor has a 5.0 volt reference, a ground and a signal circuit. TP sensor Signal voltage should be about 0.6 volt at idle. The TP sensor voltage should increase to above 4.0 volts at wide open throttle (WOT).

When the PCM senses a signal voltage higher than the normal operating range of the sensor, this DTC will set.

Conditions for Setting The DTC

- TP sensor signal voltage is greater than 4.8 volts.
- Condition present for 1 second.

Action Taken When the DTC Sets

- The PCM will illuminate the Malfunction Indicator Lamp (MIL) when the diagnostic runs and fails.
- The PCM will use a default TP sensor value.
- The PCM will record operating conditions at the time the diagnostic fails. This information will be stored in the Freeze Frame and/or Failure Records.
- Transmission TCC will not apply.
- High transmission line pressure.
- Fixed transmission shift points, hard shifts and no fourth gear in hot mode.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL OFF after three consecutive drive trips that the diagnostic runs and does not fail.
- A last test failed (Current DTC) will clear when the diagnostic runs and does not fail.
- A History DTC will clear after forty consecutive warm-up cycles, if no failures are reported by this or any other emission related diagnostic.
- PCM battery voltage is interrupted.
- Using a Scan tool.

Diagnostic Aids

- An intermittent may be caused by the following:
 - Mis-routed harness.
 - Rubbed through wire insulation.
 - Broken wire inside the insulation.
- If other DTCs are set that share the same ground and/or 5.0 volt reference circuit, check for faulty connections and for faulty wiring.
- The PCM 5 volt reference circuits are internally connected within the PCM. If all the TP sensor circuits check to be OK, inspect related 5.0 volt reference circuits.
- If it is determined that the DTC occurs intermittently, performing the DTC P1121 diagnostic table may isolate the cause of the fault.

For intermittents, refer to *Symptoms*.

Test Description

Number(s) below refer to step numbers on the diagnostic table.

2. This checks if the fault is present.
3. Using Freeze Frame and/or Failure Records data may aid in locating an intermittent condition. If the DTC cannot be duplicated, the information included in the Freeze Frame and/or Failure Records data can be useful in determining how many miles since the DTC set. The Fail Counter and Pass Counter can also be used to determine how many ignition cycles the diagnostic reported a pass and/or a fail. Operate vehicle within the same freeze frame conditions (RPM, load, vehicle speed, temperature etc.) that were noted. This will isolate when the DTC failed.
4. Vehicles equipped with traction control will have to disconnect the EBTCTM. This will determine if the short is caused from the EBTCTM. After repairs are made, reconnect the EBTCTM, clear any DTCs that may have been set when the EBTCTM was disconnected.
6. This checks whether the ground circuit is available to the TP sensor. Check for poor electrical connections at the TP sensor. Refer to *Repair Procedures in Electrical Diagnosis* (8A Cell 5).

DTC P0123 TP Sensor Circuit High Voltage

Step	Action	Value(s)	Yes	No
1	Was the Powertrain On-Board Diagnostic (OBD) System Check performed?	—	Go to Step 2	Go to Powertrain OBD System Check
2	1. Install the scan tool. 2. Turn the ignition ON, engine OFF. 3. With the throttle closed, observe the TP sensor voltage and percentage display on the Engine 1 Data List of the scan tool. Is the TP sensor voltage or the Throttle Angle above the specified values?	4.7V, 0%	Go to Step 4	Go to Step 3
3	1. Turn the ignition ON, engine OFF, review Freeze Frame and/or Failure Records data for this DTC and note parameters. 2. Turn the ignition OFF for 15 seconds. 3. Start the engine and operate the vehicle within the conditions required for this diagnostic to run, and as close to the conditions recorded in Freeze Frame/Failure Records as possible. Special operating conditions that need to be met before the PCM will run this diagnostic, where applicable, are listed in Conditions for Setting the DTC. 4. Using the scan tool, select DTC, Specific, then enter the DTC number which was set. Does the scan tool indicate that this diagnostic failed this ignition?	—	Go to Step 4	Go to Diagnostic Aids - DTC P0123 TP Sensor Circuit High Voltage
4	Important: This step is only for D and Y cars. Proceed to step 5 if the vehicle is not a D or Y car. 1. Turn the ignition OFF. 2. Disconnect the EBTCM. 3. Turn the ignition ON. Is the TP sensor voltage above the specified value?	4.7V	Go to Step 5	Go to Section 5E2 for further diagnosis of the EBTCM
5	1. Disconnect the TP sensor electrical connector. 2. Observe the TP sensor voltage display on the scan tool. Is the TP sensor voltage below the specified value?	0.20V (200mV)	Go to Step 6	Go to Step 9
6	Probe the sensor ground circuit at the TP sensor harness connector with a test light (J 34142-B) connected to B+. Is the test light ON?	—	Go to Step 7	Go to Step 10
7	Using a DVM (J 39200), measure the voltage at the 5 volt reference circuit to ground. Is the voltage greater than the specified value?	5.0V	Go to Step 13	Go to Step 8
8	Replace the TP sensor. Refer to <i>TP Sensor</i> . Is the action complete?	—	Go to Step 14	—
9	1. Turn the ignition OFF, disconnect the PCM. 2. Turn the ignition ON, engine OFF. 3. Check for a short to voltage on the TP sensor signal circuit; also check for a short circuit between the TP sensor signal circuit and the EBTCM. 4. If the TP sensor signal circuit is shorted, repair it as necessary. Refer to <i>Repair Procedures in Electrical Diagnosis (8A Cell 5)</i> . Was the TP sensor signal circuit shorted?	—	Go to Step 14	Go to Step 12

DTC P0123 TP Sensor Circuit High Voltage (cont'd)

Step	Action	Value(s)	Yes	No
10	1. Turn the ignition OFF, disconnect the PCM. 2. Check the TP sensor ground circuit for a good connection at the PCM. 3. If a poor connection is found at the PCM, replace the terminal as necessary. Refer to <i>Repair Procedures in Electrical Diagnosis (8A Cell 5)</i> . Was a poor connection found at the PCM?	—	Go to Step 14	Go to Step 11
11	1. Check for an open TP sensor ground circuit. 2. If the TP sensor ground circuit is open, repair it as necessary. Refer to <i>Repair Procedures in Electrical Diagnosis (8A Cell 5)</i> . Was the TP sensor ground circuit open?	—	Go to Step 14	Go to Step 12
12	Important: Replacement PCM must be programmed. Refer to <i>PCM Replacement/Programming</i> . Replace the PCM. Is the action complete?	—	Go to Step 14	—
13	Repair the 5 volt reference circuit for a short to voltage. Refer to <i>Repair Procedures in Electrical Diagnosis (8A Cell 5)</i> . Is the action complete?	—	Go to Step 14	—
14	1. Using the scan tool, select DTC, Clear Info. 2. Start the engine and idle at normal operating temperature. 3. Select DTC, Specific, then enter the DTC number which was set. 4. Operate the vehicle within the conditions for setting this DTC as specified in the supporting text, if applicable. Does the scan tool indicate that this test ran and passed?	—	Go to Step 15	Go to Step 2
15	Using the scan tool, select Capture Info, Review Info. Are any DTCs displayed that have not been diagnosed?	—	Go to the applicable DTC table	System OK

DTC P0125 ECT Excessive Time to Closed Loop

30394

Circuit Description

While the engine is warming, the PCM monitors the ECT sensor to determine how long it takes the engine to reach the coolant temperature required for Closed Loop operation. DTC P0125 will set if the PCM determines that the engine does not reach Closed Loop temperature in a specified amount of time. This test will not run if either the intake air or engine coolant temperature is too low at start up. The PCM will only run this DTC on a cold start and only once per cold start.

Conditions for Setting the DTC

- DTCs P0112, P0113, P0117, P0118, not set.
- Engine coolant and intake air temperature are greater than 10°C (50°F) at start-up.
- Vehicle speed greater than 8 km/h (5 mph).
- Closed loop coolant temperature, 60°C (140°F), is not reached within about 7 minutes.

Action Taken When the DTC Sets

- The PCM will illuminate the Malfunction Indicator Lamp (MIL) on the second consecutive drive trip that the diagnostic runs and fails.

- The PCM will record operating conditions at the time the diagnostic fails. The first time the diagnostic fails, this information will be stored in Failure Records. If the diagnostic reports a failure on the second consecutive drive trip, the operating conditions at the time of failure will be written to Freeze Frame and the Failure record will be updated.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL OFF after three consecutive drive trips that the diagnostic runs and does not fail.
- A last test failed (Current DTC) will clear when the ignition is cycled and the diagnostic runs and does not fail.
- A History DTC will clear after forty consecutive warm-up cycles, if no failures are reported by this or any other emission related diagnostic.
- PCM battery voltage is interrupted.
- Using a Scan tool.

Diagnostic Aids

- Using Freeze Frame and/or Failure Records data may aid in locating an intermittent condition. If the DTC cannot be duplicated, the information included in the Freeze Frame and/or Failure Records data can be useful in determining how many miles since the DTC set. The Fail Counter and Pass Counter can also be used to determine how many ignition cycles the diagnostic reported a pass and/or a fail. Operate vehicle within the same freeze frame conditions (RPM, load, vehicle speed, temperature etc.) that were noted. This will isolate when the DTC failed. For intermittents, refer to *Symptoms*.
- If other DTCs are set that share the same ground and/or 5.0 volt reference circuit, check for faulty connections and for faulty wiring.
- If the engine has been allowed to sit overnight, the engine coolant temperature and intake air temperature values should display within a few degrees of each other. If the temperatures are not within 3°C (5°F), refer to *Temperature Vs Resistance Table*.
- If it is determined that the DTC occurs intermittently, performing the P1114 or P1115 diagnostics table may isolate the cause of the fault.
- If the engine coolant temperature exceeds 60°C (140°F), this indicates that the engine is capable of reaching the proper temperature, but not necessarily in the correct amount of time.

This diagnostic table must be repeated on a cold engine, engine coolant and intake air temperature less than 50°C (122°F) and within 3°C (5°F) of each other, and the time required to reach the temperature threshold must be measured. When starting a cold engine, measure the amount of time it takes the engine to reach the specified temperature. The engine should reach the specified temperature within 7 minutes. If the specified temperature is not reached within 7 minutes, check the following:

- Coolant level.
- Thermostat operation.
- Are fans on at all times?
- Refer to *Engine Cooling System (6B)* for additional information.

Test Description

Number(s) below refer to step numbers on the diagnostic table.

- An ECT failure could cause a DTC P0125 to set, so correct any ECT DTCs that are set. For any test that requires probing the PCM or a component harness connector, must use the Connector Test Adapter Kit J 35616-A. Using this kit will prevent damage to the harness connector terminals.
- If it is obvious that the engine is not reaching full operating temperature, for example the radiator hoses never get very warm, or there is a complaint of little or no heat from the heater, this step could be skipped.

DTC P0125 ECT Excessive Time to Closed Loop

Step	Action	Value(s)	Yes	No
1	Was the Powertrain On-Board Diagnostic (OBD) System Check performed?	—	Go to Step 2	Go to Powertrain OBD System Check
2	Are any engine coolant temperature DTCs set?	—	Go to applicable DTC table	Go to Step 3
3	1. Install the scan tool. 2. Turn the ignition ON, engine OFF. 3. Disconnect the ECT sensor. Does the scan tool indicate the ECT sensor is less than the specified value?	-35°C (-31°F)	Go to Step 4	Go to DTC P0117 ECT Sensor Circuit Low Voltage
4	Using a jumper wire, jumper terminals at the ECT sensor harness connector together. Does the scan tool indicate the ECT is greater than the specified value?	150°C (302°F)	Go to Step 5	Go to DTC P0118 ECT Sensor Circuit High Voltage

DTC P0125 ECT Excessive Time to Closed Loop (cont'd)

Step	Action	Value(s)	Yes	No
5	1. Reconnect the ECT sensor. 2. Start and idle the engine. 3. With the engine idling, observe the ECT sensor display on the Engine 1 Data List of the scan tool. Important: Allow time for the engine to warm up if it has not already reached the specified temperature. 7 minutes is the maximum amount of time it should take to reach this temperature from a cold start. Less time should be necessary if the engine is already warm. Does the scan tool indicate the engine coolant temperature reached the specified value?	60°C (140°F)	System must be rechecked on a cold start. Refer to Diagnostic Aids.	Go to Step 6
6	Using a DVM (J 39200), measure the resistance of the ECT sensor. Refer to <i>Temperature Vs Resistance Table</i> . Is the ECT resistance close to the value indicated in the Temperature Vs Resistance Table?	—	Go to Step 7	Go to Step 8
7	For an engine cooling system problem, check for the following conditions: • Thermostat operation • Coolant level • Coolant to water ratio • Cooling fan operation etc. Refer to <i>Engine Cooling System</i> . Is the action complete?	—	Go to Step 9	—
8	Replace the ECT sensor. Refer to <i>ECT Sensor</i> . Is the action complete?	—	Go to Step 9	—
9	1. Using the scan tool, select DTC, Clear Info. 2. Start the engine and idle at normal operating temperature. 3. Select DTC Specific, then enter the DTC number which was set. 4. Operate the vehicle within the conditions for setting this DTC as specified in the supporting text, if applicable. Does the scan tool indicate that this test ran and passed?	—	Go to Step 10	Go to Step 2
10	Using the scan tool, select Capture Info, Review Info. Are any DTCs displayed that have not been diagnosed?	—	Go to the applicable DTC table	System OK

DTC P0131 HO2S Circuit Low Voltage Bank1 Sensor1

30395

Circuit Description

The PCM supplies a voltage of about 450 mV between the HO2S high and low signal circuits. The oxygen sensor varies the voltage over a range from about 1000 mV when the exhaust is rich, down through about 10 mV when exhaust is lean.

The PCM monitors and stores the heated oxygen sensor (HO2S) voltage information. The PCM evaluates the HO2S voltage samples to determine the amount of time the HO2S voltage was out of range. The PCM will compare the stored HO2S voltage samples taken within each sample period and determine if majority of the samples are out of the operating range.

The PCM monitors the HO2S voltage for being fixed below a predetermined voltage. If the PCM detects the voltage is below a predetermined voltage, a DTC will set.

Conditions for Setting the DTC

- DTCs P0100, P0102, P0103, P0107, P0108, P0112, P0113, P0117, P0118, P0122, P0123, P0125, P0131, P0200, P0372, P1371 not set.
- Engine coolant temperature greater than 48°C (118°F).
- Fuel system operating in Closed Loop.
- Fuel trim learn enabled.
- Air/fuel ratio between 14.6:1 and 14.8:1.
- TP angle between 3% and 20%.
- HO2S signal voltage remains below 200 mV for 30 seconds.

Action Taken When the DTC Sets

- The PCM will illuminate the Malfunction Indicator Lamp (MIL) when the diagnostic runs and fails.
- Open loop fueling.
- The PCM will record operating conditions at the time the diagnostic fails. This information will be stored in the Freeze Frame and/or Failure Records.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL OFF after three consecutive drive trips that the diagnostic runs and does not fail.
- A last test failed (Current DTC) will clear when the ignition is cycled and the diagnostic runs and does not fail.
- A History DTC will clear after forty consecutive warm-up cycles, if no failures are reported by this or any other emission related diagnostic.
- PCM battery voltage is interrupted.
- Using a Scan tool.

Diagnostic Aids

- Heated Oxygen Sensor (HO2S) wire. Sensor pigtail may be contacting the exhaust manifold.
- An oxygen supply inside the HO2S is necessary for proper operation. This supply of oxygen is provided through the HO2S wires. All HO2S wires and connections should be inspected for breaks or contamination. Refer to *Repair Procedures in Electrical Diagnosis (8A Cell 5)*
- Check for intermittent ground in signal wire between connector and sensor.
- Lean injector(s). Perform Injector Balance Test.
- Fuel contamination. Water near the in-tank fuel pump inlet can be delivered to the injectors. The water causes a lean exhaust and can set a DTC.

- Fuel pressure. System will be lean if fuel pressure is low. Refer to *Fuel System* diagnosis.
- Exhaust leaks. An exhaust leak near the HO2S can cause a lean condition. Vacuum or crankcase leaks can also cause a lean condition.
- If the above are OK, the HO2S may be at fault. For intermittents, refer to *Symptoms*.

Test Description

Number(s) below refer to step numbers on the diagnostic table.

2. Engine must be at normal operating temperature before performing this test. For any test that requires probing the PCM or a component harness connector, must use the Connector Test Adapter Kit J 35616-A. Using this kit will prevent damage to the harness connector terminals.
3. Using Freeze Frame and/or Failure Records data may aid in locating an intermittent condition. If the DTC cannot be duplicated, the information included in the Freeze Frame and/or Failure Records data can be useful in determining how many miles since the DTC set. The Fail Counter and Pass Counter can also be used to determine how many ignition cycles the diagnostic reported a pass and/or a fail. Operate vehicle within the same freeze frame conditions (RPM, load, vehicle speed, temperature etc.) that were noted. This will isolate when the DTC failed.
4. Grounding the low side circuit of the HO2S should cause the HO2S voltage to display a bias voltage. If the voltage stayed near 0.0 volts indicates the low circuit is open, or the high circuit is open or grounded.
5. Disconnecting the PCM will allow using the DVM (J 39200) to check continuity of the circuits. This will aid in locating an open or shorted circuit.

DTC P0131 HO2S Circuit Low Voltage Bank1 Sensor1

Step	Action	Value(s)	Yes	No
1	Was the Powertrain On-Board Diagnostic (OBD) System Check performed?	—	Go to Step 2	Go to Powertrain OBD System Check
2	Important: Before proceeding with this DTC, check the HO2S for being secure. A sensor that is loose could cause this DTC to set. 1. Install the scan tool. 2. Start the engine and idle until normal operating temperature is reached. 3. Operate the vehicle within parameters specified under Conditions for Setting the DTC in the supporting text. 4. Using a scan tool, monitor the HO2S voltage display on the Engine 1 Data List. Is the HO2S voltage less than the specified value?	200 mV	Go to Step 4	Go to Step 3
3	1. Turn the ignition ON, engine OFF, review Freeze Frame and/or Failure Records data for this DTC and note parameters. 2. Turn the ignition OFF for 15 seconds. 3. Start the engine and operate the vehicle within the conditions required for this diagnostic to run, and as close to the conditions recorded in Freeze Frame/Failure Records as possible. Special operating conditions that need to be met before the PCM will run this diagnostic, where applicable, are listed in Conditions for Setting the DTC. 4. Using the scan tool, select DTC, Specific, then enter the DTC number which was set. Does the scan tool indicate that this diagnostic failed this ignition?	—	Go to Step 4	Go to Diagnostic Aids-HO2S Circuit Low
4	Disconnect the HO2S and jumper the HO2S low circuit (PCM side) to ground. Does the scan tool indicate HO2S voltage is within the specified values?	375–525 mV	Go to Diagnostic Aids-HO2S Circuit Low	Go to Step 5
5	1. Turn the ignition OFF. 2. Disconnect the PCM. 3. Check the HO2S signal circuit for a short to ground or a short to the sensor ground circuit. Is the HO2S signal circuit shorted?	—	Go to Step 6	Go to Step 7
6	Repair the HO2S signal circuit. Refer to <i>Repair Procedures in Electrical Diagnosis (8A Cell 5)</i>. Is the action complete?	—	Go to Step 8	—
7	Important: Replacement PCM must be programmed. Refer to <i>PCM Replacement/Programming</i>. Replace the PCM. Is the action complete?	—	Go to Step 8	—

DTC P0131 HO2S Circuit Low Voltage Bank1 Sensor1 (cont'd)

Step	Action	Value(s)	Yes	No
8	1. Using the scan tool, select DTC, Clear Info. 2. Start the engine and idle at normal operating temperature. 3. Select DTC, Specific, then enter the DTC number which was set. 4. Operate the vehicle within the conditions for setting this DTC as specified in the supporting text, if applicable. Does the scan tool indicate that this test ran and passed?	—	Go to Step 9	Go to Step 2
9	Using the scan tool, select Capture Info, Review Info. Are any DTCs displayed that have not been diagnosed?	—	Go to the applicable DTC table	System OK

DTC P0132 HO2S Circuit High Voltage Bank1 Sensor1

30395

Circuit Description

The PCM supplies a voltage of about 450 mV between the HO2S high and low signal circuits. The oxygen sensor varies the voltage over a range from about 1000 mV when the exhaust is rich, down through about 10 mV when exhaust is lean.

The PCM monitors and stores the heated oxygen sensor (HO2S) voltage information. The PCM evaluates the HO2S voltage samples to determine the amount of time the HO2S voltage was out of range. The PCM will compare the stored HO2S voltage samples taken within each sample period and determine if majority of the samples are out of the operating range.

The PCM monitors the HO2S voltage for being fixed above a predetermined voltage. If the PCM detects the voltage is above a predetermined voltage, a DTC will set.

Conditions for Setting the DTC

- DTCs P0100, P0102, P0103, P0107, P0108, P0112, P0113, P0118, P0121, P0122, P0123, P0125, P0200, P0372, P1371 not set.
- System operating in Closed Loop.
- Fuel trim learn enabled.
- Air/fuel ratio between 14.6:1 and 14.8:1.
- TP angle between 3% and 20%.
- HO2S signal voltage remains above 774 mV for 30 seconds.

Action Taken When the DTC Sets

- The PCM will illuminate the Malfunction Indicator Lamp (MIL) when the diagnostic runs and fails.
- Open loop fueling.
- The PCM will record operating conditions at the time the diagnostic fails. This information will be stored in the Freeze Frame and/or Failure Records.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL OFF after three consecutive drive trips that the diagnostic runs and does not fail.
- A last test failed (Current DTC) will clear when the ignition is cycled and the diagnostic runs and does not fail.
- A History DTC will clear after forty consecutive warm-up cycles, if no failures are reported by this or any other emission related diagnostic.
- PCM battery voltage is interrupted.
- Using a Scan tool.

Diagnostic Aids

- Fuel pressure. System will go rich if pressure is too high. The PCM can compensate for some increase. However, if fuel pressure is too high, a DTC may set. Refer to *Fuel System Diagnosis*
- Rich injector(s). Perform Injector Balance Test.
- Leaking injector. Refer to *Fuel System Diagnosis*
- Evaporative emissions (EVAP) canister purge. Check for fuel saturation. If full of fuel, check canister control and hoses. Refer to *EVAP Control System*
- MAF sensor. Disconnect the MAF sensor and see if rich condition is corrected. If so, check for proper installation. If installed OK, replace MAF sensor. If MAF sensor is installed backwards, the system will go rich. The plastic portion of the sensor has arrows cast into it indicating proper air flow direction. The arrow must point toward the engine.

- An oxygen supply inside the HO2S is necessary for proper operation. This supply of oxygen is provided through the HO2S wires. All HO2S wires and connections should be inspected for breaks or contamination. Refer to *Repair Procedures in Electrical Diagnosis (8A Cell 5)*.
- Check for leaking fuel pressure regulator diaphragm by checking vacuum line to regulator for fuel.
- TP sensor. An intermittent TP sensor output will cause the system to go rich, due to a false indication of the engine accelerating. For intermittents, refer to *Symptoms*.

Test Description

Number(s) below refer to step numbers on the diagnostic table.

2. Engine must be at normal operating temperature before performing this test. For any test that requires probing the PCM or a component harness connector, must use the Connector Test Adapter Kit J 35616-A. Using this kit will prevent damage to the harness connector terminals.
3. Using Freeze Frame and/or Failure Records data may aid in locating an intermittent condition. If the DTC cannot be duplicated, the information included in the Freeze Frame and/or Failure Records data can be useful in determining how many miles since the DTC set. The Fail Counter and Pass Counter can also be used to determine how many ignition cycles the diagnostic reported a pass and/or a fail. Operate vehicle within the same freeze frame conditions (RPM, load, vehicle speed, temperature etc.) that were noted. This will isolate when the DTC failed. Refer to *Symptoms*.
5. Grounding the low side circuit of the HO2S should cause the HO2S voltage to display a bias voltage.
9. Review the system mechanization. Check for a short between the HO2S signal circuit and any other wires powered by this fuse that run together inside the harness.

DTC P0132 HO2S Circuit High Voltage Bank1 Sensor1

Step	Action	Value(s)	Yes	No
1	Was the Powertrain On-Board Diagnostic (OBD) System Check performed?	—	Go to Step 2	Go to Powertrain OBD System Check
2	1. Install the scan tool. 2. Start the engine and idle until normal operating temperature is reached. 3. Raise the engine speed to 1200 RPM. 4. Using a scan tool, monitor HO2S voltage display on the Engine 1 Data List. Is the HO2S voltage greater than the specified value?	774 mV	Go to Step 4	Go to Step 3
3	1. Turn the ignition ON, engine OFF, review Freeze Frame and/or Failure Records data for this DTC and note parameters. 2. Turn the ignition OFF for 15 seconds. 3. Start the engine and operate the vehicle within the conditions required for this diagnostic to run, and as close to the conditions recorded in Freeze Frame/Failure Records as possible. Special operating conditions that need to be met before the PCM will run this diagnostic, where applicable, are listed in Conditions for Setting the DTC. 4. Using the scan tool, select DTC, Specific, then enter the DTC number which was set. Does the scan tool indicate that this diagnostic failed this ignition?	—	Go to Step 4	Go to Diagnostic Aids - HO2S Circuit High Voltage
4	While monitoring the HO2S voltage, remove the HO2S heater fuse. Does the voltage drop to within the specified range when the power to the heater is disconnected?	375–525 mV	Go to Step 5	Go to Step 7
5	1. Reinstall the fuse. 2. Disconnect HO2S and jumper the HO2S low signal (PCM side) circuit to ground. Does the scan tool indicate HO2S voltage within the specified values?	375–525 mV	Go to Step 10	Go to Step 6
6	While monitoring the HO2S voltage, remove the HO2S heater fuse. Does the voltage drop to within the specified range when the power to the heater is disconnected?	375–525 mV	Go to Step 9	Go to Step 8
7	1. Turn the ignition OFF. 2. Disconnect the PCM connector containing the HO2S signal circuit. 3. Disconnect the HO2S. 4. Turn the ignition ON. 5. Using a DVM (J 39200), check for voltage on the HO2S sensor signal circuit at PCM harness connector. Is there any voltage present?	—	Go to Step 8	Go to Diagnostic Aids - HO2S Circuit High Voltage
8	Repair short to voltage in HO2S signal circuit. Refer to Repair Procedures in Electrical Diagnosis (8A Cell 5). Is the action complete?	—	Go to Step 12	—

DTC P0132 HO2S Circuit High Voltage Bank1 Sensor1 (cont'd)

Step	Action	Value(s)	Yes	No
9	Repair HO2S signal circuit and HO2S heater B+ circuit shorted together. Refer to <i>Repair Procedures in Electrical Diagnosis (8A Cell 5)</i> . Is the action complete?	—	Go to Step 10	Go to Step 11
10	Replace the HO2S. Refer to <i>Heated Oxygen Sensor (HO2S)</i> . Is the action complete?	—	Go to Step 12	—
11	Important: Replacement PCM must be programmed. Refer to <i>PCM Replacement/Programming</i> . Replace the PCM. Is the action complete?	—	Go to Step 12	—
12	1. Using the scan tool, select DTC, Clear Info. 2. Start the engine and idle at normal operating temperature. 3. Select DTC, Specific, then enter the DTC number which was set. 4. Operate the vehicle within the conditions for setting this DTC as specified in the supporting text, if applicable. Does the scan tool indicate that this test ran and passed?	—	Go to Step 13	Go to Step 2
13	Using the scan tool, select Capture Info, Review Info. Are any DTCs displayed that have not been diagnosed?	—	Go to the applicable DTC table	System OK

DTC P0133 HO2S Slow Response Bank1 Sensor1

30395

Circuit Description

The PCM continuously monitors the Heated Oxygen Sensor (HO2S) activity for 100 seconds. During the monitor period the PCM counts the number of times that the HO2S responds from rich to lean and from lean to rich and adds the amount of time it took to complete all transitions. With this information, an average time for all transitions can be determined. If the average response time is too slow, a DTC will set.

A lean to rich transition is determined when the HO2S voltage changes from less than 300 mV to greater than 600 mV. A rich to lean transition is determined when the HO2S voltage changes from more than 600 mV to less than 300 mV. An HO2S that responds too slowly is most likely defective and should be replaced.

Conditions for Setting the DTC

- DTCs P0100, P0107, P0108, P0116, P0117, P0118, P0131, P0132, P0134, P0135, P0171, P0172, P0174, P0175, P0410, P1114, P1115, P1133, not set.
- Fuel system operating in Closed Loop.
- Engine speed between 1000 RPM and 1700 RPM.
- Engine Air Flow between 12 grams per second and 28 grams per second.
- EVAP Canister purge duty cycle less than 100%.
- Lean to rich (Below 300 mV to above 600 mV) response average time is greater than 110 Milliseconds or 150 milliseconds if the vehicle is equipped with an L99 engine.

- Rich to lean (Above 600 mV to below 300 mV) response average time is greater than 110 Milliseconds or 150 milliseconds if the vehicle is equipped with an L99 engine.
- Above conditions are met for 100 seconds

Action Taken When the DTC Sets

- The PCM will illuminate the Malfunction Indicator Lamp (MIL) on the second consecutive drive trip that the diagnostic runs and fails.
- The PCM will record operating conditions at the time the diagnostic fails. The first time the diagnostic fails, this information will be stored in Failure Records. If the diagnostic reports a failure on the second consecutive drive trip, the operating conditions at the time of failure will be written to Freeze Frame and the Failure record will be updated.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL OFF after three consecutive drive trips that the diagnostic runs and does not fail.
- A last test failed (Current DTC) will clear when the ignition is cycled and the diagnostic runs and does not fail.
- A History DTC will clear after forty consecutive warm-up cycles, if no failures are reported by this or any other emission related diagnostic.
- PCM battery voltage is interrupted.
- Using a Scan tool.

Diagnostic Aids

- A malfunction in the HO2S heater circuits will cause a DTC to set. Check HO2S heater circuits for intermittent opens/connections.
- An oxygen supply inside the HO2S is necessary for proper operation. This supply of oxygen is provided through the HO2S wires. All HO2S wires and connections should be inspected for breaks or contamination. Refer to *Repair Procedures in Electrical Diagnosis (8A Cell 5)*.

- Using Freeze Frame and/or Failure Records data may aid in locating an intermittent condition. If the DTC cannot be duplicated, the information included in the Freeze Frame and/or Failure Records data can be useful in determining how many miles since the DTC set. The Fail Counter and Pass Counter can also be used to determine how many ignition cycles the diagnostic reported a pass and/or a fail. Operate vehicle within the same freeze frame conditions (RPM, load, vehicle speed, temperature etc.) that were noted. This will isolate when the DTC failed. For intermittents, refer to *Symptoms*.

Test Description

Number(s) below refer to step numbers on the diagnostic table.

2. Determines if the fault is present. This test may take 5 minutes for the diagnostic to run. For any test that requires probing the PCM or a component harness connector, must use the Connector Test Adapter Kit J 35616-A. Using this kit will prevent damage to the harness connector terminals.
3. When DTCs P0133 and P0153 are set at the same time, is good indication that a fuel contamination problem is present.
4. An exhaust leak 6–12 inches away from the HO2S can cause a DTC to set.
5. Checks whether a good ground circuit is available.
6. Checks the integrity of the signal circuit to the PCM.
7. Checks the integrity of the signal circuit to the PCM.
8. Certain RTV silicone gasket materials give off vapors that can contaminate the HO2S. There is also a possibility of silicone contamination caused by silicone in fuel. If it appears that the sensors are contaminated by silicone and all silicone sealant is a none silicone base, advise customer to try a different fuel company. A fuel filler restrictor missing, indicates leaded fuel may have been used.

DTC P0133 HO2S Slow Response Bank1 Sensor1

Step	Action	Value(s)	Yes	No
1	Was the Powertrain On-Board Diagnostic (OBD) System Check performed?	—	Go to Step 2	Go to Powertrain OBD System Check
2	Important: If any DTCs are set (Except P0153), refer to those DTCs before proceeding with this diagnostic table. 1. Install the scan tool. 2. Start the and idle engine until normal operating temperature is reached. 3. Operate vehicle within parameters specified under Conditions for setting the DTC in the supporting text. 4. Using the scan tool, monitor FAIL THIS IGN. under DTC Info. Does the scan tool indicate DTC P0133 test failed?	—	Go to Step 3	Go to Diagnostic Aids - HO2S Slow Response
3	Did the scan tool also indicate P0153 test failed?	—	Go to Step 8	Go to Step 4
4	1. Perform Exhaust System Leak Test. Refer to <i>Exhaust System (6F)</i>. After Exhaust System Leak Test has been performed, return to this diagnostic. 2. If an exhaust leak is found, repair as necessary. Was an exhaust leak isolated?	—	Go to Step 2	Go to Step 5
5	Visually/physically inspect the following items: • Ensure that the Bank 1 HO2S 1 is securely installed. • Check for corrosion on terminals. • Check terminal tension (at Bank 1 HO2S 1 and at the PCM). • Check for damaged wiring. Was a problem found in any of the above areas?	—	Go to Step 9	Go to Step 6
6	1. Disconnect Bank 1 HO2S 1 and jumper HO2S low (PCM side) signal circuit to ground. 2. Using the scan tool, monitor Bank 1 HO2S 1 voltage on the Engine 1 Data List. Does the scan tool indicate voltage within the specified values?	375–525 mV	Go to Step 7	Go to Step 10
7	1. Jumper Bank 1 HO2S 1 high and low (PCM side) signal circuits to ground. 2. Using the scan tool, monitor Bank 1 HO2S 1 voltage. Does the scan tool indicate voltage below specified value?	200 mV	Go to Step 12	Go to Step 11
8	Important: Before replacing a sensor, the cause of the contamination must be determined and corrected. Check for the following conditions: • Fuel contamination. • Use of improper RTV sealant. • Engine oil/coolant consumption. Replace the affected Heated Oxygen sensor. Refer to <i>Heated Oxygen Sensor (HO2S)</i> . Is the action complete?	—	Go to Step 13	—
9	Repair condition as necessary. Is the action complete?	—	Go to Step 13	—

DTC P0133 HO2S Slow Response Bank1 Sensor1 (cont'd)

Step	Action	Value(s)	Yes	No
10	Repair open Bank 1 HO2S 1 low signal circuit or grounded Bank 1 HO2S 1 high signal circuit. Refer to <i>Repair Procedures in Electrical Diagnosis (8A Cell 5)</i> . Is the action complete?	—	Go to Step 13	—

DTC P0134 HO2S Insufficient Activity Bank1 Sensor1

30395

Circuit Description

The PCM supplies a voltage of about 450 mV between the HO2S high and low signal circuits. The oxygen sensor varies the voltage over a range from about 1000 mV when the exhaust is rich, down through about 10 mV when exhaust is lean.

The PCM monitors and stores the heated oxygen sensor (HO2S) voltage information. The PCM evaluates the HO2S voltage samples to determine the amount of time the HO2S voltage was out of range. The PCM will compare the stored HO2S voltage samples taken within each sample period and determine if majority of the samples are out of the operating range.

The PCM monitors the HO2S voltage and detects if the voltage goes out of the bias range. If the PCM does not detect the voltage went out of the bias range, a DTC will set.

Conditions for Setting the DTC

- DTCs P0100, P0102, P0103, P0107, P0108, P0112, P0113, P0117, P0118, P0122, P0123, P0125, P0200, P0372, P1371 not set.
- Engine operating longer than 68 seconds.
- Engine coolant temperature greater than 48°C (118°F).
- HO2S signal voltage steady between 352 mV and 552 mV for 45 seconds.

Action Taken When the DTC Sets

- The PCM will illuminate the Malfunction Indicator Lamp (MIL) when the diagnostic runs and fails.
- Open loop fueling.
- The PCM will record operating conditions at the time the diagnostic fails. This information will be stored in the Freeze Frame and/or Failure Records.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL OFF after three consecutive drive trips that the diagnostic runs and does not fail.
- A last test failed (Current DTC) will clear when the ignition is cycled and the diagnostic runs and does not fail.
- A History DTC will clear after forty consecutive warm-up cycles, if no failures are reported by this or any other emission related diagnostic.
- PCM battery voltage is interrupted.
- Using a Scan tool.

Diagnostic Aids

- An oxygen supply inside the HO2S is necessary for proper operation. This supply of oxygen is provided through the HO2S wires. All HO2S wires and connections should be inspected for breaks or contamination. Refer to *Repair Procedures in Electrical Diagnosis (8A Cell 5)*.
- For intermittents, refer to *Symptoms*.

Test Description

Number(s) below refer to step numbers on the diagnostic table.

2. Engine must be at normal operating temperature before performing this test. For any test that requires probing the PCM or a component harness connector, must use the Connector Test Adapter Kit J 35616-A. Using this kit will prevent damage to the harness connector terminals.
3. Using Freeze Frame and/or Failure Records data may aid in locating an intermittent condition. If the DTC cannot be duplicated, the information included in the Freeze Frame and/or Failure Records data can be useful in determining how many miles since the DTC set. The Fail Counter and Pass Counter can also be used to determine how many ignition cycles the diagnostic reported a pass and/or a fail. Operate vehicle within the same freeze frame conditions (RPM, load, vehicle speed, temperature etc.) that were noted. This will isolate when the DTC failed. Refer to *Symptoms*.
4. If the scan tool indicates the HO2S voltage goes below 200 mV, indicates the HO2S circuits and PCM are OK.
5. Checks whether the signal circuit from the PCM is OK.
6. Disconnecting the PCM will allow using the DVM (J 39200) to check continuity of the circuits. This will aid in locating an open or shorted circuit.
7. Disconnecting the PCM will allow using the DVM (J 39200) to check continuity of the circuits. This will aid in locating an open or shorted circuit.

DTC P0134 HO2S Insufficient Activity Bank1 Sensor1

Step	Action	Value(s)	Yes	No
1	Was the Powertrain On-Board Diagnostic (OBD) System Check performed?	—	Go to Step 2	Go to Powertrain OBD System Check
2	Important: Before proceeding with this DTC, check the HO2S for being secure. A sensor that is loose could cause this DTC to set. 1. Install the scan tool. 2. Start and idle the engine until normal operating temperature is reached. 3. Raise the engine above 1200 RPM for two minutes. 4. Using a scan tool, monitor the HO2S voltage display on the Engine 1 Data List. Does the scan tool indicate Bank 1 HO2S 1 voltage varying outside the specified values?	352–552 mV	Go to Step 3	Go to Step 4
3	1. Turn the ignition ON, engine OFF, review Freeze Frame and/or Failure Records data for this DTC and note parameters. 2. Turn the ignition OFF for 15 seconds. 3. Start the engine and operate the vehicle within the conditions required for this diagnostic to run, and as close to the conditions recorded in Freeze Frame/Failure Records as possible. Special operating conditions that need to be met before the PCM will run this diagnostic, where applicable, are listed in Conditions for Setting the DTC. 4. Using the scan tool, select DTC, Specific, then enter the DTC number which was set. Does the scan tool indicate that this diagnostic failed this ignition?	—	Go to Step 4	Go to Diagnostic Aids-HO2S Insufficient Activity DTCs
4	1. Turn the ignition ON, Engine OFF. 2. Disconnect Bank 1 HO2S 1 and jumper HO2S high and low (PCM side) signal circuits to ground. 3. Using the scan tool, monitor Bank 1 HO2S 1 voltage. Is the Bank 1 HO2S 1 voltage below the specified value?	200 mV	Go to Step 8	Go to Step 5
5	1. Remove the jumper wire. 2. Using a DVM (J 39200), measure the voltage between the Bank 1 HO2S 1 high signal circuit (PCM side) and the Bank 1 HO2S 1 heater ground circuit. Does the Bank 1 HO2S 1 voltage measure above the specified value?	375 mV	Go to Step 6	Go to Step 7
6	1. Turn the ignition OFF. 2. Disconnect the PCM and check continuity of the Bank 1 HO2S 1 low circuit. 3. If the Bank 1 HO2S 1 low circuit measures over the specified value, repair open or poor connection as necessary. Refer to <i>Repair Procedures in Electrical Diagnosis (8A Cell 5)</i>. Was a Bank 1 HO2S 1 low circuit problem found and corrected?	2 Ω	Go to Step 13	Go to Step 9

DTC P0134 HO2S Insufficient Activity Bank1 Sensor1 (cont'd)

Step	Action	Value(s)	Yes	No
7	1. Turn the ignition OFF. 2. Disconnect the PCM and check continuity of the Bank 1 HO2S 1 signal circuit. 3. If the Bank 1 HO2S 1 signal circuit measures over the specified value, repair open or poor connection as necessary. Refer to <i>Repair Procedures in Electrical Diagnosis (8A Cell 5)</i> . Was a Bank 1 HO2S 1 signal circuit problem found and corrected?	2 Ω	Go to Step 13	Go to Step 10
8	Check for a poor Bank 1 HO2S 1 signal or low circuit terminal connection at the Bank 1 HO2S 1 harness connector and replace terminal(s) if necessary. Refer to <i>Repair Procedures in Electrical Diagnosis (8A Cell 5)</i> . Did any terminals require replacement?	—	Go to Step 13	Go to Step 11
9	Check for poor Bank 1 HO2S 1 low circuit terminal connection at the PCM and replace terminal if necessary. Refer to <i>Repair Procedures in Electrical Diagnosis (8A Cell 5)</i> . Did the terminal require replacement?	—	Go to Step 13	Go to Step 12
10	Check for poor Bank 1 HO2S 1 signal circuit terminal connection at the PCM and replace terminal if necessary. Refer to <i>Repair Procedures in Electrical Diagnosis (8A Cell 5)</i> . Did the terminal require replacement?	—	Go to Step 13	Go to Step 12
11	Replace Bank 1 HO2S 1. Refer to <i>Heated Oxygen Sensor (HO2S)</i> . Is the action completed?	—	Go to Step 13	—
12	Important: Replacement PCM must be programmed. Refer to <i>PCM Replacement/Programming</i> . Replace the PCM. Is the action complete?	—	Go to Step 13	—
13	1. Using the scan tool, select DTC, Clear Info. 2. Start the engine and idle at normal operating temperature. 3. Select DTC, Specific, then enter the DTC number which was set. 4. Operate the vehicle within the conditions for setting this DTC as specified in the supporting text, if applicable. Does the scan tool indicate that this test ran and passed?	—	Go to Step 14	Go to Step 2
14	Using the scan tool, select Capture Info, Review Info. Are any DTCs displayed that have not been diagnosed?	—	Go to the applicable DTC table	System OK

DTC P0135 HO2S Heater Circuit Bank1 Sensor1

30395

Circuit Description

The PCM supplies a bias voltage (approximately 450 mV) on the Heated Oxygen Sensor (HO2S) signal high and low circuits. When the ignition is turned to the ON position, battery voltage is supplied to the HO2S heater. As the heater reaches operating temperature, the HO2S voltage responds by changing from a bias voltage range to normal operation. Typically, as the HO2S reaches operating temperature, the HO2S voltage goes from a bias voltage to a voltage below 300 mV. Depending on the exhaust gas content, it is possible for the HO2S voltage to go above 450 mV.

The PCM will run the heater test only on a cold start (depends on cumulative air flow) and only once an ignition cycle. When the engine is started the PCM will monitor the HO2S voltage. When the HO2S

voltage goes above or below the bias range threshold, the PCM will determine how much time it took. If the PCM detects that it took too much time for the HO2S to enter into normal operating range, a DTC will set. The time it takes the HO2S to reach operating temperature is based on the amount of air that flows into the engine.

Conditions for Setting the DTC

- DTCs P0100, P0102, P0103, P0112, P0113, P0117, P0118, P0122, P0123, P0131, P0132, P0134, P0200 not set.
- Engine is started and Intake Air and Engine Coolant temperatures are less than 50°C (122°F) and are within 3°C (5°F) of each other at start-up.
- Ignition voltage between 10 volts and 16 volts.

- Engine air flow less than 40 grams per second.
- TP sensor angle less than 20%.
- HO2S voltage remains between 300 mV and 700 mV for a predetermined amount of time (depends on engine coolant temperature and air flow).

Action Taken When the DTC Sets

- The PCM will illuminate the Malfunction Indicator Lamp (MIL) on the second consecutive drive trip that the diagnostic runs and fails.
- The PCM will record operating conditions at the time the diagnostic fails. The first time the diagnostic fails, this information will be stored in Failure Records. If the diagnostic reports a failure on the second consecutive drive trip, the operating conditions at the time of failure will be written to Freeze Frame and the Failure record will be updated.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL OFF after three consecutive drive trips that the diagnostic runs and does not fail.
- A last test failed (Current DTC) will clear when the ignition is cycled and the diagnostic runs and does not fail.
- A History DTC will clear after forty consecutive warm-up cycles, if no failures are reported by this or any other emission related diagnostic.
- PCM battery voltage is interrupted.
- Using a Scan tool.

Diagnostic Aids

- Using Freeze Frame and/or Failure Records data may aid in locating an intermittent condition. If the DTC cannot be duplicated, the information included in the Freeze Frame and/or Failure Records data can be useful in determining how many miles since the DTC set. The Fail Counter and Pass Counter can also be used to determine how many ignition cycles

the diagnostic reported a pass and/or a fail. Operate vehicle within the same freeze frame conditions (RPM, load, vehicle speed, temperature etc.) that were noted. This will isolate when the DTC failed.

- The heater diagnostic will only run on a cold start and it will only run once per ignition cycle.
- An oxygen supply inside the HO2S is necessary for proper operation. This supply of oxygen is provided through the HO2S wires. All HO2S wires and connections should be inspected for breaks or contamination. Refer to *Repair Procedures in Electrical Diagnosis (8A Cell 5)*.
- For intermittents, refer to *Symptoms*.

Test Description

Number(s) below refer to step numbers on the diagnostic table.

- The engine must be allowed to cool, as the HO2S maybe at operating temperature and no drop or rise in HO2S voltage would occur. If the HO2S voltage stays between 300–700 mV indicates the HO2S heater is inoperative. For any test that requires probing the PCM or a component harness connector, must use the Connector Test Adapter Kit J 35616–A. Using this kit will prevent damage to the harness connector terminals.
- If more then one HO2S DTC is set, is good indication that the HO2S fuse is open. Check all related circuits going to all heated oxygen sensors for a short to ground. If all wiring checks to be OK, it may be necessary to disconnect each HO2S one at a time to locate a shorted sensor.
- Checks whether B+ supply is available at the sensor.
- Checks whether a ground is available at the sensor.
- Checks whether the HO2S heater element is internally open.

DTC P0135 HO2S Heater Circuit Bank1 Sensor1

Step	Action	Value(s)	Yes	No
1	Was the Powertrain On–Board Diagnostic (OBD) System Check performed?	—	Go to Step 2	Go to Powertrain OBD System Check
2	Important: If engine has just been operating, allow engine to cool for about one half hour before proceeding. 1. Turn the ignition OFF. 2. Install the scan tool. 3. Turn the ignition ON, engine OFF. 4. Monitor the HO2S voltage display on the Engine 1 Data List of the scan tool. Does HO2S voltage go from a bias voltage to above or below the specified values?	300–700 mV	Go to Diagnostic Aids–HO2S Heater Circuit DTCs	Go to Step 3

DTC P0135 HO2S Heater Circuit Bank1 Sensor1 (cont'd)

Step	Action	Value(s)	Yes	No
3	Inspect fuse for the HO2S ignition feed. Is HO2S fuse open?	—	Go to Step 11	Go to Step 4
4	1. Raise the vehicle. 2. Disconnect HO2S electrical connector. 3. Using a test light (J 34142-B) connected to ground (A known good ground. Do not use HO2S heater ground or HO2S low), probe ignition feed circuit at the HO2S electrical connector (PCM side). Does the test light illuminate?	—	Go to Step 5	Go to Step 7
5	Connect the test light between HO2S ignition feed and HO2S heater ground. Does the test light illuminate?	—	Go to Step 6	Go to Step 8
6	Using a DVM (J 39200), measure resistance between HO2S ignition feed and HO2S heater ground at HO2S pigtail. Is the HO2S resistance within the specified values?	3.5–14.0 Ω	Go to Step 9	Go to Step 10
7	Repair the open in the HO2S ignition feed circuit to HO2S. Refer to <i>Repair Procedures in Electrical Diagnosis (8A Cell 5)</i> . Is the action complete?	—	Go to Step 12	—
8	Repair the open in the HO2S heater ground circuit. Refer to <i>Repair Procedures in Electrical Diagnosis (8A Cell 5)</i> . Is the action complete?	—	Go to Step 12	—
9	1. Check for a poor connection at the HO2S harness terminals. 2. If a poor connection is found, replace terminals. Refer to <i>Repair Procedures in Electrical Diagnosis (8A Cell 5)</i> . Was a poor connection found?	—	Go to Step 12	Go to Step 10
10	Replace the HO2S. Refer to <i>Heated Oxygen Sensor (HO2S)</i> . Is the action complete?	—	Go to Step 12	—
11	Locate and repair the short to ground in HO2S ignition feed circuit and replace the faulty fuse. Refer to <i>Repair Procedures in Electrical Diagnosis (8A Cell 5)</i> . Is the action complete?	—	Go to Step 12	—
12	1. Using the scan tool, select DTC, Clear Info. 2. Start the engine and idle at normal operating temperature. 3. Select DTC, Specific, then enter the DTC number which was set. 4. Operate the vehicle within the conditions for setting this DTC as specified in the supporting text, if applicable. Does the scan tool indicate that this test ran and passed?	—	Go to Step 13	Go to Step 2
13	Using the scan tool, select Capture Info, Review Info. Are any DTCs displayed that have not been diagnosed?	—	Go to the applicable DTC table	System OK

DTC P0137 HO2S Circuit Low Voltage Bank1 Sensor2

30395

Circuit Description

The PCM supplies a voltage of about 450 mV between the HO2S high and low signal circuits. The oxygen sensor varies the voltage over a range from about 1000 mV when the exhaust is rich, down through about 10 mV when exhaust is lean.

The PCM monitors and stores the heated oxygen sensor (HO2S) voltage information. The PCM evaluates the HO2S voltage samples to determine the amount of time the HO2S voltage was out of range. The PCM will compare the stored HO2S voltage samples taken within each sample period and determine if majority of the samples are out of the operating range.

The PCM monitors the HO2S voltage for being fixed below a predetermined voltage. If the PCM detects the voltage is below a predetermined voltage, a DTC will set.

Conditions for Setting the DTC

- DTCs P0100, P0102, P0103, P0107, P0108, P0112, P0113, P0117, P0118, P0122, P0123, P0125, P0151, P0200, P0372, P1371 not set.
- Engine coolant temperature greater than 48°C (118°F).
- Fuel system operating in Closed Loop.
- Fuel trim learn enabled.
- Air/fuel ratio between 14.6:1 and 14.8:1.
- TP angle between 3% and 20%.
- HO2S signal voltage remains below 39 mV for 38 seconds.

Action Taken When the DTC Sets

- The PCM will illuminate the Malfunction Indicator Lamp (MIL) on the second consecutive drive trip that the diagnostic runs and fails.
- The PCM will record operating conditions at the time the diagnostic fails. The first time the diagnostic fails, this information will be stored in Failure Records. If the diagnostic reports a failure on the second consecutive drive trip, the operating conditions at the time of failure will be written to Freeze Frame and the Failure record will be updated.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL OFF after three consecutive drive trips that the diagnostic runs and does not fail.
- A last test failed (Current DTC) will clear when the ignition is cycled and the diagnostic runs and does not fail.
- A History DTC will clear after forty consecutive warm-up cycles, if no failures are reported by this or any other emission related diagnostic.
- PCM battery voltage is interrupted.
- Using a Scan tool.

Diagnostic Aids

- Heated Oxygen Sensor (HO2S) wire. Sensor pigtail may be contacting the exhaust manifold.
- An oxygen supply inside the HO2S is necessary for proper operation. This supply of oxygen is provided through the HO2S wires. All HO2S wires and connections should be inspected for breaks or contamination. Refer to *Repair Procedures in Electrical Diagnosis (8A Cell 5)*.
- Check for intermittent ground in signal wire between connector and sensor.
- Lean injector(s). Perform Injector Balance Test.
- Fuel contamination. Water near the in-tank fuel pump inlet can be delivered to the injectors. The water causes a lean exhaust and can set a DTC.

- Fuel pressure. System will be lean if fuel pressure is low. Refer to *Fuel System* diagnosis.
- Exhaust leaks. An exhaust leak near the HO2S can cause a lean condition. Vacuum or crankcase leaks can also cause a lean condition.
- If the above are OK, the HO2S may be at fault. For intermittents, refer to *Symptoms*.

Test Description

Number(s) below refer to step numbers on the diagnostic table.

2. Engine must be at normal operating temperature before performing this test. For any test that requires probing the PCM or a component harness connector, must use the Connector Test Adapter Kit J 35616-A. Using this kit will prevent damage to the harness connector terminals.
3. Using Freeze Frame and/or Failure Records data may aid in locating an intermittent condition. If the DTC cannot be duplicated, the information included in the Freeze Frame and/or Failure Records data can be useful in determining how many miles since the DTC set. The Fail Counter and Pass Counter can also be used to determine how many ignition cycles the diagnostic reported a pass and/or a fail. Operate vehicle within the same freeze frame conditions (RPM, load, vehicle speed, temperature etc.) that were noted. This will isolate when the DTC failed.
4. It may be necessary to lower the exhaust system to gain sufficient access to an HO2S and/or its connector. Refer to *Exhaust System*. Grounding the low side circuit of the HO2S should cause the HO2S voltage to display a bias voltage. If the voltage stayed near 0.0 volts indicates the low circuit is open, or the high circuit is open or grounded.
5. Disconnecting the PCM will allow using the DVM (J 39200) to check continuity of the circuits. This will aid in locating an open or shorted circuit.

DTC P0137 HO2S Circuit Low Voltage Bank1 Sensor2

Step	Action	Value(s)	Yes	No
1	Was the Powertrain On-Board Diagnostic (OBD) System Check performed?	—	Go to Step 2	Go to Powertrain OBD System Check
2	Important: Before proceeding with this DTC, check the HO2S for being secure. A sensor that is loose could cause this DTC to set. 1. Install the scan tool. 2. Start and idle the engine until normal operating temperature is reached. 3. Operate the vehicle within the parameters specified under Conditions for Setting the DTC in the supporting text. 4. Using the scan tool, monitor the HO2S voltage display on the Engine 1 Data List . Is the HO2S voltage less than the specified value?	39 mV	Go to Step 4	Go to Step 3
3	1. Turn the ignition ON, engine OFF, review Freeze Frame and/or Failure Records data for this DTC and note parameters. 2. Turn the ignition OFF for 15 seconds. 3. Start the engine and operate the vehicle within the conditions required for this diagnostic to run, and as close to the conditions recorded in Freeze Frame/Failure Records as possible. Special operating conditions that need to be met before the PCM will run this diagnostic, where applicable, are listed in Conditions for Setting the DTC. 4. Using the scan tool, select DTC, Specific, then enter the DTC number which was set. Does the scan tool indicate that this diagnostic failed this ignition?	—	Go to Step 4	Go to Diagnostic Aids-HO2S Circuit Low (Rear HO2S) DTCs
4	Disconnect the HO2S and jumper the HO2S low circuit (PCM side) to ground. Does the scan tool indicate the HO2S voltage is within the specified values?	375–525 mV	Go to Diagnostic Aids-HO2S Circuit Low (Rear HO2S) DTCs	Go to Step 5
5	1. Turn the ignition OFF. 2. Disconnect the PCM. 3. Check the HO2S signal circuit for a short to ground or a short to the sensor ground circuit. Is the HO2S signal circuit shorted?	—	Go to Step 6	Go to Step 7
6	Repair the HO2S signal circuit. Refer to <i>Repair Procedures in Electrical Diagnosis (8A Cell 5)</i> . Is the action complete?	—	Go to Step 8	—
7	Important: Replacement PCM must be programmed. Refer to <i>PCM Replacement/Programming</i> . Replace the PCM. Is the action complete?	—	Go to Step 8	—

DTC P0137 HO2S Circuit Low Voltage Bank1 Sensor2 (cont'd)

DTC P0138 HO2S Circuit High Voltage Bank1 Sensor2

30395

Circuit Description

The PCM supplies a voltage of about 450 mV between the HO2S high and low signal circuits. The oxygen sensor varies the voltage over a range from about 1000 mV when the exhaust is rich, down through about 10 mV when exhaust is lean.

The PCM monitors and stores the heated oxygen sensor (HO2S) voltage information. The PCM evaluates the HO2S voltage samples to determine the amount of time the HO2S voltage was out of range. The PCM will compare the stored HO2S voltage samples taken within each sample period and determine if majority of the samples are out of the operating range.

The PCM monitors the HO2S voltage for being fixed above a predetermined voltage. If the PCM detects the voltage is above a predetermined voltage, a DTC will set.

Conditions for Setting the DTC

- DTCs P0100, P0102, P0103, P0107, P0108, P0112, P0113, P0117, P0118, P0122, P0123, P0125, P0200, P0372, P1371 not set.
- Closed Loop.
- Fuel Trim learn enabled.
- Air/fuel ratio between 14.6:1 and 14.8:1.
- TP angle between 3% and 20%.
- HO2S signal voltage remains above 930 mV for 38 seconds.

Action Taken When the DTC Sets

- The PCM will illuminate the Malfunction Indicator Lamp (MIL) on the second consecutive drive trip that the diagnostic runs and fails.
- The PCM will record operating conditions at the time the diagnostic fails. The first time the diagnostic fails, this information will be stored in Failure Records. If the diagnostic reports a failure on the second consecutive drive trip, the operating conditions at the time of failure will be written to Freeze Frame and the Failure record will be updated.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL OFF after three consecutive drive trips that the diagnostic runs and does not fail.
- A last test failed (Current DTC) will clear when the ignition is cycled and the diagnostic runs and does not fail.
- A History DTC will clear after forty consecutive warm-up cycles, if no failures are reported by this or any other emission related diagnostic.
- PCM battery voltage is interrupted.
- Using a Scan tool.

Diagnostic Aids

- Fuel pressure. System will go rich if pressure is too high. The PCM can compensate for some increase. However, if fuel pressure is too high, a DTC may set. Refer to *Fuel System Diagnosis*.
- Rich injector(s). Perform Injector Balance Test.
- Leaking injector. Refer to *Fuel System Diagnosis*.
- Evaporative emissions (EVAP) canister purge. Check for fuel saturation. If full of fuel, check canister control and hoses. Refer to *EVAP Control System*.
- MAF sensor. Disconnect the MAF sensor and see if rich condition is corrected. If so, check for proper installation. If installed OK, replace MAF sensor. If MAF sensor is installed backwards, the system will go rich. The plastic portion of the sensor has arrows cast into it indicating proper air flow direction. The arrow must point toward the engine.

- An oxygen supply inside the HO2S is necessary for proper operation. This supply of oxygen is provided through the HO2S wires. All HO2S wires and connections should be inspected for breaks or contamination. Refer to *Repair Procedures in Electrical Diagnosis (8A Cell 5)*.
- Check for leaking fuel pressure regulator diaphragm by checking vacuum line to regulator for fuel.
- TP sensor. An intermittent TP sensor output will cause the system to go rich, due to a false indication of the engine accelerating. For intermittents, refer to *Symptoms*.

Test Description

Number(s) below refer to step numbers on the diagnostic table.

2. Engine must be at normal operating temperature before performing this test. For any test that requires probing the PCM or a component harness connector, must use the Connector Test Adapter Kit J 35616-A. Using this kit will prevent damage to the harness connector terminals.
3. Using Freeze Frame and/or Failure Records data may aid in locating an intermittent condition. If the DTC cannot be duplicated, the information included in the Freeze Frame and/or Failure Records data can be useful in determining how many miles since the DTC set. The Fail Counter and Pass Counter can also be used to determine how many ignition cycles the diagnostic reported a pass and/or a fail. Operate vehicle within the same freeze frame conditions (RPM, load, vehicle speed, temperature etc.) that were noted. This will isolate when the DTC failed. Refer to *Symptoms*.
5. Grounding the low side circuit of the HO2S should cause the HO2S voltage to display a bias voltage.
9. Review the system mechanization. Check for a short between the HO2S signal circuit and any other wires powered by this fuse that run together inside the harness.

DTC P0138 HO2S Circuit High Voltage Bank1 Sensor2

Step	Action	Value(s)	Yes	No
1	Was the Powertrain On-Board Diagnostic (OBD) System Check performed?	—	Go to Step 2	Go to Powertrain OBD System Check
2	1. Install the scan tool. 2. Start and idle the engine until normal operating temperature is reached. 3. Raise the engine speed to 1200 RPM. 4. Using the scan tool, monitor HO2S voltage display on the Engine 1 Data List. Is the HO2S voltage greater than the specified value?	930 mV	Go to Step 4	Go to Step 3
3	1. Turn the ignition ON, engine OFF, review Freeze Frame and/or Failure Records data for this DTC and note parameters. 2. Turn the ignition OFF for 15 seconds. 3. Start the engine and operate the vehicle within the conditions required for this diagnostic to run, and as close to the conditions recorded in Freeze Frame/Failure Records as possible. Special operating conditions that need to be met before the PCM will run this diagnostic, where applicable, are listed in Conditions for Setting the DTC. 4. Using the scan tool, select DTC, Specific, then enter the DTC number which was set. Does the scan tool indicate that this diagnostic failed this ignition?	—	Go to Step 4	Go to Diagnostic Aids - HO2S Circuit High Voltage
4	While monitoring the HO2S voltage, remove the HO2S heater fuse. Does the voltage drop to within the specified range when the power to the heater is disconnected?	375–525 mV	Go to Step 5	Go to Step 7
5	1. Reinstall the fuse. 2. Disconnect the HO2S and jumper the HO2S low signal (PCM side) circuit to ground. Does the scan tool indicate the HO2S voltage is within the specified values?	375–525 mV	Go to Step 10	Go to Step 6
6	While monitoring the HO2S voltage, remove the HO2S heater fuse. Does the voltage drop to within the specified range when the power to the heater is disconnected?	375–525 mV	Go to Step 9	Go to Step 8
7	1. Turn the ignition OFF. 2. Disconnect the PCM connector containing the HO2S signal circuit. 3. Disconnect the HO2S. 4. Turn the ignition ON. 5. Using a DVM (J 39200), check for voltage on the HO2S sensor signal circuit at PCM harness connector. Is there any voltage present?	—	Go to Step 8	Go to Diagnostic Aids - HO2S Circuit High Voltage
8	Repair the short to voltage in the HO2S signal circuit. Refer to <i>Repair Procedures in Electrical Diagnosis</i> (8A Cell 5). Is the action complete?	—	Go to Step 12	—

DTC P0138 HO2S Circuit High Voltage Bank1 Sensor2 (cont'd)

Step	Action	Value(s)	Yes	No
9	Repair the HO2S signal circuit and the HO2S heater B+ circuit for being shorted together. Refer to <i>Repair Procedures in Electrical Diagnosis (8A Cell 5)</i> . Is the action complete?	—	Go to Step 10	Go to Step 11
10	Replace the HO2S. Refer to <i>Heated Oxygen Sensor (HO2S)</i> . Is the action complete?	—	Go to Step 12	—
11	Important: Replacement PCM must be programmed. Refer to <i>PCM Replacement/Programming</i> . Replace the PCM. Is the action complete?	—	Go to Step 12	—
12	1. Using the scan tool, select DTC, Clear Info. 2. Start the engine and idle at normal operating temperature. 3. Select DTC, Specific, then enter the DTC number which was set. 4. Operate the vehicle within the conditions for setting this DTC as specified in the supporting text, if applicable. Does the scan tool indicate that this test ran and passed?	—	Go to Step 13	Go to Step 2
13	Using the scan tool, select Capture Info, Review Info. Are any DTCs displayed that have not been diagnosed?	—	Go to the applicable DTC table	System OK

DTC P0140 HO2S Insufficient Activity Bank1 Sensor2

30395

Circuit Description

The PCM supplies a voltage of about 450 mV between the HO2S high and low signal circuits. The oxygen sensor varies the voltage over a range from about 1000 mV when the exhaust is rich, down through about 10 mV when exhaust is lean.

The PCM monitors and stores the heated oxygen sensor (HO2S) voltage information. The PCM evaluates the HO2S voltage samples to determine the amount of time the HO2S voltage was out of range. The PCM will compare the stored HO2S voltage samples taken within each sample period and determine if majority of the samples are out of the operating range.

The PCM monitors the HO2S voltage and detects if the voltage goes out of the bias range. If the PCM does not detect the voltage went out of the bias range, a DTC will set.

Conditions for Setting the DTC

- DTCs P0100, P0102, P0103, P0107, P0108, P0112, P0113, P0117, P0118, P0122, P0123, P0125, P0141, P0200, P0372, P1371 not set.
- Engine operating longer than 68 seconds.
- Fuel system operating in Closed Loop.
- Engine coolant temperature greater than 48°C (118°F).
- HO2S signal voltage steady between 391 mV and 491 mV for 2.5 minutes.

Action Taken When the DTC Sets

- The PCM will illuminate the Malfunction Indicator Lamp (MIL) on the second consecutive drive trip that the diagnostic runs and fails.
- The PCM will record operating conditions at the time the diagnostic fails. The first time the diagnostic fails, this information will be stored in Failure Records. If the diagnostic reports a failure on the second consecutive drive trip, the operating conditions at the time of failure will be written to Freeze Frame and the Failure record will be updated.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL OFF after three consecutive drive trips that the diagnostic runs and does not fail.
- A last test failed (Current DTC) will clear when the ignition is cycled and the diagnostic runs and does not fail.
- A History DTC will clear after forty consecutive warm-up cycles, if no failures are reported by this or any other emission related diagnostic.
- PCM battery voltage is interrupted.
- Using a Scan tool.

Diagnostic Aids

- An oxygen supply inside the HO2S is necessary for proper operation. This supply of oxygen is provided through the HO2S wires. All HO2S wires and connections should be inspected for breaks or contamination. Refer to *Repair Procedures in Electrical Diagnosis (8A Cell 5)*.
- For intermittents, refer to *Symptoms*.

Test Description

Number(s) below refer to step numbers on the diagnostic table.

2. Engine must be at normal operating temperature before performing this test. For any test that requires probing the PCM or a component harness connector, must use the Connector Test Adapter Kit J 35616-A. Using this kit will prevent damage to the harness connector terminals.
3. Using Freeze Frame and/or Failure Records data may aid in locating an intermittent condition. If the DTC cannot be duplicated, the information included in the Freeze Frame and/or Failure Records data can be useful in determining how many miles since the DTC set. The Fail Counter and Pass Counter can also be used to determine how many ignition cycles the diagnostic reported a pass and/or a fail. Operate vehicle within the same freeze frame conditions (RPM, load, vehicle speed, temperature etc.) that were noted. This will isolate when the DTC failed. Refer to *Symptoms, Intermittents*.
4. It may be necessary to lower the exhaust system to gain sufficient access to an HO2S and/or its connector. Refer to *Section 6F, Exhaust System*. If the scan tool indicates the HO2S voltage goes below 200 mV, indicates the HO2S circuits and PCM are OK.
5. Checks whether the signal circuit from the PCM is OK.
6. Disconnecting the PCM will allow using the DVM (J 39200) to check continuity of the circuits. This will aid in locating an open or shorted circuit.
7. Disconnecting the PCM will allow using the DVM (J 39200) to check continuity of the circuits. This will aid in locating an open or shorted circuit.

DTC P0140 HO2S Insufficient Activity Bank1 Sensor2

Step	Action	Value(s)	Yes	No
1	Was the Powertrain On-Board Diagnostic (OBD) System Check performed?	—	Go to Step 2	Go to Powertrain OBD System Check
2	Important: Before proceeding with this DTC, check the HO2S for being secure. A sensor that is loose could cause this DTC to set. 1. Install the scan tool. 2. Start and idle the engine until normal operating temperature is reached. 3. Operate engine above 1200 RPM for two minutes. 4. Using a scan tool, monitor HO2S voltage display on the Engine 1 Data List. Does the scan tool indicate Bank 1 HO2S 1 voltage varying outside the specified values?	391–491 mV	Go to Step 3	Go to Step 4
3	1. Turn the ignition ON, engine OFF, review Freeze Frame and/or Failure Records data for this DTC and note parameters. 2. Turn the ignition OFF for 15 seconds. 3. Start the engine and operate the vehicle within the conditions required for this diagnostic to run, and as close to the conditions recorded in Freeze Frame/Failure Records as possible. Special operating conditions that need to be met before the PCM will run this diagnostic, where applicable, are listed in Conditions for Setting the DTC. 4. Using the scan tool, select DTC, Specific, then enter the DTC number which was set. Does the scan tool indicate that this diagnostic failed this ignition?	—	Go to Step 4	Go to Diagnostic Aids-HO2S Insufficient Activity DTCs
4	1. Turn the ignition ON, Engine OFF. 2. Disconnect Bank 1 HO2S 1 and jumper HO2S high and low (PCM side) signal circuits to ground. 3. Using a scan tool, monitor Bank 1 HO2S 1 voltage. Is Bank 1 HO2S 1 voltage below the specified value?	200 mV	Go to Step 8	Go to Step 5
5	1. Remove the jumper wire. 2. Using a DVM (J 39200), measure voltage between the Bank 1 HO2S 1 high signal circuit (PCM side) and the Bank 1 HO2S 1 heater ground circuit. Does Bank 1 HO2S 1 voltage measure above the specified value?	375 mV	Go to Step 6	Go to Step 7
6	1. Turn the ignition OFF. 2. Disconnect the PCM and check continuity of the Bank 1 HO2S 1 low circuit. 3. If the Bank 1 HO2S 1 low circuit measures over the specified value, repair open or poor connection as necessary. Refer to <i>Repair Procedures in Electrical Diagnosis (8A Cell 5)</i>. Was a Bank 1 HO2S 1 low circuit problem found and corrected?	2 Ω	Go to Step 13	Go to Step 9

DTC P0140 HO2S Insufficient Activity Bank1 Sensor2 (cont'd)

Step	Action	Value(s)	Yes	No
7	1. Turn the ignition OFF. 2. Disconnect the PCM and check continuity of the Bank 1 HO2S 1 signal circuit. 3. If the Bank 1 HO2S 1 signal circuit measures over the specified value, repair open or poor connection as necessary. Refer to <i>Repair Procedures in Electrical Diagnosis (8A Cell 5)</i> . Was a Bank 1 HO2S 1 signal circuit problem found and corrected?	2 Ω	Go to Step 13	Go to Step 10
8	Check for a poor Bank 1 HO2S 1 signal or low circuit terminal connection at the Bank 1 HO2S 1 harness connector and replace terminal(s) if necessary. Refer to <i>Repair Procedures in Electrical Diagnosis (8A Cell 5)</i> . Did any terminals require replacement?	—	Go to Step 13	Go to Step 11
9	Check for poor Bank 1 HO2S 1 low circuit terminal connection at the PCM and replace terminal if necessary. Did the terminal require replacement?	—	Go to Step 13	Go to Step 12
10	Check for poor Bank 1 HO2S 1 signal circuit terminal connection at the PCM and replace terminal if necessary. Refer to <i>Repair Procedures in Electrical Diagnosis (8A Cell 5)</i> . Did the terminal require replacement?	—	Go to Step 13	Go to Step 12
11	Replace Bank 1 HO2S 1. Refer to <i>Heated Oxygen Sensor (HO2S)</i> . Is the action complete?	—	Go to Step 13	—
12	Important: Replacement PCM must be programmed. Refer to <i>PCM Replacement/Programming</i> . Replace the PCM. Is the action complete?	—	Go to Step 13	—
13	1. Using the scan tool, select DTC, Clear Info. 2. Start engine and idle at normal operating temperature. 3. Select DTC, Specific, then enter the DTC number which was set. 4. Operate vehicle within the conditions for setting this DTC as specified in the supporting text, if applicable. Does the scan tool indicate that this test ran and passed?	—	Go to Step 14	Go to Step 2
14	Using the scan tool, select Capture Info, Review Info. Are any DTCs displayed that have not been diagnosed?	—	Go to the applicable DTC table	System OK

DTC P0141 HO2S Heater Circuit Bank1 Sensor2

Circuit Description

The PCM supplies a bias voltage (approximately 450 mV) on the Heated Oxygen Sensor (HO2S) signal high and low circuits. When the ignition is turned to the ON position, battery voltage is supplied to the HO2S heater. As the heater reaches operating temperature, the HO2S voltage responds by changing from a bias voltage range to normal operation. Typically, as the HO2S reaches operating temperature, the HO2S voltage goes from a bias voltage to a voltage below 300 mV. Depending on the exhaust gas content, it is possible for the HO2S voltage to go above 450 mV.

The PCM will run the heater test only on a cold start (depends on cumulative air flow) and only once an ignition cycle. When the engine is started the PCM will monitor the HO2S voltage. When the HO2S

voltage goes above or below the bias range threshold, the PCM will determine how much time it took. If the PCM detects that it took too much time for the HO2S to enter into normal operating range, a DTC will set. The time it takes the HO2S to reach operating temperature is based on the amount of air that flows into the engine.

Conditions for Setting the DTC

- DTCs P0100,P0102, P0103, P0112, P0113, P0117, P0118, P0122, P0123, P0200 not set.
- Engine is started and Intake Air and Engine Coolant temperatures are less than 50°C (122°F) and are within 3°C (5°F) of each other at start-up.
- Ignition voltage between 10 volts and 16 volts.
- Engine air flow less than 30 grams per second.

- TP sensor angle less than 20%.
- HO2S voltage remains between 300 mV and 700 mV for a predetermined amount of time (depends on engine coolant temperature and air flow).

Action Taken When the DTC Sets

- The PCM will illuminate the Malfunction Indicator Lamp (MIL) on the second consecutive drive trip that the diagnostic runs and fails.
- The PCM will record operating conditions at the time the diagnostic fails. The first time the diagnostic fails, this information will be stored in Failure Records. If the diagnostic reports a failure on the second consecutive drive trip, the operating conditions at the time of failure will be written to Freeze Frame and the Failure record will be updated.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL OFF after three consecutive drive trips that the diagnostic runs and does not fail.
- A last test failed (Current DTC) will clear when the ignition is cycled and the diagnostic runs and does not fail.
- A History DTC will clear after forty consecutive warm-up cycles, if no failures are reported by this or any other emission related diagnostic.
- PCM battery voltage is interrupted.
- Using a Scan tool.

Diagnostic Aids

- Using Freeze Frame and/or Failure Records data may aid in locating an intermittent condition. If the DTC cannot be duplicated, the information included in the Freeze Frame and/or Failure Records data can be useful in determining how many miles since the DTC set. The Fail Counter and Pass Counter can also be used to determine how many ignition cycles

the diagnostic reported a pass and/or a fail. Operate vehicle within the same freeze frame conditions (RPM, load, vehicle speed, temperature etc.) that were noted. This will isolate when the DTC failed.

- The heater diagnostic will only run on a cold start and it will only run once per ignition cycle.
- An oxygen supply inside the HO2S is necessary for proper operation. This supply of oxygen is provided through the HO2S wires. All HO2S wires and connections should be inspected for breaks or contamination. Refer to *Repair Procedures in Electrical Diagnosis (8A Cell 5)*.
- For intermittents, refer to *Symptoms*.

Test Description

Number(s) below refer to step numbers on the diagnostic table.

- The engine must be allowed to cool, as the HO2S maybe at operating temperature and no drop or rise in HO2S voltage would occur. If the HO2S voltage stays between 300–700 mV indicates the HO2S heater is inoperative. For any test that requires probing the PCM or a component harness connector, must use the Connector Test Adapter Kit J 35616–A. Using this kit will prevent damage to the harness connector terminals.
- If more than one HO2S DTC is set, is good indication that the HO2S fuse is open. Check all related circuits going to all heated oxygen sensors for a short to ground. If all wiring checks to be OK, it may be necessary to disconnect each HO2S one at a time to locate a shorted sensor.
- Checks whether B+ supply is available at the sensor.
- Checks whether a ground is available at the sensor.
- Checks whether the HO2S heater element is internally open.

DTC P0141 HO2S Heater Circuit Bank1 Sensor2

Step	Action	Value(s)	Yes	No
1	Was the Powertrain On-Board Diagnostic (OBD) System Check performed?	—	Go to Step 2	Go to Powertrain OBD System Check
2	Important: If the engine has just been operating, allow the engine to cool for about one half hour before proceeding. - Turn the ignition OFF. - Install the scan tool. - Turn the ignition ON, engine OFF. - Monitor the HO2S voltage display on the Engine 1 Data List of the scan tool. Does the HO2S voltage go from a bias voltage to above or below the specified values?	300–700 mV	Go to Diagnostic Aids- HO2S Heater Circuit DTCs	Go to Step 3

DTC P0141 HO2S Heater Circuit Bank1 Sensor2 (cont'd)

Step	Action	Value(s)	Yes	No
3	Inspect the fuse for HO2S ignition feed. Is the HO2S fuse open?	—	Go to Step 11	Go to Step 4
4	1. Raise the vehicle. 2. Disconnect the HO2S electrical connector. 3. Using a test light (J 34142-B) connected to ground (A known good ground. Do not use HO2S heater ground or HO2S low), probe the ignition feed circuit at HO2S electrical connector (PCM side). Does the test light illuminate?	—	Go to Step 5	Go to Step 7
5	Connect the test light between HO2S ignition feed and HO2S heater ground. Does the test light illuminate?	—	Go to Step 6	Go to Step 8
6	Using a DVM (J 39200), measure resistance between HO2S ignition feed and HO2S heater ground at HO2S pigtail. Is the HO2S resistance within the specified values?	3.5–14.0 Ω	Go to Step 9	Go to Step 10
7	Repair open in the HO2S ignition feed circuit to HO2S. Refer to <i>Repair Procedures in Electrical Diagnosis (8A Cell 5)</i> . Is the action complete?	—	Go to Step 12	—
8	Repair open in the HO2S heater ground circuit. Refer to <i>Repair Procedures in Electrical Diagnosis (8A Cell 5)</i> . Is the action complete?	—	Go to Step 12	—
9	1. Check for a poor connection at the HO2S harness terminals. 2. If a poor connection is found, replace terminals. Refer to <i>Repair Procedures in Electrical Diagnosis (8A Cell 5)</i> . Was a poor connection found?	—	Go to Step 12	Go to Step 10
10	Replace the HO2S. Refer to <i>Heated Oxygen Sensor (HO2S)</i> . Is the action complete?	—	Go to Step 12	—
11	Locate and repair the short to ground in the HO2S ignition feed circuit and replace faulty fuse. Refer to <i>Repair Procedures in Electrical Diagnosis (8A Cell 5)</i> . Is the action complete?	—	Go to Step 12	—
12	1. Using the scan tool, select DTC, Clear Info. 2. Start the engine and idle at normal operating temperature. 3. Select DTC, Specific, then enter the DTC number which was set. 4. Operate the vehicle within the conditions for setting this DTC as specified in the supporting text, if applicable. Does the scan tool indicate that this test ran and passed?	—	Go to Step 13	Go to Step 2
13	Using the scan tool, select Capture Info, Review Info. Are any DTCs displayed that have not been diagnosed?	—	Go to the applicable DTC table	System OK

DTC P0151 HO2S Circuit Low Voltage Bank2 Sensor1

30396

Circuit Description

The PCM supplies a voltage of about 450 mV between the HO2S high and low signal circuits. The oxygen sensor varies the voltage over a range from about 1000 mV when the exhaust is rich, down through about 10 mV when exhaust is lean.

The PCM monitors and stores the heated oxygen sensor (HO2S) voltage information. The PCM evaluates the HO2S voltage samples to determine the amount of time the HO2S voltage was out of range. The PCM will compare the stored HO2S voltage samples taken within each sample period and determine if majority of the samples are out of the operating range.

The PCM monitors the HO2S voltage for being fixed below a predetermined voltage. If the PCM detects the voltage is below a predetermined voltage, a DTC will set.

Conditions for Setting the DTC

- DTCs P0100, P0102, P0103, P0107, P0108, P0112, P0113, P0117, P0118, P0122, P0123, P0125, P0131, P0200, P0372, P1371 not set.
- Engine coolant temperature greater than 48°C (118°F).
- Fuel system operating in Closed Loop.
- Fuel trim learn enabled.
- Air/fuel ratio between 14.6:1 and 14.8:1.
- TP angle between 3% and 20%.
- HO2S signal voltage remains below 200 mV for 30 seconds.

Action Taken When the DTC Sets

- The PCM will illuminate the Malfunction Indicator Lamp (MIL) when the diagnostic runs and fails.
- Open loop fueling.
- The PCM will record operating conditions at the time the diagnostic fails. This information will be stored in the Freeze Frame and/or Failure Records.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL OFF after three consecutive drive trips that the diagnostic runs and does not fail.
- A last test failed (Current DTC) will clear when the ignition is cycled and the diagnostic runs and does not fail.
- A History DTC will clear after forty consecutive warm-up cycles, if no failures are reported by this or any other emission related diagnostic.
- PCM battery voltage is interrupted.
- Using a Scan tool.

Diagnostic Aids

- Heated Oxygen Sensor (HO2S) wire. Sensor pigtail may be contacting the exhaust manifold.
- An oxygen supply inside the HO2S is necessary for proper operation. This supply of oxygen is provided through the HO2S wires. All HO2S wires and connections should be inspected for breaks or contamination. Refer to *Repair Procedures in Electrical Diagnosis (8A Cell 5)*
- Check for intermittent ground in signal wire between connector and sensor.
- Lean injector(s). Perform Injector Balance Test.
- Fuel contamination. Water near the in-tank fuel pump inlet can be delivered to the injectors. The water causes a lean exhaust and can set a DTC.

- Fuel pressure. System will be lean if fuel pressure is low. Refer to *Fuel System* diagnosis.
- Exhaust leaks. An exhaust leak near the HO2S can cause a lean condition. Vacuum or crankcase leaks can also cause a lean condition.
- If the above are OK, the HO2S may be at fault. For intermittents, refer to *Symptoms*.

Test Description

Number(s) below refer to step numbers on the diagnostic table.

2. Engine must be at normal operating temperature before performing this test. For any test that requires probing the PCM or a component harness connector, must use the Connector Test Adapter Kit J 35616-A. Using this kit will prevent damage to the harness connector terminals.
3. Using Freeze Frame and/or Failure Records data may aid in locating an intermittent condition. If the DTC cannot be duplicated, the information included in the Freeze Frame and/or Failure Records data can be useful in determining how many miles since the DTC set. The Fail Counter and Pass Counter can also be used to determine how many ignition cycles the diagnostic reported a pass and/or a fail. Operate vehicle within the same freeze frame conditions (RPM, load, vehicle speed, temperature etc.) that were noted. This will isolate when the DTC failed.
4. Grounding the low side circuit of the HO2S should cause the HO2S voltage to display a bias voltage. If the voltage stayed near 0.0 volts indicates the low circuit is open, or the high circuit is open or grounded.
5. Disconnecting the PCM will allow using the DVM (J 39200) to check continuity of the circuits. This will aid in locating an open or shorted circuit.

DTC P0151 HO2S Circuit Low Voltage Bank2 Sensor1

Step	Action	Value(s)	Yes	No
1	Was the Powertrain On-Board Diagnostic (OBD) System Check performed?	—	Go to Step 2	Go to Powertrain OBD System Check
2	Important: Before proceeding with this DTC, check the HO2S for being secure. A sensor that is loose could cause this DTC to set. 1. Install the scan tool. 2. Start and idle the engine until normal operating temperature reached. 3. Operate the vehicle within parameters specified under Conditions for Setting the DTC in the supporting text. 4. Using a scan tool, monitor HO2S voltage display on the Engine 1 Data List. Is the HO2S voltage less than the specified value?	200 mV	Go to Step 4	Go to Step 3
3	1. Turn the ignition ON, engine OFF, review Freeze Frame and/or Failure Records data for this DTC and note parameters. 2. Turn the ignition OFF for 15 seconds. 3. Start the engine and operate the vehicle within the conditions required for this diagnostic to run, and as close to the conditions recorded in Freeze Frame/Failure Records as possible. Special operating conditions that need to be met before the PCM will run this diagnostic, where applicable, are listed in Conditions for Setting the DTC. 4. Using the scan tool, select DTC, Specific, then enter the DTC number which was set. Does the scan tool indicate that this diagnostic failed this ignition?	—	Go to Step 4	Go to Diagnostic Aids-HO2S Circuit Low
4	Disconnect the HO2S and jumper the HO2S low circuit (PCM side) to ground. Does the scan tool indicate HO2S voltage within the specified values?	375–525 mV	Go to Diagnostic Aids-HO2S Circuit Low	Go to Step 5
5	1. Turn the ignition OFF. 2. Disconnect the PCM. 3. Check the HO2S signal circuit for a short to ground or a short to the sensor ground circuit. Is the HO2S signal circuit shorted?	—	Go to Step 6	Go to Step 7
6	Repair the HO2S signal circuit. Refer to <i>Repair Procedures in Electrical Diagnosis (8A Cell 5)</i>. Is the action complete?	—	Go to Step 10	—
7	Important: Replacement PCM must be programmed. Refer to <i>PCM Replacement/Programming</i>. Replace the PCM. Is the action complete?	—	Go to Step 10	—

DTC P0152 HO2S Circuit High Voltage Bank2 Sensor1

Circuit Description

The PCM supplies a voltage of about 450 mV between the HO2S high and low signal circuits. The oxygen sensor varies the voltage over a range from about 1000 mV when the exhaust is rich, down through about 10 mV when exhaust is lean.

The PCM monitors and stores the heated oxygen sensor (HO2S) voltage information. The PCM evaluates the HO2S voltage samples to determine the amount of time the HO2S voltage was out of range. The PCM will compare the stored HO2S voltage samples taken within each sample period and determine if majority of the samples are out of the operating range.

The PCM monitors the HO2S voltage for being fixed above a predetermined voltage. If the PCM detects the voltage is above a predetermined voltage, a DTC will set.

Conditions for Setting the DTC

- DTCs P0100, P0102, P0103, P0107, P0108, P0112, P0113, P0118, P0121, P0122, P0123, P0125, P0200, P0372, P1371 not set.
- System operating in Closed Loop.
- Fuel trim learn enabled.
- Air/fuel ratio between 14.6:1 and 14.8:1.
- TP angle between 3% and 20%.
- HO2S signal voltage remains above 774 mV for 30 seconds.

Action Taken When the DTC Sets

- The PCM will illuminate the Malfunction Indicator Lamp (MIL) when the diagnostic runs and fails.
- Open loop fueling.
- The PCM will record operating conditions at the time the diagnostic fails. This information will be stored in the Freeze Frame and/or Failure Records.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL OFF after three consecutive drive trips that the diagnostic runs and does not fail.
- A last test failed (Current DTC) will clear when the ignition is cycled and the diagnostic runs and does not fail.
- A History DTC will clear after forty consecutive warm-up cycles, if no failures are reported by this or any other emission related diagnostic.
- PCM battery voltage is interrupted.
- Using a Scan tool.

Diagnostic Aids

- Fuel pressure. System will go rich if pressure is too high. The PCM can compensate for some increase. However, if fuel pressure is too high, a DTC may set. Refer to *Fuel System Diagnosis*
- Rich injector(s). Perform Injector Balance Test.
- Leaking injector. Refer to *Fuel System Diagnosis*
- Evaporative emissions (EVAP) canister purge. Check for fuel saturation. If full of fuel, check canister control and hoses. Refer to *EVAP Control System*
- MAF sensor. Disconnect the MAF sensor and see if rich condition is corrected. If so, check for proper installation. If installed OK, replace MAF sensor. If MAF sensor is installed backwards, the system will go rich. The plastic portion of the sensor has arrows cast into it indicating proper air flow direction. The arrow must point toward the engine.

- An oxygen supply inside the HO2S is necessary for proper operation. This supply of oxygen is provided through the HO2S wires. All HO2S wires and connections should be inspected for breaks or contamination. Refer to *Repair Procedures in Electrical Diagnosis (8A Cell 5)*.
- Check for leaking fuel pressure regulator diaphragm by checking vacuum line to regulator for fuel.
- TP sensor. An intermittent TP sensor output will cause the system to go rich, due to a false indication of the engine accelerating. For intermittents, refer to *Symptoms*.

Test Description

Number(s) below refer to step numbers on the diagnostic table.

2. Engine must be at normal operating temperature before performing this test. For any test that requires probing the PCM or a component harness connector, must use the Connector Test Adapter Kit J 35616-A. Using this kit will prevent damage to the harness connector terminals.
3. Using Freeze Frame and/or Failure Records data may aid in locating an intermittent condition. If the DTC cannot be duplicated, the information included in the Freeze Frame and/or Failure Records data can be useful in determining how many miles since the DTC set. The Fail Counter and Pass Counter can also be used to determine how many ignition cycles the diagnostic reported a pass and/or a fail. Operate vehicle within the same freeze frame conditions (RPM, load, vehicle speed, temperature etc.) that were noted. This will isolate when the DTC failed. Refer to *Symptoms, Intermittents*.
5. Grounding the low side circuit of the HO2S should cause the HO2S voltage to display a bias voltage.
9. Review the system mechanization. Check for a short between the HO2S signal circuit and any other wires powered by this fuse that run together inside the harness.

DTC P0152 HO2S Circuit High Voltage Bank2 Sensor1

Step	Action	Value(s)	Yes	No
1	Was the Powertrain On-Board Diagnostic (OBD) System Check performed?	—	Go to Step 2	Go to Powertrain OBD System Check
2	1. Install the scan tool. 2. Engine at operating temperature. 3. Engine speed at 1200 RPM. 4. Using a scan tool, monitor the HO2S voltage display on the Engine 1 Data List. Is the HO2S voltage greater than the specified value?	774 mV	Go to Step 4	Go to Step 3
3	1. Ignition ON, engine OFF, review Freeze Frame and/or Failure Records data for this DTC and note parameters. 2. Ignition OFF for 15 seconds. 3. Start the engine and operate the vehicle within the conditions required for this diagnostic to run, and as close to the conditions recorded in Freeze Frame/Failure Records as possible. Special operating conditions that need to be met before the PCM will run this diagnostic, where applicable, are listed in Conditions for Setting the DTC. 4. Using the scan tool, select DTC, Specific, then enter the DTC number which was set. Does the scan tool indicate that this diagnostic failed this ignition?	—	Go to Step 4	Go to Diagnostic Aids - HO2S Circuit High Voltage
4	While monitoring the HO2S voltage, remove the HO2S heater fuse. Does the voltage drop to within the specified range when the power to the heater is disconnected?	375–525 mV	Go to Step 5	Go to Step 7
5	1. Reinstall the fuse. 2. Disconnect HO2S and jumper the HO2S low signal (PCM side) circuit to ground. Does the scan tool indicate the HO2S voltage within the specified values?	375–525 mV	Go to Step 10	Go to Step 6
6	While monitoring the HO2S voltage, remove the HO2S heater fuse. Does the voltage drop to within the specified range when the power to the heater is disconnected?	375–525 mV	Go to Step 9	Go to Step 8
7	1. Turn the Ignition OFF. 2. Disconnect the PCM connector containing the HO2S signal circuit. 3. Disconnect the HO2S. 4. Turn the Ignition ON. 5. Using a DVM (J 39200), check for voltage on the HO2S sensor signal circuit at PCM harness connector. Is there any voltage?	—	Go to Step 8	Go to Diagnostic Aids - HO2S Circuit High Voltage
8	Repair short to voltage in HO2S signal circuit. Refer to Repair Procedures in Electrical Diagnosis (8A Cell 5). Is the action complete?	—	Go to Step 12	—

DTC P0152 HO2S Circuit High Voltage Bank2 Sensor1 (cont'd)

Step	Action	Value(s)	Yes	No
9	Repair HO2S signal circuit and HO2S heater B+ circuit shorted together. Refer to <i>Repair Procedures in Electrical Diagnosis (8A Cell 5)</i> . Is the action complete?	—	Go to Step 10	Go to Step 11
10	Replace the HO2S. Refer to <i>Heated Oxygen Sensor (HO2S)</i> . Is the action complete?	—	Go to Step 12	—
11	Important: Replacement PCM must be programmed. Refer to <i>PCM Replacement/Programming</i> . Replace the PCM. Is the action complete?	—	Go to Step 12	—
12	1. Using the scan tool, select DTC, Clear Info. 2. Start the engine and idle at normal operating temperature. 3. Select DTC, Specific, then enter the DTC number which was set. 4. Operate vehicle within the conditions for setting this DTC as specified in the supporting text, if applicable. Does the scan tool indicate that this test ran and passed?	—	Go to Step 13	Go to Step 2
13	Using the scan tool, select Capture Info, Review Info. Are any DTCs displayed that have not been diagnosed?	—	Go to the applicable DTC table	System OK

DTC P0153 HO2S Slow Response Bank2 Sensor1

30396

Circuit Description

The PCM continuously monitors the Heated Oxygen Sensor (HO2S) activity for 100 seconds. During the monitor period the PCM counts the number of times that the HO2S responds from rich to lean and from lean to rich and adds the amount of time it took to complete all transitions. With this information, an average time for all transitions can be determined. If the average response time is too slow, a DTC will set.

A lean to rich transition is determined when the HO2S voltage changes from less than 300 mV to greater than 600 mV. A rich to lean transition is determined when the HO2S voltage changes from more than 600 mV to less than 300 mV. An HO2S that responds too slowly is most likely defective and should be replaced.

Conditions for Setting the DTC

- DTCs P0100, P0102, P0103, P0107, P0108, P0117, P0118, P0125, P0151, P0152, P0154, P0155, P0200, P0372, not set.
- Fuel system operating in Closed Loop.
- Engine speed between 1000 RPM and 1700 RPM.
- Engine Air Flow between 12 grams per second and 28 grams per second.
- EVAP Canister purge duty cycle less than 100%.
- Lean to rich (Below 300 mV to above 600 mV) response average time is greater than 110 Milliseconds or 150 milliseconds if the vehicle is equipped with an L99 engine.

- Rich to lean (Above 600 mV to below 300 mV) response average time is greater than 110 Milliseconds or 150 milliseconds if the vehicle is equipped with an L99 engine.
- Above conditions are met for 100 seconds

Action Taken When the DTC Sets

- The PCM will illuminate the Malfunction Indicator Lamp (MIL) on the second consecutive drive trip that the diagnostic runs and fails.
- The PCM will record operating conditions at the time the diagnostic fails. The first time the diagnostic fails, this information will be stored in Failure Records. If the diagnostic reports a failure on the second consecutive drive trip, the operating conditions at the time of failure will be written to Freeze Frame and the Failure record will be updated.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL OFF after three consecutive drive trips that the diagnostic runs and does not fail.
- A last test failed (Current DTC) will clear when the ignition is cycled and the diagnostic runs and does not fail.
- A History DTC will clear after forty consecutive warm-up cycles, if no failures are reported by this or any other emission related diagnostic.
- PCM battery voltage is interrupted.
- Using a Scan tool.

Diagnostic Aids

- A malfunction in the HO2S heater circuits will cause a DTC to set. Check HO2S heater circuits for intermittent opens/connections.
- An oxygen supply inside the HO2S is necessary for proper operation. This supply of oxygen is provided through the HO2S wires. All HO2S wires and connections should be inspected for breaks or contamination. Refer to *Repair Procedures in Electrical Diagnosis (8A Cell 5)*.

- Using Freeze Frame and/or Failure Records data may aid in locating an intermittent condition. If the DTC cannot be duplicated, the information included in the Freeze Frame and/or Failure Records data can be useful in determining how many miles since the DTC set. The Fail Counter and Pass Counter can also be used to determine how many ignition cycles the diagnostic reported a pass and/or a fail. Operate vehicle within the same freeze frame conditions (RPM, load, vehicle speed, temperature etc.) that were noted. This will isolate when the DTC failed. For intermittents, refer to *Symptoms*.

Test Description

Number(s) below refer to step numbers on the diagnostic table.

2. Determines if the fault is present. This test may take 5 minutes for the diagnostic to run. For any test that requires probing the PCM or a component harness connector, must use the Connector Test Adapter Kit J 35616-A. Using this kit will prevent damage to the harness connector terminals.
3. When DTCs P0133 and P0153 are set at the same time, is good indication that a fuel contamination problem is present.
4. An exhaust leak 6–12 inches away from the HO2S can cause a DTC to set.
5. Checks whether a good ground circuit is available.
6. Checks the integrity of the signal circuit to the PCM.
7. Checks the integrity of the signal circuit to the PCM.
8. Certain RTV silicone gasket materials give off vapors that can contaminate the HO2S. There is also a possibility of silicone contamination caused by silicone in fuel. If it appears that the sensors are contaminated by silicone and all silicone sealant is a none silicone base, advise customer to try a different fuel company. A fuel filler restrictor missing, indicates leaded fuel may have been used.

DTC P0153 HO2S Slow Response Bank2 Sensor1

Step	Action	Value(s)	Yes	No
1	Was the Powertrain On-Board Diagnostic (OBD) System Check performed?	—	Go to Step 2	Go to Powertrain OBD System Check
2	Important: If any DTCs are set (Except P0133), refer to those DTCs before proceeding with this diagnostic table. 1. Install the scan tool. 2. Start and idle the engine until normal operating temperature is reached. 3. Operate the vehicle within parameters specified under Conditions for setting the DTC in the supporting text. 4. Using a scan tool, monitor FAIL THIS IGN. under DTC Info. Does the scan tool indicate DTC P0153 test failed?	—	Go to Step 3	Go to Diagnostic Aids - HO2S Slow Response
3	Did the scan tool also indicate P0133 test failed?	—	Go to Step 8	Go to Step 4
4	Inspect the exhaust system for leaks. If an exhaust leak is found, repair as necessary. Was a problem found and corrected?	—	Go to Step 2	Go to Step 5
5	Visually/physically inspect the following items: • Ensure that the Bank 2 HO2S 1 is securely installed. • Check for corrosion on terminals. • Check terminal tension (at Bank 2 HO2S 1 and at the PCM). • Check for damaged wiring. Was a problem found in any of the above areas?	—	Go to Step 9	Go to Step 6
6	1. Disconnect Bank 2 HO2S 1 and jumper HO2S low (PCM side) signal circuit to ground. 2. Using a scan tool, monitor Bank 2 HO2S 1 voltage on the Engine 1 Data List. Does the scan tool indicate voltage within the specified values?	375–525mV	Go to Step 7	Go to Step 10
7	1. Jumper Bank 2 HO2S 1 high and low (PCM side) signal circuits to ground. 2. Using a scan tool, monitor Bank 2 HO2S 1 voltage. Does the scan tool indicate voltage below specified value?	200mV	Go to Step 12	Go to Step 11
8	Replace affected Heated Oxygen Sensor. Refer to <i>Heated Oxygen Sensor (HO2S)</i> . Important: Before replacing sensors, the cause of the contamination must be determined and corrected. Check for the following conditions: • Fuel contamination. • Use of improper RTV sealant. • Engine oil/coolant consumption. Is the action complete?	—	Go to Step 13	—
9	Repair condition as necessary. Is the action complete?	—	Go to Step 13	—
10	Repair open Bank 2 HO2S 1 low signal circuit or grounded Bank 2 HO2S 1 high signal circuit. Refer to <i>Repair Procedures in Electrical Diagnosis (8A Cell 5)</i> . Is the action complete?	—	Go to Step 13	—

DTC P0153 HO2S Slow Response Bank2 Sensor1 (cont'd)

Step	Action	Value(s)	Yes	No
11	Repair open Bank 2 HO2S 1 high signal circuit or faulty PCM connections. Refer to <i>Repair Procedures in Electrical Diagnosis (8A Cell 5)</i> . Is the action complete?	—	Go to Step 13	—
12	Replace Bank 2 HO2S 1. Refer to <i>Heated Oxygen Sensor (HO2S)</i> . Is the action complete?	—	Go to Step 13	—
13	1. Using the scan tool, select DTC, Clear Info. 2. Start the engine and idle at normal operating temperature. 3. Select DTC, Specific, then enter the DTC number which was set. 4. Operate vehicle within the conditions for setting this DTC as specified in the supporting text, if applicable. Does the scan tool indicate that this test ran and passed?	—	Go to Step 14	Go to Step 2
14	Using the scan tool, select Capture Info, Review Info. Are any DTCs displayed that have not been diagnosed?	—	Go to the applicable DTC table	System OK

DTC P0154 HO2S Insufficient Activity Bank2 Sensor1

30396

Circuit Description

The PCM supplies a voltage of about 450 mV between the HO2S high and low signal circuits. The oxygen sensor varies the voltage over a range from about 1000 mV when the exhaust is rich, down through about 10 mV when exhaust is lean.

The PCM monitors and stores the heated oxygen sensor (HO2S) voltage information. The PCM evaluates the HO2S voltage samples to determine the amount of time the HO2S voltage was out of range. The PCM will compare the stored HO2S voltage samples taken within each sample period and determine if majority of the samples are out of the operating range.

The PCM monitors the HO2S voltage and detects if the voltage goes out of the bias range. If the PCM does not detect the voltage went out of the bias range, a DTC will set.

Conditions for Setting the DTC

- DTCs P0100, P0102, P0103, P0107, P0108, P0112, P0113, P0117, P0118, P0122, P0123, P0125, P0200, P0372, P1371 not set.
- Engine operating longer than 68 seconds.
- Engine coolant temperature greater than 48°C (118°F).
- HO2S signal voltage steady between 352 mV and 552 mV for 45 seconds.

Action Taken When the DTC Sets

- The PCM will illuminate the Malfunction Indicator Lamp (MIL) when the diagnostic runs and fails.
- Open loop fueling.
- The PCM will record operating conditions at the time the diagnostic fails. This information will be stored in the Freeze Frame and/or Failure Records.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL OFF after three consecutive drive trips that the diagnostic runs and does not fail.
- A last test failed (Current DTC) will clear when the ignition is cycled and the diagnostic runs and does not fail.
- A History DTC will clear after forty consecutive warm-up cycles, if no failures are reported by this or any other emission related diagnostic.
- PCM battery voltage is interrupted.
- Using a Scan tool.

Diagnostic Aids

- An oxygen supply inside the HO2S is necessary for proper operation. This supply of oxygen is provided through the HO2S wires. All HO2S wires and connections should be inspected for breaks or contamination. Refer to *Repair Procedures in Electrical Diagnosis (8A Cell 5)*.
- For intermittents, refer to *Symptoms*.

Test Description

Number(s) below refer to step numbers on the diagnostic table.

2. Engine must be at normal operating temperature before performing this test. For any test that requires probing the PCM or a component harness connector, must use the Connector Test Adapter Kit J 35616-A. Using this kit will prevent damage to the harness connector terminals.
3. Using Freeze Frame and/or Failure Records data may aid in locating an intermittent condition. If the DTC cannot be duplicated, the information included in the Freeze Frame and/or Failure Records data can be useful in determining how many miles since the DTC set. The Fail Counter and Pass Counter can also be used to determine how many ignition cycles the diagnostic reported a pass and/or a fail. Operate vehicle within the same freeze frame conditions (RPM, load, vehicle speed, temperature etc.) that were noted. This will isolate when the DTC failed. Refer to *Symptoms, Intermittents*.
4. If the scan tool indicates the HO2S voltage goes below 200 mV, indicates the HO2S circuits and PCM are OK.
5. Checks whether the signal circuit from the PCM is OK.
6. Disconnecting the PCM will allow using the DVM (J 39200) to check continuity of the circuits. This will aid in locating an open or shorted circuit.
7. Disconnecting the PCM will allow using the DVM (J 39200) to check continuity of the circuits. This will aid in locating an open or shorted circuit.

DTC P0154 HO2S Insufficient Activity Bank2 Sensor1

Step	Action	Value(s)	Yes	No
1	Was the Powertrain On-Board Diagnostic (OBD) System Check performed?	—	Go to Step 2	Go to Powertrain OBD System Check
2	Important: Before proceeding with this DTC, check the HO2S for being secure. A sensor that is loose could cause this DTC to set. 1. Install the scan tool. 2. Start and idle the engine until normal operating temperature is reached. 3. Operate engine above 1200 RPM for two minutes. 4. Using a scan tool, monitor HO2S voltage display on the Engine 1 Data List. Does the scan tool indicate Bank 2 HO2S 1 voltage varying outside the specified values?	352–552 mV	Go to Step 3	Go to Step 4

DTC P0154 HO2S Insufficient Activity Bank2 Sensor1 (cont'd)

Step	Action	Value(s)	Yes	No
3	1. Turn the ignition ON, engine OFF, review the Freeze Frame and/or Failure Records data for this DTC and note parameters. 2. Turn the ignition OFF for 15 seconds. 3. Start the engine and operate the vehicle within the conditions required for this diagnostic to run, and as close to the conditions recorded in Freeze Frame/Failure Records as possible. Special operating conditions that need to be met before the PCM will run this diagnostic, where applicable, are listed in Conditions for Setting the DTC. 4. Using the scan tool, select DTC, Specific, then enter the DTC number which was set. Does the scan tool indicate that this diagnostic failed this ignition?	—	Go to Step 4	Go to Diagnostic Aids-HO2S Insufficient Activity DTCs
4	1. Turn the ignition ON, Engine OFF. 2. Disconnect the Bank 2 HO2S 1 and jumper the HO2S high and low (PCM side) signal circuits to ground. 3. Using a scan tool, monitor Bank 2 HO2S 1 voltage. Is Bank 2 HO2S 1 voltage below the specified value?	200 mV	Go to Step 8	Go to Step 5
5	1. Remove jumper wire. 2. Using a DVM (J 39200), measure the voltage between the Bank 2 HO2S 1 high signal circuit (PCM side) and the Bank 2 HO2S 1 heater ground circuit. Does Bank 2 HO2S 1 voltage measure above the specified value?	375 mV	Go to Step 6	Go to Step 7
6	1. Turn the ignition OFF. 2. Disconnect the PCM and check continuity of the Bank 2 HO2S 1 low circuit. 3. If the Bank 2 HO2S 1 low circuit measures over the specified value, repair open or poor connection as necessary. Was a Bank 2 HO2S 1 low circuit problem found and corrected?	2 Ω	Go to Step 10	Go to Step 9
7	1. Turn the ignition OFF. 2. Disconnect the PCM and check continuity of the Bank 2 HO2S 1 signal circuit. 3. If the Bank 2 HO2S 1 signal circuit measures over the specified value, repair open or poor connection as necessary. Refer to <i>Repair Procedures in Electrical Diagnosis (8A Cell 5)</i>. Was a Bank 2 HO2S 1 signal circuit problem found and corrected?	2 Ω	Go to Step 13	Go to Step 10
8	Check for a poor Bank 2 HO2S 1 signal or low circuit terminal connection at the Bank 2 HO2S 1 harness connector and replace terminal(s) if necessary. Refer to <i>Repair Procedures in Electrical Diagnosis (8A Cell 5)</i>. Did any terminals require replacement?	—	Go to Step 13	Go to Step 11

DTC P0154 HO2S Insufficient Activity Bank2 Sensor1 (cont'd)

Step	Action	Value(s)	Yes	No
9	Check for poor Bank 2 HO2S 1 low circuit terminal connection at the PCM and replace terminal if necessary. Refer to <i>Repair Procedures in Electrical Diagnosis (8A Cell 5)</i> . Did the terminal require replacement?	—	Go to Step 13	Go to Step 12
10	Check for poor Bank 2 HO2S 1 signal circuit terminal connection at the PCM and replace terminal if necessary. Refer to <i>Repair Procedures in Electrical Diagnosis (8A Cell 5)</i> . Did the terminal require replacement?	—	Go to Step 13	Go to Step 12
11	Replace Bank 2 HO2S 1. Refer to <i>Heated Oxygen Sensor (HO2S)</i> . Is the action complete?	—	Go to Step 13	—
12	Important: Replacement PCM must be programmed. Refer to <i>PCM Replacement/Programming</i> . Replace the PCM. Is the action complete?	—	Go to Step 13	—
13	1. Using the scan tool, select DTC, Clear Info. 2. Start the engine and idle at normal operating temperature. 3. Select DTC, Specific, then enter the DTC number which was set. 4. Operate the vehicle within the conditions for setting this DTC as specified in the supporting text, if applicable. Does the scan tool indicate that this test ran and passed?	—	Go to Step 14	Go to Step 2
14	Using the scan tool, select Capture Info, Review Info. Are any DTCs displayed that have not been diagnosed?	—	Go to the applicable DTC table	System OK

DTC P0155 HO2S Heater Circuit Bank2 Sensor1

30396

Circuit Description

The PCM supplies a bias voltage (approximately 450 mV) on the Heated Oxygen Sensor (HO2S) signal high and low circuits. When the ignition is turned to the ON position, battery voltage is supplied to the HO2S heater. As the heater reaches operating temperature, the HO2S voltage responds by changing from a bias voltage range to normal operation. Typically, as the HO2S reaches operating temperature, the HO2S voltage goes from a bias voltage to a voltage below 300 mV. Depending on the exhaust gas content, it is possible for the HO2S voltage to go above 450 mV.

The PCM will run the heater test only on a cold start (depends on cumulative air flow) and only once an ignition cycle. When the engine is started the PCM will monitor the HO2S voltage. When the HO2S

voltage goes above or below the bias range threshold, the PCM will determine how much time it took. If the PCM detects that it took too much time for the HO2S to enter into normal operating range, a DTC will set. The time it takes the HO2S to reach operating temperature is based on the amount of air that flows into the engine.

Conditions for Setting the DTC

- DTCs P0100, P0102, P0103, P0112, P0113, P0117, P0118, P0122, P0123, P0151, P0152, P0154, P0200 not set.
- Engine is started and Intake Air and Engine Coolant temperatures are less than 50°C (122°F) and are within 3°C (5°F) of each other at start-up.
- Ignition voltage between 10 volts and 16 volts.

- Engine air flow less than 40 grams per second.
- TP sensor angle less than 20%.
- HO2S voltage remains between 300 mV and 700 mV for a predetermined amount of time (depends on engine coolant temperature and air flow).

Action Taken When the DTC Sets

- The PCM will illuminate the Malfunction Indicator Lamp (MIL) on the second consecutive drive trip that the diagnostic runs and fails.
- The PCM will record operating conditions at the time the diagnostic fails. The first time the diagnostic fails, this information will be stored in Failure Records. If the diagnostic reports a failure on the second consecutive drive trip, the operating conditions at the time of failure will be written to Freeze Frame and the Failure record will be updated.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL OFF after three consecutive drive trips that the diagnostic runs and does not fail.
- A last test failed (Current DTC) will clear when the ignition is cycled and the diagnostic runs and does not fail.
- A History DTC will clear after forty consecutive warm-up cycles, if no failures are reported by this or any other emission related diagnostic.
- PCM battery voltage is interrupted.
- Using a Scan tool.

Diagnostic Aids

- Using Freeze Frame and/or Failure Records data may aid in locating an intermittent condition. If the DTC cannot be duplicated, the information included in the Freeze Frame and/or Failure Records data can be useful in determining how many miles since the DTC set. The Fail Counter and Pass Counter can also be used to determine how many ignition cycles

the diagnostic reported a pass and/or a fail. Operate vehicle within the same freeze frame conditions (RPM, load, vehicle speed, temperature etc.) that were noted. This will isolate when the DTC failed.

- The heater diagnostic will only run on a cold start and it will only run once per ignition cycle.
- An oxygen supply inside the HO2S is necessary for proper operation. This supply of oxygen is provided through the HO2S wires. All HO2S wires and connections should be inspected for breaks or contamination. Refer to *Repair Procedures in Electrical Diagnosis (8A Cell 5)*.
- For intermittents, refer to *Symptoms*.

Test Description

Number(s) below refer to step numbers on the diagnostic table.

2. The engine must be allowed to cool, as the HO2S maybe at operating temperature and no drop or rise in HO2S voltage would occur. If the HO2S voltage stays between 300–700 mV indicates the HO2S heater is inoperative. For any test that requires probing the PCM or a component harness connector, must use the Connector Test Adapter Kit J 35616–A. Using this kit will prevent damage to the harness connector terminals.
3. If more then one HO2S DTC is set, is good indication that the HO2S fuse is open. Check all related circuits going to all heated oxygen sensors for a short to ground. If all wiring checks to be OK, it may be necessary to disconnect each HO2S one at a time to locate a shorted sensor.
4. Checks whether B+ supply is available at the sensor.
5. Checks whether a ground is available at the sensor.
6. Checks whether the HO2S heater element is internally open.

DTC P0155 HO2S Heater Circuit Bank2 Sensor1

Step	Action	Value(s)	Yes	No
1	Was the Powertrain On-Board Diagnostic (OBD) System Check performed?	—	Go to Step 2	Go to Powertrain OBD System Check
2	Important: If engine has just been operating, allow engine to cool for about one half hour before proceeding. 1. Turn the ignition OFF. 2. Install the scan tool. 3. Turn the ignition ON, engine OFF. 4. Monitor HO2S voltage display on the Engine 1 Data List of the scan tool. Does the HO2S voltage go from a bias voltage to above or below the specified values?	300–700 mV	Go to Diagnostic Aids-HO2S Heater Circuit DTCs	Go to Step 3

DTC P0155 HO2S Heater Circuit Bank2 Sensor1 (cont'd)

Step	Action	Value(s)	Yes	No
3	Inspect the fuse for HO2S ignition feed. Is the HO2S fuse open?	—	Go to Step 11	Go to Step 4
4	1. Raise the vehicle. 2. Disconnect the HO2S electrical connector. 3. Using a test light (J 34142-B) connected to ground (A known good ground. Do not use the HO2S heater ground or the HO2S low), probe ignition feed circuit at HO2S electrical connector (PCM side). Does the test light illuminate?	—	Go to Step 5	Go to Step 7
5	Connect the test light between HO2S ignition feed and HO2S heater ground. Does the test light illuminate?	—	Go to Step 6	Go to Step 8
6	Using a DVM (J 39200), measure resistance between HO2S ignition feed and HO2S heater ground at HO2S pigtail. Is the HO2S resistance within the specified values?	3.5–14.0 Ω	Go to Step 9	Go to Step 10
7	Repair the open HO2S ignition feed circuit to HO2S. Refer to <i>Repair Procedures in Electrical Diagnosis (8A Cell 5)</i> . Is the action complete?	—	Go to Step 12	—
8	Repair open HO2S heater ground circuit. Refer to <i>Repair Procedures in Electrical Diagnosis (8A Cell 5)</i> . Is the action complete?	—	Go to Step 12	—
9	1. Check for a poor connection at the HO2S harness terminals. 2. If a poor connection is found, replace terminals. Refer to <i>Repair Procedures in Electrical Diagnosis (8A Cell 5)</i> . Was a poor connection found?	—	Go to Step 12	Go to Step 10
10	Replace the HO2S. Refer to <i>Heated Oxygen Sensor (HO2S)</i> . Is the action complete?	—	Go to Step 12	—
11	Locate and repair short to ground in HO2S ignition feed circuit and replace faulty fuse. Refer to <i>Repair Procedures in Electrical Diagnosis (8A Cell 5)</i> . Is the action complete?	—	Go to Step 12	—
12	1. Using the scan tool, select DTC, Clear Info. 2. Start the engine and idle until normal operating temperature is reached. 3. Select DTC, Specific, then enter the DTC number which was set. 4. Operate the vehicle within the conditions for setting this DTC as specified in the supporting text, if applicable. Does the scan tool indicate that this test ran and passed?	—	Go to Step 13	Go to Step 2
13	Using the scan tool, select Capture Info, Review Info. Are any DTCs displayed that have not been diagnosed?	—	Go to the applicable DTC table	System OK

DTC P0157 HO2S Circuit Low Voltage Bank2 Sensor2

30396

Circuit Description

The PCM supplies a voltage of about 450 mV between the HO2S high and low signal circuits. The oxygen sensor varies the voltage over a range from about 1000 mV when the exhaust is rich, down through about 10 mV when exhaust is lean.

The PCM monitors and stores the heated oxygen sensor (HO2S) voltage information. The PCM evaluates the HO2S voltage samples to determine the amount of time the HO2S voltage was out of range. The PCM will compare the stored HO2S voltage samples taken within each sample period and determine if majority of the samples are out of the operating range.

The PCM monitors the HO2S voltage for being fixed below a predetermined voltage. If the PCM detects the voltage is below a predetermined voltage, a DTC will set.

Conditions for Setting the DTC

- DTCs P0100, P0102, P0103, P0107, P0108, P0112, P0113, P0117, P0118, P0122, P0123, P0125, P0151, P0200, P0372, P1371 not set.
- Engine coolant temperature greater than 48°C (118°F).
- Fuel system operating in Closed Loop.
- Fuel trim learn enabled.
- Air/fuel ratio between 14.6:1 and 14.8:1.
- TP angle between 3% and 20%.
- HO2S signal voltage remains below 39 mV for 38 seconds.

Action Taken When the DTC Sets

- The PCM will illuminate the Malfunction Indicator Lamp (MIL) on the second consecutive drive trip that the diagnostic runs and fails.
- The PCM will record operating conditions at the time the diagnostic fails. The first time the diagnostic fails, this information will be stored in Failure Records. If the diagnostic reports a failure on the second consecutive drive trip, the operating conditions at the time of failure will be written to Freeze Frame and the Failure record will be updated.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL OFF after three consecutive drive trips that the diagnostic runs and does not fail.
- A last test failed (Current DTC) will clear when the ignition is cycled and the diagnostic runs and does not fail.
- A History DTC will clear after forty consecutive warm-up cycles, if no failures are reported by this or any other emission related diagnostic.
- PCM battery voltage is interrupted.
- Using a Scan tool.

Diagnostic Aids

- Heated Oxygen Sensor (HO2S) wire. Sensor pigtail may be contacting the exhaust manifold.
- An oxygen supply inside the HO2S is necessary for proper operation. This supply of oxygen is provided through the HO2S wires. All HO2S wires and connections should be inspected for breaks or contamination. Refer to *Repair Procedures in Electrical Diagnosis (8A Cell 5)*.
- Check for intermittent ground in signal wire between connector and sensor.
- Lean injector(s). Perform Injector Balance Test.
- Fuel contamination. Water near the in-tank fuel pump inlet can be delivered to the injectors. The water causes a lean exhaust and can set a DTC.

- Fuel pressure. System will be lean if fuel pressure is low. Refer to *Fuel System* diagnosis.
- Exhaust leaks. An exhaust leak near the HO2S can cause a lean condition. Vacuum or crankcase leaks can also cause a lean condition.
- If the above are OK, the HO2S may be at fault.

For intermittents, refer to *Symptoms*.

Test Description

Number(s) below refer to step numbers on the diagnostic table.

2. Engine must be at normal operating temperature before performing this test. For any test that requires probing the PCM or a component harness connector, must use the Connector Test Adapter Kit J 35616-A. Using this kit will prevent damage to the harness connector terminals.
3. Using Freeze Frame and/or Failure Records data may aid in locating an intermittent condition. If the DTC cannot be duplicated, the information included in the Freeze Frame and/or Failure Records data can be useful in determining how many miles since the DTC set. The Fail Counter and Pass Counter can also be used to determine how many ignition cycles the diagnostic reported a pass and/or a fail. Operate vehicle within the same freeze frame conditions (RPM, load, vehicle speed, temperature etc.) that were noted. This will isolate when the DTC failed.
4. It may be necessary to lower the exhaust system to gain sufficient access to an HO2S and/or its connector. Refer to *Section 6F, Exhaust System*. Grounding the low side circuit of the HO2S should cause the HO2S voltage to display a bias voltage. If the voltage stayed near 0.0 volts indicates the low circuit is open, or the high circuit is open or grounded.
5. Disconnecting the PCM will allow using the DVM (J 39200) to check continuity of the circuits. This will aid in locating an open or shorted circuit.

DTC P0157 HO2S Circuit Low Voltage Bank2 Sensor2

Step	Action	Value(s)	Yes	No
1	Was the Powertrain On-Board Diagnostic (OBD) System Check performed?	—	Go to Step 2	Go to Powertrain OBD System Check
2	Important: Before proceeding with this DTC, check the HO2S for being secure. A sensor that is loose could cause this DTC to set. 1. Install the scan tool. 2. Start and idle the engine until normal operating temperature is reached. 3. Operate the vehicle within parameters specified under Conditions for Setting the DTC in the supporting text. 4. Using a scan tool, monitor the HO2S voltage display on the Engine 1 Data List. Is the HO2S voltage less than the specified value?	39 mV	Go to Step 4	Go to Step 3
3	1. Turn the ignition ON, engine OFF, review Freeze Frame and/or Failure Records data for this DTC and note parameters. 2. Turn the ignition OFF for 15 seconds. 3. Start the engine and operate the vehicle within the conditions required for this diagnostic to run, and as close to the conditions recorded in Freeze Frame/Failure Records as possible. Special operating conditions that need to be met before the PCM will run this diagnostic, where applicable, are listed in Conditions for Setting the DTC. 4. Using the scan tool, select DTC, Specific, then enter the DTC number which was set. Does the scan tool indicate that this diagnostic failed this ignition?	—	Go to Step 4	Go to Diagnostic Aids-HO2S Circuit Low (Rear HO2S) DTCs
4	Disconnect the HO2S and jumper the HO2S low circuit (PCM side) to ground. Does the scan tool indicate HO2S voltage within the specified values?	375–525 mV	Go to Diagnostic Aids-HO2S Circuit Low (Rear HO2S) DTCs	Go to Step 5
5	1. Turn the ignition OFF. 2. Disconnect the PCM 3. Check the HO2S signal circuit for a short to ground or a short to the sensor ground circuit. Is the HO2S signal circuit shorted?	—	Go to Step 6	Go to Step 7
6	Repair the HO2S signal circuit. Refer to <i>Repair Procedures in Electrical Diagnosis (8A Cell 5)</i>. Is the action complete?	—	Go to Step 8	—
7	Important: Replacement PCM must be programmed. Refer to <i>PCM Replacement/Programming</i>. Replace the PCM. Is the action complete?	—	Go to Step 8	—

DTC P0157 HO2S Circuit Low Voltage Bank2 Sensor2 (cont'd)

Step	Action	Value(s)	Yes	No
8	1. Using the scan tool, select DTC, Clear Info. 2. Start the engine and idle at normal operating temperature. 3. Select DTC, Specific, then enter the DTC number which was set. 4. Operate the vehicle within the conditions for setting this DTC as specified in the supporting text, if applicable. Does the scan tool indicate that this test ran and passed?	—	Go to Step 9	Go to Step 2
9	Using the scan tool, select Capture Info, Review Info. Are any DTCs displayed that have not been diagnosed?	—	Go to the applicable DTC table	System OK

DTC P0158 HO2S Circuit High Voltage Bank2 Sensor2

30396

Circuit Description

The PCM supplies a voltage of about 450 mV between the HO2S high and low signal circuits. The oxygen sensor varies the voltage over a range from about 1000 mV when the exhaust is rich, down through about 10 mV when exhaust is lean.

The PCM monitors and stores the heated oxygen sensor (HO2S) voltage information. The PCM evaluates the HO2S voltage samples to determine the amount of time the HO2S voltage was out of range. The PCM will compare the stored HO2S voltage samples taken within each sample period and determine if majority of the samples are out of the operating range.

The PCM monitors the HO2S voltage for being fixed above a predetermined voltage. If the PCM detects the voltage is above a predetermined voltage, a DTC will set.

Conditions for Setting the DTC

- DTCs P0100, P0102, P0103, P0107, P0108, P0112, P0113, P0117, P0118, P0122, P0123, P0125, P0200, P0372, P1371 not set.
- Closed Loop.
- Fuel Trim learn enabled.
- Air/fuel ratio between 14.6:1 and 14.8:1.
- TP angle between 3% and 20%.
- HO2S signal voltage remains above 930 mV for 38 seconds.

Action Taken When the DTC Sets

- The PCM will illuminate the Malfunction Indicator Lamp (MIL) on the second consecutive drive trip that the diagnostic runs and fails.
- The PCM will record operating conditions at the time the diagnostic fails. The first time the diagnostic fails, this information will be stored in Failure Records. If the diagnostic reports a failure on the second consecutive drive trip, the operating conditions at the time of failure will be written to Freeze Frame and the Failure record will be updated.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL OFF after three consecutive drive trips that the diagnostic runs and does not fail.
- A last test failed (Current DTC) will clear when the ignition is cycled and the diagnostic runs and does not fail.
- A History DTC will clear after forty consecutive warm-up cycles, if no failures are reported by this or any other emission related diagnostic.
- PCM battery voltage is interrupted.
- Using a Scan tool.

Diagnostic Aids

- Fuel pressure. System will go rich if pressure is too high. The PCM can compensate for some increase. However, if fuel pressure is too high, a DTC may set. Refer to *Fuel System Diagnosis*
- Rich injector(s). Perform Injector Balance Test.
- Leaking injector. Refer to *Fuel System Diagnosis*
- Evaporative emissions (EVAP) canister purge. Check for fuel saturation. If full of fuel, check canister control and hoses. Refer to *EVAP Control System*
- MAF sensor. Disconnect the MAF sensor and see if rich condition is corrected. If so, check for proper installation. If installed OK, replace MAF sensor. If MAF sensor is installed backwards, the system will go rich. The plastic portion of the sensor has arrows cast into it indicating proper air flow direction. The arrow must point toward the engine.

- An oxygen supply inside the HO2S is necessary for proper operation. This supply of oxygen is provided through the HO2S wires. All HO2S wires and connections should be inspected for breaks or contamination. Refer to *Repair Procedures in Electrical Diagnosis (8A Cell 5)*.
- Check for leaking fuel pressure regulator diaphragm by checking vacuum line to regulator for fuel.
- TP sensor. An intermittent TP sensor output will cause the system to go rich, due to a false indication of the engine accelerating. For intermittents, refer to *Symptoms*.

Test Description

Number(s) below refer to step numbers on the diagnostic table.

2. Engine must be at normal operating temperature before performing this test. For any test that requires probing the PCM or a component harness connector, must use the Connector Test Adapter Kit J 35616-A. Using this kit will prevent damage to the harness connector terminals.
3. Using Freeze Frame and/or Failure Records data may aid in locating an intermittent condition. If the DTC cannot be duplicated, the information included in the Freeze Frame and/or Failure Records data can be useful in determining how many miles since the DTC set. The Fail Counter and Pass Counter can also be used to determine how many ignition cycles the diagnostic reported a pass and/or a fail. Operate vehicle within the same freeze frame conditions (RPM, load, vehicle speed, temperature etc.) that were noted. This will isolate when the DTC failed. Refer to *Symptoms , Intermittents*.
5. Grounding the low side circuit of the HO2S should cause the HO2S voltage to display a bias voltage.
9. Review the system mechanization. Check for a short between the HO2S signal circuit and any other wires powered by this fuse that run together inside the harness.

DTC P0158 HO2S Circuit High Voltage Bank2 Sensor2

Step	Action	Value(s)	Yes	No
1	Was the Powertrain On-Board Diagnostic (OBD) System Check performed?	—	Go to Step 2	Go to Powertrain OBD System Check
2	1. Install the scan tool. 2. Start and idle the engine until normal operating temperature is reached. 3. Engine speed at 1200 RPM. 4. Using a scan tool, monitor HO2S voltage display on the Engine 1 Data List. Is the HO2S voltage greater than the specified value?	930 mV	Go to Step 4	Go to Step 3
3	1. Turn the ignition ON, engine OFF, review Freeze Frame and/or Failure Records data for this DTC and note parameters. 2. Turn the ignition OFF for 15 seconds. 3. Start the engine and operate the vehicle within the conditions required for this diagnostic to run, and as close to the conditions recorded in Freeze Frame/Failure Records as possible. Special operating conditions that need to be met before the PCM will run this diagnostic, where applicable, are listed in Conditions for Setting the DTC. 4. Using the scan tool, select DTC, Specific, then enter the DTC number which was set. Does the scan tool indicate that this diagnostic failed this ignition?	—	Go to Step 4	Go to Diagnostic Aids - HO2S Circuit High Voltage
4	While monitoring the HO2S voltage, remove the HO2S heater fuse. Does the voltage drop to within the specified range when the power to the heater is disconnected?	375–525 mV	Go to Step 5	Go to Step 7
5	1. Reinstall the fuse. 2. Disconnect HO2S and jumper the HO2S low signal (PCM side) circuit to ground. Does the scan tool indicate HO2S voltage within the specified values?	375–525 mV	Go to Step 10	Go to Step 6
6	While monitoring the HO2S voltage, remove the HO2S heater fuse. Does the voltage drop to within the specified range when the power to the heater is disconnected?	375–525 mV	Go to Step 9	Go to Step 8
7	1. Turn the ignition OFF. 2. Disconnect the PCM connector containing the HO2S signal circuit. 3. Disconnect the HO2S. 4. Turn the ignition ON. 5. Using a DVM (J 39200), check for voltage on the HO2S sensor signal circuit at PCM harness connector. No voltage should be present. Is there?	—	Go to Step 8	Go to Diagnostic Aids - HO2S Circuit High Voltage
8	Repair the short to voltage in HO2S signal circuit. Refer to <i>Repair Procedures in Electrical Diagnosis (8A Cell 5)</i> . Is the action complete?	—	Go to Step 12	—

DTC P0158 HO2S Circuit High Voltage Bank2 Sensor2 (cont'd)

Step	Action	Value(s)	Yes	No
9	Repair HO2S signal circuit and HO2S heater B+ circuit shorted together. Refer to <i>Repair Procedures in Electrical Diagnosis (8A Cell 5)</i> . Is the action complete?	—	Go to Step 10	Go to Step 11
10	Replace the HO2S. Refer to <i>Heated Oxygen Sensor (HO2S)</i> . Is the action complete?	—	Go to Step 12	—
11	Important: Replacement PCM must be programmed. Refer to <i>PCM Replacement/Programming</i> . Replace the PCM. Is the action complete?	—	Go to Step 12	—
12	1. Using the scan tool, select DTC, Clear Info. 2. Start the engine and idle at normal operating temperature. 3. Select DTC, Specific, then enter the DTC number which was set. 4. Operate the vehicle within the conditions for setting this DTC as specified in the supporting text, if applicable. Does the scan tool indicate that this test ran and passed?	—	Go to Step 13	Go to Step 2
13	Using the scan tool, select Capture Info, Review Info. Are any DTCs displayed that have not been diagnosed?	—	Go to the applicable DTC table	System OK

DTC P0160 HO2S Insufficient Activity Bank2 Sensor2

30396

Circuit Description

The PCM supplies a voltage of about 450 mV between the HO2S high and low signal circuits. The oxygen sensor varies the voltage over a range from about 1000 mV when the exhaust is rich, down through about 10 mV when exhaust is lean.

The PCM monitors and stores the heated oxygen sensor (HO2S) voltage information. The PCM evaluates the HO2S voltage samples to determine the amount of time the HO2S voltage was out of range. The PCM will compare the stored HO2S voltage samples taken within each sample period and determine if majority of the samples are out of the operating range.

The PCM monitors the HO2S voltage and detects if the voltage goes out of the bias range. If the PCM does not detect the voltage went out of the bias range, a DTC will set.

Conditions for Setting the DTC

- DTCs P0100, P0102, P0103, P0107, P0108, P0112, P0113, P0117, P0118, P0122, P0123, P0125, P0141, P0200, P0372, P1371 not set.
- Engine operating longer than 68 seconds.
- Fuel system operating in Closed Loop.
- Engine coolant temperature greater than 48°C (118°F).
- HO2S signal voltage steady between 391 mV and 491 mV for 2.5 minutes.

Action Taken When the DTC Sets

- The PCM will illuminate the Malfunction Indicator Lamp (MIL) on the second consecutive drive trip that the diagnostic runs and fails.
- The PCM will record operating conditions at the time the diagnostic fails. The first time the diagnostic fails, this information will be stored in Failure Records. If the diagnostic reports a failure on the second consecutive drive trip, the operating conditions at the time of failure will be written to Freeze Frame and the Failure record will be updated.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL OFF after three consecutive drive trips that the diagnostic runs and does not fail.
- A last test failed (Current DTC) will clear when the ignition is cycled and the diagnostic runs and does not fail.
- A History DTC will clear after forty consecutive warm-up cycles, if no failures are reported by this or any other emission related diagnostic.
- PCM battery voltage is interrupted.
- Using a Scan tool.

Diagnostic Aids

- An oxygen supply inside the HO2S is necessary for proper operation. This supply of oxygen is provided through the HO2S wires. All HO2S wires and connections should be inspected for breaks or contamination. Refer to *Repair Procedures in Electrical Diagnosis (8A Cell 5)*.
- For intermittents, refer to *Symptoms*.

Test Description

Number(s) below refer to step numbers on the diagnostic table.

2. Engine must be at normal operating temperature before performing this test. For any test that requires probing the PCM or a component harness connector, must use the Connector Test Adapter Kit J 35616-A. Using this kit will prevent damage to the harness connector terminals.
3. Using Freeze Frame and/or Failure Records data may aid in locating an intermittent condition. If the DTC cannot be duplicated, the information included in the Freeze Frame and/or Failure Records data can be useful in determining how many miles since the DTC set. The Fail Counter and Pass Counter can also be used to determine how many ignition cycles the diagnostic reported a pass and/or a fail. Operate vehicle within the same freeze frame conditions (RPM, load, vehicle speed, temperature etc.) that were noted. This will isolate when the DTC failed. Refer to *Symptoms*.
4. It may be necessary to lower the exhaust system to gain sufficient access to an HO2S and/or it's connector. Refer to *Section 6F, Exhaust System*. If the scan tool indicates the HO2S voltage goes below 200 mV, indicates the HO2S circuits and PCM are OK.
5. Checks whether the signal circuit from the PCM is OK.
6. Disconnecting the PCM will allow using the DVM (J 39200) to check continuity of the circuits. This will aid in locating an open or shorted circuit.
7. Disconnecting the PCM will allow using the DVM (J 39200) to check continuity of the circuits. This will aid in locating an open or shorted circuit.

DTC P0160 HO2S Insufficient Activity Bank2 Sensor2

Step	Action	Value(s)	Yes	No
1	Was the Powertrain On-Board Diagnostic (OBD) System Check performed?	—	Go to Step 2	Go to Powertrain OBD System Check
2	1. Install the scan tool. 2. Start and idle the Engine until normal operating temperature is reached. 3. Operate the engine above 1200 RPM for two minutes. 4. Using a scan tool, monitor HO2S voltage display on the Engine 1 Data List. Does the scan tool indicate the Bank 2 HO2S 2 voltage varying outside the specified values?	391–491 mV	Go to Step 3	Go to Step 4
3	1. Turn the ignition ON, engine OFF, review Freeze Frame and/or Failure Records data for this DTC and note parameters. 2. Turn the ignition OFF for 15 seconds. 3. Start the engine and operate the vehicle within the conditions required for this diagnostic to run, and as close to the conditions recorded in Freeze Frame/Failure Records as possible. Special operating conditions that need to be met before the PCM will run this diagnostic, where applicable, are listed in Conditions for Setting the DTC. 4. Using the scan tool, select DTC, Specific, then enter the DTC number which was set. Does the scan tool indicate that this diagnostic failed this ignition?	—	Go to Step 4	Go to Diagnostic Aids-HO2S Insufficient Activity DTCs
4	1. Turn the ignition ON, Engine OFF. 2. Disconnect the Bank 2 HO2S 2 and jumper the HO2S high and low (PCM side) signal circuits to ground. 3. Using a scan tool, monitor the Bank 2 HO2S 2 voltage. Is the Bank 2 HO2S 2 voltage below the specified value?	200 mV	Go to Step 8	Go to Step 5
5	1. Remove the jumper wire. 2. Using a DVM (J 39200), measure voltage between the Bank 2 HO2S 2 high signal circuit (PCM side) and the Bank 2 HO2S 2 heater ground circuit. Does the Bank 2 HO2S 2 voltage measure above the specified value?	375 mV	Go to Step 6	Go to Step 7
6	1. Turn the ignition OFF. 2. Disconnect the PCM and check continuity of the Bank 2 HO2S 2 low circuit. 3. If the Bank 2 HO2S 2 low circuit measures over the specified value, repair open or poor connection as necessary. Was a Bank 2 HO2S 2 low circuit problem found and corrected?	2 Ω	Go to Step 13	Go to Step 9

DTC P0160 HO2S Insufficient Activity Bank2 Sensor2 (cont'd)

Step	Action	Value(s)	Yes	No
7	1. Turn the ignition OFF. 2. Disconnect the PCM and check continuity of the Bank 2 HO2S 2 signal circuit. 3. If the Bank 2 HO2S 2 signal circuit measures over the specified value, repair open or poor connection as necessary. Was a Bank 2 HO2S 2 signal circuit problem found and corrected?	2 Ω	Go to Step 13	Go to Step 10
8	Check for a poor Bank 2 HO2S 2 signal or low circuit terminal connection at the Bank 2 HO2S 2 harness connector and replace terminal(s) if necessary. Refer to <i>Repair Procedures in Electrical Diagnosis (8A Cell 5)</i> . Did any terminals require replacement?	—	Go to Step 13	Go to Step 11
9	Check for poor Bank 2 HO2S 2 low circuit terminal connection at the PCM and replace terminal if necessary. Refer to <i>Repair Procedures in Electrical Diagnosis (8A Cell 5)</i> . Did the terminal require replacement?	—	Go to Step 13	Go to Step 12
10	Check for poor Bank 2 HO2S 2 signal circuit terminal connection at the PCM and replace terminal if necessary. Refer to <i>Repair Procedures in Electrical Diagnosis (8A Cell 5)</i> . Did the terminal require replacement?	—	Go to Step 13	Go to Step 12
11	Replace the Bank 2 HO2S 2. Refer to <i>Heated Oxygen Sensor (HO2S)</i> . Is the action complete?	—	Go to Step 13	—
12	Important: Replacement PCM must be programmed. Refer to <i>PCM Replacement/Programming</i> . Replace the PCM. Is the action complete?	—	Go to Step 13	—
13	1. Using the scan tool, select DTC, Clear Info. 2. Start the engine and idle at normal operating temperature. 3. Select DTC, Specific, then enter the DTC number which was set. 4. Operate the vehicle within the conditions for setting this DTC as specified in the supporting text, if applicable. Does the scan tool indicate that this test ran and passed?	—	Go to Step 14	Go to Step 2
14	Using the scan tool, select Capture Info, Review Info. Are any DTCs displayed that have not been diagnosed?	—	Go to the applicable DTC table	System OK

DTC P0161 HO2S Heater Circuit Bank2 Sensor2

30396

Circuit Description

The PCM supplies a bias voltage (approximately 450 mV) on the Heated Oxygen Sensor (HO2S) signal high and low circuits. When the ignition is turned to the ON position, battery voltage is supplied to the HO2S heater. As the heater reaches operating temperature, the HO2S voltage responds by changing from a bias voltage range to normal operation. Typically, as the HO2S reaches operating temperature, the HO2S voltage goes from a bias voltage to a voltage below 300 mV. Depending on the exhaust gas content, it is possible for the HO2S voltage to go above 450 mV.

The PCM will run the heater test only on a cold start (depends on cumulative air flow) and only once an ignition cycle. When the engine is started the PCM will monitor the HO2S voltage. When the HO2S

voltage goes above or below the bias range threshold, the PCM will determine how much time it took. If the PCM detects that it took too much time for the HO2S to enter into normal operating range, a DTC will set. The time it takes the HO2S to reach operating temperature is based on the amount of air that flows into the engine.

Conditions for Setting the DTC

- DTCs P0100, P0102, P0103, P0112, P0113, P0117, P0118, P0125, P0122, P0123, P0157, P0158, P0160, P0200 not set.
- Engine is started and Intake Air and Engine Coolant temperatures are less than 50 °C (122 °F) and are within 3 °C (5 °F) of each other at start-up.
- Ignition voltage between 10 volts and 16 volts.

- Engine air flow less than 40 grams per second.
- TP sensor angle less than 20%.
- HO2S voltage remains between 300 mV and 700 mV for a predetermined amount of time (depends on engine coolant temperature and air flow).

Action Taken When the DTC Sets

- The PCM will illuminate the Malfunction Indicator Lamp (MIL) on the second consecutive drive trip that the diagnostic runs and fails.
- The PCM will record operating conditions at the time the diagnostic fails. The first time the diagnostic fails, this information will be stored in Failure Records. If the diagnostic reports a failure on the second consecutive drive trip, the operating conditions at the time of failure will be written to Freeze Frame and the Failure record will be updated.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL OFF after three consecutive drive trips that the diagnostic runs and does not fail.
- A last test failed (Current DTC) will clear when the ignition is cycled and the diagnostic runs and does not fail.
- A History DTC will clear after forty consecutive warm-up cycles, if no failures are reported by this or any other emission related diagnostic.
- PCM battery voltage is interrupted.
- Using a Scan tool.

Diagnostic Aids

- Using Freeze Frame and/or Failure Records data may aid in locating an intermittent condition. If the DTC cannot be duplicated, the information included in the Freeze Frame and/or Failure Records data can be useful in determining how many miles since the DTC set. The Fail Counter and Pass Counter can also be used to determine how many ignition cycles the diagnostic reported a pass and/or a fail.

Operate vehicle within the same freeze frame conditions (RPM, load, vehicle speed, temperature etc.) that were noted. This will isolate when the DTC failed.

- The heater diagnostic will only run on a cold start and it will only run once per ignition cycle.
- An oxygen supply inside the HO2S is necessary for proper operation. This supply of oxygen is provided through the HO2S wires. All HO2S wires and connections should be inspected for breaks or contamination. Refer to *Repair Procedures in Electrical Diagnosis (8A Cell 5)*.
- For intermittents, refer to *Symptoms*.

Test Description

Number(s) below refer to step numbers on the diagnostic table.

2. The engine must be allowed to cool, as the HO2S maybe at operating temperature and no drop or rise in HO2S voltage would occur. If the HO2S voltage stays between 300–700 mV indicates the HO2S heater is inoperative. For any test that requires probing the PCM or a component harness connector, must use the Connector Test Adapter Kit J 35616–A. Using this kit will prevent damage to the harness connector terminals.
3. If more than one HO2S DTC is set, is good indication that the HO2S fuse is open. Check all related circuits going to all heated oxygen sensors for a short to ground. If all wiring checks to be OK, it may be necessary to disconnect each HO2S one at a time to locate a shorted sensor.
4. It may be necessary to lower the exhaust system to gain sufficient access to an HO2S and/or it's connector. Refer to *Section 6F, Exhaust System Checks* whether B+ supply is available at the sensor.
5. Checks whether a ground is available at the sensor.
6. Checks whether the HO2S heater element is internally open.

DTC P0161 HO2S Heater Circuit Bank2 Sensor2

Step	Action	Value(s)	Yes	No
1	Was the Powertrain On-Board Diagnostic (OBD) System Check performed?	—	Go to Step 2	Go to Powertrain OBD System Check
2	Important: If engine has just been operating, allow engine to cool for about one half hour before proceeding. 1. Turn the ignition OFF. 2. Install the scan tool. 3. Turn the ignition ON, engine OFF. 4. Monitor the HO2S voltage display on the Engine 1 Data List of the scan tool. Does the HO2S voltage go from a bias voltage to above or below the specified values?	300–700 mV	Go to Diagnostic Aids-HO2S Heater Circuit DTCs	Go to Step 3
3	Inspect the fuse for HO2S ignition feed. Is the HO2S fuse open?	—	Go to Step 11	Go to Step 4
4	1. Raise the vehicle. 2. Disconnect the HO2S electrical connector. 3. Using a test light (J 34142-B) connected to ground (A known good ground. Do not use HO2S heater ground or HO2S low), probe ignition feed circuit at HO2S electrical connector (PCM side). Does the test light illuminate?	—	Go to Step 5	Go to Step 7
5	Connect test light between HO2S ignition feed and HO2S heater ground. Does the test light illuminate?	—	Go to Step 6	Go to Step 8
6	Using a DVM (J 39200), measure resistance between HO2S ignition feed and HO2S heater ground at HO2S pigtail. Is the HO2S resistance within the specified values?	3.5–14.0 Ω	Go to Step 9	Go to Step 10
7	Repair open HO2S ignition feed circuit to HO2S. Refer to <i>Repair Procedures in Electrical Diagnosis (8A Cell 5)</i> . Is the action complete?	—	Go to Step 12	—
8	Repair open HO2S heater ground circuit. Refer to <i>Repair Procedures in Electrical Diagnosis (8A Cell 5)</i> . Is the action complete?	—	Go to Step 12	—
9	1. Check for a poor connection at the HO2S harness terminals. 2. If a poor connection is found, replace terminals. Refer to <i>Repair Procedures in Electrical Diagnosis (8A Cell 5)</i> . Was a poor connection found?	—	Go to Step 12	Go to Step 10
10	Replace the HO2S. Refer to <i>Heated Oxygen Sensor (HO2S)</i> . Is the action complete?	—	Go to Step 12	—
11	Locate and repair the short to ground in the HO2S ignition feed circuit and replace faulty fuse. Refer to <i>Repair Procedures in Electrical Diagnosis (8A Cell 5)</i> . Is the action complete?	—	Go to Step 12	—

DTC P0161 HO2S Heater Circuit Bank2 Sensor2 (cont'd)

Step	Action	Value(s)	Yes	No
12	1. Using the scan tool, select DTC, Clear Info. 2. Start the engine and idle at normal operating temperature. 3. Select DTC, Specific, then enter the DTC number which was set. 4. Operate vehicle within the conditions for setting this DTC as specified in the supporting text, if applicable. Does the scan tool indicate that this test ran and passed?	—	<i>Go to Step 13</i>	<i>Go to Step 2</i>
13	Using the scan tool, select Capture Info, Review Info. Are any DTCs displayed that have not been diagnosed?	—	Go to the applicable DTC table	System OK

DTC P0171 Fuel Trim System Lean Bank1

Circuit Description

To provide the best possible combination of driveability, fuel economy and emission control, a 'Closed Loop' air/fuel metering system is used. While in 'Closed Loop', the PCM monitors the heated oxygen sensor signal voltage and adjusts fuel delivery based on signal voltage. A change made to fuel delivery will be indicated by the Long and Short Term Fuel Trim values. Short Term Fuel Trim values change rapidly in response to the HO2S signal voltages. These changes 'fine tune' engine fueling. Long Term Fuel Trim values change in response to trends in Short Term Fuel Trim. Long Term Fuel Trim makes coarse adjustments to fueling in order to re-center and restore control to Short Term Fuel Trim. Short and Long Term Fuel Trim can be monitored with a scan tool. Ideal fuel trim values are around 0%. A positive Fuel Trim value indicates that the PCM is adding fuel to compensate for a lean condition. A negative Fuel Trim value indicates that the PCM is reducing the amount of fuel to compensate for a rich condition. If an excessively Rich or Lean condition is detected, the PCM will set a DTC. The long term fuel trim diagnostic parameter is an average of several of the long term speed load learn cells which are selected based on speed and load.

Conditions for Setting the DTC

- DTCs P0100, P0102, P0103, P0107, P0108, P0112, P0113, P0117, P0118, P0122, P0123, P0131, P0132, P0134, P0135, P0151, P0152, P0154, P0155, P0200, P0300, P0372, P0441, P0443, P0500, P0601, P1133, P1153, P1351, P1361, P1371, P1415, P1416, P1441 not set.
- Engine Coolant Temperature between 60°C (120°F) and 115°C (239°F).
- Fuel system operating in Closed Loop.
- Fuel trim enabled.
- Barometric Pressure greater than 70 kPa.
- Mass Air Flow between 5 grams per second and 100 grams per second.
- Manifold Absolute Pressure between 20 kPa and 90 kPa.
- Intake Air Temperature between -30°C (-22°F) and 150°C (302°F).
- EVAP Canister purge not enabled or EVAP Canister purge duty cycle greater than 75%.
- Engine speed between 500 RPM and 4000 RPM.
- TP Sensor angle less than 75%.
- Vehicle speed less than 121 km/h (75 mph).
- The PCM detects the average Long Term Fuel Trim cell values are above a predetermined threshold.
- All above conditions met for approximately 10 seconds.

Action Taken When the DTC Sets

- The PCM will illuminate the Malfunction Indicator Lamp (MIL) on the second consecutive drive trip that the diagnostic runs and fails, if the diagnostic fails under the same conditions (load, RPM, temperature, etc.) as the previous ignition cycle that the test ran and failed.
- The first time the diagnostic fails, the PCM will record operating conditions in Failure Records.
- The second consecutive drive trip that this diagnostic fails [under the same conditions (load, RPM, temperature, etc.) as the previous ignition cycle that the test ran and failed], this information will be stored in Freeze Frame. Any data previously stored in Freeze Frame will be copied into Failure Records and Freeze Frame will be overwritten by this DTC. The only exception to this is if a Misfire DTC was already recorded in Freeze Frame. In this case, the Misfire data stays in Freeze Frame and the Fuel Trim data will be updated in Failure Records.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL OFF after three consecutive drive trips that the diagnostic runs and does not fail within the same conditions that the DTC last failed.

Important: If the last failure was during a non-typical driving condition, the MIL may remain ON longer than three drive trips. Review Freeze Frame/Failure Records for the last failure conditions.

- A History DTC will clear after forty consecutive warm-up cycles, if no failures are reported by this or any other emission related diagnostic.
- A last test failed (Current DTC) will clear when the diagnostic runs and does not fail.
- PCM battery voltage is interrupted.
- Using a Scan tool.

Diagnostic Aids

- If a DTC P0171 cannot be duplicated, it may have been caused by the customer running the vehicle out of fuel.
- A fuel delivery malfunction will cause this DTC to set. Thoroughly inspect all items that can cause a lean condition.
- For intermittents, refer to *Symptoms*

Test Description

Number(s) below refer to step numbers on the diagnostic table.

2. Determines whether the fault is present. For any test that requires probing the PCM or a component harness connector, must use the Connector Test Adapter Kit J 35616-A. Using this kit will prevent damage to the harness connector terminals.

3. Using Freeze Frame and/or Failure Records data may aid in locating an intermittent condition. If the DTC cannot be duplicated, the information included in the Freeze Frame and/or Failure Records data can be useful in determining how many miles since the DTC set. The Fail Counter and Pass Counter can also be used to determine how many ignition cycles the diagnostic reported a pass and/or a fail. Operate vehicle within the same freeze frame conditions (RPM, load, vehicle speed, temperature etc.) that were noted. This will isolate when the DTC failed.
4. If DTC 174 is also set indicates both banks of the engine are operating lean. Inspect items that would cause both banks to operate lean.
5. A vacuum leak will cause DTCs P0171 and P0174 to set at the same time. Inspect all areas of the engine for a vacuum leak. Also inspect PCV valve for being the correct one for this application. Make sure the engine oil fill cap is in place and that its tight. Check that the engine oil dip stick is fully seated.

DTC P0171 Fuel Trim System Lean Bank1

Step	Action	Value(s)	Yes	No
1	Was the Powertrain On-Board Diagnostic (OBD) System Check performed?	—	Go to Step 2	Go to Powertrain OBD System Check
2	Important: If any DTCs are set (Except P0171 and P0174) refer to those DTCs before proceeding with this diagnostic. 1. Install the scan tool. 2. Start and idle the engine until normal operating temperature is reached. 3. Fuel system in Closed Loop. 4. Using a scan tool, monitor LT FT Bn 1 and ST FT Bn 1 display on the Fuel Trim Data List. Is the LT FT and the ST FT less than the specified values indicated?	22% LT 10% ST	Go to Step 3	Go to Step 4
3	1. Turn the ignition ON, engine OFF, review Freeze Frame and/or Failure Records data for this DTC and note parameters. 2. Turn the ignition OFF for 15 seconds. 3. Start the engine and operate the vehicle within the conditions required for this diagnostic to run, and as close to the conditions recorded in Freeze Frame/Failure Records as possible. Special operating conditions that need to be met before the PCM will run this diagnostic, where applicable, are listed in Conditions for Setting the DTC. 4. Using the scan tool, select DTC, Specific, then enter the DTC number which was set. Does the scan tool indicate that this diagnostic failed this ignition?	—	Go to Step 4	Refer to Diagnostic Aids
4	Is DTC P0174 also set?	—	Go to Step 5	Go to Step 6

DTC P0171 Fuel Trim System Lean Bank1 (cont'd)

Step	Action	Value(s)	Yes	No
5	Visually/physically inspect the following items: • Vacuum hoses for splits, kinks and proper connections. Refer to <i>Under Hood Vacuum Hose Routing Diagrams</i>. • Throttle body, intake manifold and EGR valve for vacuum leaks. • Crankcase ventilation valve and/or system for leaks. • Contaminated fuel. Refer to <i>Crankcase Ventilation System</i>. • PCM and sensor grounds are clean tight and in proper locations. • Air induction system after MAF sensor for vacuum leaks. • Engine mechanical failure. Refer to <i>Engine General Information</i>. Was a problem found in any of the above areas?	—	Go to Step 7	Go to Fuel System Diagnosis
6	Visually/physically inspect the following items: • Bank 1 exhaust leaks, missing or loose exhaust hardware. • Bank 1 HO2S 1 is installed securely and electrical connector not contacting exhaust system or ignition wires. • Engine mechanical failure. Refer to <i>Engine General Information</i>. • Vacuum leaks that will only affect bank 1 (Intake manifold, injector "O" rings, etc.) Was a problem found in any of the above areas?	—	Go to Step 7	Go to Fuel System Diagnosis
7	Repair or replace any faulty items found. Is the action complete?	—	Go to Step 8	—
8	1. Using the scan tool, select DTC, Clear Info. 2. Start the engine and idle at normal operating temperature. 3. Select DTC, Specific, then enter the DTC number which was set. 4. Operate the vehicle within the conditions for setting this DTC as specified in the supporting text, if applicable. Does the scan tool indicate that this test ran and passed?	—	Go to Step 9	Go to Step 2
9	Using the scan tool, select Capture Info, Review Info. Are any DTCs displayed that have not been diagnosed?	—	Go to the applicable DTC table	System OK

DTC P0172 Fuel Trim System Rich Bank1**Circuit Description**

To provide the best possible combination of driveability, fuel economy and emission control, a 'Closed Loop' air/fuel metering system is used. While in 'Closed Loop', the PCM monitors the heated oxygen sensor signal voltage and adjusts fuel delivery based on signal voltage. A change made to fuel delivery will be indicated by the Long and Short Term Fuel Trim values. Short Term Fuel Trim values change rapidly in response to the HO2S signal voltages. These changes 'fine tune' engine fueling. Long Term Fuel Trim values change in response to trends in Short Term Fuel Trim. Long Term Fuel Trim makes coarse adjustments to fueling in order to re-center and restore control to Short Term Fuel Trim. Short and Long Term Fuel Trim can be monitored with a scan tool. Ideal fuel trim values are around 0%. A positive Fuel Trim value indicates that the PCM is adding fuel to compensate for a lean condition. A negative Fuel Trim value indicates that the PCM is reducing the amount of fuel to compensate for a rich condition. If an excessively Rich or Lean condition is detected, the PCM will set a DTC. The long term fuel trim diagnostic parameter is an average of several of the long term speed load learn cells which are selected based on speed and load.

Conditions for Setting the DTC

- DTCs P0100, P0102, P0103, P0107, P0108, P0112, P0113, P0117, P0118, P0122, P0123, P0131, P0132, P0134, P0135, P0151, P0152, P0154, P0155, P0200, P0300, P0372, P0441, P0443, P0500, P0601, P1133, P1153, P1351, P1361, P1371, P1415, P1416, P1441 not set.
- Engine Coolant Temperature between 60°C (120°F) and 115°C (239°F).
- Fuel system operating in Closed Loop.
- Fuel trim enabled.
- Barometric Pressure greater than 70 kPa.
- Mass Air Flow between 5 grams per second and 100 grams per second.
- Manifold Absolute Pressure between 20 kPa and 90 kPa.
- Intake Air Temperature between -30°C (-22°F) and 150°C (302°F).
- EVAP Canister purge not enabled or EVAP Canister purge duty cycle greater than 75%.
- Engine speed between 500 RPM and 4000 RPM.
- TP Sensor angle less than 75%.
- Vehicle speed less than 121 km/h (75 mph).

- The PCM detects the average Long Term Fuel Trim cell values are below a predetermined threshold.
- All above conditions met for approximately 10 seconds.

Action Taken When the DTC Sets

- The PCM will illuminate the Malfunction Indicator Lamp (MIL) on the second consecutive drive trip that the diagnostic runs and fails, if the diagnostic fails under the same conditions (load, RPM, temperature, etc.) as the previous ignition cycle that the test ran and failed.
- The first time the diagnostic fails, the PCM will record operating conditions in Failure Records.
- The second consecutive drive trip that this diagnostic fails [under the same conditions (load, RPM, temperature, etc.) as the previous ignition cycle that the test ran and failed], this information will be stored in Freeze Frame. Any data previously stored in Freeze Frame will be copied into Failure Records and Freeze Frame will be overwritten by this DTC. The only exception to this is if a Misfire DTC was already recorded in Freeze Frame. In this case, the Misfire data stays in Freeze Frame and the Fuel Trim data will be updated in Failure Records.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL OFF after three consecutive drive trips that the diagnostic runs and does not fail within the same conditions that the DTC last failed.

Important: If the last failure was during a non-typical driving condition, the MIL may remain ON longer than three drive trips. Review Freeze Frame/Failure Records for the last failure conditions.

- A History DTC will clear after forty consecutive warm-up cycles, if no failures are reported by this or any other emission related diagnostic.
- A last test failed (Current DTC) will clear when the diagnostic runs and does not fail.
- PCM battery voltage is interrupted.
- Using a Scan tool.

Diagnostic Aids

For intermittents, refer to *Symptoms*.

Test Description

Number(s) below refer to step numbers on the diagnostic table.

2. Determines whether the fault is present.

3. Using Freeze Frame and/or Failure Records data may aid in locating an intermittent condition. If the DTC cannot be duplicated, the information included in the Freeze Frame and/or Failure Records data can be useful in determining how many miles since the DTC set. The Fail Counter and Pass Counter can also be used to determine how many ignition cycles the diagnostic reported a pass and/or a fail. Operate vehicle within the same freeze frame conditions (RPM, load, vehicle speed, temperature etc.) that were noted. This will isolate when the DTC failed.
4. If DTC 175 is also set, then both banks are operating rich. Inspect items that would cause both banks to operate rich.
5. Excessive fuel in the oil will cause DTCs P0172 and P0175 to set at the same time. Remove the PCV valve from the intake manifold and plug with a suitable stopper. Also disconnect the fresh air pipe from the rocker cover and plug with a suitable stopper. If the long and short trim values increase, indicates there is fuel in the oil.

10	Using the scan tool, select Capture Info, Review Info. Are any DTCs displayed that have not been diagnosed?	—	Go to the applicable DTC table	System OK

DTC P0174 Fuel Trim System Lean Bank2

Circuit Description

To provide the best possible combination of driveability, fuel economy and emission control, a 'Closed Loop' air/fuel metering system is used. While in 'Closed Loop', the PCM monitors the heated oxygen sensor signal voltage and adjusts fuel delivery based on signal voltage. A change made to fuel delivery will be indicated by the Long and Short Term Fuel Trim values. Short Term Fuel Trim values change rapidly in response to the HO₂S signal voltages. These changes 'fine tune' engine fueling. Long Term Fuel Trim values change in response to trends in Short Term Fuel Trim. Long Term Fuel Trim makes coarse adjustments to fueling in order to re-center and restore control to Short Term Fuel Trim. Short and Long Term Fuel Trim can be monitored with a scan tool. Ideal fuel trim values are around 0%. A positive Fuel Trim value indicates that the PCM is adding fuel to compensate for a lean condition. A negative Fuel Trim value indicates that the PCM is reducing the amount of fuel to compensate for a rich condition. If an excessively Rich or Lean condition is detected, the PCM will set a DTC. The long term fuel trim diagnostic parameter is an average of several of the long term speed load learn cells which are selected based on speed and load.

Conditions for Setting the DTC

- DTCs P0100, P0102, P0103, P0107, P0108, P0112, P0113, P0117, P0118, P0122, P0123, P0131, P0132, P0134, P0135, P0151, P0152, P0154, P0155, P0200, P0300, P0372, P0441, P0443, P0500, P0601, P1133, P1153, P1351, P1361, P1371, P1415, P1416, P1441 not set.
- Engine Coolant Temperature between 60°C (120°F) and 115°C (239°F).
- Fuel system operating in Closed Loop.
- Fuel trim enabled.
- Barometric Pressure greater than 70 kPa.
- Mass Air Flow between 5 grams per second and 100 grams per second.
- Manifold Absolute Pressure between 20 kPa and 90 kPa.
- Intake Air Temperature between -30°C (-22°F) and 150°C (302°F).
- EVAP Canister purge not enabled or EVAP Canister purge duty cycle greater than 75%.
- Engine speed between 500 RPM and 4000 RPM.
- TP Sensor angle less than 75%.
- Vehicle speed less than 121 km/h (75 mph).
- The PCM detects the average Long Term Fuel Trim cell values are above a predetermined threshold.
- All above conditions met for approximately 10 seconds.

Action Taken When the DTC Sets

- The PCM will illuminate the Malfunction Indicator Lamp (MIL) on the second consecutive drive trip that the diagnostic runs and fails, if the diagnostic fails under the same conditions (load, RPM, temperature, etc.) as the previous ignition cycle that the test ran and failed.
- The first time the diagnostic fails, the PCM will record operating conditions in Failure Records.
- The second consecutive drive trip that this diagnostic fails [under the same conditions (load, RPM, temperature, etc.) as the previous ignition cycle that the test ran and failed], this information will be stored in Freeze Frame. Any data previously stored in Freeze Frame will be copied into Failure Records and Freeze Frame will be overwritten by this DTC. The only exception to this is if a Misfire DTC was already recorded in Freeze Frame. In this case, the Misfire data stays in Freeze Frame and the Fuel Trim data will be updated in Failure Records.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL OFF after three consecutive drive trips that the diagnostic runs and does not fail within the same conditions that the DTC last failed.

Important: If the last failure was during a non-typical driving condition, the MIL may remain ON longer than three drive trips. Review Freeze Frame/Failure Records for the last failure conditions.

- A History DTC will clear after forty consecutive warm-up cycles, if no failures are reported by this or any other emission related diagnostic.
- A last test failed (Current DTC) will clear when the diagnostic runs and does not fail.
- PCM battery voltage is interrupted.
- Using a Scan tool.

Diagnostic Aids

- If a DTC P0174 cannot be duplicated, it may have been caused by the customer running the vehicle out of fuel.
- A fuel delivery malfunction will cause this DTC to set. Thoroughly inspect all items that can cause a lean condition.
- For intermittents, refer to *Symptoms*.

Test Description

Number(s) below refer to step numbers on the diagnostic table.

2. Determines whether the fault is present. For any test that requires probing the PCM or a component harness connector, must use the Connector Test Adapter Kit J 35616-A. Using this kit will prevent damage to the harness connector terminals.

3. Using Freeze Frame and/or Failure Records data may aid in locating an intermittent condition. If the DTC cannot be duplicated, the information included in the Freeze Frame and/or Failure Records data can be useful in determining how many miles since the DTC set. The Fail Counter and Pass Counter can also be used to determine how many ignition cycles the diagnostic reported a pass and/or a fail. Operate vehicle within the same freeze frame conditions (RPM, load, vehicle speed, temperature etc.) that were noted. This will isolate when the DTC failed.
4. If DTC 171 is also set indicates both banks of the engine are operating lean. Inspect items that would cause both banks to operate lean.
5. A vacuum leak will cause DTCs P0171 and P0174 to set at the same time. Inspect all areas of the engine for a vacuum leak. Also inspect PCV valve for being the correct one for this application. Make sure the engine oil fill cap is in place and that its tight. Check that the engine oil dip stick is fully seated.

DTC P0175 Fuel Trim System Rich Bank2**Circuit Description**

To provide the best possible combination of driveability, fuel economy and emission control, a Closed Loop air/fuel metering system is used. While in Closed Loop, the PCM monitors the heated oxygen sensor signal voltage and adjusts fuel delivery based on signal voltage. A change made to fuel delivery will be indicated by the Long and Short Term Fuel Trim values. Short Term Fuel Trim values change rapidly in response to the HO2S signal voltages. These changes fine tune engine fueling. Long Term Fuel Trim values change in response to trends in Short Term Fuel Trim. Long Term Fuel Trim makes coarse adjustments to fueling in order to re-center and restore control to Short Term Fuel Trim. Short and Long Term Fuel Trim can be monitored with a scan tool. Ideal fuel trim values are around 0%. A positive Fuel Trim value indicates that the PCM is adding fuel to compensate for a lean condition. A negative Fuel Trim value indicates that the PCM is reducing the amount of fuel to compensate for a rich condition. If an excessively Rich or Lean condition is detected, the PCM will set a DTC. The long term fuel trim diagnostic parameter is an average of several of the long term speed load learn cells which are selected based on speed and load.

Conditions for Setting the DTC

- DTCs P0100, P0102, P0103, P0107, P0108, P0112, P0113, P0117, P0118, P0122, P0123, P0131, P0132, P0134, P0135, P0151, P0152, P0154, P0155, P0200, P0300, P0372, P0441, P0443, P0500, P0601, P1133, P1153, P1351, P1361, P1371, P1415, P1416, P1441 not set.
- Engine Coolant Temperature between 60°C (120°F) and 115°C (239°F).
- Fuel system operating in Closed Loop.
- Fuel trim enabled.
- Barometric Pressure greater than 70 kPa.
- Mass Air Flow between 5 grams per second and 100 grams per second.
- Manifold Absolute Pressure between 20 kPa and 90 kPa.
- Intake Air Temperature between -30°C (-22°F) and 150°C (302°F).
- EVAP Canister purge not enabled or EVAP Canister purge duty cycle greater than 75%.
- Engine speed between 500 RPM and 4000 RPM.
- TP Sensor angle less than 75%.
- Vehicle speed less than 121 km/h (75 mph).

- The PCM detects the average Long Term Fuel Trim cell values are below a predetermined threshold.
- All above conditions met for approximately 10 seconds.

Action Taken When the DTC Sets

- The PCM will illuminate the Malfunction Indicator Lamp (MIL) on the second consecutive drive trip that the diagnostic runs and fails, if the diagnostic fails under the same conditions (load, RPM, temperature, etc.) as the previous ignition cycle that the test ran and failed.
- The first time the diagnostic fails, the PCM will record operating conditions in Failure Records.
- The second consecutive drive trip that this diagnostic fails [under the same conditions (load, RPM, temperature, etc.) as the previous ignition cycle that the test ran and failed], this information will be stored in Freeze Frame. Any data previously stored in Freeze Frame will be copied into Failure Records and Freeze Frame will be overwritten by this DTC. The only exception to this is if a Misfire DTC was already recorded in Freeze Frame. In this case, the Misfire data stays in Freeze Frame and the Fuel Trim data will be updated in Failure Records.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL OFF after three consecutive drive trips that the diagnostic runs and does not fail within the same conditions that the DTC last failed.

Important: If the last failure was during a non-typical driving condition, the MIL may remain ON longer than three drive trips. Review Freeze Frame/Failure Records for the last failure conditions.

- A History DTC will clear after forty consecutive warm-up cycles, if no failures are reported by this or any other emission related diagnostic.
- A last test failed (Current DTC) will clear when the diagnostic runs and does not fail.
- PCM battery voltage is interrupted.
- Using a Scan tool.

Diagnostic Aids

For intermittents, refer to *Symptoms*.

Test Description

Number(s) below refer to step numbers on the diagnostic table.

2. Determines whether the fault is present.

3. Using Freeze Frame and/or Failure Records data may aid in locating an intermittent condition. If the DTC cannot be duplicated, the information included in the Freeze Frame and/or Failure Records data can be useful in determining how many miles since the DTC set. The Fail Counter and Pass Counter can also be used to determine how many ignition cycles the diagnostic reported a pass and/or a fail. Operate vehicle within the same freeze frame conditions (RPM, load, vehicle speed, temperature etc.) that were noted. This will isolate when the DTC failed.
4. If DTC 172 is also set, then both banks are operating rich. Inspect items that would cause both banks to operate rich.
5. Excessive fuel in the oil will cause DTCs P0172 and P0175 to set at the same time. Remove the PCV valve from the intake manifold and plug with a suitable stopper. Also disconnect the fresh air pipe from the rocker cover and plug with a suitable stopper. If the long and short trim values increase, indicates there is fuel in the oil.

DTC P0175 Fuel Trim System Rich Bank2

Step	Action	Value(s)	Yes	No
1	Was the Powertrain On-Board Diagnostic (OBD) System Check performed?	—	Go to Step 2	Go to Powertrain OBD System Check
2	Important: If any DTCs are set (Except P0172 and P0175) refer to those DTCs before proceeding with this diagnostic. 1. Install the scan tool. 2. Start and idle the engine until normal operating temperature is reached. 3. Fuel system in Closed Loop. 4. Using a scan tool, monitor LT FT Bn 2 and ST FT Bn 2 display on the Fuel Trim Data List. Is LT FT and the ST FT greater than the specified values indicated?	-14% LT -10% ST	Go to Step 3	Go to Step 4
3	1. Turn the ignition ON, engine OFF, review Freeze Frame and/or Failure Records data for this DTC and note parameters. 2. Turn the ignition OFF for 15 seconds. 3. Start the engine and operate the vehicle within the conditions required for this diagnostic to run, and as close to the conditions recorded in Freeze Frame/Failure Records as possible. Special operating conditions that need to be met before the PCM will run this diagnostic, where applicable, are listed in Conditions for Setting the DTC. 4. Using the scan tool, select DTC, Specific, then enter the DTC number which was set. Does the scan tool indicate that this diagnostic failed this ignition?	—	Go to Step 4	Go to Diagnostic Aids-Fuel Trim System Rich
4	Is DTC P0172 also set?	—	Go to Step 5	Go to Step 6

DTC P0175 Fuel Trim System Rich Bank2 (cont'd)

Step	Action	Value(s)	Yes	No
5	Visually/physically inspect the following items: - Collapsed air intake duct. - Air filter element for being restricted. Refer to <i>Air Filter Element/Air Cleaner Assembly</i>. - MAF sensor for being installed in the proper direction and for foreign objects blocking inlet screen. Refer to <i>MAF Sensor</i>. - For fuel in pressure regulator hose. Refer to <i>Fuel System Diagnosis</i>. - For excessive fuel in the crankcase. Check the engine oil level. Change oil as necessary. Was a problem found in any of the above areas?	—	Go to Step 7	Go to <i>Fuel System Diagnosis</i>
6	Important: When the fuel system check is finished, return to this table. Inspect injectors for leaking (Bank 2), refer to <i>Fuel System Diagnosis</i> . Was any injector(s) leaking?	—	Go to Step 9	Go to Step 8
7	Repair or replace any faulty items found. Is the action complete?	—	Go to Step 9	—
8	Replace faulty HO2S. Refer to <i>Heated Oxygen Sensor (HO2S)</i> . Is the action complete?	—	Go to Step 9	—
9	1. Using the scan tool, select DTC, Clear Info. 2. Start the engine and idle at normal operating temperature. 3. Select DTC, Specific, then enter the DTC number which was set. 4. Operate the vehicle within the conditions for setting this DTC as specified in the supporting text, if applicable. Does the scan tool indicate that this test ran and passed?	—	Go to Step 10	Go to Step 2
10	Using the scan tool, select Capture Info, Review Info. Are any DTCs displayed that have not been diagnosed?	—	Go to the applicable DTC table	System OK

DTC P0200 Injector Control Circuit

Circuit Description

The PCM will enable an injector on the intake stroke of each cylinder. Individual cylinder fuel control is referred to as Sequential Multiport Fuel Injection (SFI).

Ignition voltage is supplied directly to the fuel injectors. The PCM controls each injector by grounding the control circuit via an internal switch called a driver. The primary function of the driver is to supply the ground for the component being controlled. Each driver has a fault line which is monitored by the PCM. When the PCM is commanding a component ON, the voltage of the control circuit should be (refer to *Injectors* for schematic) low (near 0 volts). When the PCM is commanding the control circuit to a component OFF, the voltage potential of the circuit should be high (near battery voltage). If the fault detection circuit senses a voltage other than what is expected, the fault line status will change causing the DTC to set.

The PCM will monitor each injector circuit for the following:

- A grounded circuit.
- An open circuit.
- A circuit shorted to voltage.
- An injector that is open.
- An injector that is shorted or has low resistance.

When the PCM detects any of the above malfunctions, a DTC P0200/P1222 will set and the driver will be disabled.

Conditions for Setting the DTC

- Engine operating.
- Ignition voltage greater than 10.0 volts.
- The PCM detects the wrong voltage potential on any injector driver circuits for 4.0 seconds or more.

Action Taken When the DTC Sets

- The PCM will illuminate the Malfunction Indicator Lamp (MIL) when the diagnostic runs and fails.
- The PCM will record operating conditions at the time the diagnostic fails. This information will be stored in the Freeze Frame and/or Failure Records.
- The injector will be disabled for the entire ignition cycle.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL OFF after three consecutive drive trips that the diagnostic runs and does not fail.
- A last test failed (Current DTC) will clear when the ignition is cycled and the diagnostic runs and does not fail.
- A History DTC will clear after forty consecutive warm-up cycles, if no failures are reported by this or any other emission related diagnostic.
- PCM battery voltage is interrupted.
- Using a Scan tool.

Diagnostic Aids

- If an injector is disconnected while the engine is operating and a DTC P0200 sets, the injector driver will be disabled for the entire ignition cycle.
- When the injector driver is disabled, an engine misfire will be apparent and a misfire DTC will set.

For intermittents, refer to *Symptoms*.

Test Description

Number(s) below refer to step numbers on the diagnostic table.

2. Determines if a malfunction is present. For any test that requires probing the PCM or a component harness connector, must use the Connector Test Adapter Kit J 35616-A. Using this kit will prevent damage to the harness connector terminals.
3. There are two ways to isolate a malfunctioning injector circuit:
 - DTC P0300 indicates a misfire is present. So if an injector DTC is present at the same time a misfire DTC is set, use misfire event counters to locate the cylinder that is misfiring.
 - If no misfire DTC is present, Start and idle the engine while monitoring misfire event counters. If a misfire is present, the misfire event counters will increase for a cylinder that has a misfire.
6. Check injector connections before replacing the injector. A faulty connection will cause a DTC P0200 to set.
9. Checks for an ignition feed circuit that is shorted to ground.

Disconnecting the PCM will allow using the DVM (J 39200) to check continuity of the circuits. This will aid in locating an open or shorted circuit.

DTC P0200 Injector Control Circuit

Step	Action	Value(s)	Yes	No
1	Was the Powertrain On-Board Diagnostic (OBD) System Check performed?	—	Go to Step 2	Go to Powertrain OBD System Check
2	1. Install the scan tool. 2. Start and idle engine. 3. Using a scan tool, monitor all the Misfire Cur. Counters on the Misfire Data List (There are a total of 8 counters. One counter per cylinder.) Are any of the Misfire Cur. Counters incrementing?	—	Go to Step 4	Go to Step 3
3	Using a scan tool, monitor the Misfire Hist. Counters on the Misfire Data List (There are a total of 8 counters. One counter per cylinder.) Do any of the Misfire Hist. Counters indicate a number other than 0.0 counts?	—	Go to DTC P1222 Injector Control Circuit Intermittent	Go to Diagnostic Aids
4	Important: This step is only for B, D and Y cars. Proceed to step 5 if the vehicle is not a B, D or Y car. Are the injector fuses OK?	—	Go to Step 5	Go to Step 8
5	1. Turn the ignition OFF. 2. Disconnect the injector(s) harness that the Misfire Cur counter was incrementing for. 3. Turn the ignition ON. 4. Using a test light (J 34142-B) connected to ground, probe the injector harness ignition feed circuit. Does the test light illuminate?	—	Go to Step 6	Go to Step 10
6	1. Turn the ignition OFF. 2. Connect injector test light (J 34730-2C) to isolated injector harness. 3. Start engine and idle. Does the test light blink?	—	Go to Step 7	Go to Step 11
7	1. Inspect the injector harness terminals for proper terminal tension. 2. Replace terminal as necessary. Refer to <i>Repair Procedures in Electrical Diagnosis (8A Cell 5)</i> . Did the terminal need replacing?	—	Go to Step 17	Go to Step 15
8	1. Turn the ignition OFF. 2. Disconnect the four injector harness connectors related to the fuse that was open. 3. Using a test light (J 34142-B) connected to B+, probe the injector ignition feed circuits of one of the injector harnesses that are disconnected. Does the test light illuminate?	—	Go to Step 13	Go to Step 9
9	Using a DVM (J 39200), measure resistance of each injector that is powered by the fuse that was open. Does any injector measure less than the specified value?	11.6 Ω	Go to Step 15	Go to Step 14
10	Repair the injector ignition feed circuit to isolated injector. Refer to <i>Repair Procedures in Electrical Diagnosis (8A Cell 5)</i> . Is the action complete?	—	Go to Step 17	—

DTC P0200 Injector Control Circuit (cont'd)

Step	Action	Value(s)	Yes	No
11	1. Turn the ignition OFF. 2. Disconnect the PCM electrical connector. 3. Check injector driver circuit for an open. Is the injector driver circuit open?	—	Go to Step 12	Go to Step 16
12	Repair injector driver circuit for an open. Refer to <i>Repair Procedures in Electrical Diagnosis (8A Cell 5)</i> . Is the action complete?	—	Go to Step 17	—
13	Repair the grounded ignition feed circuit to the injectors. Refer to <i>Repair Procedures in Electrical Diagnosis (8A Cell 5)</i> . Is the action complete?	—	Go to Step 17	—
14	Repair intermittent short to ground in the injector ignition feed circuit. Refer to <i>Repair Procedures in Electrical Diagnosis (8A Cell 5)</i> . Is the action complete?	—	Go to Step 17	—
15	Replace the faulty injector(s) that was isolated. Refer to <i>Fuel Injector</i> . Is the action complete?	—	Go to Step 17	—
16	Important: Replacement PCM must be programmed. Refer to <i>PCM Replacement/Programming</i> . Replace the PCM. Is the action complete?	—	Go to Step 17	—
17	1. Using the scan tool, select DTC, Clear Info. 2. Start the engine and idle at normal operating temperature. 3. Select DTC, Specific, then enter the DTC number which was set. 4. Operate the vehicle within the conditions for setting this DTC as specified in the supporting text, if applicable. Does the scan tool indicate that this test ran and passed?	—	Go to Step 18	Go to Step 2
18	Using the scan tool, select Capture Info, Review Info. Are any DTCs displayed that have not been diagnosed?	—	Go to the applicable DTC table	System OK

DTC P0300 Engine Misfire Detected

30389

Circuit Description

A 4X reluctor wheel is located on the front of the crankshaft. The crankshaft position sensor will send a pulse every falling edge of the 4X reluctor wheel. A misfire causes a change in crankshaft speed. The PCM times the interval between each pulse and compares each new time interval with the previous one to determine when an excessive change in crankshaft speed has occurred. A certain amount of acceleration/deceleration is expected between each firing stroke, but if the crankshaft speed changes are greater than an expected amount, the PCM will interpret this as a misfire. The PCM continuously calculates crankshaft position from the low and high resolution signals. This information is used to determine which cylinder is misfiring so that the PCM can increment the appropriate misfire counter.

Conditions for Setting the DTC

- DTCs P0100, P0102, P0103, P0107, P0108, P0117, P0118, P0122, P0123, P0335, P0336, P0500, P0502, P0601, P0742, not set.
- Engine speed between 325 RPM and 3000 RPM.
- Ignition voltage between 9.0 volts and 16.0 volts.
- Engine coolant temperature between -7°C (19°F) and 130°C (266°F).
- Throttle angle steady within 1%.
- ABS and Traction Control not active.
- Transmission not changing gears.

- EGR and AIR diagnostic tests not in progress.
- A/C clutch steady state.
- Not in fuel shut-off or decel fuel cut-off.
- ABS signals not exceeding rough road thresholds.
- The PCM determines that an emission type Misfire is present.
- The PCM determines that a catalyst damaging Misfire is present.

Action Taken When the DTC Sets

The PCM will illuminate the Malfunction Indicator Lamp (MIL) under the following conditions:

- The PCM determines the percent of misfire over a 1000 revolution period is high enough to cause excessive tail pipe emissions. The PCM will illuminate the Malfunction Indicator lamp the next consecutive ignition cycle that the diagnostic runs and fails, if the diagnostic fails under the same conditions (load, RPM, temperature, etc.) as the previous ignition cycle that the test ran and failed.
- The second consecutive drive trip that this diagnostic fails, under the same conditions (load, RPM, temperature, etc.) as the previous ignition cycle that the test ran and failed, this information will be stored in Freeze Frame. Any data previously stored in Freeze Frame will be copied into Failure Records and Freeze Frame will be overwritten by this DTC. The only exception to this is if a Fuel Trim DTC was already recorded in Freeze Frame. In this case, the Fuel Trim data stays in Freeze Frame and the Misfire data will be updated in Failure Records.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL OFF after three consecutive drive trips that the diagnostic runs and does not fail within the same conditions that the DTC last failed.

Important: If the last failure was during a non-typical driving condition, the MIL may remain ON longer than three drive trips. Review Freeze Frame/Failure Records for the last failure conditions.

- A History DTC will clear after forty consecutive warm-up cycles, if no failures are reported by this or any other emission related diagnostic.
- A last test failed (Current DTC) will clear when the diagnostic runs and does not fail.
- PCM battery voltage is interrupted.
- Using a Scan tool.

Diagnostic Aids

- If cylinder #1 is misfiring, inspect the EGR valve for hanging open. Remove the EGR valve and inspect for contaminants. Clean the EGR as necessary. Refer to *EGR Valve*.
- The vehicle running out of fuel can cause sufficient misfire to set DTC P0300.
- A misfire DTC could be caused by excessive vibration from sources other than the engine. The following are possible sources:
 - Tire/wheel out of round/balance
 - Variable thickness brake rotor/drum
 - Drive shaft not balanced
 - Certain rough road conditions
- For intermittents, refer to *Symptoms*.

Test Description

Number(s) below refer to step numbers on the diagnostic table.

- Wetting down the secondary ignition system with water from a spray bottle may help locate damaged or deteriorated components. Look/listen for arcing or misfiring as water is applied. If the Misfire Cur counters are incrementing and there is no apparent misfire, an erratic CKP sensor signal could be the cause. Perform the diagnostic table for DTC P0335 first if this condition is suspected. If misfire is present and a fuel control problem is suspected, force the system into Open Loop using the scan tool and allow the engine to run for a few minutes. If this eliminates the misfire, refer to any fuel control related DTCs which are set. If no other DTCs are set, refer to the Engine Scan Tool Data List.
- This distributor ignition system has lower KV requirements than typical systems. The J 26792 spark tester (ST-125) may not fire *consistently* when testing this system. This chart only asks if the system is *capable* of firing the spark tester.
- This distributor ignition system has lower KV requirements than typical systems. The J 26792 spark tester (ST-125) may not fire *consistently* when testing this system. This chart only asks if the system is *capable* of firing the spark tester.
- If the plug is gas fouled, dry out the plug before reinstalling it in another cylinder.
- If the customers complaint is The MIL is flashing, indicates that a Catalyst Misfire has occurred. The vehicle must be driven in the conditions to run the catalyst diagnostic. Refer to *DTC P0420 TWC System Low Efficiency Bank1* and/or *DTC P0430 TWC System Low Efficiency Bank2* for Conditions for Setting the DTC.

DTC P0300 Engine Misfire Detected

Step	Action	Value(s)	Yes	No
1	Was the Powertrain On-Board Diagnostic (OBD) System Check performed?	—	Go to Step 2	Go to Powertrain OBD System Check
2	Important: If any DTCs are set, (except DTCs P0131, P0132, P0133, P0151, P0152, P0153, P0171, P0172, P0174, P0175, P1133, P1135, P1136, P1153, P1155, P1156) refer to those DTCs before proceeding with this diagnostic. 1. Install the scan tool. 2. Start and idle engine. 3. Using a scan tool, monitor all the Misfire Cur. counters on the misfire data list (There are a total of 8 counters, One counter per cylinder). Are any of the Misfire Cur. counters incrementing?	—	Go to Step 3	Go to Step 4
3	Important: If only one cylinder is misfiring, go to step 5. Visually/physically inspect the following items: • Proper vent system operation, Refer to Service Category <i>Distributor Vent System Check</i>. • Vacuum hoses for splits, kinks and proper connections. • Throttle body, intake manifold and EGR valve for vacuum leaks. • Crankcase ventilation valve and/or system for vacuum leaks. • PCM grounds for being clean and secure. • Check that all injector harness connectors are connected to the proper injector/cylinder. • Check that the ignition wires are connected to the proper cylinders. Did any of the above checks isolate a condition requiring a repair?	—	Go to Step 19	Go to Step 5
4	1. Turn the ignition ON, engine OFF, review Freeze Frame and/or Failure Records data for this DTC and note parameters. 2. Turn the ignition OFF for 15 seconds. 3. Start the engine and operate the vehicle within the conditions required for this diagnostic to run, and as close to the conditions recorded in Freeze Frame/Failure Records as possible. Special operating conditions that need to be met before the PCM will run this diagnostic, where applicable, are listed in Conditions for Setting the DTC. 4. Using the scan tool, select DTC, Specific, then enter the DTC number which was set. Does the scan tool indicate that this diagnostic failed this ignition?	—	Go to Step 5	Go to Diagnostic Aids-DTCP0300 Engine Misfire Detected
5	1. Turn the ignition OFF. 2. Disconnect ignition coil wire from distributor and install spark tester J 26792 to ground. 3. Crank the engine and observe the spark tester. With engine cranking, does spark jump the tester gap?	—	Go to Step 6	Go to Step 12

DTC P0300 Engine Misfire Detected (cont'd)

Step	Action	Value(s)	Yes	No
6	1. Reconnect coil wire to the distributor. 2. Disconnect the ignition wire(s) that corresponds to the Misfire Cur counter(s) that was incrementing. 3. Using spark tester J 26792 check for spark at the ignition wire(s) that indicated a misfire. Does spark jump the tester gap?	—	Go to Step 7	Go to Step 15
7	Remove the spark plugs from the cylinder that indicated a misfire. Does the spark plug appear to be OK or only gas fouled (not oil or coolant fouled)?	—	Go to Step 8	Go to Step 9
8	1. Swap the suspected spark plug with another cylinder that is operating properly. 2. Operate the vehicle under the same conditions that the misfire occurred. Important: If the Injector Coil Test Procedure checks to be OK, refer to Engine Mechanical diagnosis. Did the misfire move with the spark plug?	—	Go to Step 17	Go to Fuel Injector Coil Test
9	Are the spark plugs oil or coolant fouled?	—	Refer to Engine Mechanical for diagnosis	Go to Step 10
10	Do the spark plugs show any signs of being cracked, worn, or improperly gapped?	—	Go to Step 11	Go to Step 18
11	Replace or re-gap spark plugs (If improper gap is found, be sure to re-gap spark plugs using a wire type gauge, J 41319.) Is the action complete?	—	Go to Step 19	—
12	Using a DVM (J 39200), measure the resistance of the coil wire. Is the coil wire resistance less than the specified value?	10,000 Ω	Go to Step 13	Go to Step 14
13	Replace ignition coil. Is the action complete?	—	Go to Step 19	—
14	Replace coil wire. Is the action complete?	—	Go to Step 19	—
15	Using a DVM (J 39200), measure resistance of ignition wire(s) that are indicating a misfire. Do any ignition wires measure greater than the specified value?	10,000 Ω	Go to Step 16	Go to Step 17
16	Replace faulty ignition wire(s). Is the action complete?	—	Go to Step 19	—
17	Replace faulty spark plug(s). Is the action complete?	—	Go to Step 19	—
18	Inspect the distributor for the following: • Carbon tracking • Contamination • Moisture • Physical damage Refer to <i>Ignition System (6D)</i> . Did any of the above checks isolate a condition requiring a repair?	—	Go to Step 19	Refer to Engine Mechanical for diagnosis.

DTC P0300 Engine Misfire Detected (cont'd)

Step	Action	Value(s)	Yes	No
19	Was the customer complaining that the MIL was flashing?	—	Go to DTC P0420 TWC System Low Efficiency Bank1 or DTC P0430 TWC System Low Efficiency Bank2	Go to Step 20
20	- Using the scan tool, select DTC, Clear Info. - Start the engine and idle at normal operating temperature. - Select DTC, Specific, then enter the DTC number which was set. - Operate the vehicle within the conditions for setting this DTC as specified in the supporting text, if applicable. Does the scan tool indicate that this test ran and passed?	—	Go to Step 21	Go to Step 2
21	Using the scan tool, select Capture Info, Review Info. Are any DTCs displayed that have not been diagnosed?	—	Go to the applicable DTC table	System OK

DTC P0323 DI Low/High Resolution CKT Intermittent

30389

Circuit Description

The distributor ignition system supplies two timing inputs to the PCM, a high resolution signal (180 pulses per one crankshaft revolution) and a low resolution signal (4 pulses per one crankshaft revolution). The PCM can determine if one of the timing inputs is not being received by comparing the two inputs.

The high and low resolution circuits toggle between 0 and 5 volts as the camshaft turns. The following intermittent malfunctions to the low resolution circuit may cause a DTC P0323 to set:

- An open.
- A short to voltage.
- A short to ground.
- A defective ignition module within the distributor.

Conditions for Setting the DTC

- The PCM detects an interruption in the either the low or high resolution signal.

Action Taken When the DTC Sets

- The DTC will be stored in the PCM memory when the diagnostic runs and fails.
- The Malfunction Indicator Lamp (MIL) will not illuminate.
- The PCM will record operating conditions at the time the diagnostic fails. This information will be stored in Failure Records.

Conditions for Clearing the MIL/DTC

- A history DTC will clear after 40 consecutive warm-up cycles, if no failures are reported by this or any other non-emission related diagnostic.
- A last test failed (Current DTC) will clear when the diagnostic runs and does not fail.
- PCM battery voltage is interrupted.
- Using a scan tool.

Diagnostic Aids

- When DTC P0323 occurs, a misfire may be apparent. To locate an intermittent, use the scan tools snapshot feature. Try to duplicate the conditions under which the misfire is present. When reviewing captured data, watch for any abnormal high and low resolution timing pulses.
- For intermittents, refer to *Symptoms*.

Test Description

Number(s) below refer to step numbers on the diagnostic table.

- Using Freeze Frame and/or Failure Records data may aid in locating an intermittent condition. If the DTC cannot be duplicated, the information included in the Freeze Frame and/or Failure Records data can be useful in determining how many miles since the DTC set. The Fail Counter and Pass Counter can also be used to determine how many ignition cycles the diagnostic reported a pass and/or a fail. Operate vehicle within the same freeze frame conditions (RPM, load, vehicle speed, temperature etc.) that were noted.
- A defective ignition module within the distributor could cause this DTC to set. Inspect the distributor for signs of damage including contamination. Refer to *Section 6D4, Ignition System*. If distributor components must be replaced, check distributor vent system operation. Refer to *Distributor Vent System Check*.

DTC P0323 DI Low/High Resolution CKT Intermittent

Step	Action	Value(s)	Yes	No
1	Was the Powertrain On-Board Diagnostic (OBD) System Check performed?	—	Go to Step 2	Go to Powertrain OBD System Check
2	1. Install the scan tool. 2. Engine idling. 3. Using a scan tool, monitor Failed This Ignition under DTC Status for DTCs P0372 and P1371 Did DTC P0372 or P1371 fail this ignition cycle?	—	Go to applicable DTC Table	Go to Step 3
3	1. Install the scan tool. 2. Using the scan tool, observe Engine Speed while moving related harness connectors (at component and PCM). Also watch for an engine miss or stall when a connector is moved. Does the Engine Speed display change abruptly, or does an engine miss or stall occur while a related connector is being moved?	—	Go to Step 6	Go to Step 4
4	Using a scan tool, observe Engine Speed while moving related wiring harnesses. Also watch for an engine miss or stall when the harness is moved. Does the Engine Speed display change abruptly, or does an engine miss or stall occur while moving related electrical harnesses?	—	Go to Step 7	Go to Step 5

DTC P0323 DI Low/High Resolution CKT Intermittent (cont'd)

Step	Action	Value(s)	Yes	No
5	1. Turn the ignition ON, engine OFF, review Freeze Frame and/or Failure Records data for this DTC and note parameters. 2. Turn the ignition OFF for 15 seconds. 3. Start the engine and operate the vehicle within the conditions required for this diagnostic to run, and as close to the conditions recorded in Freeze Frame/Failure Records as possible. Special operating conditions that need to be met before the PCM will run this diagnostic, where applicable, are listed in Conditions for Setting the DTC. 4. Using the scan tool, select DTC, Specific, then enter the DTC number which was set. Does the scan tool indicate that this diagnostic failed this ignition?	—	Go to Step 8	Go to Diagnostic Aids- DTC P0323 DI Low/High Resolution Circuit Intermittent
6	Repair the damage connectors/terminals. Refer to <i>Repair Procedures in Electrical Diagnosis (8A Cell 5)</i>. Is the action complete?	—	Go to Step 9	—
7	Repair faulty wiring. Refer to <i>Repair Procedures in Electrical Diagnosis (8A Cell 5)</i>. Is the action complete?	—	Go to Step 9	—
8	1. Re-inspect all related circuits and connectors. 2. If all circuits have been checked thoroughly and no faults can be found, inspect the distributor. Refer to <i>Section 6D4, Ignition System</i>. Is the action complete?	—	Go to Step 9	—
9	1. Using the scan tool, select DTC, Clear Info. 2. Start the engine and idle at normal operating temperature. 3. Select DTC, Specific, then enter the DTC number which was set. 4. Operate the vehicle within the conditions for setting this DTC as specified in the supporting text, if applicable. Does the scan tool indicate that this test ran and passed?	—	Go to Step 10	Go to Step 2
10	Using the scan tool, select Capture Info, Review Info. Are any DTCs displayed that have not been diagnosed?	—	Go to the applicable DTC table	System OK

DTC P0325 Knock Sensor Module Circuit**Circuit Description**

A removable Knock Sensor (KS) module is located in the PCM. The KS module monitors both knock sensors to determine if detonation is present. If the KS module determines that excessive knock (detonation) is present, the PCM will retard the spark timing based on the signals from the KS module. When knock is present, the KS module voltage input signal to the PCM goes low. The PCM will then retard timing until no knock is present. When the KS module is missing or malfunctioning, the KS circuit voltage going to the PCM will go low. The PCM interprets this low signal as spark knock.

Conditions for Setting the DTC

- The PCM detects that the KS module is missing
- A malfunction with the KS module or circuits to the module are faulty.

Action Taken When the DTC Sets

- The DTC will be stored in the PCM memory when the diagnostic runs and fails.
- The Malfunction Indicator Lamp (MIL) will not illuminate.
- The PCM will record operating conditions at the time the diagnostic fails. This information will be stored in Failure Records.

Conditions for Clearing the MIL/DTC

- A history DTC will clear after 40 consecutive warm-up cycles, if no failures are reported by this or any other non-emission related diagnostic.
- A last test failed (Current DTC) will clear when the diagnostic runs and does not fail.
- PCM battery voltage is interrupted.
- Using a scan tool.

Diagnostic Aids

- If the diagnostic test does not run, review Conditions for Setting the DTC criteria.
- Check the KS module terminals for corrosion. If corrosion is found, inspect KS Module access cover seal for cuts and nicks.

For intermittents, refer to *Symptoms*.

Test Description

Number(s) below refer to step numbers on the diagnostic table.

3. Check the KS module terminals for corrosion. If corrosion is found, replace the PCM and the KS module.
5. If the PCM is at fault, the original KS module must be installed in the new PCM.

DTC P0325 Knock Sensor Module Circuit

Step	Action	Value(s)	Yes	No
1	Was the Powertrain On-Board Diagnostic (OBD) System Check performed?	—	Go to Step 2	Go to Powertrain OBD System Check
2	Important: If an engine knock can be heard, repair the engine mechanical problem before proceeding with this diagnostic. 1. Start and idle the engine for 2 minutes. 2. Using the scan tool, select DTC, Specific, then enter the DTC number which was set. Does the scan tool indicate that this diagnostic failed this ignition?	—	Go to Step 3	Go to Diagnostic Aids
3	1. Turn the ignition OFF. 2. Check the PCM for a missing module, for the module not being fully seated or for incorrect installation. Was a problem found and corrected?	—	Go to Step 6	Go to Step 4
4	1. Replace the KS module. Refer to <i>Knock Sensor Module</i> . 2. Start and idle the engine for 2 minutes. 3. Using the scan tool, select DTC, Specific, then enter the DTC number which was set. Does the scan tool indicate that this diagnostic failed this ignition?	—	Go to Step 5	Go to Step 6

DTC P0327 Knock Sensor Circuit Bank1

30399

Circuit Description

The Knock Sensor (KS) system is used to detect engine detonation. The PCM will retard the spark timing based on the signals from the KS module. The Knock Sensors produce an AC voltage that is sent to the KS module. The amount of AC voltage produced is proportional to the amount of knock.

An operating engine produces a normal amount of engine mechanical vibration (Noise). The knock sensors will produce an AC voltage signal from this Noise. When an engine is operating, the PCM will learn the minimum and maximum frequency of the noise the engine produces. When the PCM determines that this frequency is less than or greater than the expected amount, a knock sensor DTC will set.

Conditions for Setting the DTC

- DTCs P0117, P0118, P0122, P0123, P0125, P1114, P1115 not set.
- Engine operating time is greater than 20 seconds.
- Engine Coolant temperature greater than 80°C (176°F).
- Engine speed between 1100 and 2500 RPM.
- Throttle angle greater than 10%.
- The PCM determines that this frequency is less than or greater than the expected amount, a knock sensor DTC will set.

Action Taken When the DTC Sets

- The DTC will be stored in the PCM memory when the diagnostic runs and fails.

- The Malfunction Indicator Lamp (MIL) will not illuminate.
- The PCM will record operating conditions at the time the diagnostic fails. This information will be stored in Failure Records.

Conditions for Clearing the MIL/DTC

- A history DTC will clear after 40 consecutive warm-up cycles, if no failures are reported by this or any other non-emission related diagnostic.
- A last test failed (Current DTC) will clear when the diagnostic runs and does not fail.
- PCM battery voltage is interrupted.
- Using a scan tool.

Diagnostic Aids

Check the Knock Sensor for proper installation. A Knock Sensor that is loose or over torqued may cause DTC P0327 to set.

For intermittents, refer to *Symptoms*.

Test Description

Number(s) below refer to step numbers on the diagnostic table.

2. This verifies the malfunction is present.
3. Failure Records data does not include the parameter KS Activity, however other parameters may aid in locating the conditions under which an intermittent occurred.
4. This test will isolate the Knock Sensor from the rest of the circuit.

DTC P0327 Knock Sensor Circuit Bank1

Step	Action	Value(s)	Yes	No
1	Was the Powertrain On-Board Diagnostic (OBD) System Check performed?	—	Go to Step 2	Go to Powertrain OBD System Check
2	Important: If an engine knock can be heard, repair the engine mechanical problem before proceeding with this diagnostic. 1. Start the engine and allow it to reach normal operating temperature. 2. Install the scan tool. 3. Using the scan tool, monitor KS Activity. Does the scan tool indicate YES?	—	Go to Step 4	Go to Step 3
3	1. Turn the ignition ON, engine OFF, review Freeze Frame and/or Failure Records data for this DTC and note parameters. 2. Turn the ignition OFF for 15 seconds. 3. Start the engine and operate the vehicle within the conditions required for this diagnostic to run, and as close to the conditions recorded in Freeze Frame/Failure Records as possible. Special operating conditions that need to be met before the PCM will run this diagnostic, where applicable, are listed in Conditions for Setting the DTC. 4. Using the scan tool, select DTC, Specific, then enter the DTC number which was set. Does the scan tool indicate that this diagnostic failed this ignition?	—	Go to Step 4	Go to Diagnostic Aids-DTC P0327 KS Circuit Low
4	1. Disconnect knock sensor electrical connector. 2. Using a DVM (J 39200), measure voltage between the KS signal circuit and ground. Does the DVM indicate voltage at the specified value?	5.0 V	Go to Step 5	Go to Step 8
5	1. Measure the resistance of the knock sensor by connecting the DVM between the sensor terminal and the engine block. 2. Set DVM to 400K Ω scale. Is resistance of the knock sensor within the specified range?	93K–107K Ω	Go to Step 6	Go to Step 9
6	1. Turn the ignition OFF. 2. Connect DVM to Knock Sensor and ground. 3. Set DVM to AC voltage scale. 4. Tap on engine while observing signal indicated on DVM. Is any signal indicated on the DVM while tapping on the engine near the Knock Sensor?	—	Go to Step 7	Go to Step 9
7	Check the KS signal circuit for a poor terminal connection at the knock sensor. Was a problem found and corrected?	—	Go to Step 12	Go to Step 10

DTC P0327 Knock Sensor Circuit Bank1 (cont'd)

Step	Action	Value(s)	Yes	No
8	1. Turn the ignition OFF, disconnect the PCM. 2. Turn the ignition ON, check the KS signal circuit between the PCM and the knock sensor connector for the following: • An open. • A short to voltage. • A short to ground. Was a problem found and corrected?	—	Go to Step 12	Go to Step 10
9	Replace the Knock Sensor. Refer to <i>Knock Sensor</i> . Is action complete?	—	Go to Step 12	—
10	1. Turn the ignition OFF. 2. Disconnect the PCM. 3. Check the KS signal circuit for a poor terminal connection at the PCM. Was a problem found and corrected?	—	Go to Step 12	Go to Step 11
11	Important: Replacement PCM must be programmed. Refer to <i>PCM Replacement/Programming</i> . Replace the PCM. Is the action complete?	—	Go to Step 12	—
12	1. Using the scan tool, select DTC, Clear Info. 2. Start the engine and idle at normal operating temperature. 3. Select DTC, Specific, then enter the DTC number which was set. 4. Operate the vehicle within the conditions for setting this DTC as specified in the supporting text, if applicable. Does the scan tool indicate that this test ran and passed?	—	Go to Step 13	Go to Step 2
13	Using the scan tool, select Capture Info, Review Info. Are any DTCs displayed that have not been diagnosed?	—	Go to the applicable DTC table	System OK

DTC P0332 Knock Sensor Circuit Bank2

30399

Circuit Description

The Knock Sensor (KS) system is used to detect engine detonation. The PCM will retard the spark timing based on the signals from the KS module. The Knock Sensors produce an AC voltage that is sent to the KS module. The amount of AC voltage produced is proportional to the amount of knock.

An operating engine produces a normal amount of engine mechanical vibration (Noise). The knock sensors will produce an AC voltage signal from this Noise. When an engine is operating, the PCM will learn the minimum and maximum frequency of the noise the engine produces. When the PCM determines that this frequency is less than or greater than the expected amount, a knock sensor DTC will set.

Conditions for Setting the DTC

- DTCs P0117, P0118, P0122, P0123, P0125, P1114, P1115 not set.
- Engine operating time is greater than 20 seconds.
- Engine Coolant temperature greater than 80°C (176°F).
- Engine speed between 1100 and 2500 RPM.
- Throttle angle greater than 10%.
- The PCM determines that this frequency is less than or greater than the expected amount, a knock sensor DTC will set.

Action Taken When the DTC Sets

- The DTC will be stored in the PCM memory when the diagnostic runs and fails.

- The Malfunction Indicator Lamp (MIL) will not illuminate.
- The PCM will record operating conditions at the time the diagnostic fails. This information will be stored in Failure Records.

Conditions for Clearing the MIL/DTC

- A history DTC will clear after 40 consecutive warm-up cycles, if no failures are reported by this or any other non-emission related diagnostic.
- A last test failed (Current DTC) will clear when the diagnostic runs and does not fail.
- PCM battery voltage is interrupted.
- Using a scan tool.

Diagnostic Aids

Check the Knock Sensor for proper installation. A Knock Sensor that is loose or over torqued may cause DTC P0332 to set.

For intermittents, refer to *Symptoms*.

Test Description

Number(s) below refer to step numbers on the diagnostic table.

2. This verifies the malfunction is present.
3. Failure Records data does not include the parameter KS Activity, however other parameters may aid in locating the conditions under which an intermittent occurred.
4. This test will isolate the Knock Sensor from the rest of the circuit.

DTC P0335 Crankshaft Position (CKP) Sensor CKT

30389

Circuit Description

The Crankshaft Position Sensor is mounted in the engine front cover assembly and works in conjunction with a 4X reluctor wheel on the front of the crankshaft. The CKP sensor has a B+ power supply, a ground and a signal circuit.

As the crankshaft rotates, the reluctor wheel teeth interrupt a magnetic field produced by a magnet within the sensor. The sensor's internal circuitry detects this and produces a signal which is read by the PCM. The PCM uses this signal to accurately measure crankshaft velocity which is a variable used to detect misfire. This sensor is not used for spark or fueling. For this diagnostic the PCM monitors the Crankshaft Position Sensor signal, and the Low Resolution and the High Resolution signals from the

distributor. During normal operation, at the falling edge of a Crankshaft Sensor signal pulse (signal voltage transitions to low), the PCM starts counting High Resolution pulses. The counter will increase until the PCM detects the leading edge of the next Low Resolution signal pulse (voltage transitions to high). The PCM monitors the number of High Resolution counts to verify proper CKP sensor operation. The scan tool parameter that displays the results of this calculation is CKP:Lo Resolution Angle. The value displayed is the number of degrees that the camshaft deviates [either advanced (+) or retarded (-)] from its normal alignment with the crankshaft. During normal operation, on a vehicle with little or no timing chain wear, the value displayed would be near 0° Dev.

Conditions for Setting the DTC

- Engine Speed between 500 and 4000 RPM (LT1), 675 and 4000 RPM (LT4)
- Ignition Voltage between 9 and 17 volts
- CKP:Lo Resolution Angle goes outside of the range from -21° Dev to $+51^{\circ}$ Dev No signal from the CKP sensor will also cause this condition.

Action Taken When the DTC Sets

- The PCM will illuminate the Malfunction Indicator Lamp (MIL) on the second consecutive drive trip that the diagnostic runs and fails.
- The PCM will record operating conditions at the time the diagnostic fails. The first time the diagnostic fails, this information will be stored in Failure Records. If the diagnostic reports a failure on the second consecutive drive trip, the operating conditions at the time of failure will be written to Freeze Frame and the Failure record will be updated.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL OFF after three consecutive drive trips that the diagnostic runs and does not fail.
- A last test failed (Current DTC) will clear when the diagnostic runs and does not fail.
- A History DTC will clear after forty consecutive warm-up cycles, if no failures are reported by this or any other emission related diagnostic.
- PCM battery voltage is interrupted.
- Using a Scan tool.

Diagnostic Aids

The following mechanical problems may cause this DTC to set:

- Poor connections/terminal tension at the sensor.
- Excessive timing chain/gear wear.
- Excessive distributor drive backlash or other mechanical distributor problem.
- Crankshaft reluctor wheel damage or improper installation.
- Engine front cover assembly damage.
- The sensor coming in contact with the reluctor wheel.

Using Freeze Frame and/or Failure Records data may aid in locating an intermittent condition. If the DTC cannot be duplicated, the information included in the Freeze Frame and/or Failure Records data can be useful in determining how many miles since the DTC set. The Fail Counter and Pass Counter can also be used to determine how many ignition cycles the diagnostic reported a pass and/or a fail.

Operate vehicle within the same freeze frame conditions (RPM, load, vehicle speed, temperature etc.) that were noted. This will isolate when the DTC failed.

For intermittents, refer to *Symptoms*.

Test Description

Number(s) below refer to step numbers on the diagnostic table.

3. Crankshaft RPM should be similar to Engine Speed within approximately ± 75 RPM.

Important: During hard acceleration these two parameters can differ widely from each other due to time variances in the PCMs internal calculating processes. This difference could show up in a snapshot. If other parameters indicate a hard acceleration condition, the difference in the two values should be disregarded.

5. If there is excessive timing chain/gear wear, the camshaft has a tendency to retard on acceleration and to advance on deceleration. This parameter will indicate a positive value as the crankshaft accelerates, then flip to a negative value as the crankshaft decelerates. This may be more apparent while driving the vehicle than it is under a no-load situation.
6. If the reluctor wheel keyway moves off of the key in the crankshaft before the damper hub is completely installed, it is possible to pinch the reluctor wheel in an incorrect position. This will cause the CKP: Lo Res Angle parameter to be skewed. If the distributor drive pin is not properly indexed into the distributor and then the distributor is drawn into place with the mounting bolts, the CKP:Lo Res Angle parameter will be skewed. Check the condition of the distributor shaft for evidence of this condition.
7. The parameter Cyl Mode Misfire Index is the difference in crankshaft deceleration from one reference period to the next (in counts). On a perfect engine this value would equal zero, however, due to normal variations in engine operation, a value less than 1000 is acceptable. In this diagnostic table, Cyl Mode Misfire Index is being used to detect erratic signals from the CKP sensor. The following conditions should be met before using this parameter:
 - Engine idling at normal operating temperature.
 - All accessories OFF.
 - No apparent engine misfire. DTC P0300 may or may not be set since that diagnostic relies on data from this sensor. If the engine is misfiring, this needs to be corrected before proceeding. Refer to *Symptoms*.
11. With the signal generator set to 54 mph, the Crankshaft RPM should indicate approximately 900 RPM.

DTC P0335 Crankshaft Position (CKP) Sensor CKT

Step	Action	Value(s)	Yes	No
1	Was the Powertrain On-Board Diagnostic (OBD) System Check performed?	—	Go to Step 2	Go to Powertrain OBD System Check
2	Is DTC P1371 or P1373 also set?	—	Go to that DTC Table first	Go to Step 3
3	1. Start the engine. 2. Using the scan tool, monitor Crankshaft RPM. Is RPM indicated?	—	Go to Step 4	Go to Step 9
4	Using the scan tool, monitor CKP: Lo Res Angle. The actual value may fluctuate, but should remain within the range shown. Is the value within the range specified?	-10° Dev to +7° Dev	Go to Step 7	Go to Step 5
5	While observing CKP: Lo Res Angle, Quickly rev the engine once and allow it to return to idle. Does the CKP: Lo Res Angle change from a positive value on acceleration to a negative value on deceleration?	—	Go to Step 15	Go to Step 6
6	Does the CKP: Lo Res Angle appear to be fixed at or near a value outside the specified range?	- 10° Dev to +7° Dev	Go to Step 16	Go to Step 7
7	Important: Review the information in the Test Description before proceeding. Using the scan tool, monitor Cyl Mode Misfire Index (in the Misfire data list) with the engine idling. Typically this value should remain below 1000. Is the value below the specified value?	1000	Go to Step 8	Go to Step 12
8	1. Turn the ignition ON, engine OFF, review Freeze Frame and/or Failure Records data for this DTC and note parameters. 2. Ignition OFF for 15 seconds. 3. Start the engine and operate the vehicle within the conditions required for this diagnostic to run, and as close to the conditions recorded in Freeze Frame/Failure Records as possible. Special operating conditions that need to be met before the PCM will run this diagnostic, where applicable, are listed in Conditions for Setting the DTC. 4. Using the scan tool, select DTC, Specific, then enter the DTC number which was set. Does the scan tool indicate that this diagnostic failed this ignition?	—	Go to Step 9	Go to Diagnostic Aids- DTC P0335 Crankshaft Position Sensor Circuit
9	1. Turn the ignition ON, engine OFF. 2. Disconnect the Crankshaft Position Sensor harness connector. 3. Connect a test light (J 34142-B) from the ignition feed circuit in the Crankshaft Position Sensor harness connector to battery ground. Is the test light ON?	—	Go to Step 10	Go to Step 17

DTC P0335 Crankshaft Position (CKP) Sensor CKT (cont'd)

DTC P0336 CKP Sensor Circuit Performance

30389

Circuit Description

The Crankshaft Position Sensor is mounted in the engine front cover assembly and works in conjunction with a 4X reluctor wheel on the front of the crankshaft. The CKP sensor has a B+ power supply, a ground and a signal circuit.

As the crankshaft rotates, the reluctor wheel teeth interrupt a magnetic field produced by a magnet within the sensor. The sensor's internal circuitry detects this and produces a signal which is read by the PCM. The PCM uses this signal to accurately measure crankshaft velocity which is a variable used to detect misfire. This sensor is not used for spark or fueling. For this diagnostic the PCM monitors the Crankshaft Position Sensor signal, and the Low Resolution and the High Resolution signals from the

distributor. During normal operation, at the falling edge of a Crankshaft Sensor signal pulse (signal voltage transitions to low), the PCM starts counting High Resolution pulses. The counter will increase until the PCM detects the leading edge of the next Low Resolution signal pulse (voltage transitions to high). The PCM monitors the number of High Resolution counts to verify proper CKP sensor operation. The scan tool parameter that displays the results of this calculation is CKP:Lo Resolution Angle. The value displayed is the number of degrees that the camshaft deviates [either advanced (+) or retarded (-)] from its normal alignment with the crankshaft. During normal operation, on a vehicle with little or no timing chain wear, the value displayed would be near 0° Dev.

Conditions for Setting the DTC

- Engine Speed between 500 and 4000 RPM (LT1), 675 and 4000 RPM (LT4)
- Ignition Voltage between 9 and 17 volts
- CKP:Lo Res Angle goes outside of the range from -10° Dev to $+7^{\circ}$ Dev but is still within the range -21° Dev to $+51^{\circ}$ Dev.

Action Taken When the DTC Sets

- The PCM will illuminate the Malfunction Indicator Lamp (MIL) on the second consecutive drive trip that the diagnostic runs and fails.
- The PCM will record operating conditions at the time the diagnostic fails. The first time the diagnostic fails, this information will be stored in Failure Records. If the diagnostic reports a failure on the second consecutive drive trip, the operating conditions at the time of failure will be written to Freeze Frame and the Failure record will be updated.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL OFF after three consecutive drive trips that the diagnostic runs and does not fail.
- A last test failed (Current DTC) will clear when the diagnostic runs and does not fail.
- A History DTC will clear after forty consecutive warm-up cycles, if no failures are reported by this or any other emission related diagnostic.
- PCM battery voltage is interrupted.
- Using a Scan tool.

Diagnostic Aids

The following mechanical problems may cause this DTC to set:

- Poor connections/terminal tension at the sensor.
- Excessive timing chain/gear wear.
- Excessive distributor drive backlash or other mechanical distributor problem.
- Crankshaft reluctor wheel damage or improper installation.
- Engine front cover assembly damage.
- The sensor coming in contact with the reluctor wheel.

Using Freeze Frame and/or Failure Records data may aid in locating an intermittent condition. If the DTC cannot be duplicated, the information included in the Freeze Frame and/or Failure Records data can be useful in determining how many miles since the DTC set. The Fail Counter and Pass Counter can also be used to determine how many ignition cycles the diagnostic reported a pass and/or a fail.

Operate vehicle within the same freeze frame conditions (RPM, load, vehicle speed, temperature etc.) that were noted. This will isolate when the DTC failed.

For intermittents, refer to *Symptoms*.

Test Description

Number(s) below refer to step numbers on the diagnostic table.

3. Crankshaft RPM should be similar to Engine Speed within approximately ± 75 RPM.

Important: During hard acceleration these two parameters can differ widely from each other due to time variances in the PCMs internal calculating processes. This difference could show up in a snapshot. If other parameters indicate a hard acceleration condition, the difference in the two values should be disregarded.

5. If there is excessive timing chain/gear wear, the camshaft has a tendency to retard on acceleration and to advance on deceleration. This parameter will indicate a positive value as the crankshaft accelerates, then flip to a negative value as the crankshaft decelerates. This may be more apparent while driving the vehicle than it is under a no-load situation.
6. If the reluctor wheel keyway moves off of the key in the crankshaft before the damper hub is completely installed, it is possible to pinch the reluctor wheel in an incorrect position. This will cause the CKP:Lo Res Angle parameter to be skewed. If the distributor drive pin is not properly indexed into the distributor and then the distributor is drawn into place with the mounting bolts, the CKP:Lo Res Angle parameter will be skewed. Check the condition of the distributor shaft for evidence of this condition.
7. The parameter Cyl Mode Misfire Index is the difference in crankshaft deceleration from one reference period to the next (in counts). On a perfect engine this value would equal zero, however, due to normal variations in engine operation, a value less than 1000 is acceptable. In this diagnostic table, Cyl Mode Misfire Index is being used to detect erratic signals from the CKP sensor. The following conditions should be met before using this parameter:
 - Engine idling at normal operating temperature.
 - All accessories OFF.
 - No apparent engine misfire. DTC P0300 may or may not be set since that diagnostic relies on data from this sensor. If the engine is misfiring, this needs to be corrected before proceeding. Refer to *Symptoms*.
11. With the signal generator set to 54 mph, the Crankshaft RPM should indicate approximately 900 RPM.

DTC P0336 CKP Sensor Circuit Performance

Step	Action	Value(s)	Yes	No
1	Was the Powertrain On-Board Diagnostic (OBD) System Check performed?	—	Go to Step 2	Go to Powertrain OBD System Check
2	Is DTC P1371 or P1373 also set?	—	Go to that DTC Table first	Go to Step 3

6	Does the CKP:Lo Res Angle appear to be fixed at or near a value outside the specified range?	- 10° Dev to +7° Dev	Go to Step 15	Go to Step 7
7	Important: Review the information in the Test Description before proceeding. Using the scan tool, monitor Cyl Mode Misfire Index (in the Misfire data list) with the engine idling. Typically this value should remain below 1000. Is the value below the specified value?	1000	Go to Step 8	Go to Step 12
8	1. Turn the ignition ON, engine OFF, review Freeze Frame and/or Failure Records data for this DTC and note parameters. 2. Turn the ignition OFF for 15 seconds. 3. Start the engine and operate the vehicle within the conditions required for this diagnostic to run, and as close to the conditions recorded in Freeze Frame/Failure Records as possible. Special operating conditions that need to be met before the PCM will run this diagnostic, where applicable, are listed in Conditions for Setting the DTC. 4. Using the scan tool, select DTC, Specific, then enter the DTC number which was set. Does the scan tool indicate that this diagnostic failed this ignition?	—	Go to Step 9	Go to Diagnostic Aids-DTC P0335 Crankshaft Position Sensor Circuit
9	1. Turn the ignition ON, engine OFF. 2. Disconnect the Crankshaft Position Sensor harness connector. 3. Connect a test light (J 34142-B) from the ignition feed circuit in the Crankshaft Position Sensor harness connector to battery ground. Is the test light ON?	—	Go to Step 10	Go to Step 17

DTC P0336 CKP Sensor Circuit Performance (cont'd)

Step	Action	Value(s)	Yes	No
10	Connect a test light (J 34142-B) from the ignition feed circuit to the ground circuit in the Crankshaft Position Sensor harness connector. Is the test light ON?	—	Go to Step 11	Go to Step 18
11	1. Install the Signal Generator Tester (J 33431-B) to the signal circuit in the Crankshaft Position Sensor harness connector (one terminal connected to the signal circuit and the other to ground). 2. Ignition ON, Tester ON and set to generate a 54 mph signal. 3. Using the scan tool, monitor Crankshaft RPM. Does the scan tool indicate Crankshaft RPM?	—	Go to Step 16	Go to Step 13
12	Visually inspect the Crankshaft Position Sensor for the following conditions: - Physical damage. - Loose or improper installation. - Wiring routed too closely to secondary ignition components. - Poor connections/terminal tension at the sensor and/or the PCM. Was a problem found and corrected?	—	Go to Step 22	Go to Step 20
13	1. Turn the ignition OFF. 2. Disconnect PCM connector C1. 3. Using DVM J 39200, check continuity of the signal circuit from the sensor harness connector to the PCM connector. Does the DVM display the value shown (or lower)?	5 Ω	Go to Step 21	Go to Step 19
14	Check for excessive timing chain/gear wear. Refer to <i>Engine Unit Repair, Section 6A</i> . Is the action complete?	—	Go to Step 22	—
15	Check for poor connections/terminal tension at the sensor. If the connections are OK, Check for proper reluctor wheel installation. Refer to <i>Engine Unit Repair, Section 6A</i> . Is the action complete?	—	Go to Step 22	—
16	Check for poor connections/terminal tension at the sensor. Was a problem found and corrected?	—	Go to Step 22	Go to Step 20
17	Repair the ignition feed circuit Is the action complete?	—	Go to Step 22	—
18	Repair the ground circuit Is the action complete?	—	Go to Step 22	—
19	Repair the signal circuit Is the action complete?	—	Go to Step 22	—
20	Replace the Crankshaft Position Sensor. Is the action complete?	—	Go to Step 22	—

DTC P0336 CKP Sensor Circuit Performance (cont'd)

Step	Action	Value(s)	Yes	No
21	Important: Replacement PCM must be programmed. Refer to <i>PCM Replacement/Programming</i> . Replace the PCM. Is the action complete?	—	<i>Go to Step 22</i>	—
22	1. Using the scan tool, select DTC, Clear Info. 2. Start the engine and idle at normal operating temperature. 3. Select DTC, Specific, then enter the DTC number which was set. 4. Operate vehicle within the conditions for setting this DTC as specified in the supporting text, if applicable. Does the scan tool indicate that this test ran and passed?	—	<i>Go to Step 23</i>	<i>Go to Step 2</i>
23	Using the scan tool, select Capture Info, Review Info. Are any DTCs displayed that have not been diagnosed?	—	Go to the applicable DTC table	System OK

DTC P0372 DI High Resolution Circuit

30389

Circuit Description

The distributor ignition system supplies two timing inputs to the PCM, a high resolution signal (180 pulses per one crankshaft revolution) and a low resolution signal (4 pulses per one crankshaft revolution). The high resolution and low resolution circuits toggle between 0 and 5 volts as the camshaft turns. The PCM can determine if one of the timing inputs is not being received by comparing the two inputs.

The following malfunctions to the high resolution circuit will cause a DTC P0372 to set:

- An open.
- A short to voltage.
- A short to ground.
- A defective ignition module within the distributor.

Conditions for Setting the DTC

- The PCM detects low resolution pulses but no high resolution pulses.

Action Taken When the DTC Sets

- The PCM will illuminate the Malfunction Indicator Lamp (MIL) when the diagnostic runs and fails.
- The PCM will record operating conditions at the time the diagnostic fails. This information will be stored in the Freeze Frame and/or Failure Records.
- The injector will be disabled for the entire ignition cycle.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL OFF after three consecutive drive trips that the diagnostic runs and does not fail.
- A last test failed (Current DTC) will clear when the diagnostic runs and does not fail.
- A History DTC will clear after forty consecutive warm-up cycles, if no failures are reported by this or any other emission related diagnostic.
- PCM battery voltage is interrupted.
- Using a Scan tool.

Diagnostic Aids

- If DTC P1351 and/or DTC P1361 is also set with a DTC P0372, and no external fault can be found, replace the PCM. If only DTC P0372 is set and the distributor connections are OK, replace the distributor.
- If distributor components must be replaced, check distributor vent system operation.
- For intermittents, refer to *Symptoms*.

Test Description

Number(s) below refer to step numbers on the diagnostic table.

2. This verifies if the malfunction is present. The engine may experience a extremely long crank time if the high resolution circuit is open, shorted to B+, or shorted to ground.
3. Using Freeze Frame Data may aid in locating an intermittent condition.
4. Normal voltage may vary slightly from the specified value. A value that is significantly higher or lower indicates a problem. This step isolates the circuit between the PCM and the test connector.
5. Normal voltage may vary slightly from the specified value. A value that is significantly higher or lower indicates a problem. This step isolates the circuit between the test connector and the distributor.

DTC P0372 DI High Resolution Circuit

Step	Action	Value(s)	Yes	No
1	Was the Powertrain On-Board Diagnostic (OBD) System Check performed?	—	Go to Step 2	Go to Powertrain OBD System Check
2	1. Start the engine and allow it to reach normal operating temperature. 2. Install scan tool 3. Using a scan tool, monitor High Res Signal. Does the scan tool indicate Inactive?	—	Go to Step 4	Go to Step 3
3	1. Turn the ignition ON, engine OFF, review Freeze Frame and/or Failure Records data for this DTC and note parameters. 2. Turn the ignition OFF for 15 seconds. 3. Start the engine and operate the vehicle within the conditions required for this diagnostic to run, and as close to the conditions recorded in Freeze Frame/Failure Records as possible. Special operating conditions that need to be met before the PCM will run this diagnostic, where applicable, are listed in Conditions for Setting the DTC. 4. Using the scan tool, select DTC, Specific, then enter the DTC number which was set. Does the scan tool indicate that this diagnostic failed this ignition?	—	Go to Step 4	Go to Diagnostic Aids-DTC P0372 DI High Resolution Circuit
4	1. Turn the ignition OFF. 2. Disconnect ignition system test connector. 3. Turn the ignition ON, use a DVM (J 39200) on DC volts scale, measure voltage on terminal B at the PCM side of the ignition test connector. Does the DVM indicate the voltage specified?	5 V	Go to Step 5	Go to Step 8

DTC P0372 DI High Resolution Circuit (cont'd)

Step	Action	Value(s)	Yes	No
5	1. Turn the ignition OFF. 2. Reconnect ignition system test connector. 3. Disconnect Distributor connector. 4. Turn the ignition ON, use a DVM (J 39200) on DC volts scale, measure voltage on terminal B of Distributor electrical connector. Does the DVM indicate voltage specified?	5 V	Go to Step 11	Go to Step 6
6	Is voltage higher than the specified value?	5 V	Go to Step 7	Go to Step 12
7	Repair the short to voltage on the High Resolution signal circuit from the PCM to the ignition system test connector. Is the action complete?	—	Go to Step 14	—
8	Is voltage higher than the specified value?	5V	Go to Step 10	Go to Step 9
9	Repair the open or grounded High Resolution circuit from the ignition system test connector to the PCM. Was the condition found and repaired?	—	Go to Step 14	Go to Step 13
10	Repair the short to voltage on High resolution signal circuit from ignition system test connector to Distributor. Is the action complete?	—	Go to Step 14	—
11	Repair the faulty Distributor connection or faulty Distributor. Is the action complete?	—	Go to Step 14	—
12	Repair the open or grounded High Resolution circuit from the ignition system test connector to the Distributor. Was the condition found and repaired?	—	Go to Step 14	Go to Step 13
13	Important: Replacement PCM must be programmed. Refer to <i>PCM Replacement/Programming</i> . Replace the PCM. Is the action complete?	—	Go to Step 14	—
14	1. Using the scan tool, select DTC, Clear Info. 2. Start the engine and idle at normal operating temperature. 3. Select DTC, Specific, then enter the DTC number which was set. 4. Operate the vehicle within the conditions for setting this DTC as specified in the supporting text, if applicable. Does the scan tool indicate that this test ran and passed?	—	Go to Step 15	Go to Step 2
15	Using the scan tool, select Capture Info, Review Info. Are any DTCs displayed that have not been diagnosed?	—	Go to the applicable DTC table	System OK

DTC P0400 EGR System

30406

Circuit Description

Vacuum to the Exhaust Gas Recirculation (EGR) valve is controlled by the EGR vacuum control signal solenoid valve. The vacuum signal to the EGR valve is regulated by varying the duty cycle (on-time) of the solenoid valve. The duty cycle is calculated by the PCM based on data from the ECT sensor, the MAF sensor and RPM. The PCM uses engine coolant temperature (ECT) and intake air temperature (IAT) to determine when to enable the EGR system. If the ambient temperature is cool when the vehicle is started, IAT is below 15°C (59°F), the PCM will wait longer before enabling the EGR, the EGR will not be enabled until ECT reaches 82°C (180°F). In warmer ambient temperatures, the PCM will allow the EGR system to operate earlier in the warm up cycle [If IAT is above 15°C (59°F) at start up, EGR will be enabled when ECT reaches 60°C (140°F). EGR operation is prevented under the following additional conditions:

- Transmission is in Park/Neutral
- Throttle Angle is less than a predetermined value
- At wide open throttle (WOT)

The PCM tests the EGR system operation during specific driving conditions.

Conditions for Setting the DTC

Enabling Conditions:

- DTCs P0107, P0108, P0112, P0113, P0117, P0118, P0122, P0123, P0601, P0719, P0724 not set.
- Coolant above 27°C (81°F)
- Vehicle speed above 14 mph
- Baro above 95 kPa
- RPM between 500 and 900
- IAC steady
- MAP less than 24 kPa
- A/C clutch, TCC, Brake switch, no transitions

Test Conditions:

Decel Mode Test

- TP Sensor below 1%
- Not in DFCO
- EGR duty cycle = 0%
- The expected change in MAP is less than a predetermined amount when the PCM commands EGR ON during the test.
- MAP within the range shown in the table (depends on altitude) and steady.

Baro (kPa)	Map Range for Test (kPa)	
100	30	60
95	25	55
90	20	50
85	15	45
80	10	40

Action Taken When the DTC Sets

- The PCM will illuminate the Malfunction Indicator Lamp (MIL) when the diagnostic runs and fails.
- The PCM will record operating conditions at the time the diagnostic fails. This information will be stored in the Freeze Frame and/or Failure Records.
- The injector will be disabled for the entire ignition cycle.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL OFF after three consecutive drive trips that the diagnostic runs and does not fail.
- A last test failed (Current DTC) will clear when the diagnostic runs and does not fail.
- A History DTC will clear after forty consecutive warm-up cycles, if no failures are reported by this or any other emission related diagnostic.
- PCM battery voltage is interrupted.
- Using a Scan tool.

Diagnostic Aids

- Suction from shop exhaust hoses can alter back pressure and may affect the operation of the EGR valve during in-stall testing. This DTC can be set by a leaking exhaust system because an exhaust leak alters back pressure. Thoroughly check the exhaust system for leaks. Refer to *Section 6F, Exhaust System*.
- Vacuum lines should be thoroughly checked for proper routing. The vacuum source goes to the orifice side of the solenoid valve. Refer to the Vehicle Emissions Control Information label.

- Using Freeze Frame and/or Failure Records data may aid in locating an intermittent condition. If the DTC cannot be duplicated, the information included in the Freeze Frame and/or Failure Records data can be useful in determining how many miles since the DTC set. The Fail Counter and Pass Counter can also be used to determine how many ignition cycles the diagnostic reported a pass and/or a fail. Operate vehicle within the same freeze frame conditions (RPM, load, vehicle speed, temperature etc.) that were noted. This will isolate when the DTC failed.
- A leaking EGR valve pipe assembly will cause an exhaust leak and can reduce EGR flow volume. Refer to *Section 6A, Engine On-Vehicle Service* if this condition is noted.

For intermittents, refer to *Symptoms*.

Test Description

Number(s) below refer to step numbers on the diagnostic table.

10. **Intake Passage:** Turn the engine OFF. Remove the EGR valve from the manifold. Plug the exhaust side hole with a suitable stopper. With the intake side hole open, attempt to start the engine. If the engine runs at a very high idle (up to 3000 RPM is possible), or starts and stalls, the EGR passages are not restricted. If the engine starts and idles normally, the EGR intake side passage in the intake manifold is restricted. Refer to *EGR System* for more information.

Exhaust Passage: With the EGR valve still removed, plug the intake side hole with a suitable stopper. With the exhaust side hole open and the engine running, check for the presence of exhaust gas. If no exhaust gas is present, the EGR exhaust side passage in the intake manifold is restricted. Refer to *EGR System* for more information.

DTC P0400 EGR System

Step	Action	Value(s)	Yes	No
1	Was the Powertrain On-Board Diagnostic (OBD) System Check performed?	—	Go to Step 2	Go to Powertrain OBD System Check
2	1. Start and idle the engine until normal operating temperature is reached. 2. Using the scan tool, command the EGR Duty Cycle to 100% and then back to 0%. Does the engine RPM decrease and/or the engine idle roughly with an EGR Duty Cycle of 100% and then Engine RPM/idle quality return to normal when the duty cycle is returned to 0%?	—	Go to Step 3	Go to Step 4
3	1. Turn the ignition ON, engine OFF, review Freeze Frame and/or Failure Records data for this DTC and note parameters. 2. Turn the ignition OFF for 15 seconds. 3. Start the engine and operate the vehicle within the conditions required for this diagnostic to run, and as close to the conditions recorded in Freeze Frame/Failure Records as possible. Special operating conditions that need to be met before the PCM will run this diagnostic, where applicable, are listed in Conditions for Setting the DTC. 4. Using the scan tool, select DTC, Specific, then enter the DTC number which was set. Does the scan tool indicate that this diagnostic failed this ignition?	—	Go to Step 4	Go to Diagnostic Aids-DTC P0400 EGR System
4	Manually lift the EGR valve diaphragm. Does the engine RPM decrease and/or the engine idle roughly?	—	Go to Step 5	Go to Step 10
5	1. Disconnect the vacuum harness at the solenoid valve. 2. Connect a vacuum gauge to the manifold side of the harness and check the vacuum supply to the solenoid valve. Is the vacuum greater than the minimum value shown, at 2000 RPM?	25 kPa (7 inch Hg)	Go to Step 6	Go to Step 11
6	1. Turn the engine OFF. 2. Rotate the vacuum harness and connect only the manifold vacuum side to the solenoid valve. 3. Connect a vacuum gauge to the other port on the solenoid valve. 4. Start the engine. 5. Using the scan tool, command the EGR solenoid valve ON and OFF while observing the vacuum gauge. Does the vacuum gauge indicate vacuum when the solenoid is ON and bleed off when the solenoid is OFF?	—	Go to Step 7	Go to Step 13
7	1. Reconnect the vacuum harness to the solenoid valve. 2. Using the scan tool, command the EGR solenoid valve ON and OFF while observing the vacuum gauge. Does the vacuum gauge indicate vacuum when the solenoid is ON and bleed off when the solenoid is OFF?	—	Go to Step 8	Go to Step 12

DTC P0400 EGR System (cont'd)

Step	Action	Value(s)	Yes	No
8	1. Turn the ignition OFF. 2. Connect a vacuum pump to the EGR valve. 3. Observe the EGR valve diaphragm while applying vacuum. Does the diaphragm move freely and hold vacuum for at least 20 seconds?	—	Go to Step 9	Go to Step 14
9	1. Apply 34 kPa (10 inch Hg) vacuum to the EGR valve. 2. Start the engine and immediately observe the gauge on the vacuum pump. Does the EGR valve diaphragm move to the seated position and vacuum drop from the pump gauge while starting the engine?	—	Go to Step 15	Go to Step 14
10	Repair plugged or restricted EGR passages. Refer to <i>EGR System</i> for more information. Is the action complete?	—	Go to Step 16	—
11	Repair the plugged vacuum port or faulty vacuum line. Is the action complete?	—	Go to Step 16	—
12	Repair the faulty vacuum line to the EGR valve. Is the action complete?	—	Go to Step 16	—
13	Replace the solenoid valve. Is the action complete?	—	Go to Step 16	—
14	Replace the EGR valve. Is the action complete?	—	Go to Step 16	—
15	Check for any of the following conditions which may cause insufficient EGR flow: • Partially clogged EGR passages • Restricted or damaged EGR pipe • Non OEM, modified or faulty exhaust system components Is the action complete?	—	Go to Step 16	—
16	1. Using the scan tool, select DTC, Clear Info. 2. Start the engine and idle at normal operating temperature. 3. Select DTC, Specific, then enter the DTC number which was set. 4. Operate the vehicle within the conditions for setting this DTC as specified in the supporting text, if applicable. Does the scan tool indicate that this test ran and passed?	—	Go to Step 17	Go to Step 2
17	Using the scan tool, select Capture Info, Review Info. Are any DTCs displayed that have not been diagnosed?	—	Go to the applicable DTC table	System OK

DTC P0403 EGR Solenoid Control Circuit

30406

Circuit Description

Ignition voltage is supplied directly to the EGR vacuum control signal solenoid valve. The PCM controls the solenoid by grounding the control circuit via an internal switch called a driver. The primary function of the driver is to supply the ground for the component being controlled. Each driver has a fault line which is monitored by the PCM. When the PCM is commanding a component ON, the voltage of the control circuit should be low (near 0 volts). When the PCM is commanding the control circuit to a component OFF, the voltage potential of the circuit should be high (near battery voltage). If the fault detection circuit senses a voltage other than what is expected, the fault line status will change causing the DTC to set.

Conditions for Setting the DTC

- Engine speed greater than 600 RPM.
- The PCM detects that the commanded state of the driver and the actual state of the control circuit do not match.
- Condition must be present for a minimum of 25.5 seconds.

Action Taken When the DTC Sets

- The PCM will illuminate the Malfunction Indicator Lamp (MIL) on the second consecutive drive trip that the diagnostic runs and fails.
- The PCM will record operating conditions at the time the diagnostic fails. The first time the diagnostic fails, this information will be stored in Failure Records. If the diagnostic reports a failure on the second consecutive drive trip, the operating conditions at the time of failure will be written to Freeze Frame and the Failure record will be updated.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL OFF after three consecutive drive trips that the diagnostic runs and does not fail.
- A last test failed (Current DTC) will clear when the diagnostic runs and does not fail.
- A History DTC will clear after forty consecutive warm-up cycles, if no failures are reported by this or any other emission related diagnostic.
- PCM battery voltage is interrupted.
- Using a Scan tool.

Diagnostic Aids

Using Freeze Frame and/or Failure Records data may aid in locating an intermittent condition. If the DTC cannot be duplicated, the information included in the Freeze Frame and/or Failure Records data can be useful in determining how many miles since the DTC set. The Fail Counter and Pass Counter can also be used to determine how many ignition cycles the diagnostic reported a pass and/or a fail. Operate vehicle within the same freeze frame conditions (RPM, load, vehicle speed, temperature etc.) that were noted. This will isolate when the DTC failed.

For intermittents, refer to *Symptoms*.

Test Description

Number(s) below refer to step numbers on the diagnostic table.

2. Listen for an audible click when the solenoid operates. Be sure that both the ON and the OFF states are commanded. Repeat the commands as necessary.
3. This check can detect a partially shorted coil which would cause excessive current flow. Leaving the circuit energized for 2 minutes allows the coil to warm up. When warm the coil may open (Amps drop to 0), or short (goes above .75 Amp).
13. If no trouble is found in the control circuit or the connection at the PCM, the PCM may be faulty, however, this is an extremely unlikely failure.

DTC P0403 EGR Solenoid Control Circuit

Step	Action	Value(s)	Yes	No
1	Was the Powertrain On-Board Diagnostic (OBD) System Check performed?	—	Go to Step 2	Go to Powertrain OBD System Check
2	1. Turn the ignition ON, engine OFF. 2. Using a Scan tool, command the solenoid ON and OFF. Does the solenoid turn ON and OFF with each command?	—	Go to Step 3	Go to Step 5
3	1. Turn the ignition OFF. 2. Disconnect the PCM connector containing the solenoid control circuit 3. Turn the ignition ON. 4. Using DVM J 39200 on 10 Amp scale, measure current from the solenoid control circuit in the PCM harness connector to ground for 2 minutes. Does the current draw measure less than the specified value shown (but not 0)?	0.75 A	Go to Diagnostic Aids	Go to Step 4
4	1. Turn the ignition OFF. 2. Disconnect the solenoid. 3. Using DVM J 39200, measure resistance from the solenoid control circuit in the PCM harness connector to ground. Does the DVM display infinite resistance?	—	Go to Step 12	Go to Step 10
5	1. Turn the ignition OFF. 2. Disconnect the solenoid. 3. Connect test light J 34142-B between the terminals in the solenoid harness connector. 4. Turn the ignition ON. 5. Using a Scan tool, command the solenoid ON and OFF. Does the test light turn ON and OFF with each command?	—	Go to Step 8	Go to Step 6
6	1. With the test light connected to ground, probe the ignition feed circuit in the solenoid harness connector. Does the test light illuminate?	—	Go to Step 7	Go to Step 11

DTC P0403 EGR Solenoid Control Circuit (cont'd)

Step	Action	Value(s)	Yes	No
7	1. Turn the ignition OFF. 2. Reconnect the solenoid. 3. Disconnect the PCM connector containing the solenoid control circuit. 4. Turn the ignition ON. 5. With a fused jumper wire connected to ground, probe the solenoid control circuit in the PCM harness connector. Does the solenoid operate?	—	Go to Step 9	Go to Step 10
8	Check the connections at the solenoid. Was a problem found and corrected?	—	Go to Step 14	Go to Step 12
9	Check the connections at the PCM. Was a problem found and corrected?	—	Go to Step 14	Go to Step 13
10	Repair the faulty solenoid control circuit. Is the action complete?	—	Go to Step 14	—
11	Repair the faulty solenoid ignition feed circuit. Is the action complete?	—	Go to Step 14	—
12	Replace the solenoid Is the action complete?	—	Go to Step 14	—
13	Important: Replacement PCM must be programmed. Refer to <i>PCM Replacement/Programming</i> . Replace the PCM. Is the action complete?	—	Go to Step 14	—
14	1. Using the scan tool, select DTC, Clear Info. 2. Start the engine and idle at normal operating temperature. 3. Select DTC, Specific, then enter the DTC number which was set. 4. Operate vehicle within the conditions for setting this DTC as specified in the supporting text, if applicable. Does the scan tool indicate that this test ran and passed?	—	Go to Step 15	Go to Step 2
15	Using the scan tool, select Capture Info, Review Info. Are any DTCs displayed that have not been diagnosed?	—	Go to the applicable DTC table	System OK

DTC P0410 AIR System

30415

Circuit Description

An AIR pump is used on this vehicle to lower tail pipe emissions on start-up. The PCM supplies a ground to the AIR pump relay, which energizes the AIR pump.

The PCM will run two tests using the HO2S voltages to diagnose the AIR system. Both tests have two parts.

Test one consists of the following:

Part 1

When the AIR pump is enabled, the PCM monitors the HO2S voltage. If the HO2S voltages go below a threshold, the PCM interprets this as an indication that the AIR system is operational.

Part 2

When the AIR pump is disabled, the PCM monitors the HO2S voltages. The HO2S voltages should increase above a threshold and switch normally.

If the PCM did not sense more than a predetermined amount of HO2S rich switches, a malfunction will be reported. If both of these test indicate a pass, no further action is taken. If one of the above tests failed or is inconclusive, the diagnostic will proceed to test two.

Test two consist of the following:

Part 1

During this test the PCM will activate the AIR pump during closed loop operation. When the AIR is activated, the PCM will monitor the HO2S voltages and short term fuel trim values for both banks of the engine. If the AIR system is operating properly, the HO2S voltages should go low and the short term fuel trim should go high.

Part 2

The PCM checks that the HO2S voltages return to above a rich threshold when the air pump is disabled.

If the PCM determines that the HO2S voltages for *both* banks did not respond as expected during the tests, DTC P0410 will set. If only one sensor responded, the PCM will set either a DTC P1415 or P1416 to indicate on which bank the AIR system is inoperative.

Conditions for Setting the DTC

- DTCs P0107, P0108, P0116, P0117, P0118, P0133, P0135, P0153, P0155, P0171, P0172, P0174, P0175, not set.
- Engine operating about 2 seconds.

Test 1

- TP angle not moving more than 1%.
- Engine load less than 6.6%.
- Engine air flow less than 26 grams per second.
- Air fuel ratio greater than 13:1.
- ECT less than 115°C (239°F).
- HO2S bias voltage between 365 mV and 513 mV.
- HO2S voltage does not go below 400 mV for 19 seconds (Engine coolant temperature less than 75°C (167°F) when the engine is started.) or HO2S voltage does not go below 417 mV for 7 seconds (Engine coolant temperature greater than 75°C (167°F) when the engine is started.)
- HO2S voltage does not go above 722 mV for 19 seconds (Engine coolant temperature less than 75°C (167°F) when the engine is started.) or HO2S voltage does not go above 700 mV for 7 seconds (Engine coolant temperature greater than 75°C (167°F) when the engine is started.)

Test 2

- Engine operating longer than 200 seconds.
- Engine speed greater than 600 RPM.
- Maximum air flow 17 gm/s.
- Engine coolant temperature between 60°C (140°F) and 115°C (239°F).
- IAT greater than 10°C (50°C).
- Ignition voltage greater than 11.0 volts.
- Engine load less than 5.5%.
- HO2S voltage does not go below 222 mV within 1.5 seconds.
- Short term fuel trim does not go above a predetermined amount.

Action Taken When the DTC Sets

- The PCM will illuminate the Malfunction Indicator Lamp (MIL) on the second consecutive drive trip that the diagnostic runs and fails.
- The PCM will record operating conditions at the time the diagnostic fails. The first time the diagnostic fails, this information will be stored in Failure Records. If the diagnostic reports a failure on the second consecutive drive trip, the operating conditions at the time of failure will be written to Freeze Frame and the Failure record will be updated.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL OFF after three consecutive drive trips that the diagnostic runs and does not fail.
- A last test failed (Current DTC) will clear when the diagnostic runs and does not fail.
- A History DTC will clear after forty consecutive warm-up cycles, if no failures are reported by this or any other emission related diagnostic.
- PCM battery voltage is interrupted.
- Using a Scan tool.

Diagnostic Aids

- If the #3 underhood fuse is open, inspect AIR system for water intrusion. Inspect the AIR pump for water. Check the AIR check valves for proper operation. Refer to *Air Check Valve and Pipes* or *Air Check Valve and Pipes* for procedure.
- The AIR vacuum bleed system contains a one way check valve. If the system checks out OK, make sure this valve is not stuck closed, restricted or blocked. The check valve is in-line in the hose that goes to the vacuum bleed valve.
- Using Freeze Frame and/or Failure Records data may aid in locating an intermittent condition. If the DTC cannot be duplicated, the information included in the Freeze Frame and/or Failure Records data can be useful in determining how many miles since the DTC set. The Fail Counter and Pass Counter can also be used to determine how many ignition cycles the diagnostic reported a pass and/or a fail. Operate vehicle within the same freeze frame conditions (RPM, load, vehicle speed, temperature etc.) that were noted. This will isolate when the DTC failed.
- For intermittents, refer to *Symptoms*.

Test Description

Number(s) below refer to step numbers on the diagnostic table.

3. For any test that requires probing the PCM or a component harness connector, must use the Connector Test Adapter Kit J 35616-A. Using this kit will prevent damage to the harness connector terminals.
6. This checks whether B+ supply is available at the integral stop valve at the AIR pump.

9. This step begins a test of the vacuum bleed portion of the system. Normal engine operation can cause vacuum to build up within the AIR pipes and hoses. If there is vacuum present in the system when the PCM commands the AIR pump ON, the integral stop valve within the AIR pump may not be able to overcome this vacuum and no air will enter the system. The AIR vacuum bleed solenoid valve is designed to open whenever the AIR pump is commanded ON, to eliminate this problem.

DTC P0410 AIR System

Step	Action	Value(s)	Yes	No
1	Was the Powertrain On-Board Diagnostic (OBD) System Check performed?	—	Go to Step 2	Go to Powertrain OBD System Check
2	1. Install the scan tool. 2. Turn the engine OFF, Ignition ON. 3. Using a scan tool, enable the AIR pump. Does the AIR pump turn ON?	—	Go to Step 6	Go to Step 3
3	1. Turn the ignition OFF. 2. Disconnect AIR pump relay. 3. Turn the ignition ON, engine OFF. 4. Using a test light (J 34142-B) to ground, probe B+ (switch side of relay) supply circuit to relay. Does the test light illuminate?	—	Go to Step 4	Go to Step 14
4	1. Turn the ignition OFF. 2. Reconnect AIR pump relay. 3. Disconnect electrical connector from AIR pump. 4. Using a test light (J 34142-B), probe terminal A of AIR pump electrical connector to battery ground. 5. Turn the ignition ON, engine OFF. 6. Using a scan tool, enable the AIR pump. Does the test light illuminate?	—	Go to Step 5	Go to Step 22
5	1. Using a test light (J 34142-B), probe terminal A of the AIR pump electrical connector to terminal C of the AIR pump electrical connector. 2. Using a scan tool, enable the AIR pump. Does the test light illuminate?	—	Go to Step 31	Go to Step 23
6	1. Turn the ignition OFF. 2. Disconnect the AIR pump electrical connector. 3. Using a test light (J 34142-B), probe terminal B of the AIR pump electrical connector to battery ground. 4. Turn the ignition ON, engine OFF. 5. Using a scan tool, enable the AIR pump. Does the test light illuminate?	—	Go to Step 7	Go to Step 24

DTC P0410 AIR System (cont'd)

Step	Action	Value(s)	Yes	No
7	1. Turn the ignition OFF. 2. Reconnect the AIR pump electrical connector. 3. Disconnect the AIR pump outlet hose. 4. Turn the ignition ON. 5. Using a scan tool, enable the AIR pump. Is air present at the AIR pump outlet?	—	Go to Step 8	Go to Step 31
8	Check for a restriction or blockage in AIR hoses/pipes between the AIR pump and the point where the system branches to both sides of the engine. Was a problem found and corrected?	—	Go to Step 35	Go to Step 9
9	1. Remove the vacuum bleed valve line from the tee in the AIR pump outlet hose. 2. Connect this vacuum line to a hand held vacuum pump and apply approximately 5 inch Hg vacuum. Does the vacuum hold?	—	Go to Step 10	Go to Step 13
10	Using a scan tool, enable the AIR pump. Does the vacuum bleed off?	—	Go to Diagnostic Aids- AIR System	Go to Step 11
11	1. Turn the ignition OFF. 2. Disconnect the vacuum bleed valve electrical connector. 3. Connect a test light across the terminals in the vacuum bleed valve harness connector. 4. Turn the ignition ON, engine OFF. 5. Using a scan tool, command the AIR pump ON and OFF. Does the test light illuminate?	—	Go to Step 33	Go to Step 12
12	1. With the test light connected to ground, probe the power feed circuit in the vacuum bleed valve harness connector. 2. Using a scan tool, command the AIR pump ON and OFF. Does the test light illuminate?	—	Go to Step 26	Go to Step 25
13	Check the vacuum hose to the valve for cracks, splits or other damage. Was a problem found and corrected?	—	Go to Step 35	Go to Step 33
14	Repair the B+ supply circuit to relay. Is the action complete?	—	Go to Step 35	—
15	Check the fuse for the battery feed circuit to the relay. Is the fuse OK?	—	Go to Step 16	Go to Step 17
16	Using a test light to ground, check for power at the fuse. Is there power to the fuse?	—	Go to Step 27	Go to Step 28
17	Using a test light to B+, probe the relay battery feed circuit in the relay connector. Is the test light OFF?	—	Go to Step 18	Go to Step 29

DTC P0410 AIR System (cont'd)

Step	Action	Value(s)	Yes	No
18	1. Install a new fuse. 2. Disconnect the AIR pump electrical connector and the vacuum bleed solenoid valve electrical connector. 3. Using a test light to B+, probe the power feed circuit in the vacuum bleed solenoid valve harness connector. Is the test light OFF?	—	Go to Step 19	Go to Step 30
19	1. Using a test light connected to ground probe the power feed circuit in the vacuum bleed solenoid valve harness connector. 2. Using a scan tool, enable the AIR pump. Does the test light illuminate?	—	Go to Step 20	Go to Step 32
20	1. Reconnect the AIR pump. 2. Using a scan tool, enable the AIR pump. Did the fuse open?	—	Go to Step 34	Go to Step 21
21	1. Reconnect the vacuum bleed solenoid valve. 2. Using a scan tool, enable the AIR pump. Did the fuse open?	—	Go to Step 33	Go to Symptoms
22	Repair the open circuit between the AIR pump and the AIR pump relay. Is the action complete?	—	Go to Step 35	—
23	Repair the faulty ground connection or open AIR pump ground circuit. Is the action complete?	—	Go to Step 35	—
24	Repair the open circuit from terminal B of the AIR pump to the splice. Is the action complete?	—	Go to Step 35	—
25	Repair the open vacuum bleed solenoid valve power circuit between the solenoid electrical connector and the splice. Is the action complete?	—	Go to Step 35	—
26	Repair the open vacuum bleed solenoid valve ground circuit. Is the action complete?	—	Go to Step 35	—
27	Repair the open circuit between the fuse and the relay. Is the action complete?	—	Go to Step 35	—
28	Repair the power feed circuit to the fuse. Is the action complete?	—	Go to Step 35	—
29	Repair the short to ground between the fuse and the relay. Is the action complete?	—	Go to Step 35	—
30	Repair the short to ground between the relay and the AIR pump/vacuum bleed solenoid valve. Is the action complete?	—	Go to Step 35	—
31	Check the AIR pump electrical connections. Was a problem found and corrected?	—	Go to Step 35	Go to Step 34

DTC P0410 AIR System (cont'd)

Step	Action	Value(s)	Yes	No

33	Replace the vacuum bleed solenoid valve. Is the action complete?	—	Go to Step 35	—
34	Replace the AIR pump. Is the action complete?	—	Go to Step 35	—
35	1. Using the scan tool, select DTC, Clear Info. 2. Start the engine and idle at normal operating temperature. 3. Select DTC, Specific, then enter the DTC number which was set. 4. Operate the vehicle within the conditions for setting this DTC as specified in the supporting text, if applicable. Does the scan tool indicate that this test ran and passed?	—	Go to Step 36	Go to Step 2
36	Using the scan tool, select Capture Info, Review Info. Are any DTCs displayed that have not been diagnosed?	—	Go to the applicable DTC table	System OK

DTC P0412 AIR Relay Control Circuit

30415

Circuit Description

Ignition voltage is supplied directly to the AIR injection pump relay coil. The PCM controls the relay by grounding the control circuit via an internal switch called a driver. The primary function of the driver is to supply the ground for the component being controlled. Each driver has a fault line which is monitored by the PCM. When the PCM is commanding a component ON, the voltage of the control circuit should be low (near 0 volts). When the PCM is commanding the control circuit to a component OFF, the voltage potential of the circuit should be high (near battery voltage). If the fault detection circuit senses a voltage other than what is expected, the fault line status will change causing the DTC to set.

The relay is used to control the high current flow to the AIR injection pump. This allows the PCM driver to only have to handle the relatively low current used by the relay.

Conditions for Setting the DTC

- Engine speed greater than 600 RPM.
- The PCM detects that the commanded state of the driver and the actual state of the control circuit do not match.
- Condition must be present for a minimum of 5 seconds.

Action Taken When the DTC Sets

- The PCM will illuminate the Malfunction Indicator Lamp (MIL) on the second consecutive drive trip that the diagnostic runs and fails.
- The PCM will record operating conditions at the time the diagnostic fails. The first time the diagnostic fails, this information will be stored in Failure Records. If the diagnostic reports a failure on the second consecutive drive trip, the operating conditions at the time of failure will be written to Freeze Frame and the Failure record will be updated.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL OFF after three consecutive drive trips that the diagnostic runs and does not fail.
- A last test failed (Current DTC) will clear when the diagnostic runs and does not fail.
- A History DTC will clear after forty consecutive warm-up cycles, if no failures are reported by this or any other emission related diagnostic.
- PCM battery voltage is interrupted.
- Using a Scan tool.

Diagnostic Aids

Using Freeze Frame and/or Failure Records data may aid in locating an intermittent condition. If the DTC cannot be duplicated, the information included in the

Freeze Frame and/or Failure Records data can be useful in determining how many miles since the DTC set. The Fail Counter and Pass Counter can also be used to determine how many ignition cycles the diagnostic reported a pass and/or a fail. Operate vehicle within the same freeze frame conditions (RPM, load, vehicle speed, temperature etc.) that were noted. This will isolate when the DTC failed.

For intermittents, refer to *Symptoms*.

Test Description

Number(s) below refer to step numbers on the diagnostic table.

2. Listen for an audible click when the relay operates. Be sure that both the ON and the OFF states are commanded. Repeat the commands as necessary.
3. This check can detect a partially shorted coil which would cause excessive current flow. Leaving the circuit energized for 2 minutes allows the coil to warm up. When warm the coil may open (Amps drop to 0), or short (goes above 0.75 Amp).
5. It is important to identify and test the relay coil terminals to avoid improper diagnosis.
13. If no trouble is found in the control circuit or the connection at the PCM, the PCM may be faulty, however, this is an extremely unlikely failure.

DTC P0412 AIR Relay Control Circuit

Step	Action	Value(s)	Yes	No
1	Was the Powertrain On-Board Diagnostic (OBD) System Check performed?	—	Go to Step 2	Go to Powertrain OBD System Check
2	1. Turn the ignition ON, engine OFF. 2. Using a scan tool, command the relay ON and OFF. Does the relay turn ON and OFF with each command?	—	Go to Step 3	Go to Step 5
3	1. Turn the ignition OFF. 2. Disconnect the PCM connector containing the relay control circuit. 3. Ignition ON. 4. Using DVM J 39200 on 10 Amp scale, measure current from the relay control circuit in the PCM harness connector to ground for 2 minutes. Does the current draw measure less than the specified value shown (but not 0)?	0.75 A	Go to Diagnostic Aids	Go to Step 4
4	1. Turn the ignition OFF. 2. Disconnect the relay. 3. Using DVM J 39200, measure resistance from the relay control circuit in the PCM harness connector to ground. Does the DVM display infinite resistance?	—	Go to Step 12	Go to Step 10

DTC P0412 AIR Relay Control Circuit (cont'd)

Step	Action	Value(s)	Yes	No
5	1. Turn the ignition OFF. 2. Disconnect the relay. 3. Connect test light J 34142-B between the relay coil terminals in the relay harness connector. 4. Turn the ignition ON. 5. Using a scan tool, command the relay ON and OFF. Does the test light turn ON and OFF with each command?	—	Go to Step 8	Go to Step 6
6	With the test light connected to ground, probe the ignition feed circuit in the relay harness connector. Does the test light illuminate?	—	Go to Step 7	Go to Step 11
7	1. Turn the ignition OFF. 2. Reconnect the relay. 3. Disconnect the PCM connector containing the relay control circuit. 4. Turn the ignition ON. 5. With a fused jumper wire connected to ground, probe the relay control circuit in the PCM harness connector. Does the relay operate?	—	Go to Step 9	Go to Step 10
8	Check the connections at the relay. Was a problem found and corrected?	—	Go to Step 14	Go to Step 12
9	Check the connections at the PCM. Was a problem found and corrected?	—	Go to Step 14	Go to Step 13
10	Repair the faulty relay control circuit. Is the action complete?	—	Go to Step 14	—
11	Repair the faulty relay ignition feed circuit. Is the action complete?	—	Go to Step 14	—
12	Replace the relay. Is the action complete?	—	Go to Step 14	—
13	Important: Replacement PCM must be programmed. Refer to <i>PCM Replacement/Programming</i> . Replace the PCM. Is the action complete?	—	Go to Step 14	—
14	1. Using the scan tool, select DTC, Clear Info. 2. Start engine and idle at normal operating temperature. 3. Select DTC, Specific, then enter the DTC number which was set. 4. Operate vehicle within the conditions for setting this DTC as specified in the supporting text, if applicable. Does the scan tool indicate that this test ran and passed?	—	Go to Step 15	Go to Step 2
15	Using the scan tool, select Capture Info, Review Info. Are any DTCs displayed that have not been diagnosed?	—	Go to the applicable DTC table	System OK

DTC P0420 TWC System Low Efficiency Bank1

Circuit Description

In order to maintain a reasonably low emissions of Hydrocarbons (HC), Carbon Monoxide (CO), and Oxides of Nitrogen (NOx), a three-way catalytic converter is used. The catalyst within the converter promotes a chemical reaction which oxidizes the HC and CO present in the exhaust gas. This reaction converts them into harmless water vapor and carbon monoxide. The catalyst also reduces NOx, converting it to nitrogen. The PCM has the capability to monitor this process using Bank 1 HO2S #2. Bank 1 HO2S #2, located in the exhaust stream past the three-way catalytic converter, produces an output signal which indicates the oxygen storage capacity of the catalyst. This determines the catalysts ability to convert exhaust emissions effectively. If the catalyst is functioning correctly, the Bank 1 HO2S #2 signal will be far less active than that produced by Bank 1 HO2S #1. If a problem exists which causes the PCM to detect excessive Bank 1 HO2S #2 activity outside of an acceptable range for an extended period of time, the PCM will set DTC P0420. This indicates that the three-way catalytic converters oxygen storage capacity is below a threshold considered acceptable.

Conditions for Setting the DTC

- No MAF, MAP, ECT, Left Bank HO2S, Misfire, Left Bank Fuel Trim, Injector, VSS, IAC, Engine coolant fan(s), Transmission DTCs set.
- Engine operating.
- Engine coolant temperature greater than 51°C (124°F).
- Vehicle speed is between 32 km/h (20 mph) and 121 km/h (75 mph).
- Throttle angle greater than 2%.
- Engine speed less than 3500 RPM.

- MAP between 25 kPa and 80 kPa.
- Air flow is between 15 gm/s and 100 gm/s.
- Closed loop fuel control enabled.
- The PCM determines oxygen storage capability of the catalytic converter has degraded below a calibrated threshold.

Action Taken When the DTC Sets

- The PCM will illuminate the Malfunction Indicator Lamp (MIL) on the second consecutive drive trip that the diagnostic runs and fails.
- The PCM will record operating conditions at the time the diagnostic fails. The first time the diagnostic fails, this information will be stored in Failure Records. If the diagnostic reports a failure on the second consecutive drive trip, the operating conditions at the time of failure will be written to Freeze Frame and the Failure record will be updated.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL OFF after three consecutive drive trips that the diagnostic runs and does not fail.
- A last test failed (Current DTC) will clear when the diagnostic runs and does not fail.
- A History DTC will clear after forty consecutive warm-up cycles, if no failures are reported by this or any other emission related diagnostic.
- PCM battery voltage is interrupted.
- Using a Scan tool.

Test Description

Number(s) below refer to step numbers on the diagnostic table.

4. Before replacing the Three Way Catalytic Converter, make sure that any conditions which may have caused the catalyst to be damaged have been corrected.

DTC P0420 TWC System Low Efficiency Bank1

Step	Action	Value(s)	Yes	No
1	Was the Powertrain On-Board Diagnostic (OBD) System Check performed?	—	Go to Step 2	Go to Powertrain OBD System Check
2	Are any other DTCs set?	—	Go to the applicable DTC table	Go to Step 3
3	Check for the following conditions: • Verify that the three-way catalytic converter is an original equipment part. • Inspect the three-way catalytic converter for damage (dents, severe discoloration caused by excessive temperature, holes, etc.). • Insure that internal three-way catalytic converter rattle caused by damaged catalyst is not present. • Inspect exhaust system for leaks, damage, or loose or missing hardware (area from converter to HO2S #2 primarily). • Insure that the HO2S #1 and the HO2S #2 are secure and that their pigtails and wiring are not damaged or contacting the exhaust. Was a problem found and corrected?	—	Go to Step 5	Go to Step 4
4	Replace converter. Is the action complete?	—	Go to Step 5	—
5	1. Using the scan tool, select DTC, Clear Info. 2. Start the engine and idle at normal operating temperature. 3. Select DTC, Specific, then enter the DTC number which was set. 4. Operate the vehicle within the conditions for setting this DTC as specified in the supporting text, if applicable. Does the scan tool indicate that this test ran and passed?	—	Go to Step 6	Go to Step 2
6	Using the scan tool, select Capture Info, Review Info. Are any DTCs displayed that have not been diagnosed?	—	Go to the applicable DTC table	System OK

DTC P0430 TWC System Low Efficiency Bank2

Circuit Description

In order to maintain a reasonably low emissions of Hydrocarbons (HC), Carbon Monoxide (CO), and Oxides of Nitrogen (NOx), a three-way catalytic converter is used. The catalyst within the converter promotes a chemical reaction which oxidizes the HC and CO present in the exhaust gas. This reaction converts them into harmless water vapor and carbon monoxide. The catalyst also reduces NOx, converting it to nitrogen. The PCM has the capability to monitor this process using Bank 2 HO2S #2. Bank 2 HO2S #2, located in the exhaust stream past the three-way catalytic converter, produces an output signal which indicates the oxygen storage capacity of the catalyst. This determines the catalysts ability to convert exhaust emissions effectively. If the catalyst is functioning correctly, the Bank 2 HO2S #2 signal will be far less active than that produced by Bank 2 HO2S #1. If a problem exists which causes the PCM to detect excessive Bank 2 HO2S #2 activity outside of an acceptable range for an extended period of time, the PCM will set DTC P0430. This indicates that the three-way catalytic converters oxygen storage capacity is below a threshold considered acceptable.

Conditions for Setting the DTC

- No MAF, MAP, ECT, Left Bank HO2S, Misfire, Left Bank Fuel Trim, Injector, VSS, IAC, Engine coolant fan(s), Transmission DTCs set.
- Engine operating.
- Engine coolant temperature greater than 51 °C (124 °F).
- Vehicle speed is between 32 km/h (20 mph) and 121 km/h (75 mph).
- Throttle angle greater than 2%.
- Engine speed less than 3500 RPM.

- MAP between 25 kPa and 80 kPa.
- Air flow is between 15 gm/s and 100 gm/s.
- Closed loop fuel control enabled.
- The PCM determines oxygen storage capability of the catalytic converter has degraded below a calibrated threshold.

Action Taken When the DTC Sets

- The PCM will illuminate the Malfunction Indicator Lamp (MIL) on the second consecutive drive trip that the diagnostic runs and fails.
- The PCM will record operating conditions at the time the diagnostic fails. The first time the diagnostic fails, this information will be stored in Failure Records. If the diagnostic reports a failure on the second consecutive drive trip, the operating conditions at the time of failure will be written to Freeze Frame and the Failure record will be updated.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL OFF after three consecutive drive trips that the diagnostic runs and does not fail.
- A last test failed (Current DTC) will clear when the diagnostic runs and does not fail.
- A History DTC will clear after forty consecutive warm-up cycles, if no failures are reported by this or any other emission related diagnostic.
- PCM battery voltage is interrupted.
- Using a Scan tool.

Test Description

Number(s) below refer to step numbers on the diagnostic table.

4. Before replacing the Three Way Catalytic Converter, make sure that any conditions which may have caused the catalyst to be damaged have been corrected.

DTC P0441 EVAP System No Flow During Purge

30414

Circuit Description

The EVAP vacuum switch is a normally closed switch connected to ground, mounted in the vacuum line between the EVAP canister and the EVAP solenoid. 12 volts is supplied to the switch through a pull-up resistor in the PCM. When the PCM commands the EVAP canister purge solenoid valve open (purge ON) and engine vacuum draws the evaporative emissions from the canister, the EVAP vacuum switch opens (signal voltage high) providing feedback to the PCM that the EVAP system is operating. When the PCM commands purge OFF, the EVAP vacuum switch closes (signal voltage low) confirming purging has ceased.

Conditions for Setting the DTC

- DTCs P0100, P0101, P0102, P0103, P0106, P0323, P0325, P0327, P0332, P0335, P0336, P0372, P0400, P0403, P0410, P0412, P0420, P0430, P0441, P0443, P0500, P0502, P0503, P0506, P0507, P0530, P0531, P0719, P0758, P1415, P1642, P1652 not set.
- ECT less than 115°C (239°F)
- IAT greater than 3°C (37°F)

- Engine speed between 800 and 3000 RPM
- TP Angle between 2% and 50%
- MAP between 33 and 77 kPa
- BARO greater than 77 kPa
- Purge duty cycle above 60%
- The PCM detects low signal voltage on the EVAP vacuum switch signal circuit when the PCM is commanding purge ON.
- Fault present for 5 seconds

Action Taken When the DTC Sets

- The PCM will illuminate the Malfunction Indicator Lamp (MIL) on the second consecutive drive trip that the diagnostic runs and fails.
- The PCM will record operating conditions at the time the diagnostic fails. The first time the diagnostic fails, this information will be stored in Failure Records. If the diagnostic reports a failure on the second consecutive drive trip, the operating conditions at the time of failure will be written to Freeze Frame and the Failure record will be updated.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL OFF after three consecutive drive trips that the diagnostic runs and does not fail.
- A last test failed (Current DTC) will clear when the diagnostic runs and does not fail.
- A History DTC will clear after forty consecutive warm-up cycles, if no failures are reported by this or any other emission related diagnostic.
- PCM battery voltage is interrupted.
- Using a Scan tool.

Diagnostic Aids

Before replacing any components, visually/physically check for the following:

- Mis-routed harness.
- Rubbed through wire insulation.

- Broken wire inside the insulation.
- Kinked or damaged vacuum hoses.
- Physically damaged system components.
- Inspect components and vacuum lines for traces of carbon or other contaminants. The presence of foreign material may be causing a restriction in the system or preventing the solenoid valve from closing properly. Either condition may cause a DTC to set.

For intermittents, refer to *Symptoms*.

Test Description

Number(s) below refer to step numbers on the diagnostic table.

2. DTC P0443 indicates that the purge control solenoid may not be operating correctly. This condition must be corrected first.

DTC P0441 EVAP System No Flow During Purge

Step	Action	Value(s)	Yes	No
1	Was the Powertrain On-Board Diagnostic (OBD) System Check performed?	—	Go to Step 2	Go to Powertrain OBD System Check
2	Important: If DTC P0443 is set, refer to that DTC first. 1. Turn the ignition ON, engine OFF. 2. Using the scan tool, check the EVAP vacuum switch status. Does the scan tool indicate the EVAP vacuum switch has No Purge?	—	Go to Step 3	Go to Step 5
3	1. Start the engine. 2. Using the scan tool, command the EVAP canister purge solenoid valve ON while observing the EVAP vacuum switch status. Does the scan tool indicate Purge when the solenoid is commanded ON?	—	Go to Diagnostic Aids- EVAP System	Go to Step 4
4	1. Turn the engine OFF. 2. Disconnect the purge hose from the EVAP vacuum switch (the vacuum line from the canister). 3. Connect a vacuum gauge to the canister side of the EVAP switch. 4. Start the engine. 5. Using the scan tool, command the EVAP canister purge solenoid valve ON while observing the vacuum gauge. Does the vacuum gauge indicate close to normal engine vacuum when the solenoid is commanded ON?	—	Go to Step 5	Go to Step 7
5	Disconnect the EVAP vacuum switch harness connector. Does the scan tool indicate Purge?	—	Go to Step 9	Go to Step 6

DTC P0441 EVAP System No Flow During Purge (cont'd)

Step	Action	Value(s)	Yes	No
6	1. Turn the ignition OFF. 2. Disconnect the PCM connector C2. 3. Using DVM J 39200, check for continuity between the EVAP vacuum switch signal circuit and ground. Does the DVM indicate infinite resistance?	—	Go to Step 10	Go to Step 12
7	Disconnect the vacuum harness from the EVAP canister purge solenoid valve and connect a vacuum gauge to the manifold side of the vacuum harness. Is normal manifold vacuum indicated?	—	Go to Step 8	Go to Step 13
8	1. Rotate the vacuum harness connector enough to reconnect only the manifold vacuum supply hose to the solenoid valve. 2. Connect the vacuum gauge to the other port on the solenoid valve. 3. Using the scan tool, command the EVAP canister purge solenoid valve ON while observing the vacuum gauge. Is vacuum indicated when the EVAP canister purge solenoid valve is ON?	—	Go to Step 14	Go to Step 15
9	Replace EVAP vacuum switch. Refer to <i>EVAP Purge Vacuum Switch</i> . Refer to <i>EVAP System Cleaning</i> for cleaning procedure of EVAP system before replacing the EVAP vacuum switch. Is the action complete?	—	Go to Step 16	—
10	Check connections at the PCM. Was a problem found and corrected?	—	Go to Step 16	—
11	Important: Replacement PCM must be programmed. Refer to <i>PCM Replacement/Programming</i> . Replace the PCM. Is the action complete?	—	Go to Step 16	—
12	Repair signal circuit shorted to ground. Is the action complete?	—	Go to Step 16	—
13	Check for the following conditions: - Blocked or restricted manifold vacuum port. - Restricted, kinked or leaking hose between the EVAP solenoid and the intake manifold, Refer to <i>EVAP System Cleaning</i> for cleaning procedure of EVAP system. Was a problem found and corrected?	—	Go to Step 16	Go to Step 14
14	Repair restricted, kinked or leaking hose between the EVAP solenoid and the EVAP vacuum switch, Refer to <i>EVAP System Cleaning</i> for cleaning procedure of EVAP system. Is the action complete?	—	Go to Step 16	—

DTC P0441 EVAP System No Flow During Purge (cont'd)

Step	Action	Value(s)	Yes	No
15	Replace the EVAP solenoid. Refer to <i>EVAP Canister Purge Solenoid Valve</i> . Refer to <i>EVAP System Cleaning</i> for cleaning procedure of EVAP system before replacing the EVAP solenoid. Is the action complete?	—	Go to Step 16	—
16	1. Using the scan tool, select DTC, Clear Info. 2. Start the engine and idle at normal operating temperature. 3. Select DTC, Specific, then enter the DTC number which was set. 4. Operate the vehicle within the conditions for setting this DTC as specified in the supporting text, if applicable. Does the scan tool indicate that this test ran and passed?	—	Go to Step 17	Go to Step 2
17	Using the scan tool, select Capture Info, Review Info. Are any DTCs displayed that have not been diagnosed?	—	Go to the applicable DTC table	System OK

DTC P0443 EVAP Purge Solenoid Control Circuit

Circuit Description

Ignition voltage is supplied directly to the EVAP canister purge solenoid valve. The PCM controls the solenoid by grounding the control circuit via an internal switch called a driver. The primary function of the driver is to supply the ground for the component being controlled. Each driver has a fault line which is monitored by the PCM. When the PCM is commanding a component ON, the voltage of the control circuit should be low (near 0 volts). When the PCM is commanding the control circuit to a component OFF, the voltage potential of the circuit should be high (near battery voltage). If the fault detection circuit senses a voltage other than what is expected, the fault line status will change causing the DTC to set.

Conditions for Setting the DTC

- Engine speed greater than 600 RPM.
- The PCM detects that the commanded state of the driver and the actual state of the control circuit do not match.
- Condition must be present for a minimum of 25.5 seconds.

Action Taken When the DTC Sets

- The PCM will illuminate the Malfunction Indicator Lamp (MIL) on the second consecutive drive trip that the diagnostic runs and fails.
- The PCM will record operating conditions at the time the diagnostic fails. The first time the diagnostic fails, this information will be stored in Failure Records. If the diagnostic reports a failure on the second consecutive drive trip, the operating conditions at the time of failure will be written to Freeze Frame and the Failure record will be updated.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL OFF after three consecutive drive trips that the diagnostic runs and does not fail.
- A last test failed (Current DTC) will clear when the diagnostic runs and does not fail.
- A History DTC will clear after forty consecutive warm-up cycles, if no failures are reported by this or any other emission related diagnostic.
- PCM battery voltage is interrupted.
- Using a Scan tool.

Diagnostic Aids

Using Freeze Frame and/or Failure Records data may aid in locating an intermittent condition. If the DTC cannot be duplicated, the information included in the Freeze Frame and/or Failure Records data can be useful in determining how many miles since the DTC set. The Fail Counter and Pass Counter can also be used to determine how many ignition cycles the diagnostic reported a pass and/or a fail. Operate vehicle within the same freeze frame conditions (RPM, load, vehicle speed, temperature etc.) that were noted. This will isolate when the DTC failed.

For intermittents, refer to *Symptoms*.

Test Description

Number(s) below refer to step numbers on the diagnostic table.

2. Listen for an audible click when the solenoid operates. Be sure that both the ON and the OFF states are commanded. Repeat the commands as necessary.
3. This check can detect a partially shorted coil which would cause excessive current flow. Leaving the circuit energized for 2 minutes allows the coil to warm up. When warm the coil may open (Amps drop to 0), or short (goes above .75 Amp).
13. If no trouble is found in the control circuit or the connection at the PCM, the PCM may be faulty, however, this is an extremely unlikely failure.

DTC P0443 EVAP Purge Solenoid Control Circuit

Step	Action	Value(s)	Yes	No
1	Was the Powertrain On-Board Diagnostic (OBD) System Check performed?	—	Go to Step 2	Go to Powertrain OBD System Check
2	1. Turn the ignition ON, engine OFF. 2. Using a Scan tool, command the solenoid ON and OFF. Does the solenoid turn ON and OFF with each command?	—	Go to Step 3	Go to Step 5
3	1. Turn the ignition OFF. 2. Disconnect the PCM connector containing the solenoid control circuit 3. Ignition ON. 4. Using DVM J 39200 on 10 Amp scale, measure current from the solenoid control circuit in the PCM harness connector to ground for 2 minutes. Does the current draw measure less than the specified value shown (but not 0)?	0.75 A	Go to Diagnostic Aids	Go to Step 4
4	1. Turn the ignition OFF. 2. Disconnect the solenoid. 3. Using DVM J 39200, measure resistance from the solenoid control circuit in the PCM harness connector to ground. Does the DVM display infinite resistance?	—	Go to Step 12	Go to Step 10
5	1. Turn the ignition OFF. 2. Disconnect the solenoid. 3. Connect test light J 34142-B between the terminals in the solenoid harness connector. 4. Turn the ignition ON. 5. Using a Scan tool, command the solenoid ON and OFF. Does the test light turn ON and OFF with each command?	—	Go to Step 8	Go to Step 6
6	With the test light connected to ground, probe the ignition feed circuit in the solenoid harness connector. Does the test light illuminate?	—	Go to Step 7	Go to Step 11

DTC P0443 EVAP Purge Solenoid Control Circuit (cont'd)

Step	Action	Value(s)	Yes	No
7	1. Turn the ignition OFF. 2. Reconnect the solenoid. 3. Disconnect the PCM connector containing the solenoid control circuit. 4. Turn the ignition ON. 5. With a fused jumper wire connected to ground, probe the solenoid control circuit in the PCM harness connector. Does the solenoid operate?	—	Go to Step 9	Go to Step 10
8	Check the connections at the solenoid. Was a problem found and corrected?	—	Go to Step 14	Go to Step 12
9	Check the connections at the PCM. Was a problem found and corrected?	—	Go to Step 14	Go to Step 13
10	Repair the faulty solenoid control circuit. Is the action complete?	—	Go to Step 14	—
11	Repair the faulty solenoid ignition feed circuit. Is the action complete?	—	Go to Step 14	—
12	Replace the solenoid Is the action complete?	—	Go to Step 14	—
13	Important: Replacement PCM must be programmed. Refer to <i>PCM Replacement/Programming</i> . Replace the PCM. Is the action complete?	—	Go to Step 14	—
14	1. Using the scan tool, select DTC, Clear Info. 2. Start engine and idle at normal operating temperature. 3. Select DTC, Specific, then enter the DTC number which was set. 4. Operate vehicle within the conditions for setting this DTC as specified in the supporting text, if applicable. Does the scan tool indicate that this test ran and passed?	—	Go to Step 15	Go to Step 2
15	Using the scan tool, select Capture Info, Review Info. Are any DTCs displayed that have not been diagnosed?	—	Go to the applicable DTC table	System OK

DTC P0506 Idle System Low - IAC Responding

30418

Circuit Description

The Idle Air Control valve is a PCM controlled stepper motor located on the throttle body. The stepper motor drives a valve pintle which protrudes into a passage that bypasses the throttle plates. To decrease idle speed, the PCM commands the IAC valve pintle to extend. As the pintle approaches its seat, bypass air flow is reduced and idle speed decreases. To increase idle speed, the PCM retracts the IAC valve pintle away from its seat, allowing more air to bypass the throttle plates. One of the PCMs uses for the IAC system is to maintain a desired idle speed, which can vary depending on input to the PCM and other criteria. If the PCM detects engine speed is outside the IAC systems range of control at idle, it will perform an active test while the vehicle is being driven. During this test the PCM commands the IAC valve to move while monitoring MAF. If the expected change in MAF is detected, IAC valve operation is verified. Since idle RPM was out of IAC System control and the IAC valve is operational, DTC P0506 is set. If no change in MAF were to occur, it would be determined that the IAC valve is not functional. If idle RPM was out of IAC System control and the IAC valve did not operate, DTC P1508 would be set.

Conditions for Setting the DTC

- DTCs P0107, P0108, P0122, P0123, P0174, P0175, P0300, P0325 not set.
- Engine running for at least 25 seconds.
- Coolant temperature greater than 60°C (140°F)
- IAT greater than -10°C (14°F)

- Baro greater than 77 kPa
- System voltage between 10 and 17 volts
- Vehicle speed less than 1 mph
- Throttle Angle 0%
- Idle speed below desired RPM
- Conditions met for 1 sec

Then

- Vehicle speed is between 20 and 77 mph.
- MAF between 13 and 35 gm/s
- TPS steady
- RPM steady
- Conditions met for 5 seconds

The active test will then be performed.

- If a 6 gm/s change in MAF is detected, DTC P0506 will be set.
- If a 6 gm/s change in MAF is not detected, DTC P1508 will be set.

Action Taken When the DTC Sets

- The PCM will illuminate the Malfunction Indicator Lamp (MIL) on the second consecutive drive trip that the diagnostic runs and fails.
- The PCM will record operating conditions at the time the diagnostic fails. The first time the diagnostic fails, this information will be stored in Failure Records. If the diagnostic reports a failure on the second consecutive drive trip, the operating conditions at the time of failure will be written to Freeze Frame and the Failure record will be updated.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL OFF after three consecutive drive trips that the diagnostic runs and does not fail.
- A last test failed (Current DTC) will clear when the diagnostic runs and does not fail.
- A History DTC will clear after forty consecutive warm-up cycles, if no failures are reported by this or any other emission related diagnostic.
- PCM battery voltage is interrupted.
- Using a Scan tool.

Diagnostic Aids

Using Freeze Frame and/or Failure Records data may aid in locating an intermittent condition. If the DTC cannot be duplicated, the information included

in the Freeze Frame and/or Failure Records data can be useful in determining how many miles since the DTC set. The Fail Counter and Pass Counter can also be used to determine how many ignition cycles the diagnostic reported a pass and/or a fail. Operate vehicle within the same freeze frame conditions (RPM, load, vehicle speed, temperature etc.) that were noted. This will isolate when the DTC failed. For intermittents, refer to *Symptoms*.

Test Description

Number(s) below refer to step numbers on the diagnostic table.

- Determines whether or not the engine can achieve the commanded RPM, and if not, whether the RPM is too high or too low.

DTC P0506 Idle System Low - IAC Responding

Step	Action	Value(s)	Yes	No
1	Was the Powertrain On-Board Diagnostic (OBD) System Check performed?	—	Go to Step 2	Go to Powertrain OBD System Check
2	1. Start the engine. 2. Using a scan tool, command RPM up to 1500, down to 500 up to 1500 and then EXIT. Does the engine speed correspond (within 50 RPM) with each command?	—	Go to Diagnostic Aids	Go to Step 3
3	Is the engine RPM too high (greater than 50 RPM above Desired RPM)?	—	Go to Step 4	Go to Step 5
4	Check for the following conditions: • Vacuum leaks. • Throttle plates not closing properly. • Faulty PCV valve. Is the action complete?	—	Go to Step 6	—
5	Check for the following conditions: • Excessive deposits in throttle body. • Parasitic load on engine (ie: transmission problem etc.). Is the action complete?	—	Go to Step 6	—
6	1. Using the scan tool, select DTC, Clear Info. 2. Start the engine and idle at normal operating temperature. 3. Select DTC, Specific, then enter the DTC number which was set. 4. Operate the vehicle within the conditions for setting this DTC as specified in the supporting text, if applicable. Does the scan tool indicate that this test ran and passed?	—	Go to Step 7	Go to Step 2
7	Using the scan tool, select Capture Info, Review Info. Are any DTCs displayed that have not been diagnosed?	—	Go to the applicable DTC table	System OK

DTC P0507 Idle System High - IAC Responding

30418

Circuit Description

The Idle Air Control valve is a PCM controlled stepper motor located on the throttle body. The stepper motor drives a valve pintle which protrudes into a passage that bypasses the throttle plates. To decrease idle speed, the PCM commands the IAC valve pintle to extend. As the pintle approaches its seat, bypass air flow is reduced and idle speed decreases. To increase idle speed, the PCM retracts the IAC valve pintle away from its seat, allowing more air to bypass the throttle plates. One of the PCMs uses for the IAC system is to maintain a desired idle speed, which can vary depending on input to the PCM and other criteria. If the PCM detects engine speed is outside the IAC systems range of control at idle, it will perform an active test while the vehicle is being driven. During this test the PCM commands the IAC valve to move while monitoring MAF. If the expected change in MAF is detected, IAC valve operation is verified. Since idle RPM was out of IAC System control and the IAC valve is operational, DTC P0507 is set. If no change in MAF were to occur, it would be determined that the IAC valve is not functional. If idle RPM was out of IAC System control and the IAC valve did not operate, DTC P1509 would be set.

Conditions for Setting the DTC

- DTCs P0107, P0108, P0122, P0123, P0174, P0175, P0300, P0325 not set.
- Engine running for at least 25 seconds.
- Coolant temperature greater than 60°C (140°F)
- IAT greater than -10°C (14°F)

- Baro greater than 77 kPa
- System voltage between 10 and 17 volts
- Vehicle speed less than 1 mph
- Throttle Angle 0%
- Idle speed below desired RPM
- Conditions met for 1 sec

Then

- Vehicle speed is between 20 and 77 mph.
- MAF between 13 and 35 gm/s
- TP Sensor steady
- RPM steady
- Conditions met for 5 seconds

The active test will then be performed.

- If a 6 gm/s change in MAF is detected, DTC P0507 will be set.
- If a 6 gm/s change in MAF is not detected, DTC P1509 will be set.

Action Taken When the DTC Sets

- The PCM will illuminate the Malfunction Indicator Lamp (MIL) on the second consecutive drive trip that the diagnostic runs and fails.
- The PCM will record operating conditions at the time the diagnostic fails. The first time the diagnostic fails, this information will be stored in Failure Records. If the diagnostic reports a failure on the second consecutive drive trip, the operating conditions at the time of failure will be written to Freeze Frame and the Failure record will be updated.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL OFF after three consecutive drive trips that the diagnostic runs and does not fail.
- A last test failed (Current DTC) will clear when the diagnostic runs and does not fail.
- A History DTC will clear after forty consecutive warm-up cycles, if no failures are reported by this or any other emission related diagnostic.
- PCM battery voltage is interrupted.
- Using a Scan tool.

Diagnostic Aids

Using Freeze Frame and/or Failure Records data may aid in locating an intermittent condition. If the DTC cannot be duplicated, the information included in the Freeze Frame and/or Failure Records data

can be useful in determining how many miles since the DTC set. The Fail Counter and Pass Counter can also be used to determine how many ignition cycles the diagnostic reported a pass and/or a fail. Operate vehicle within the same freeze frame conditions (RPM, load, vehicle speed, temperature etc.) that were noted. This will isolate when the DTC failed. For intermittents, refer to *Symptoms*.

Test Description

Number(s) below refer to step numbers on the diagnostic table.

2. Determines whether or not the engine can achieve the commanded RPM, and if not, whether the RPM is too high or too low.

DTC P0507 Idle System High - IAC Responding

Step	Action	Value(s)	Yes	No
1	Was the Powertrain On-Board Diagnostic (OBD) System Check performed?	—	Go to Step 2	Go to Powertrain OBD System Check
2	1. Start the engine. 2. Using a scan tool, command RPM up to 1500, down to 500 up to 1500 and then EXIT. Does the engine speed correspond (within 50 RPM) with each command?	—	Go to Diagnostic Aids	Go to Step 3
3	Is Engine RPM too high (greater than 50 RPM above Desired RPM)?	—	Go to Step 4	Go to Step 5
4	Check for the following conditions: • Vacuum leaks. • Throttle plates not closing properly. • Faulty PCV valve. Is the action complete?	—	Go to Step 6	—

7	Using the scan tool, select Capture Info, Review Info. Are any DTCs displayed that have not been diagnosed?	—	Go to the applicable DTC table	System OK

DTC P0530 A/C Refrigerant Pressure Sensor Circuit

Circuit Description

The A/C system uses an A/C refrigerant pressure sensor mounted in the high side of the A/C system to monitor A/C refrigerant pressure. The PCM utilizes this information to turn ON the engine coolant fans when the A/C refrigerant pressure is high.

The A/C refrigerant pressure sensor operates much like other 3-wire sensors. A 5.0 volt reference is supplied to the sensor and returned to the PCM on the signal circuit. As A/C pressure increases or decreases, the resistance of the sensor changes and varies the amount of signal returning to the PCM.

The PCM monitors the A/C refrigerant pressure sensor signal circuit and can determine when A/C pressure is too high or too low. When pressures are out of range (high or low) for a predetermined time, the PCM will disable the A/C compressor clutch and set a DTC P0530. When a DTC P0530 is set, the PCM will disable the A/C compressor clutch so compressor damage does not occur.

Conditions for Setting the DTC

- A/C refrigerant pressure sensor indicates A/C refrigerant pressure is below -8.0 psi for 5.0 seconds.
- A/C refrigerant pressure sensor indicates A/C refrigerant pressure is above 448 psi for 5.0 seconds.

Action Taken When the DTC Sets

- The DTC will be stored in the PCM memory when the diagnostic runs and fails.
- The Malfunction Indicator Lamp (MIL) will not illuminate.
- The PCM will record operating conditions at the time the diagnostic fails. This information will be stored in Failure Records.

Conditions for Clearing the MIL/DTC

- A history DTC will clear after 40 consecutive warm-up cycles, if no failures are reported by this or any other non-emission related diagnostic.
- A last test failed (Current DTC) will clear when the diagnostic runs and does not fail.
- PCM battery voltage is interrupted.
- Using a scan tool.

Diagnostic Aids

If the test did not fail this ignition cycle, move related electrical harnesses and connectors while monitoring a scan tool.

For intermittents, refer to *Symptoms*.

Test Description

Number(s) below refer to step numbers on the diagnostic table.

2. Normal A/C voltage is between 1 and 1.8 volts. If A/C voltage is within range, review freeze frame data to determine when DTC P0530 set.
4. If A/C pressure/voltage stays high after disconnecting the A/C refrigerant pressure sensor electrical connector, indicates the signal circuit is shorted to a voltage.
6. Checks for a good ground circuit.
7. Checks the integrity of A/C refrigerant pressure sensor signal circuit.
10. If the 5 volt reference circuit has been checked thoroughly (for opens, shorts too ground, PCM connections etc.) and checks OK, then replace the PCM.
11. If the ground circuit has been checked thoroughly for opens and PCM connections are OK, then replace the PCM.

Important: Be sure to inspect PCM engine grounds for being secure and clean.

DTC P0530 A/C Refrigerant Pressure Sensor Circuit

Step	Action	Value(s)	Yes	No
1	Was the Powertrain On-Board Diagnostic (OBD) System Check performed?	—	Go to Step 2	Go to Powertrain OBD System Check
2	1. Turn the ignition ON, engine OFF. 2. Using a scan tool, monitor A/C High Side. Does the scan tool indicate A/C High Side between the specified values?	0.1 V to 1.8 V	Go to Step 3	Go to Step 4
3	1. Turn the ignition ON, engine OFF, review freeze frame data and note parameters. 2. Operate the vehicle within freeze frame conditions as noted. Did the test fail this ignition cycle while operating the vehicle in the conditions that were noted?	—	Go to Step 4	Go to Diagnostic Aids-DTC P0530 A/C Refrigerant Pressure Sensor Circuit

DTC P0530 A/C Refrigerant Pressure Sensor Circuit (cont'd)

Step	Action	Value(s)	Yes	No
4	Disconnect the A/C refrigerant pressure sensor electrical connector. Does the scan tool indicate the A/C High Side less than the specified value?	1.0 V	Go to Step 5	Go to Step 9
5	Using a DVM (J 39200), measure voltage from the A/C refrigerant pressure sensor 5.0 volt reference circuit to battery ground. Does the DVM indicate voltage at the specified value?	5.0 V	Go to Step 6	Go to Step 10
6	Using a DVM (J 39200), measure voltage from the A/C refrigerant pressure sensor 5.0 volt reference circuit to sensor ground circuit. Does the DVM indicate voltage at the specified value?	5.0 V	Go to Step 7	Go to Step 11
7	Using a jumper wire, jumper 5.0 volt reference circuit to A/C refrigerant pressure sensor signal circuit. Does the scan tool indicate the A/C High Side at the specified value?	5.0 V	Go to Step 8	Go to Step 12
8	Repair the faulty A/C refrigerant pressure sensor connection or faulty sensor. Is the action complete?	—	Go to Step 13	—
9	Repair the A/C refrigerant pressure sensor signal circuit shorted to voltage. Is the action complete?	—	Go to Step 13	—
10	Repair 5.0 volt reference circuit to A/C refrigerant pressure sensor. Is the action complete?	—	Go to Step 13	—
11	Repair ground circuit to A/C refrigerant pressure sensor. Is the action complete?	—	Go to Step 13	—
12	Repair signal circuit to A/C refrigerant pressure sensor. Is the action complete?	—	Go to Step 13	—
13	1. Using the scan tool, select DTC, Clear Info. 2. Start the engine and idle at normal operating temperature. 3. Select DTC, Specific, then enter the DTC number which was set. 4. Operate the vehicle within the conditions for setting this DTC as specified in the supporting text, if applicable. Does the scan tool indicate that this test ran and passed?	—	Go to Step 14	Go to Step 2
14	Using the scan tool, select Capture Info, Review Info. Are any DTCs displayed that have not been diagnosed?	—	Go to the applicable DTC table	System OK

DTC P0531 A/C Refrigerant Pressure CKT Performance

Circuit Description

The PCM can determine if the A/C clutch is engaged or not engaged through the A/C clutch status line. If the PCM has grounded the A/C relay control circuit, current can flow through the A/C relay to the A/C compressor clutch and back to the PCM on the A/C status circuit.

The PCM monitors the A/C clutch status circuit and can determine when the clutch has cycle from ON to OFF. As the A/C compressor cycles OFF, the PCM will record A/C refrigerant pressure from the A/C refrigerant pressure sensor. If the PCM does not detect an increase from the A/C refrigerant pressure sensor when the A/C clutch cycles back ON, a DTC P0531 will set. This condition can occur if the A/C refrigerant pressure sensor is fixed at one value.

Conditions for Setting the DTC

The PCM does not detect an A/C refrigerant pressure change of more than 4.0 psi when the A/C clutch has been cycled OFF for 10.0 seconds, then ON for 10.0 seconds.

Action Taken When the DTC Sets

- The DTC will be stored in the PCM memory when the diagnostic runs and fails.
- The Malfunction Indicator Lamp (MIL) will not illuminate.
- The PCM will record operating conditions at the time the diagnostic fails. This information will be stored in Failure Records.

Conditions for Clearing the MIL/DTC

- A history DTC will clear after 40 consecutive warm-up cycles, if no failures are reported by this or any other non-emission related diagnostic.

- A last test failed (Current DTC) will clear when the diagnostic runs and does not fail.
- PCM battery voltage is interrupted.
- Using a scan tool.

Diagnostic Aids

Inspect the harness going to the A/C clutch and going to the PCM for intermittent connections. While the engine is operating with the A/C enabled, move related electrical connectors and harnesses. This may aid in locating an intermittent fault. The scan tool failure records buffer feature may also help locate a fault. Drive the vehicle in the conditions that were noted from failure record data.

For intermittents, refer to *Symptoms*.

Test Description

Number(s) below refer to step numbers on the diagnostic table.

2. Checks if the PCM is able to turn the A/C compressor ON.
3. Checks for an A/C refrigerant pressure sensor that is at a fixed value (stuck).
4. An intermittent open A/C clutch status circuit, can cause the PCM to wrongly detect the A/C clutch cycling. When the PCM falsely detects the clutch cycling ON and OFF and the clutch is remaining ON, a DTC P0531 will set since no refrigerant pressure change was detected. So before replacing the A/C refrigerant pressure sensor, inspect the A/C clutch status circuit.
5. If the scan tool indicates that the A/C clutch is ON, check connections at the compressor first.
6. If the B+ supply circuit to the A/C relay is intermittent, the PCM A/C clutch status circuit may not detect voltage when A/C is commanded ON. So inspect relay connections and operation.

DTC P0531 A/C Refrigerant Pressure CKT Performance

Step	Action	Value(s)	Yes	No
1	Was the Powertrain On-Board Diagnostic (OBD) System Check performed?	—	Go to Step 2	Go to Powertrain OBD System Check
2	Important: If DTCs P0530, P1545, and P1546 are set, use those tables. 1. Start and idle the engine. 2. Turn the A/C ON. Does the A/C clutch engage?	—	Go to Step 3	Go to Step 5
3	1. Using a scan tool, observe A/C High Side pressure display on the Engine 1 Data List. 2. Turn the A/C OFF for 10 seconds. 3. Turn the A/C ON for 10 seconds. Did the A/C High Side pressure increase more than the specified value when the A/C controls were turned ON?	4 psi	Go to Diagnostic Aids-DTC P0531 A/C Refrigerant Pressure Sensor Performance	Go to Step 4

DTC P0531 A/C Refrigerant Pressure CKT Performance (cont'd)

Step	Action	Value(s)	Yes	No
4	Repair the faulty A/C refrigerant pressure sensor connection or faulty sensor. Is the action complete?	—	Go to Step 12	—
5	Does the scan tool indicate A/C clutch ON?	—	Go to Step 7	Go to Step 6
6	Repair intermittent A/C clutch circuit from the A/C relay to the splice. Is the action complete?	—	Go to Step 12	—
7	1. Turn the ignition OFF 2. Disconnect the A/C compressor clutch harness connector. 3. Using a test light (J 34142-B), probe the A/C compressor clutch B+ supply circuit to battery ground. 4. Start the engine and turn the A/C ON. Does the test light illuminate?	—	Go to Step 8	Go to Step 10
8	Using a test light, probe the A/C compressor clutch B+ supply circuit to the A/C compressor clutch ground circuit. Does the test light illuminate?	—	Go to Step 9	Go to Step 11
9	Repair the faulty A/C clutch connection or open A/C clutch coil. Is the action complete?	—	Go to Step 12	—
10	Repair the open or shorted A/C clutch B+ supply circuit. Is the action complete?	—	Go to Step 12	—
11	Repair the open A/C clutch ground circuit. Is the action complete?	—	Go to Step 12	—
12	1. Using the scan tool, select DTC, Clear Info. 2. Start the engine and idle at normal operating temperature. 3. Select DTC, Specific, then enter the DTC number which was set. 4. Operate the vehicle within the conditions for setting this DTC as specified in the supporting text, if applicable. Does the scan tool indicate that this test ran and passed?	—	Go to Step 13	Go to Step 2
13	Using the scan tool, select Capture Info, Review Info. Are any DTCs displayed that have not been diagnosed?	—	Go to the applicable DTC table	System OK

DTC P0562 System Voltage Low

30386

Circuit Description

The PCM continuously monitors system voltage. System voltage information is taken from the PCM's ignition feed circuits. Since voltages below 8.0 Volts or above 17.1 Volts, could cause improper system operation and/or component damage, the PCM operates in a default mode if a PCM Voltage DTC is set. If system voltage is low the PCM will raise the idle speed to increase generator output. If system voltage is high, the PCM disables most outputs to protect the hardware. Class 2 Serial Data is shut down when system voltage is below 9.2 Volts or above 16.0 Volts. A scan tool will not display data if system voltage is outside this range. Because of this, a DVM must be used to monitor system voltage when checking to see if the fault is currently present.

Conditions for Setting the DTC

- Engine running.
- The PCM senses system voltage below 8.0 Volts.
- Condition present for 6 seconds.

Action Taken When the DTC Sets

- DTC P0562 will be stored in the PCM memory when the diagnostic runs and fails.
- The Malfunction Indicator Lamp (MIL) will not illuminate.
- The PCM will record operating conditions at the time the diagnostic fails. This information will be stored in Failure Records.
- High idle speed.
- The transmission defaults to third gear.
- TCC operation is inhibited.

Conditions for Clearing the MIL/DTC

- A history DTC will clear after 40 consecutive warm-up cycles, if no failures are reported by this or any other non-emission related diagnostic.
- A last test failed (Current DTC) will clear when the diagnostic runs and does not fail.
- PCM battery voltage is interrupted.
- Using a scan tool.

Diagnostic Aids

- Extremely low voltage (below 7.5 Volts) may cause the loss of serial data and the MIL may not function. An open ignition feed circuit will cause a no start and the MIL will not illuminate. Low system voltage may cause other DTCs to set.
- Using Freeze Frame and/or Failure Records data may aid in locating an intermittent condition. If the DTC cannot be duplicated, the

information included in the Freeze Frame and/or Failure Records data can be useful in determining how many miles since the DTC set. The Fail Counter and Pass Counter can also be used to determine how many ignition cycles the diagnostic reported a pass and/or a fail. Operate vehicle within the same freeze frame conditions (RPM, load, vehicle speed, temperature etc.) that were noted. This will isolate when the DTC failed.

For intermittents, refer to *Symptoms*.

Test Description

Number(s) below refer to step numbers on the diagnostic table.

2. Checks the Charging system under load at idle. Voltage should remain above 8.0 Volts.

DTC P0562 System Voltage Low

Step	Action	Value(s)	Yes	No
1	Was the Powertrain On-Board Diagnostic (OBD) System Check performed?	—	Go to Step 2	Go to Powertrain OBD System Check
2	1. Start the engine. 2. Load the electrical system by turning on the headlights and high blower. 3. Using a DVM (J 39200), measure battery voltage at the battery. Is battery voltage less than the value shown?	8.0 V	Go to Service Category Starting/ Charging	Go to Step 3
3	1. Turn the ignition OFF. 2. Disconnect the PCM Connector C4. 3. Turn the ignition ON. Using a DVM (J 39200), measure voltage at terminal C4-3. Is the voltage less than the value shown?	8.0 V	Go to Step 7	Go to Step 4
4	Check for faulty connections at the PCM. Was a problem found and corrected?	—	Go to Step 8	Go to Step 5
5	1. Turn the ignition OFF. 2. Reconnect the PCM. 3. Turn the ignition ON. 4. Using the scan tool, select ENG DTC, DTC Info, FAIL THIS IGN. Is this DTC displayed?	—	Go to Step 6	DTC is intermittent. Go to Diagnostic Aids- DTC P0562 System Voltage Low.
6	Important: Replacement PCM must be programmed. Refer to <i>PCM Replacement/Programming</i> . Replace the PCM. Is the action complete?	—	Go to Step 8	—
7	Repair the faulty ignition feed circuit to the PCM. Is the action complete?	—	Go to Step 8	—

DTC P0562 System Voltage Low (cont'd)

Step	Action	Value(s)	Yes	No
8	1. Using the scan tool, select DTC, Clear Info. 2. Start the engine and idle at normal operating temperature. 3. Select DTC, Specific, then enter the DTC number which was set. 4. Operate the vehicle within the conditions for setting this DTC as specified in the supporting text, if applicable. Does the scan tool indicate that this test ran and passed?	—	<i>Go to Step 9</i>	<i>Go to Step 2</i>
9	Using the scan tool, select Capture Info, Review Info. Are any DTCs displayed that have not been diagnosed?	—	Go to the applicable DTC table	System OK

DTC P0563 System Voltage High

30386

Circuit Description

The PCM continuously monitors system voltage. System voltage information is taken from the PCM's ignition feed circuits. Since voltages below 8.0 Volts or above 17.1 Volts, could cause improper system operation and/or component damage, the PCM operates in a default mode if a PCM Voltage DTC is set. If system voltage is low the PCM will raise the idle speed to increase generator output. If system voltage is high, the PCM disables most outputs to protect the hardware. Class 2 Serial Data is shut down when system voltage is below 9.2 Volts or above 16.0 Volts. A scan tool will not display data if system voltage is outside this range. Because of this, a DVM must be used to monitor system voltage when checking to see if the fault is currently present.

Conditions for Setting the DTC

- Engine running.
- The PCM senses system voltage above 17.1 Volts.
- Condition present for 6 seconds.

Action Taken When the DTC Sets

- DTC P0563 will be stored in the PCM memory when the diagnostic runs and fails.
- The Malfunction Indicator Lamp (MIL) will not illuminate.
- The PCM will record operating conditions at the time the diagnostic fails. This information will be stored in Failure Records.

- Most PCM outputs will be disabled.
- The transmission defaults to third gear.
- TCC operation is inhibited.
- During the time the fault is present, the PCM will cycle the fans ON and OFF every few seconds.

Conditions for Clearing the MIL/DTC

- A history DTC will clear after 40 consecutive warm-up cycles, if no failures are reported by this or any other non-emission related diagnostic.
- A last test failed (Current DTC) will clear when the diagnostic runs and does not fail.
- PCM battery voltage is interrupted.
- Using a scan tool.

Diagnostic Aids

- Check the generator voltage sense circuit for high resistance or loose connections. These could cause an intermittent overcharging condition. Refer to *Charging/Starting* for circuit details.

- Using Freeze Frame and/or Failure Records data may aid in locating an intermittent condition. If the DTC cannot be duplicated, the information included in the Freeze Frame and/or Failure Records data can be useful in determining how many miles since the DTC set. The Fail Counter and Pass Counter can also be used to determine how many ignition cycles the diagnostic reported a pass and/or a fail. Operate vehicle within the same freeze frame conditions (RPM, load, vehicle speed, temperature etc.) that were noted. This will isolate when the DTC failed.

For intermittents, refer to *Symptoms*.

Test Description

Number(s) below refer to step numbers on the diagnostic table.

- Checks for excessive generator output. Voltage should remain below 17.1 Volts.

DTC P0563 System Voltage High

Step	Action	Value(s)	Yes	No
1	Was the Powertrain On-Board Diagnostic (OBD) System Check performed?	—	Go to Step 2	Go to Powertrain OBD System Check
2	1. Turn all the accessories OFF. 2. Using a DVM (J 39200), measure battery voltage at the battery while running the engine above 2000 RPM. Is battery voltage less than the value shown?	17.1 V	Go to Diagnostic Aids-DTC P0563 System Voltage High	Go to Step 3
3	Repair Starting/Charging system. Refer to Service Category <i>Starting/ Charging</i> . Is the repair completed?	—	Go to Step 4	—
4	1. Using the scan tool, select DTC, Clear Info. 2. Start the engine and idle at normal operating temperature. 3. Select DTC, Specific, then enter the DTC number which was set. 4. Operate the vehicle within the conditions for setting this DTC as specified in the supporting text, if applicable. Does the scan tool indicate that this test ran and passed?	—	Go to Step 5	Go to Step 2
5	Using the scan tool, select Capture Info, Review Info. Are any DTCs displayed that have not been diagnosed?	—	Go to the applicable DTC table	System OK

DTC P0601 PCM Memory**Circuit Description**

The PCM EEPROM contains data which is essential to running the engine and transmission. The PCM continuously checks the integrity of this data.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL OFF after three consecutive drive trips that the diagnostic runs and does not fail.
- If no failures are reported by this or any other non-emission related diagnostic.
- A last test failed (Current DTC) will clear when the diagnostic runs and does not fail.
- PCM battery voltage is interrupted.
- Using a Scan tool.

Action Taken When the DTC Sets

- The PCM will illuminate the Malfunction Indicator Lamp (MIL) when the diagnostic runs and fails.
- The PCM will record operating conditions at the time the diagnostic fails. This information will be stored in the Freeze Frame and/or Failure Records.
- The injector will be disabled for the entire ignition cycle.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL OFF after three consecutive drive trips that the diagnostic runs and does not fail.
- If no failures are reported by this or any other non-emission related diagnostic.
- A last test failed (Current DTC) will clear when the diagnostic runs and does not fail.
- PCM battery voltage is interrupted.
- Using a Scan tool.

Diagnostic Aids

Replace the PCM even if this DTC exists only in history.

For intermittents, refer to *Symptoms*.

Test Description

Number(s) below refer to step numbers on the diagnostic table.

2. Replace the PCM even if this DTC exists only in history.

DTC P0601 PCM Memory

Step	Action	Value(s)	Yes	No
1	Was the Powertrain On-Board Diagnostic (OBD) System Check performed?	—	Go to Step 2	Go to Powertrain OBD System Check
2	Important: Replacement PCM must be programmed. Refer to <i>PCM Replacement/Programming</i> . Replace the PCM. Is the action complete?	—	Go to Step 3	—
3	1. Using the scan tool, select DTC, Clear Info. 2. Start the engine and idle at normal operating temperature. 3. Select DTC, Specific, then enter the DTC number which was set. 4. Operate the vehicle within the conditions for setting this DTC as specified in the supporting text, if applicable. Does the scan tool indicate that this test ran and passed?	—	Go to Step 4	Go to Step 2
4	Using the scan tool, select Capture Info, Review Info. Are any DTCs displayed that have not been diagnosed?	—	Go to the applicable DTC table	System OK

DTC P0602 PCM Not Programmed**Circuit Description**

This DTC indicates that the PCM's internal EEPROM has not been flashed with any vehicle software. If a service PCM is installed and not flashed, the engine will not run. The purpose of this DTC is to indicate that the engine cranks but will not run situation is due to an un-flashed PCM.

Conditions for Setting the DTC

No software data is present in the PCM.

Action Taken When the DTC Sets

- DTC P0602 will be stored in the PCM memory when the diagnostic runs and fails.
- The Malfunction Indicator Lamp (MIL) will not illuminate.
- Fuel pump is disabled.
- Injector pulsewidth is set to 0.
- The PCM may record operating conditions at the time the diagnostic fails. This information will be stored in Failure Records.

Conditions for Clearing the MIL/DTC

- A history DTC will clear after 40 consecutive warm-up cycles, if no failures are reported by this or any other non-emission related diagnostic.
- A last test failed (Current DTC) will clear when the diagnostic runs and does not fail.
- PCM battery voltage is interrupted.
- Using a scan tool.

Test Description

Number(s) below refer to the step number(s) on the Diagnostic Table.

3. If the flashing routine fails, verify that the equipment used is functioning properly and that all cable connections are clean and tight. Also make sure that the software you are attempting to download is correct for the PCM being flashed. If everything checks out OK, and a second attempt fails, the PCM is faulty.

DTC P0602 PCM Not Programmed

Step	Action	Value(s)	Yes	No
1	Was the Powertrain On-Board Diagnostic (OBD) System Check performed?	—	Go to Step 2	Go to Powertrain OBD System Check
2	Flash the PCM with the correct software. Refer to <i>PCM Replacement/Programming</i> . Does DTC P0602 reset.	—	Go to Step 3	Go to Step 5
3	Verify that the equipment being used is functioning properly and that all cable connections are clean and tight. Attempt to flash the PCM again. Does DTC P0602 reset.	—	Go to Step 4	Go to Step 5
4	Replace the PCM. Is the action complete?	—	Go to Step 5	—
5	1. Using the scan tool, select DTC, Clear Info. 2. Start the engine and idle at normal operating temperature. 3. Select DTC, Specific, then enter the DTC number which was set. 4. Operate the vehicle within the conditions for setting this DTC as specified in the supporting text, if applicable. Does the scan tool indicate that this test ran and passed?	—	Go to Step 6	Go to Step 2
6	Using the scan tool, select Capture Info, Review Info. Are any DTCs displayed that have not been diagnosed?	—	Go to the applicable DTC table	System OK

DTC P1107 MAP Sensor CKT Intermittent Low Voltage

30394

Circuit Description

The Manifold Absolute Pressure (MAP) sensor is mounted to the top of the intake manifold. The MAP sensor measures pressure changes within the intake manifold which are an indication of engine load. The MAP sensor has a 5.0 volt reference, a ground and a signal circuit.

The MAP sensor contains a diaphragm which changes resistance based on pressure. When manifold pressure is low (high vacuum) sensor output voltage is low. When manifold pressure is high (low vacuum) sensor output voltage is high. MAP sensor voltage (depending on altitude) can range from 1.0–1.5 volts at idle (high vacuum) to 4.0 – 4.9 volts at wide open throttle (low vacuum). When the PCM senses a signal voltage lower than the normal operating range of the sensor, this DTC will set.

Conditions for Setting the DTC

- No TP sensor DTCs set.
- MAP less than 0.24 volts.
- All conditions are met for 0.3 second.

Action Taken When the DTC Sets

- The DTC will be stored in the PCM memory when the diagnostic runs and fails.
- The Malfunction Indicator Lamp (MIL) will not illuminate.
- The PCM will record operating conditions at the time the diagnostic fails. This information will be stored in Failure Records.

Conditions for Clearing the MIL/DTC

- A history DTC will clear after 40 consecutive warm-up cycles, if no failures are reported by this or any other non-emission related diagnostic.
- A last test failed (Current DTC) will clear when the diagnostic runs and does not fail.
- PCM battery voltage is interrupted.
- Using a scan tool.

Diagnostic Aids

An intermittent DTC can be caused by electromagnetic interference (EMI). Inspect related circuits for being too close to secondary ignition wires and the alternator.

For intermittents, refer to *Symptoms*.

Test Description

Number(s) below refer to step numbers on the diagnostic table.

2. When moving related connectors, visually/physically inspect connectors for the following:
 - Poor mating of the connector halves or a terminal not fully seated in the connector body (backed out).

- Improperly formed or damaged terminals. All connector terminals in the related circuits should be carefully reformed or replaced to insure proper contact tension.
- Poor terminal to wire connection. Inspect for poor crimps, crimping over wire insulation rather than the wire.
- Dirt or corrosion on terminals. Inspect connector seals for being there and for being damaged.

DTC P1107 MAP Sensor CKT Intermittent Low Voltage

Step	Action	Value(s)	Yes	No
1	Was the Powertrain On-Board Diagnostic (OBD) System Check performed?	—	Go to Step 2	Go to Powertrain OBD System Check
2	1. Turn the ignition ON, engine OFF. 2. Using a scan tool, select MAP from the Engine 1 Data List. 3. Move the MAP sensor electrical connector, the harness and the PCM connectors (by hand only) while observing the scan tool display. Is the MAP value affected by moving the harness or connectors?	—	Go to Step 10	Go to Step 3
3	With the ignition ON, engine OFF. Is the MAP sensor reading greater than the value shown?	85 kPa	Go to Step 4	Go to Step 11
4	1. Remove the MAP sensor from the intake manifold but leave the electrical harness connected. 2. Connect a hand operated vacuum pump to the MAP sensor. 3. Observe the MAP display while slowly applying vacuum up to 20 inch Hg as indicated on the pump gauge. Each 1 inch of vacuum applied should result in a 3 to 4 kPa drop in the MAP sensor value on the scan tool and the value should change smoothly with each increase in vacuum. Did the MAP value change smoothly through the entire range of the test without any erratic readings?	—	Go to Step 11	Go to Step 5
5	With 20 inch Hg vacuum applied to the MAP sensor, is the MAP sensor reading the same or less than the value shown?	34 kPa	Go to Step 6	Go to Step 11
6	Disconnect the vacuum source from the MAP sensor. Does the MAP sensor reading return to its original value?	—	Go to Step 7	Go to Step 11
7	1. Turn the ignition ON, engine OFF, review Freeze Frame and/or Failure Records data for this DTC and note parameters. 2. Turn the ignition OFF for 15 seconds. 3. Start the engine and operate the vehicle within the conditions required for this diagnostic to run, and as close to the conditions recorded in Freeze Frame/Failure Records as possible. Special operating conditions that need to be met before the PCM will run this diagnostic, where applicable, are listed in Conditions for Setting the DTC. 4. Using the scan tool, select DTC, Specific, then enter the DTC number which was set. Does the scan tool indicate that this diagnostic failed this ignition?	—	Go to Step 8	Go to Diagnostic Aids

DTC P1107 MAP Sensor CKT Intermittent Low Voltage (cont'd)

Step	Action	Value(s)	Yes	No
8	1. Check MAF harness for incorrect routing. • Near secondary ignition or components. • Other high current components. Such as solenoids, relays and motors. 2. If incorrect routing is found, correct harness routing. Was a problem found and corrected?	—	Go to Step 14	Go to Step 9
9	Check for a plugged or leaking vacuum supply to the MAP sensor. Was a problem found and corrected?	—	Go to Step 13	Go to Step 12
10	Check for the following conditions and repair as necessary: • Electrical connector terminals for poor connections, improper contact tension or poor terminal to wire connection. • Rubbed through wire insulation. • Broken wire inside the insulation. • Mis-routed harness. Is the action complete?	—	Go to Step 14	—
11	Replace the MAP sensor. Is the action complete?	—	Go to Step 14	—
12	Check the connections at the PCM. Was a problem found and corrected?	—	Go to Step 14	Go to Step 13
13	Important: Replacement PCM must be programmed. Refer to <i>PCM Replacement/Programming</i> . Replace the PCM. Is the action complete?	—	Go to Step 14	—
14	1. Using the scan tool, select DTC, Clear Info. 2. Start the engine and idle at normal operating temperature. 3. Select DTC, Specific, then enter the DTC number which was set. 4. Operate the vehicle within the conditions for setting this DTC as specified in the supporting text, if applicable. Does the scan tool indicate that this test ran and passed?	—	Go to Step 15	Go to Step 2
15	Using the scan tool, select Capture Info, Review Info. Are any DTCs displayed that have not been diagnosed?	—	Go to the applicable DTC table	System OK

DTC P1111 IAT Sensor CKT Intermittent High Voltage

Circuit Description

The Intake Air Temperature (IAT) sensor contains a semiconductor device which changes resistance based on temperature (a thermistor). The IAT sensor is located in the air intake passage of the engine air induction system. The IAT sensor has a signal circuit and a ground circuit. The PCM applies a voltage (about 5.0 volts) on the signal circuit to the sensor. The PCM monitors changes in this voltage caused by changes in the resistance of the sensor to determine intake air temperature.

When the intake air is cold, the sensor (thermistor) resistance is high, and the PCM's signal voltage is only pulled down a small amount through the sensor to ground. Therefore, the PCM will sense a high signal voltage (low temperature). When the intake air

is warm, the sensor resistance is low, and the signal voltage is pulled down a greater amount. This causes the PCM to sense a low signal voltage (high temperature).

When the PCM senses a signal voltage higher than the normal operating range of the sensor, this DTC will set.

Conditions for Setting the DTC

- DTC(s) P0100, P0102, P0103, P0117, P0118, P0500, P0502, P0503 not set.
- Engine operating longer than 100 seconds.
- Engine Coolant Temperature greater than 0°C (32°F).
- Intake Air Temperature is less than -35°C (-31°F).

- Vehicle speed less than 11 km/h (7 mph).
- Mass Air Flow less than 15 grams per second.
- All conditions met for 0.3 seconds.

Action Taken When the DTC Sets

- The DTC will be stored in the PCM memory when the diagnostic runs and fails.
- The Malfunction Indicator Lamp (MIL) will not illuminate.
- The PCM will record operating conditions at the time the diagnostic fails. This information will be stored in Failure Records.

Conditions for Clearing the MIL/DTC

- A history DTC will clear after 40 consecutive warm-up cycles, if no failures are reported by this or any other non-emission related diagnostic.
- A last test failed (Current DTC) will clear when the diagnostic runs and does not fail.
- PCM battery voltage is interrupted.
- Using a scan tool.

Diagnostic Aids

- If other DTCs are set that share the same ground and/or 5.0 volt reference circuit, check for faulty connections and for faulty wiring.
- If the engine has been allowed to sit overnight, the engine coolant temperature and intake air temperature values should display within a few degrees of each other. If the temperatures are not within 3°C (5°F), refer to *Temperature Vs Resistance Table*.

For intermittents, refer to *Symptoms*.

Test Description

Number(s) below refer to step numbers on the diagnostic table.

2. If DTC P0113 failed this ignition, indicates a hard failure is present. When a hard failure is present, both the hard and intermittent DTCs will set.

3. When moving related connectors, visually/physically inspect connectors for the following:
 - Poor mating of the connector halves or a terminal not fully seated in the connector body (backed out).
 - Improperly formed or damaged terminals. All connector terminals in the related circuits should be carefully reformed or replaced to insure proper contact tension.
 - Poor terminal to wire connection. Inspect for poor crimps, crimping over wire insulation rather than the wire.
 - Dirt or corrosion on terminals. Inspect connector seals for being there and for being damaged.
4. When moving related wiring harnesses, visually/physically inspect wiring for the following:
 - Wire insulation that is rubbed through, causing an intermittent short.
 - Wiring broken inside the insulation.
5. Using Freeze Frame and/or Failure Records data may aid in locating an intermittent condition. If the DTC cannot be duplicated, the information included in the Freeze Frame and/or Failure Records data can be useful in determining how many miles since the DTC set. The Fail Counter and Pass Counter can also be used to determine how many ignition cycles the diagnostic reported a pass and/or a fail. Operate vehicle within the same freeze frame conditions (RPM, load, vehicle speed, temperature etc.) that were noted. This will isolate when the DTC failed. If this DTC runs and passes the diagnostic, the scan tool will not indicate any information under DTC Status.

DTC P1111 IAT Sensor CKT Intermittent High Voltage

Step	Action	Value(s)	Yes	No
1	Was the Powertrain On-Board Diagnostic (OBD) System Check performed?	—	Go to Step 2	Go to Powertrain OBD System Check
2	1. Install the scan tool. 2. Engine idling. 3. Using a scan tool, monitor Failed This Ignition under DTC Status for DTC P0113. Did DTC P0113 fail this ignition cycle?	—	Go to DTC P0113 IAT Sensor Circuit High Voltage	Go to Step 3

DTC P1111 IAT Sensor CKT Intermittent High Voltage (cont'd)

Step	Action	Value(s)	Yes	No
3	1. Install the scan tool. 2. Turn the ignition ON, engine OFF. 3. Using a scan tool, observe affected sensor value while moving related harness connectors (at component and PCM). Does the sensor value change abruptly while a related connector is being moved?	—	Go to Step 6	Go to Step 4
4	Using a scan tool, observe affected sensor value while moving related wiring harnesses. Does the sensor value change abruptly while moving related electrical harnesses?	—	Go to Step 7	Go to Step 5
5	1. Turn the ignition ON, engine OFF, review Freeze Frame and/or Failure Records data for this DTC and note parameters. 2. Turn the ignition OFF for 15 seconds. 3. Start the engine and operate the vehicle within the conditions required for this diagnostic to run, and as close to the conditions recorded in Freeze Frame/Failure Records as possible. Special operating conditions that need to be met before the PCM will run this diagnostic, where applicable, are listed in Conditions for Setting the DTC. 4. Using the scan tool, select DTC, Specific, then enter the DTC number which was set. Does the scan tool indicate that this diagnostic failed this ignition?	—	Go to Step 8	Go to Diagnostic Aids
6	Repair damage connectors/terminals following Repair Procedures in <i>Electrical Diagnosis (8A Cell 5)</i> . Is the action complete?	—	Go to Step 9	—
7	Repair faulty wiring following Repair Procedures in <i>Electrical Diagnosis (8A Cell 5)</i> . Is the action complete?	—	Go to Step 9	—
8	1. Re-inspect all related circuits and connectors. 2. If all circuits have been check thoroughly and no faults can be found, replace the sensor/component. Is the action complete?	—	Go to Step 9	—
9	1. Using the scan tool, select DTC, Clear Info. 2. Start the engine and idle at normal operating temperature. 3. Select DTC, Specific, then enter the DTC number which was set. 4. Operate the vehicle within the conditions for setting this DTC as specified in the supporting text, if applicable. Does the scan tool indicate that this test ran and passed?	—	Go to Step 10	Go to Step 2
10	Using the scan tool, select Capture Info, Review Info. Are any DTCs displayed that have not been diagnosed?	—	Go to the applicable DTC table	System OK

DTC P1112 IAT Sensor CKT Intermittent Low Voltage

30393

Circuit Description

The Intake Air Temperature (IAT) sensor contains a semiconductor device which changes resistance based on temperature (a thermistor). The IAT sensor is located in the air intake passage of the engine air induction system. The IAT sensor has a signal circuit and a ground circuit. The PCM applies a voltage (about 5.0 volts) on the signal circuit to the sensor. The PCM monitors changes in this voltage caused by changes in the resistance of the sensor to determine intake air temperature.

When the intake air is cold, the sensor (thermistor) resistance is high, and the PCM's signal voltage is only pulled down a small amount through the sensor to ground. Therefore, the PCM will sense a high signal voltage (low temperature). When the intake air

is warm, the sensor resistance is low, and the signal voltage is pulled down a greater amount. This causes the PCM to sense a low signal voltage (high temperature).

When the PCM senses a signal voltage lower than the normal operating range of the sensor, this DTC will set.

Conditions for Setting the DTC

- DTC(s) P0100, P0102, P0103, P0117, P0118, P0500, P0502, P0503 not set.
- Engine operating longer than 30 seconds.
- Vehicle speed greater than 40 km/h (25 mph).
- Intake Air Temperature greater than 150°C (302°F).
- All conditions met for 0.3 second.

Action Taken When the DTC Sets

- The DTC will be stored in the PCM memory when the diagnostic runs and fails.
- The Malfunction Indicator Lamp (MIL) will not illuminate.
- The PCM will record operating conditions at the time the diagnostic fails. This information will be stored in Failure Records.

Conditions for Clearing the MIL/DTC

- A history DTC will clear after 40 consecutive warm-up cycles, if no failures are reported by this or any other non-emission related diagnostic.
- A last test failed (Current DTC) will clear when the diagnostic runs and does not fail.
- PCM battery voltage is interrupted.
- Using a scan tool.

Diagnostic Aids

- If other DTCs are set that share the same ground and/or 5.0 volt reference circuit, check for faulty connections and for faulty wiring.
- If the engine has been allowed to sit overnight, the engine coolant temperature and intake air temperature values should display within a few degrees of each other. If the temperatures are not within 3°C (5°F), refer to *Temperature Vs Resistance Table*.

For intermittents, refer to *Symptoms*.

Test Description

Number(s) below refer to step numbers on the diagnostic table.

2. If DTC P0112 failed this ignition, indicates a hard failure is present. When a hard failure is present, both the hard and intermittent DTCs will set.

3. When moving related connectors, visually/physically inspect connectors for the following:
 - Poor mating of the connector halves or a terminal not fully seated in the connector body (backed out).
 - Improperly formed or damaged terminals. All connector terminals in the related circuits should be carefully reformed or replaced to insure proper contact tension.
 - Poor terminal to wire connection. Inspect for poor crimps, crimping over wire insulation rather than the wire.
 - Dirt or corrosion on terminals. Inspect connector seals for being there and for being damaged.
4. When moving related wiring harnesses, visually/physically inspect wiring for the following:
 - Wire insulation that is rubbed through, causing an intermittent short.
 - Wiring broken inside the insulation.
5. Using Freeze Frame and/or Failure Records data may aid in locating an intermittent condition. If the DTC cannot be duplicated, the information included in the Freeze Frame and/or Failure Records data can be useful in determining how many miles since the DTC set. The Fail Counter and Pass Counter can also be used to determine how many ignition cycles the diagnostic reported a pass and/or a fail. Operate vehicle within the same freeze frame conditions (RPM, load, vehicle speed, temperature etc.) that were noted. This will isolate when the DTC failed. If this DTC runs and passes the diagnostic, the scan tool will not indicate any information under DTC Status.

DTC P1112 IAT Sensor CKT Intermittent Low Voltage

Step	Action	Value(s)	Yes	No
1	Was the Powertrain On-Board Diagnostic (OBD) System Check performed?	—	Go to Step 2	Go to Powertrain OBD System Check
2	1. Install the scan tool. 2. Start and idle the engine. 3. Using a scan tool, monitor Failed This Ignition under DTC Status for DTC P0112. Did DTC P0112 fail this ignition cycle?	—	Go to DTC P0112 IAT Sensor Circuit Low Voltage	Go to Step 3
3	1. Install the scan tool. 2. Turn the ignition ON, engine OFF. 3. Using a scan tool, observe affected sensor value while moving related harness connectors (at component and PCM). Does the sensor value change abruptly while a related connector is being moved?	—	Go to Step 6	Go to Step 4

DTC P1112 IAT Sensor CKT Intermittent Low Voltage (cont'd)

Step	Action	Value(s)	Yes	No
4	Using a scan tool, observe affected sensor value while moving related wiring harnesses. Does the sensor value change abruptly while moving related electrical harnesses?	—	Go to Step 7	Go to Step 5
5	1. Turn the ignition ON, engine OFF, review Freeze Frame and/or Failure Records data for this DTC and note parameters. 2. Turn the ignition OFF for 15 seconds. 3. Start the engine and operate the vehicle within the conditions required for this diagnostic to run, and as close to the conditions recorded in Freeze Frame/Failure Records as possible. Special operating conditions that need to be met before the PCM will run this diagnostic, where applicable, are listed in Conditions for Setting the DTC. 4. Using the scan tool, select DTC, Specific, then enter the DTC number which was set. Does the scan tool indicate that this diagnostic failed this ignition?	—	Go to Step 8	Go to Diagnostic Aids
6	Repair damage connectors/terminals following Repair Procedures in <i>Electrical Diagnosis</i> (8A Cell 5). Is the action complete?	—	Go to Step 9	—
7	Repair faulty wiring following Repair Procedures in <i>Electrical Diagnosis</i> (8A Cell 5). Is the action complete?	—	Go to Step 9	—
8	1. Re-inspect all related circuits and connectors. 2. If all circuits have been check thoroughly and no faults can be found, replace the sensor/component. Is the action complete?	—	Go to Step 9	—
9	1. Using the scan tool, select DTC, Clear Info. 2. Start the engine and idle at normal operating temperature. 3. Select DTC, Specific, then enter the DTC number which was set. 4. Operate the vehicle within the conditions for setting this DTC as specified in the supporting text, if applicable. 10	Using the scan tool, select Capture Info, Review Info. Are any DTCs displayed that have not been diagnosed?	—	Go to the applicable DTC table	System OK

DTC P1114 ECT Sensor CKT Intermittent Low Voltage

30394

Circuit Description

The Engine Coolant Temperature (ECT) sensor contains a semiconductor device which changes resistance based on temperature (a thermistor). The ECT sensor is mounted in the engine coolant pump housing. The ECT sensor has a signal circuit and a ground circuit. The PCM applies a voltage (about 5.0 volts) on the signal circuit to the sensor. The PCM monitors changes in this voltage caused by changes in the resistance of the sensor to determine coolant temperature.

When the coolant is cold, the sensor (thermistor) resistance is high, and the PCM's signal voltage is only pulled down a small amount through the sensor to ground. Therefore, the PCM will sense a high signal voltage (low temperature). When the coolant is warm, the sensor resistance is low, and the signal voltage is pulled down a greater amount. This causes the PCM to sense a low signal voltage (high temperature). At normal operating temperature, the voltage should measure about 1.5–2.0 volts at the PCM.

When the PCM senses a signal voltage lower than the normal operating range of the sensor, this DTC will set.

Conditions for Setting the DTC

- Engine operating longer than 20 seconds.
- The PCM indicates Engine Coolant Temperature greater than 151 °C (304 °F).

Action Taken When the DTC Sets

- The DTC will be stored in the PCM memory when the diagnostic runs and fails.
- The Malfunction Indicator Lamp (MIL) will not illuminate.
- The PCM will record operating conditions at the time the diagnostic fails. This information will be stored in Failure Records.

Conditions for Clearing the MIL/DTC

- A history DTC will clear after 40 consecutive warm-up cycles, if no failures are reported by this or any other non-emission related diagnostic.
- A last test failed (Current DTC) will clear when the diagnostic runs and does not fail.
- PCM battery voltage is interrupted.
- Using a scan tool.

Diagnostic Aids

- An intermittent DTC can be caused by electromagnetic interference (EMI). Inspect related circuits for being too close to secondary ignition wires and the alternator.
- If other DTCs are set that share the same ground and/or 5.0 volt reference circuit, check for faulty connections and for faulty wiring.
- If the engine has been allowed to sit overnight, the engine coolant temperature and intake air temperature values should display within a few degrees of each other. If the temperatures are not within 3°C (5°F), refer to *Temperature Vs Resistance Table*.

For intermittents, refer to *Symptoms*.

Test Description

Number(s) below refer to step numbers on the diagnostic table.

- If DTC P0117 failed this ignition, indicates a hard failure is present. When a hard failure is present, both the hard and intermittent DTCs will set.
- When moving related connectors, visually/physically inspect connectors for the following:
 - Poor mating of the connector halves or a terminal not fully seated in the connector body (backed out).

- Improperly formed or damaged terminals. All connector terminals in the related circuits should be carefully reformed or replaced to insure proper contact tension.
 - Poor terminal to wire connection. Inspect for poor crimps, crimping over wire insulation rather than the wire.
 - Dirt or corrosion on terminals. Inspect connector seals for being there and for being damaged.
- When moving related wiring harnesses, visually/physically inspect wiring for the following:
 - Wire insulation that is rubbed through, causing an intermittent short.
 - Wiring broken inside the insulation.
 - Using Freeze Frame and/or Failure Records data may aid in locating an intermittent condition. If the DTC cannot be duplicated, the information included in the Freeze Frame and/or Failure Records data can be useful in determining how many miles since the DTC set. The Fail Counter and Pass Counter can also be used to determine how many ignition cycles the diagnostic reported a pass and/or a fail. Operate vehicle within the same freeze frame conditions (RPM, load, vehicle speed, temperature etc.) that were noted. This will isolate when the DTC failed. If this DTC runs and passes the diagnostic, the scan tool will not indicate any information under DTC Status.

DTC P1114 ECT Sensor CKT Intermittent Low Voltage

Step	Action	Value(s)	Yes	No
1	Was the Powertrain On-Board Diagnostic (OBD) System Check performed?	—	Go to Step 2	Go to Powertrain OBD System Check
2	1. Install the scan tool. 2. Start and idle the engine. 3. Using a scan tool, monitor Failed This Ignition under DTC Status for DTC P0117. Did DTC P0117 fail this ignition cycle?	—	Go to DTC P0117 ECT Sensor Circuit Low Voltage	Go to Step 3
3	1. Install the scan tool. 2. Turn the ignition ON, engine OFF. 3. Using a scan tool, observe affected sensor value while moving related harness connectors (at component and PCM). Does sensor value change abruptly while a related connector is being moved?	—	Go to Step 6	Go to Step 4
4	Using a scan tool, observe affected sensor value while moving related wiring harnesses. Does the sensor value change abruptly while moving related electrical harnesses?	—	Go to Step 7	Go to Step 5

DTC P1114 ECT Sensor CKT Intermittent Low Voltage (cont'd)

Step	Action	Value(s)	Yes	No
5	1. Turn the ignition ON, engine OFF, review Freeze Frame and/or Failure Records data for this DTC and note parameters. 2. Turn the ignition OFF for 15 seconds. 3. Start the engine and operate the vehicle within the conditions required for this diagnostic to run, and as close to the conditions recorded in Freeze Frame/Failure Records as possible. Special operating conditions that need to be met before the PCM will run this diagnostic, where applicable, are listed in Conditions for Setting the DTC. 4. Using the scan tool, select DTC, Specific, then enter the DTC number which was set. Does the scan tool indicate that this diagnostic failed this ignition?	—	Go to Step 8	Go to Diagnostic Aids
6	Repair damage connectors/terminals following Repair Procedures in <i>Electrical Diagnosis (8A Cell 5)</i>. Is the action complete?	—	Go to Step 9	—
7	Repair faulty wiring following Repair Procedures in <i>Electrical Diagnosis (8A Cell 5)</i>. Is the action complete?	—	Go to Step 9	—
8	1. Re-inspect all related circuits and connectors. 2. If all the circuits have been check thoroughly and no faults can be found, replace the sensor/component. Is the action complete?	—	Go to Step 9	—
9	1. Using the scan tool, select DTC, Clear Info. 2. Start engine and idle at normal operating temperature. 3. Select DTC, Specific, then enter the DTC number which was set. 4. Operate the vehicle within the conditions for setting this DTC as specified in the supporting text, if applicable. Does the scan tool indicate that this test ran and passed?	—	Go to Step 10	Go to Step 2
10	Using the scan tool, select Capture Info, Review Info. Are any DTCs displayed that have not been diagnosed?	—	Go to the applicable DTC table	System OK

DTC P1115 ECT Sensor CKT Intermittent High Voltage

30394

Circuit Description

The Engine Coolant Temperature (ECT) sensor contains a semiconductor device which changes resistance based on temperature (a thermistor). The ECT sensor is mounted in the engine coolant pump housing. The ECT sensor has a signal circuit and a ground circuit. The PCM applies a voltage (about 5.0 volts) on the signal circuit to the sensor. The PCM monitors changes in this voltage caused by changes in the resistance of the sensor to determine coolant temperature.

When the coolant is cold, the sensor (thermistor) resistance is high, and the PCM's signal voltage is only pulled down a small amount through the sensor to ground. Therefore, the PCM will sense a high signal voltage (low temperature). When the coolant is warm, the sensor resistance is low, and the signal voltage is pulled down a greater amount. This causes the PCM to sense a low signal voltage (high temperature). At normal operating temperature, the voltage should measure about 1.5–2.0 volts at the PCM.

When the PCM senses a signal voltage higher than the normal operating range of the sensor, this DTC will set.

Conditions for Setting the DTC

- Engine operating longer than 20 seconds.
- The PCM indicates Engine Coolant Temperature less than -40°C (-40°F) for 0.3 seconds.

Action Taken When the DTC Sets

- The DTC will be stored in the PCM memory when the diagnostic runs and fails.
- The Malfunction Indicator Lamp (MIL) will not illuminate.
- The PCM will record operating conditions at the time the diagnostic fails. This information will be stored in Failure Records.

Conditions for Clearing the MIL/DTC

- A history DTC will clear after 40 consecutive warm-up cycles, if no failures are reported by this or any other non-emission related diagnostic.
- A last test failed (Current DTC) will clear when the diagnostic runs and does not fail.
- PCM battery voltage is interrupted.
- Using a scan tool.

Diagnostic Aids

- An intermittent DTC can be caused by electromagnetic interference (EMI). Inspect related circuits for being too close to secondary ignition wires and the alternator.
- If other DTCs are set that share the same ground and/or 5.0 volt reference circuit, check for faulty connections and for faulty wiring.
- If the engine has been allowed to sit overnight, the engine coolant temperature and intake air temperature values should display within a few degrees of each other. If the temperatures are not within 3°C (5°F), refer to *Temperature Vs Resistance Table*.

For intermittents, refer to *Symptoms*.

Test Description

Number(s) below refer to step numbers on the diagnostic table.

- If DTC P0118 failed this ignition, indicates a hard failure is present. When a hard failure is present, both the hard and intermittent DTCs will set.
- When moving related connectors, visually/physically inspect connectors for the following:
 - Poor mating of the connector halves or a terminal not fully seated in the connector body (backed out).

- Improperly formed or damaged terminals. All connector terminals in the related circuits should be carefully reformed or replaced to insure proper contact tension.
 - Poor terminal to wire connection. Inspect for poor crimps, crimping over wire insulation rather than the wire.
 - Dirt or corrosion on terminals. Inspect connector seals for being there and for being damaged.
- When moving related wiring harnesses, visually/physically inspect wiring for the following:
 - Wire insulation that is rubbed through, causing an intermittent short.
 - Wiring broken inside the insulation.
 - Using Freeze Frame and/or Failure Records data may aid in locating an intermittent condition. If the DTC cannot be duplicated, the information included in the Freeze Frame and/or Failure Records data can be useful in determining how many miles since the DTC set. The Fail Counter and Pass Counter can also be used to determine how many ignition cycles the diagnostic reported a pass and/or a fail. Operate vehicle within the same freeze frame conditions (RPM, load, vehicle speed, temperature etc.) that were noted. This will isolate when the DTC failed. If this DTC runs and passes the diagnostic, the scan tool will not indicate any information under DTC Status.

DTC P1115 ECT Sensor CKT Intermittent High Voltage

Step	Action	Value(s)	Yes	No
1	Was the Powertrain On-Board Diagnostic (OBD) System Check performed?	—	Go to Step 2	Go to Powertrain OBD System Check
2	1. Install the scan tool. 2. Start and idle the engine. 3. Using a scan tool, monitor Failed This Ignition under DTC Status for DTC P0118. Did DTC P0118 fail this ignition cycle?	—	Go to DTC P0118 ECT Sensor Circuit High Voltage	Go to Step 3
3	1. Install the scan tool. 2. Turn the ignition ON, engine OFF. 3. Using a scan tool, observe affected sensor value while moving related harness connectors (at component and PCM). Does sensor value change abruptly while a related connector is being moved?	—	Go to Step 6	Go to Step 4

7	Repair faulty wiring following Repair Procedures in <i>Electrical Diagnosis (8A Cell 5)</i> . Is the action complete?	—	Go to Step 9	—
8	1. Re-inspect all related circuits and connectors. 2. If all the circuits have been check thoroughly and no faults can be found, replace the sensor/component. Is the action complete?	—	Go to Step 9	—
9	1. Using the scan tool, select DTC, Clear Info. 2. Start the engine and idle at normal operating temperature. 3. Select DTC, Specific, then enter the DTC number which was set. 4. Operate vehicle within the conditions for setting this DTC as specified in the supporting text, if applicable. Does the scan tool indicate that this test ran and passed?	—	Go to Step 10	Go to Step 2
10	Using the scan tool, select Capture Info, Review Info. Are any DTCs displayed that have not been diagnosed?	—	Go to the applicable DTC table	System OK

DTC P1121 TP Sensor CKT Intermittent High Voltage

Circuit Description

The Throttle Position (TP) sensor is a potentiometer. The TP sensor is mounted to the right side of the throttle body. The TP sensor provides a voltage signal that changes relative to throttle blade angle. This signal voltage is one of the most important inputs used by the PCM. The TP sensor has a 5.0 volt reference, a ground and a signal circuit. TP sensor Signal voltage should be about 0.6 volt at idle. The TP sensor voltage should increase to above 4.0 volts at wide open throttle (WOT).

When the PCM senses a signal voltage higher than the normal operating range of the sensor, this DTC will set.

Conditions for Setting the DTC

TP sensor voltage is greater than 4.8 volts for 0.3 second.

Action Taken When the DTC Sets

- The DTC will be stored in the PCM memory when the diagnostic runs and fails.
- The Malfunction Indicator Lamp (MIL) will not illuminate.
- The PCM will record operating conditions at the time the diagnostic fails. This information will be stored in Failure Records.

Conditions for Clearing the MIL/DTC

- A history DTC will clear after 40 consecutive warm-up cycles, if no failures are reported by this or any other non-emission related diagnostic.
- A last test failed (Current DTC) will clear when the diagnostic runs and does not fail.
- PCM battery voltage is interrupted.
- Using a scan tool.

Diagnostic Aids

An intermittent DTC can be caused by electromagnetic interference (EMI). Inspect related circuits for being too close to secondary ignition wires and the alternator.

For intermittents, refer to *Symptoms*.

Test Description

Number(s) below refer to step numbers on the diagnostic table.

2. If DTC P0123 failed this ignition, indicates a hard failure is present. When a hard failure is present, both the hard and intermittent DTCs will set.
3. When moving related connectors, visually/physically inspect connectors for the following:
 - Poor mating of the connector halves or a terminal not fully seated in the connector body (backed out).

- Improperly formed or damaged terminals. All connector terminals in the related circuits should be carefully reformed or replaced to insure proper contact tension.
 - Poor terminal to wire connection. Inspect for poor crimps, crimping over wire insulation rather than the wire.
 - Dirt or corrosion on terminals. Inspect connector seals for being there and for being damaged.
4. When moving related wiring harnesses, visually/physically inspect wiring for the following:
 - Wire insulation that is rubbed through, causing an intermittent short.
 - Wiring broken inside the insulation.
 5. Using Freeze Frame and/or Failure Records data may aid in locating an intermittent condition. If the DTC cannot be duplicated, the information included in the Freeze Frame and/or Failure Records data can be useful in determining how many miles since the DTC set. The Fail Counter and Pass Counter can also be used to determine how many ignition cycles the diagnostic reported a pass and/or a fail. Operate vehicle within the same freeze frame conditions (RPM, load, vehicle speed, temperature etc.) that were noted. This will isolate when the DTC failed. If this DTC runs and passes the diagnostic, the scan tool will not indicate any information under DTC Status.

DTC P1121 TP Sensor CKT Intermittent High Voltage

Step	Action	Value(s)	Yes	No
1	Was the Powertrain On-Board Diagnostic (OBD) System Check performed?	—	Go to Step 2	Go to Powertrain OBD System Check
2	1. Install the scan tool. 2. Start and idle the engine. 3. Using a scan tool, monitor Failed This Ignition under DTC Status for DTC P0123. Did DTC P0123 fail this ignition cycle?	—	Go to DTC P0123 TP Sensor Circuit High Voltage	Go to Step 3
3	1. Install the scan tool. 2. Turn the ignition ON, engine OFF. 3. Using a scan tool, observe affected sensor value while moving related harness connectors (at component and PCM). Does sensor value change abruptly while a related connector is being moved?	—	Go to Step 6	Go to Step 4
4	Using a scan tool, observe affected sensor value while moving related wiring harnesses. Does sensor value change abruptly while moving related electrical harnesses?	—	Go to Step 7	Go to Step 5

DTC P1121 TP Sensor CKT Intermittent High Voltage (cont'd)

Step	Action	Value(s)	Yes	No
5	1. Turn the ignition ON, engine OFF, review Freeze Frame and/or Failure Records data for this DTC and note parameters. 2. Turn the ignition OFF for 15 seconds. 3. Start the engine and operate the vehicle within the conditions required for this diagnostic to run, and as close to the conditions recorded in Freeze Frame/Failure Records as possible. Special operating conditions that need to be met before the PCM will run this diagnostic, where applicable, are listed in Conditions for Setting the DTC. 4. Using the scan tool, select DTC, Specific, then enter the DTC number which was set. Does the scan tool indicate that this diagnostic failed this ignition?	—	Go to Step 8	Go to Diagnostic Aids
6	Repair damage connectors/terminals following repair procedures in <i>Electrical Diagnosis (8A Cell 5)</i>. Is the action complete?	—	Go to Step 9	—
7	Repair faulty wiring following repair procedures in <i>Electrical Diagnosis (8A Cell 5)</i>. Is the action complete?	—	Go to Step 9	—
8	1. Re-inspect all related circuits and connectors. 2. If all the circuits have been check thoroughly and no faults can be found, replace the sensor/component. Is the action complete?	—	Go to Step 9	—
9	1. Using the scan tool, select DTC, Clear Info. 2. Start engine and idle at normal operating temperature. 3. Select DTC, Specific, then enter the DTC number which was set. 4. Operate vehicle within the conditions for setting this DTC as specified in the supporting text, if applicable. Does the scan tool indicate that this test ran and passed?	—	Go to Step 10	Go to Step 2
10	Using the scan tool, select Capture Info, Review Info. Are any DTCs displayed that have not been diagnosed?	—	Go to the applicable DTC table	System OK

DTC P1122 TP Sensor CKT Intermittent Low Voltage

30393

Circuit Description

The Throttle Position (TP) sensor is a potentiometer. The TP sensor is mounted to the right side of the throttle body. The TP sensor provides a voltage signal that changes relative to throttle blade angle. This signal voltage is one of the most important inputs used by the PCM. The TP sensor has a 5.0 volt reference, a ground and a signal circuit. TP sensor Signal voltage should be about 0.6 volt at idle. The TP sensor voltage should increase to above 4.0 volts at wide open throttle (WOT). When the PCM senses a signal voltage lower than the normal operating range of the sensor, this DTC will set.

Conditions for Setting the DTC

TP sensor voltage is less than 0.2 volts for 0.3 second.

Action Taken When the DTC Sets

- The DTC will be stored in the PCM memory when the diagnostic runs and fails.
- The Malfunction Indicator Lamp (MIL) will not illuminate.
- The PCM will record operating conditions at the time the diagnostic fails. This information will be stored in Failure Records.

Conditions for Clearing the MIL/DTC

- A history DTC will clear after 40 consecutive warm-up cycles, if no failures are reported by this or any other non-emission related diagnostic.
- A last test failed (Current DTC) will clear when the diagnostic runs and does not fail.
- PCM battery voltage is interrupted.
- Using a scan tool.

Diagnostic Aids

An intermittent DTC can be caused by electromagnetic interference (EMI). Inspect related circuits for being too close to secondary ignition wires and the alternator.

For intermittents, refer to *Symptoms*.

Test Description

Number(s) below refer to step numbers on the diagnostic table.

2. If DTC P0122 failed this ignition, indicates a hard failure is present. When a hard failure is present, both the hard and intermittent DTCs will set. The engine must be operating longer than 30 seconds before checking if the DTC set.
3. When moving related connectors, visually/physically inspect connectors for the following:
 - Poor mating of the connector halves or a terminal not fully seated in the connector body (backed out).

- Improperly formed or damaged terminals. All connector terminals in the related circuits should be carefully reformed or replaced to insure proper contact tension.
- Poor terminal to wire connection. Inspect for poor crimps, crimping over wire insulation rather than the wire.
- Dirt or corrosion on terminals. Inspect connector seals for being there and for being damaged.

4. When moving related wiring harnesses, visually/physically inspect wiring for the following:
 - Wire insulation that is rubbed through, causing an intermittent short.
 - Wiring broken inside the insulation.
5. Using Freeze Frame and/or Failure Records data may aid in locating an intermittent condition. If the DTC cannot be duplicated, the information included in the Freeze Frame and/or Failure Records data can be useful in determining how many miles since the DTC set. The Fail Counter and Pass Counter can also be used to determine how many ignition cycles the diagnostic reported a pass and/or a fail. Operate vehicle within the same freeze frame conditions (RPM, load, vehicle speed, temperature etc.) that were noted. This will isolate when the DTC failed.

DTC P1122 TP Sensor CKT Intermittent Low Voltage

Step	Action	Value(s)	Yes	No
1	Was the Powertrain On-Board Diagnostic (OBD) System Check performed?	—	Go to Step 2	Go to Powertrain OBD System Check
2	1. Install the scan tool. 2. Start and idle the engine. 3. Using a scan tool, monitor Failed This Ignition under DTC Status for DTC P0122. Did DTC P0122 fail this ignition cycle?	—	Go to DTC P0122 TP Sensor Circuit Low Voltage	Go to Step 2
3	1. Install the scan tool. 2. Turn the ignition ON, engine OFF. 3. Using a scan tool, observe affected sensor value while moving related harness connectors (at component and PCM). Does sensor value change abruptly while a related connector is being moved?	—	Go to Step 6	Go to Step 4
4	Using a scan tool, observe affected sensor value while moving related wiring harnesses. Does sensor value change abruptly while moving related electrical harnesses?	—	Go to Step 7	Go to Step 5

DTC P1122 TP Sensor CKT Intermittent Low Voltage (cont'd)

Step	Action	Value(s)	Yes	No
5	1. Turn the ignition ON, engine OFF, review Freeze Frame and/or Failure Records data for this DTC and note parameters. 2. Ignition OFF for 15 seconds. 3. Start the engine and operate the vehicle within the conditions required for this diagnostic to run, and as close to the conditions recorded in Freeze Frame/Failure Records as possible. Special operating conditions that need to be met before the PCM will run this diagnostic, where applicable, are listed in Conditions for Setting the DTC. 4. Using the scan tool, select DTC, Specific, then enter the DTC number which was set. Does the scan tool indicate that this diagnostic failed this ignition?	—	Go to Step 8	Go to Diagnostic Aids
6	Repair the damaged connectors/terminals following repair procedures in <i>Electrical Diagnosis (8A Cell 5)</i> . Is the action complete?	—	Go to Step 9	—
7	Repair the faulty wiring following repair procedures in <i>Electrical Diagnosis (8A Cell 5)</i> . Is the action complete?	—	Go to Step 9	—
8	1. Re-inspect all the related circuits and connectors. 2. If all the circuits have been check thoroughly and no faults can be found, replace the sensor/component. Is the action complete?	—	Go to Step 9	—
9	1. Using the scan tool, select DTC, Clear Info. 2. Start engine and idle at normal operating temperature. 3. Select DTC, Specific, then enter the DTC number which was set. 4. Operate the vehicle within the conditions for setting this DTC as specified in the supporting text, if applicable. Does the scan tool indicate that this test ran and passed?	—	Go to Step 10	Go to Step 2
10	Using the scan tool, select Capture Info, Review Info. Are any DTCs displayed that have not been diagnosed?	—	Go to the applicable DTC table	System OK

DTC P1133 HO2S Insufficient Switching Bank1Sensor1

30395

Circuit Description

The PCM monitors the Heated Oxygen Sensor (HO2S) activity for 100 seconds. During this monitor period the PCM counts the number of times that the HO2S switches from rich to lean and lean to rich. When the PCM determines that the HO2S did not switch enough times, a DTC P1133 will set.

A lean to rich switch is determined when the HO₂S voltage changes from less than 300 mV to greater than 600 mV. A rich to lean switch is determined when the HO₂S voltage changes from more than 600 mV to less than 300 mV.

Conditions for Setting the DTC

- DTCs P0100, P0102, P0103, P0107, P0108, P0117, P0118, P0123, P0200, P0372, P1371 not set.
- System operating in Closed Loop
- Engine speed greater than 1000 RPM but less than 1700 RPM.
- MAF between 12 gm/s and 28 gm/s.
- The PCM determines that within 100 seconds the HO2S lean to rich switches are less than 40 and rich to lean switches are less than 30.

Action Taken When the DTC Sets

- The PCM will illuminate the Malfunction Indicator Lamp (MIL) on the second consecutive drive trip that the diagnostic runs and fails.
- The PCM will record operating conditions at the time the diagnostic fails. The first time the diagnostic fails, this information will be stored in Failure Records. If the diagnostic reports a failure on the second consecutive drive trip, the operating conditions at the time of failure will be written to Freeze Frame and the Failure record will be updated.

Conditions for Clearing the MIL/DTC

- A history DTC will clear after 40 consecutive warm-up cycles, if no failures are reported by this or any other non-emission related diagnostic.
- A last test failed (Current DTC) will clear when the diagnostic runs and does not fail.
- PCM battery voltage is interrupted.
- Using a scan tool.

Diagnostic Aids

- A malfunction in the HO2S heater circuits will cause a DTC P1133 to set. Check HO2S heater circuits for intermittent opens/connections.
- An oxygen supply inside the HO2S is necessary for proper operation. This supply of oxygen is provided through the HO2S wires. All HO2S wires and connections should be inspected for breaks or contamination. Refer to *Repair Procedures in Electrical Diagnosis (8A Cell 5)*.

- Using Freeze Frame and/or Failure Records data may aid in locating an intermittent condition. If the DTC cannot be duplicated, the information included in the Freeze Frame and/or Failure Records data can be useful in determining how many miles since the DTC set. The Fail Counter and Pass Counter can also be used to determine how many ignition cycles the diagnostic reported a pass and/or a fail. Operate vehicle within the same freeze frame conditions (RPM, load, vehicle speed, temperature etc.) that were noted. This will isolate when the DTC failed.

For intermittents, refer to *Symptoms*.

Test Description

Number(s) below refer to step numbers on the diagnostic table.

2. Determines if the fault is present. This test may take 5 minutes for the diagnostic to run.
3. When DTCs P1133 and P1153 are set at the same time, is good indication that a fuel contamination problem is present.
4. An exhaust leak 6 to 12 inches away from the HO2S can cause a DTC to set.
6. Checks whether a good ground circuit is available.
7. Checks the integrity of the signal circuit to the PCM.
8. Certain RTV silicone gasket materials give off vapors that can contaminate the HO2S. There is also a possibility of silicone contamination caused by silicone in fuel. If it appears that the sensors are contaminated by silicon and all silicone sealant is a non silicone base, advise customer to try a different fuel company. A fuel filler restrictor missing, indicates leaded fuel may have been used.

DTC P1133 HO2S Insufficient Switching Bank1Sensor1

Step	Action	Value(s)	Yes	No
1	Was the Powertrain On-Board Diagnostic (OBD) System Check performed?	—	Go to Step 2	Go to Powertrain OBD System Check
2	Important: If any DTCs are set (Except P1153), refer to those DTCs before proceeding with this diagnostic table. 1. Install the scan tool. 2. Start and idle the engine until normal operating temperature is reached. 3. Operate the vehicle within the parameters specified under Conditions for setting the DTC in the supporting text. 4. Using a scan tool, monitor FAIL THIS IGN. under DTC Info. Does the scan tool indicate DTC P1133 test failed?	—	Go to Step 3	Go to Diagnostic Aids- DTC P1133 HO2S Insufficient Switching Bank 1 Sensor 1
3	Did scan tool also indicate P1153 test failed?	—	Go to Step 8	Go to Step 4
4	1. Inspect the exhaust system for leaks. Refer to <i>Exhaust System Diagnosis</i>. 2. If an exhaust leak is found, repair as necessary. Was an exhaust leak isolated?	—	Go to Step 2	Go to Step 5
5	Visually/physically inspect the following items: • Ensure that the Bank 1 HO2S 1 is securely installed. • Check for corrosion on terminals. • Check terminal tension (at Bank 1 HO2S 1 and at the PCM). • Check for damaged wiring. Was a problem found in any of the above areas?	—	Go to Step 9	Go to Step 6
6	1. Disconnect the Bank 1 HO2S 1 and jumper the HO2S low (PCM side) signal circuit to ground. 2. Using a scan tool, monitor the Bank 1 HO2S 1 voltage. Does the scan tool indicate voltage within specified values?	375–525 mV	Go to Step 7	Go to Step 10
7	1. Jumper the Bank 1 HO2S 1 high and low (PCM side) signal circuits to ground. 2. Using a scan tool, monitor the Bank 1 HO2S 1 voltage. Does the scan tool indicate voltage below specified value?	200 mV	Go to Step 12	Go to Step 11
8	Important: Before replacing a sensor, the cause of the contamination must be determined and corrected. Check for the following conditions: • Fuel contamination. • Use of improper RTV sealant. • Engine oil/coolant consumption. Replace the affected Heated Oxygen Sensor. Refer to <i>Heated Oxygen Sensor (HO2S)</i> . Is the action complete?	—	Go to Step 13	—
9	Repair condition as necessary. Is the action complete?	—	Go to Step 13	—

DTC P1133 HO2S Insufficient Switching Bank1Sensor1 (cont'd)

Step	Action	Value(s)	Yes	No
10	Repair open Bank 1 HO2S 1 low signal circuit or grounded Bank 1 HO2S 1 high signal circuit. Is the action complete?	—	Go to Step 13	—
11	Repair open Bank 1 HO2S 1 high signal circuit or faulty PCM connections. Is the action complete?	—	Go to Step 13	—
12	Replace Bank 1 HO2S 1. Refer to <i>Heated Oxygen Sensor (HO2S)</i> . Is the action complete?	—	Go to Step 13	—
13	- Using the scan tool, select DTC, Clear Info. - Start the engine and idle at normal operating temperature. - Select DTC, Specific, then enter the DTC number which was set. - Operate the vehicle within the conditions for setting this DTC as specified in the supporting text, if applicable. Does the scan tool indicate that this test ran and passed?	—	Go to Step 14	Go to Step 2
14	Using the scan tool, select Capture Info, Review Info. Are any DTCs displayed that have not been diagnosed?	—	Go to the applicable DTC table	System OK

DTC P1134 HO2S Transition Time Ratio Bank1 Sensor1

30395

Circuit Description

The PCM monitors the Heated Oxygen Sensor (HO2S) activity. During the monitor period the PCM counts the number of times that the HO2S responds from rich to lean and from lean to rich and adds the amount of time it took to complete all transitions. With this information, an average time for all transitions can be determined. The PCM then divides the rich to lean average by the lean to rich average to obtain a ratio. If the HO2S ratio is not within range, a DTC P1134 will be set.

Conditions for Setting the DTC

- DTCs P0100, P0102, P0103, P0107, P0108, P0117, P0118, P0125, P0200, P0372 not set.

- System operating in Closed Loop
- Engine speed greater than 1000 RPM but less than 1700 RPM.
- MAF between 12 gm/s and 28 gm/s.
- The PCM determines that the HO2S transition time ratio is not at the expected value.

Action Taken When the DTC Sets

- The DTC will be stored in the PCM memory when the diagnostic runs and fails.
- The Malfunction Indicator Lamp (MIL) will not illuminate.
- The PCM will record operating conditions at the time the diagnostic fails. This information will be stored in Failure Records.

Conditions for Clearing the MIL/DTC

- A history DTC will clear after 40 consecutive warm-up cycles, if no failures are reported by this or any other non-emission related diagnostic.
- A last test failed (Current DTC) will clear when the diagnostic runs and does not fail.
- PCM battery voltage is interrupted.
- Using a scan tool.

Diagnostic Aids

- Using Freeze Frame and/or Failure Records data may aid in locating an intermittent condition. If the DTC cannot be duplicated, the information included in the Freeze Frame and/or Failure Records data can be useful in determining how many miles since the DTC set. The Fail Counter and Pass Counter can also be used to determine how many ignition cycles the diagnostic reported a pass and/or a fail. Operate vehicle within the same freeze frame conditions (RPM, load, vehicle speed, temperature etc.) that were noted. This will isolate when the DTC failed.
- An oxygen supply inside the HO2S is necessary for proper operation. This supply of oxygen is provided through the HO2S wires. All HO2S wires and connections should be inspected for breaks or contamination. Refer to *Repair Procedures in Electrical Diagnosis (8A Cell 5)*.

For intermittents, refer to *Symptoms*.

Test Description

Number(s) below refer to step numbers on the diagnostic table.

2. Determines if the fault is present. This test may take 5 minutes for the diagnostic to run.
3. When DTCs P1134 and P1154 are set at the same time, is good indication that a fuel contamination problem is present.
4. An exhaust leak 6 to 12 inches away from the HO2S can cause a DTC to set.
6. Checks whether a good ground circuit is available.
7. Checks the integrity of the signal circuit to the PCM.
8. Certain RTV silicone gasket materials give off vapors that can contaminate the HO2S. There is also a possibility of silicone contamination caused by silicone in fuel. If it appears that the sensors are contaminated by silicon and all silicone sealant is a none silicone base, advise customer to try a different fuel company. A fuel filler restrictor missing, indicates leaded fuel may have been used.

DTC P1134 HO2S Transition Time Ratio Bank1 Sensor1

Step	Action	Value(s)	Yes	No
1	Was the Powertrain On-Board Diagnostic (OBD) System Check performed?	—	Go to Step 2	Go to Powertrain OBD System Check
2	Important: If any DTCs are set (Except P1153), refer to those DTCs before proceeding with this diagnostic table. 1. Install the scan tool. 2. Start and idle the engine until normal operating temperature is reached. 3. Operate the vehicle within the parameters specified under Conditions for Setting the DTC in the supporting text. 4. Using a scan tool, monitor FAIL THIS IGN. under DTC Status. Does the scan tool indicate DTC P1133 test failed?	—	Go to Step 3	Go to Diagnostic Aids
3	Did the scan tool also indicate P1153 test failed?	—	Go to Step 8	Go to Step 4
4	1. Inspect the exhaust system for leaks. Refer to <i>Exhaust System Diagnosis</i> . 2. If an exhaust leak is found, repair as necessary. Was an exhaust leak isolated?	—	Go to Step 2	Go to Step 5

DTC P1134 HO2S Transition Time Ratio Bank1 Sensor1 (cont'd)

Step	Action	Value(s)	Yes	No
5	Visually/physically inspect the following items: • Ensure that the Bank 1 HO2S 1 is securely installed. • Check for corrosion on the terminals. • Check terminal tension (at Bank 1 HO2S 1 and at the PCM). • Check for damaged wiring. Was a problem found in any of the above areas?	—	Go to Step 9	Go to Step 6
6	1. Disconnect Bank 1 HO2S 1 and jumper HO2S low (PCM side) signal circuit to ground. 2. Using a scan tool, monitor Bank 1 HO2S 1 voltage. Does the scan tool indicate voltage within specified values?	375–525 mV	Go to Step 7	Go to Step 10
7	1. Jumper Bank 1 HO2S 1 high and low (PCM side) signal circuits to ground. 2. Using a scan tool, monitor Bank 1 HO2S 1 voltage. Does the scan tool indicate voltage below specified value?	200 mV	Go to Step 12	Go to Step 11
8	Important: Before replacing a sensor, the cause of the contamination must be determined and corrected. Check for the following conditions: • Fuel contamination. • Use of improper RTV sealant. • Engine oil/coolant consumption. Replace the affected Heated Oxygen Sensor. Refer to <i>Heated Oxygen Sensor (HO2S)</i> . Is the action complete?	—	Go to Step 13	—
9	Repair the condition as necessary. Is the action complete?	—	Go to Step 13	—
10	Repair the open Bank 1 HO2S 1 low signal circuit or grounded Bank 1 HO2S 1 high signal circuit. Is the action complete?	—	Go to Step 13	—
11	Repair the open Bank 1 HO2S 1 high signal circuit or faulty PCM connections. Is the action complete?	—	Go to Step 13	—
12	Replace Bank 1 HO2S 1. Refer to <i>Heated Oxygen Sensor (HO2S)</i> . Is the action complete?	—	Go to Step 13	—
13	1. Using the scan tool, select DTC, Clear Info. 2. Start the engine and idle at normal operating temperature. 3. Select DTC, Specific, then enter the DTC number which was set. 4. Operate the vehicle within the conditions for setting this DTC as specified in the supporting text, if applicable. Does the scan tool indicate that this test ran and passed?	—	Go to Step 14	Go to Step 2
14	Using the scan tool, select Capture Info, Review Info. Are any DTCs displayed that have not been diagnosed?	—	Go to the applicable DTC table	System OK

DTC P1153 Insufficient Switching Bank2 Sensor1

30396

Circuit Description

The PCM monitors the Heated Oxygen Sensor (HO2S) activity for 100 seconds. During this monitor period the PCM counts the number of times that the HO2S switches from rich to lean and lean to rich. When the PCM determines that the HO2S did not switch enough times, a DTC P1153 will set.

A lean to rich switch is determined when the HO2S voltage changes from less than 300 mV to greater than 600 mV. A rich to lean switch is determined when the HO2S voltage changes from more than 600 mV to less than 300 mV.

Conditions for Setting the DTC

- DTCs P0100, P0102, P0103, P0107, P0108, P0117, P0118, P0131, P0200, P0372 not set.
- System operating in Closed Loop
- Engine speed greater than 1000 RPM but less than 1700 RPM.
- MAF between 12 gm/s and 28 gm/s.
- The PCM determines that within 100 seconds the HO2S lean to rich switches are less than 30 and rich to lean switches are less than 20.

Action Taken When the DTC Sets

- The PCM will illuminate the Malfunction Indicator Lamp (MIL) on the second consecutive drive trip that the diagnostic runs and fails.
- The PCM will record operating conditions at the time the diagnostic fails. The first time the diagnostic fails, this information will be stored in Failure Records. If the diagnostic reports a failure on the second consecutive drive trip, the operating conditions at the time of failure will be written to Freeze Frame and the Failure record will be updated.

Conditions for Clearing the MIL/DTC

- A history DTC will clear after 40 consecutive warm-up cycles, if no failures are reported by this or any other non-emission related diagnostic.
- A last test failed (Current DTC) will clear when the diagnostic runs and does not fail.
- PCM battery voltage is interrupted.
- Using a scan tool.

Diagnostic Aids

- A malfunction in the HO2S heater circuits will cause a DTC P1153 to set. Check HO2S heater circuits for intermittent opens/connections.
- Using Freeze Frame and/or Failure Records data may aid in locating an intermittent condition. If the DTC cannot be duplicated, the information included in the Freeze Frame and/or Failure Records data can be useful in determining how many miles since the DTC set. The Fail Counter and Pass Counter can also be used to determine how many ignition cycles

the diagnostic reported a pass and/or a fail. Operate vehicle within the same freeze frame conditions (RPM, load, vehicle speed, temperature etc.) that were noted. This will isolate when the DTC failed.

- An oxygen supply inside the HO2S is necessary for proper operation. This supply of oxygen is provided through the HO2S wires. All HO2S wires and connections should be inspected for breaks or contamination. Refer to *Repair Procedures in Electrical Diagnosis (8A Cell 5)*.

For intermittents, refer to *Symptoms*.

Test Description

Number(s) below refer to step numbers on the diagnostic table.

2. Determines if the fault is present. This test may take 5 minutes for the diagnostic to run.
3. When DTCs P1133 and P1153 are set at the same time, is good indication that a fuel contamination problem is present.
4. An exhaust leak 6 to 12 inches away from the HO2S can cause a DTC to set.
6. Checks whether a good ground circuit is available.
7. Checks the integrity of the signal circuit to the PCM.
8. Certain RTV silicone gasket materials give off vapors that can contaminate the HO2S. There is also a possibility of silicone contamination caused by silicone in fuel. If it appears that the sensors are contaminated by silicon and all silicone sealant is a non silicone base, advise customer to try a different fuel company. A fuel filler restrictor missing, indicates leaded fuel may have been used.

DTC P1153 Insufficient Switching Bank2 Sensor1

Step	Action	Value(s)	Yes	No
1	Was the Powertrain On-Board Diagnostic (OBD) System Check performed?	—	Go to Step 2	Go to Powertrain OBD System Check
2	Important: If any DTCs are set (Except P1133), refer to those DTCs before proceeding with this diagnostic table. 1. Install scan tool. 2. Start and idle the engine until normal operating temperature is reached. 3. Operate the vehicle within parameters specified under Conditions for Setting the DTC in the supporting text. 4. Using a scan tool, monitor FAIL THIS IGN. under DTC Info. Does the scan tool indicate DTC P1153 test failed?	—	Go to Step 3	Go to Diagnostic Aids
3	Did scan tool also indicate P1133 test failed?	—	Go to Step 8	Go to Step 4
4	1. Inspect the exhaust system for leaks. Refer to <i>Exhaust System Diagnosis</i>. 2. If an exhaust leak is found, repair as necessary. Was an exhaust leak isolated?	—	Go to Step 2	Go to Step 5
5	Visually/physically inspect the following items: • Ensure that the Bank 2 HO2S 1 is securely installed. • Check for corrosion on terminals. • Check terminal tension (at Bank 2 HO2S 1 and at the PCM). • Check for damaged wiring. 6	1. Disconnect Bank 2 HO2S 1 and jumper HO2S low (PCM side) signal circuit to ground. 2. Using a scan tool, monitor Bank 2 HO2S 1 voltage. Does the scan tool indicate voltage within specified values?	375–525 mV	Go to Step 7	Go to Step 10
7	1. Jumper Bank 2 HO2S 1 high and low (PCM side) signal circuits to ground. 2. Using a scan tool, monitor Bank 2 HO2S 1 voltage. Does the scan tool indicate voltage below specified value?	200 mV	Go to Step 12	Go to Step 11
8	Important: Before replacing a sensor, the cause of the contamination must be determined and corrected. Check for the following conditions: • Fuel contamination. • Use of improper RTV sealant. • Engine oil/coolant consumption. Replace the affected Heated Oxygen Sensor. Refer to <i>Heated Oxygen Sensor (HO2S)</i> . Is the action complete?	—	Go to Step 13	—
9	Repair the condition as necessary. Is the action complete?	—	Go to Step 13	—
10	Repair the open Bank 2 HO2S 1 low signal circuit or grounded Bank 2 HO2S 1 high signal circuit. Is the action complete?	—	Go to Step 13	—

DTC P1153 Insufficient Switching Bank2 Sensor1 (cont'd)

Step	Action	Value(s)	Yes	No
11	Repair the open Bank 2 HO2S 1 high signal circuit or faulty PCM connections. Is the action complete?	—	Go to Step 13	—
12	Replace the Bank 2 HO2S 1. Refer to <i>Heated Oxygen Sensor (HO2S)</i> . Is the action complete?	—	Go to Step 13	—
13	1. Using the scan tool, select DTC, Clear Info. 2. Start the engine and idle at normal operating temperature. 3. Select DTC, Specific, then enter the DTC number which was set. 4. Operate the vehicle within the conditions for setting this DTC as specified in the supporting text, if applicable. Does the scan tool indicate that this test ran and passed?	—	Go to Step 14	Go to Step 2
14	Using the scan tool, select Capture Info, Review Info. Are any DTCs displayed that have not been diagnosed?	—	Go to the applicable DTC table	System OK

DTC P1154 HO2S Transition Time Ratio Bank2 Sensor1

30396

Circuit Description

The PCM continuously monitors the Heated Oxygen Sensor (HO2S) activity for 100 seconds. During the monitor period the PCM counts the number of times that the HO2S responds from rich to lean and from lean to rich and adds the amount of time it took to complete all transitions. With this information, an average time for all transitions can be determined. The PCM then divides the rich to lean average by the lean to rich average to obtain a ratio. If the HO2S ratio is not within range, a DTC P1154 will be set.

Conditions for Setting the DTC

- DTCs P0100, P0102, P0103, P0107, P0108, P0117, P0118, P0125, P0200, P0372 not set.

- System operating in Closed Loop
- Engine speed greater than 1000 RPM but less than 1700 RPM.
- MAF between 12 gm/s and 28 gm/s.
- The PCM determines that the HO2S transition time ratio is not at the expected value.

Action Taken When the DTC Sets

- The DTC will be stored in the PCM memory when the diagnostic runs and fails.
- The Malfunction Indicator Lamp (MIL) will not illuminate.
- The PCM will record operating conditions at the time the diagnostic fails. This information will be stored in Failure Records.

Conditions for Clearing the MIL/DTC

- A history DTC will clear after 40 consecutive warm-up cycles, if no failures are reported by this or any other non-emission related diagnostic.
- A last test failed (Current DTC) will clear when the diagnostic runs and does not fail.
- PCM battery voltage is interrupted.
- Using a scan tool.

Diagnostic Aids

- Using Freeze Frame and/or Failure Records data may aid in locating an intermittent condition. If the DTC cannot be duplicated, the information included in the Freeze Frame and/or Failure Records data can be useful in determining how many miles since the DTC set. The Fail Counter and Pass Counter can also be used to determine how many ignition cycles the diagnostic reported a pass and/or a fail. Operate vehicle within the same freeze frame conditions (RPM, load, vehicle speed, temperature etc.) that were noted. This will isolate when the DTC failed.
- An oxygen supply inside the HO2S is necessary for proper operation. This supply of oxygen is provided through the HO2S wires. All HO2S wires and connections should be inspected for breaks or contamination. Refer to *Repair Procedures in Electrical Diagnosis (8A Cell 5)*.

For intermittents, refer to *Symptoms*.

Test Description

Number(s) below refer to step numbers on the diagnostic table.

2. Determines if the fault is present. This test may take 5 minutes for the diagnostic to run. For any test that requires probing the PCM or a component harness connector, must use the Connector Test Adapter Kit J 35616-A. Using this kit will prevent damage to the harness connector terminals.
3. When DTCs P1134 and P1154 are set at the same time, is good indication that a fuel contamination problem is present.
4. An exhaust leak 6 to 12 inches away from the HO2S can cause a DTC to set.
6. Checks whether a good ground circuit is available.
7. Checks the integrity of the signal circuit to the PCM.
8. Certain RTV silicone gasket materials give off vapors that can contaminate the HO2S. There is also a possibility of silicone contamination caused by silicone in fuel. If it appears that the sensors are contaminated by silicon and all silicone sealant is a non silicone base, advise customer to try a different fuel company. A fuel filler restrictor missing, indicates leaded fuel may have been used.

DTC P1154 HO2S Transition Time Ratio Bank2 Sensor1

Step	Action	Value(s)	Yes	No
1	Was the Powertrain On-Board Diagnostic (OBD) System Check performed?	—	Go to Step 2	Go to Powertrain OBD System Check
2	Important: If any DTCs are set (Except P1134), refer to those DTCs before proceeding with this diagnostic table. 1. Install scan tool. 2. Start and idle the engine until normal operating temperature is reached. 3. Operate the vehicle within parameters specified under Conditions for Setting the DTC in the supporting text. 4. Using a scan tool, monitor FAIL THIS IGN. under DTC Info. Does the scan tool indicate DTC P1154 test failed?	—	Go to Step 3	Go to Diagnostic Aids
3	Did scan tool also indicate P1134 test failed?	—	Go to Step 8	Go to Step 4
4	1. Inspect the exhaust system for leaks. Refer to <i>Exhaust System Diagnosis</i>. 2. If an exhaust leak is found, repair as necessary. Was an exhaust leak isolated?	—	Go to Step 2	Go to Step 5

DTC P1154 HO2S Transition Time Ratio Bank2 Sensor1 (cont'd)

Step	Action	Value(s)	Yes	No
5	Visually/physically inspect the following items: • Ensure that the Bank 2 HO2S 1 is securely installed. • Check for corrosion on terminals. • Check terminal tension (at Bank 2 HO2S and at the PCM). • Check for damaged wiring. Was a problem found in any of the above areas?	—	Go to Step 9	Go to Step 6
6	1. Disconnect Bank 2 HO2S 1 and jumper HO2S low (PCM side) signal circuit to ground. 2. Using a scan tool, monitor Bank 2 HO2S 1 voltage on the Engine 1 Data List. Does the scan tool indicate voltage within specified values?	375–525 mV	Go to Step 7	Go to Step 10
7	1. Jumper Bank 2 HO2S 1 high and low (PCM side) signal circuits to ground. 2. Using a scan tool, monitor Bank 2 HO2S 1 voltage. Does the scan tool indicate voltage below specified value?	200 mV	Go to Step 12	Go to Step 11
8	Important: Before replacing a sensor, the cause of the contamination must be determined and corrected. Check for the following conditions: • Fuel contamination. • Use of improper RTV sealant. • Engine oil/coolant consumption. Replace the affected Heated Oxygen Sensor. Refer to <i>Heated Oxygen Sensor (HO2S)</i> . Is the action complete?	—	Go to Step 13	—
9	Repair the condition as necessary. Is the action complete?	—	Go to Step 13	—
10	Repair the open Bank 2 HO2S 1 low signal circuit or grounded Bank 2 HO2S 1 high signal circuit. Is the action complete?	—	Go to Step 13	—
11	Repair the open Bank 2 HO2S 1 high signal circuit or faulty PCM connections. Is the action complete?	—	Go to Step 13	—
12	Replace the Bank 2 HO2S 1. Refer to <i>Heated Oxygen Sensor (HO2S)</i> . Is the action complete?	—	Go to Step 13	—
13	1. Using the scan tool, select DTC, Clear Info. 2. Start the engine and idle at normal operating temperature. 3. Select DTC, Specific, then enter the DTC number which was set. 4. Operate the vehicle within the conditions for setting this DTC as specified in the supporting text, if applicable. Does the scan tool indicate that this test ran and passed?	—	Go to Step 14	Go to Step 2
14	Using the scan tool, select Capture Info, Review Info. Are any DTCs displayed that have not been diagnosed?	—	Go to the applicable DTC table	System OK

DTC P1171 Fuel System Lean During Acceleration

Circuit Description

The PCM can identify if the vehicle's fuel system is capable of supplying adequate amounts of fuel during heavy acceleration (power enrichment). When the power enrichment mode of operation is requested during Closed Loop operation (by heavy acceleration), the PCM will provide more fuel to the engine. Under these conditions, the PCM should detect a rich condition.

Conditions for Setting the DTC

- DTCs P0131, P0132, P0133, P0134, P0135, P0137, P0138, P0140, P0141, P0151, P0152, P0153, P0154, P0155, P0157, P0158, P0160, P0161, P0410, P0412, P1112, P1114, P1121, P1153, P1155 not set.
- The engine is operating in Closed Loop.
- Not in fuel cut off mode.
- The PCM detects lean oxygen sensor voltage for 3 seconds during power enrichment mode.

Action Taken When the DTC Sets

- The DTC will be stored in the PCM memory when the diagnostic runs and fails.
- The Malfunction Indicator Lamp (MIL) will not illuminate.
- The PCM will record operating conditions at the time the diagnostic fails. This information will be stored in Failure Records.

Conditions for Clearing the MIL/DTC

- A history DTC will clear after 40 consecutive warm-up cycles, if no failures are reported by this or any other non-emission related diagnostic.
- A last test failed (Current DTC) will clear when the diagnostic runs and does not fail.
- PCM battery voltage is interrupted.
- Using a scan tool.

Diagnostic Aids

- A restricted fuel filter can supply adequate amounts of fuel at idle but may not be able to supply enough fuel during heavy acceleration. A vapor lock condition can also set this DTC.
- If it is not possible to cause this DTC to re-set, it may have been caused by the customer running the vehicle out of fuel.
- Using Freeze Frame and/or Failure Records data may aid in locating an intermittent condition. If the DTC cannot be duplicated, the information included in the Freeze Frame and/or Failure Records data can be useful in determining how many miles since the DTC set. The Fail Counter and Pass Counter can also be used to determine how many ignition cycles the diagnostic reported a pass and/or a fail. Operate vehicle within the same freeze frame conditions (RPM, load, vehicle speed, temperature etc.) that were noted. This will isolate when the DTC failed.

For intermittents, refer to *Symptoms*.

Test Description

Number(s) below refer to step numbers on the diagnostic table.

2. Wrap a shop towel around the fuel pressure connector to absorb any small amount of fuel leakage that may occur when installing the gauge. With the ignition ON, pump pressure should be 284–325 kPa (41–47 psi). This pressure is controlled by spring pressure within the regulator assembly. Pressure below 284 kPa (41 psi) may cause hard starting cold and poor driveability. Low enough pressure will cause the engine not to run at all. Restricted flow may allow the engine to run at idle, or at low speeds, but may cause a surge and stall when more fuel is required, as when accelerating or driving at high speeds. Low fuel pressure under heavy acceleration conditions may set this DTC.

DTC P1171 Fuel System Lean During Acceleration

Step	Action	Value(s)	Yes	No
1	Was the Powertrain On-Board Diagnostic (OBD) System Check performed?	—	Go to Step 2	Go to Powertrain OBD System Check
2	1. If any HO2S DTC is set, go to that table first. 2. Install Fuel Pressure Gauge J 34730-1. Refer to <i>Fuel System Diagnosis</i> . 3. Ignition OFF for 10 seconds, A/C OFF. 4. Turn the ignition ON. The fuel pump will run for about 2 seconds. It may be necessary to cycle the ignition ON more than once to obtain maximum pressure. 5. Note fuel pressure with pump running. Pressure should be within the range shown. When the pump stops, the pressure may vary slightly then should hold steady. Is the pressure correct and does it hold?	284–325 kPa (41–47 psi)	Go to Step 3	Go to Fuel System Diagnosis
3	Check for the following conditions: • Restricted in-line fuel filter. • Restricted/damaged fuel pressure line. • Restricted/clogged fuel pump strainer. Was a problem found and corrected?	—	Go to Step 5	Go to Step 4
4	Replace faulty fuel pump. Is the action complete?	—	Go to Step 5	—
5	1. Using the scan tool, select DTC, Clear Info. 2. Start the engine and idle at normal operating temperature. 3. Select DTC, Specific, then enter the DTC number which was set. 4. Operate the vehicle within the conditions for setting this DTC as specified in the supporting text, if applicable. Does the scan tool indicate that this test ran and passed?	—	Go to Step 6	Go to Step 2
6	Using the scan tool, select Capture Info, Review Info. Are any DTCs displayed that have not been diagnosed?	—	Go to the applicable DTC table	System OK

DTC P1222 Injector Control Circuit Intermittent

Circuit Description

The PCM will enable an injector on the intake stroke of each cylinder. Individual cylinder fuel control is referred to as Sequential Multiport Fuel Injection (SFI).

Ignition voltage is supplied directly to the fuel injectors. The PCM controls each injector by grounding the control circuit via an internal switch called a driver. The primary function of the driver is to supply the ground for the component being controlled. Each driver has a fault line which is monitored by the PCM. When the PCM is commanding a component ON, the voltage of the control circuit should be (refer to *Injectors* for schematic) low (near 0 volts). When the PCM is commanding the control circuit to a component OFF, the voltage potential of the circuit should be high (near battery voltage). If the fault detection circuit senses a voltage other than what is expected, the fault line status will change causing the DTC to set.

The PCM will monitor each injector circuit for the following:

- A grounded circuit.
- An open circuit.
- A circuit shorted to voltage.
- An injector that is open.
- An injector that is shorted or has low resistance.

When the PCM detects any of the above malfunctions, a DTC P0200/P1222 will set and the driver will be disabled.

Conditions for Setting the DTC

- Ignition voltage greater than 10.0 volts.
- The PCM detects the wrong voltage potential on any injector driver circuits for less than 0.5 second.

Action Taken When the DTC Sets

- The DTC will be stored in the PCM memory when the diagnostic runs and fails.

- The Malfunction Indicator Lamp (MIL) will not illuminate.
- The PCM will record operating conditions at the time the diagnostic fails. This information will be stored in Failure Records.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL OFF after three consecutive drive trips that the diagnostic runs and does not fail.
- A last test failed (Current DTC) will clear when the ignition is cycled and the diagnostic runs and does not fail.
- A History DTC will clear after forty consecutive warm-up cycles, if no failures are reported by this or any other emission related diagnostic.
- PCM battery voltage is interrupted.
- Using a Scan tool.

Diagnostic Aids

- If an injector is disconnected while the engine is operating and a DTC P0200 sets, the injector driver will be disabled for the entire ignition cycle.
- When the injector driver is disabled, an engine misfire will be apparent and a misfire DTC will set.

For intermittents, refer to *Symptoms*.

Test Description

Number(s) below refer to step numbers on the diagnostic table.

3. If the misfire counters do not appear to indicate a specific cylinder, check the injector power feed circuit for an intermittent open. This includes the injector fuses themselves as well as the connections within the fuse panel.
5. If moving the related circuitry does not cause the counter to increment, an injector coil which opens intermittently when hot can cause this DTC to set. Refer to *Fuel Injector Coil Test*.

DTC P1222 Injector Control Circuit Intermittent

Step	Action	Value(s)	Yes	No
1	Was the Powertrain On-Board Diagnostic (OBD) System Check performed?	—	Go to Step 2	Go To Powertrain OBD System Check
2	1. Install the scan tool. 2. Start and idle the engine. 3. Using a scan tool, monitor Failed This Ignition under DTC Status for DTC P0200. Did DTC P0200 fail this ignition cycle?	—	Go to DTC P0200 Injector Control Circuit	Go to Step 3
3	Using a scan tool, monitor the Misfire Hist. Counters on the Misfire Data List (There are a total of 8 counters. One counter per cylinder.) Do any of the Misfire Hist. counters indicate a number other than 0.0 counts?	—	Go to Step 5	Go to Step 4
4	1. Turn the ignition ON, engine OFF, review Freeze Frame and/or Failure Records data for this DTC and note parameters. 2. Turn the ignition OFF for 15 seconds. 3. Start the engine and operate the vehicle within the conditions required for this diagnostic to run, and as close to the conditions recorded in Freeze Frame/Failure Records as possible. Special operating conditions that need to be met before the PCM will run this diagnostic, where applicable, are listed in Conditions for Setting the DTC. 4. Using the scan tool, select DTC, Specific, then enter the DTC number which was set. Does the scan tool indicate that this diagnostic failed this ignition?	—	Go to Step 5	Go to Diagnostic Aids
5	1. Start the engine and idle. 2. Using a scan tool, observe Misfire Curr counter for the affected cylinder while moving related harness connectors (At injector and PCM). Does Misfire Curr counter value start incrementing when a related connector is being moved?	—	Go to Step 6	Go to Fuel Injector Coil Test
6	1. Turn the ignition OFF. 2. Disconnect the injector harness connector for the affected cylinder. 3. Using a test light (J 34142-B) connected to ground, probe the ignition feed circuit in the injector harness connector. 4. Turn the ignition ON. 5. Observe the test light, while moving related harness connectors. Does the test light blink?	—	Go to Step 9	Go to Step 7

DTC P1222 Injector Control Circuit Intermittent (cont'd)

Step	Action	Value(s)	Yes	No
7	1. Turn the ignition OFF. 2. Disconnect the PCM connector C1. 3. Using a jumper, ground the injector control circuit for the affected cylinder at the PCM harness connector. 4. Using a test light connected to B+, probe the injector control circuit for the affected cylinder at the injector harness connector. 5. Observe the test light, while moving related harness connectors. Does the test light blink?	—	Go to Step 8	Go to Step 10
8	Repair the injector driver circuit to isolated injector. Is the action complete?	—	Go to Step 11	—
9	Repair the injector ignition feed circuit to isolated injector. Is the action complete?	—	Go to Step 11	—
10	Re-inspect all the related circuits and connections. Was a problem found and corrected?	—	Go to Step 11	Go to Fuel Injector Coil Test
11	1. Using the scan tool, select DTC, Clear Info. 2. Start the engine and idle at normal operating temperature. 3. Select DTC, Specific, then enter the DTC number which was set. 4. Operate the vehicle within the conditions for setting this DTC as specified in the supporting text, if applicable. Does the scan tool indicate that this test ran and passed?	—	Go to Step 12	Go to Step 2
12	Using the scan tool, select Capture Info, Review Info. Are any DTCs displayed that have not been diagnosed?	—	Go to the applicable DTC table	System OK

DTC P1351 IC Circuit High Voltage

30389

Circuit Description

The distributor ignition system provides two timing inputs to the PCM, a high resolution signal (180 pulses per crankshaft revolution) and a low resolution signal (4 pulses per crankshaft revolution). One of the PCM's uses for these signals is to calculate spark timing. This timing signal is sent to the ignition coil module on the IC circuit. Each pulse on the IC circuit triggers the coil module to fire the ignition coil. The secondary ignition voltage then travels through the distributor to the spark plug. The IC signal voltage ranges from about 0.5 volt to 4.5 volts.

Conditions for Setting the DTC

The PCM detects voltage on the IC circuit in excess of 4.6 volts during cranking.

Action Taken When the DTC Sets

- The PCM will illuminate the Malfunction Indicator Lamp (MIL) when the diagnostic runs and fails.
- The PCM will record operating conditions at the time the diagnostic fails. This information will be stored in the Freeze Frame and/or Failure Records.
- The injector will be disabled for the entire ignition cycle.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL OFF after three consecutive drive trips that the diagnostic runs and does not fail.
- A last test failed (Current DTC) will clear when the diagnostic runs and does not fail.

- A History DTC will clear after forty consecutive warm-up cycles, if no failures are reported by this or any other emission related diagnostic.
- PCM battery voltage is interrupted.
- Using a Scan tool.

Diagnostic Aids

Using Freeze Frame and/or Failure Records data may aid in locating an intermittent condition. If the DTC cannot be duplicated, the information included in the Freeze Frame and/or Failure Records data can be useful in determining how many miles since the DTC set. The Fail Counter and Pass Counter

can also be used to determine how many ignition cycles the diagnostic reported a pass and/or a fail. Operate vehicle within the same freeze frame conditions (RPM, load, vehicle speed, temperature etc.) that were noted. This will isolate when the DTC failed. For intermittents, refer to *Symptoms*.

Test Description

Number(s) below refer to step numbers on the diagnostic table.

3. The voltage fluctuates. This feature on the DVM will capture the minimum and maximum voltage of the signal.

DTC P1351 IC Circuit High Voltage

Step	Action	Value(s)	Yes	No
1	Was the Powertrain On-Board Diagnostic (OBD) System Check performed?	—	Go to Step 2	Go to Powertrain OBD System Check
2	Attempt to start the engine. Does the engine start?	—	Go to Diagnostic Aids	Go to Step 3
3	1. Turn the ignition OFF. 2. Disconnect the Ignition Coil Module harness connector. 3. Using a DVM (J 39200) on DC scale, 40 volt range and Peak Min/Max, measure the voltage between the Ignition Coil Module harness connector terminal B and ground during cranking. Is the voltage within the range shown?	1.0–4.0 V	Go to Step 4	Go to Step 5
4	1. Turn the ignition ON, engine OFF. 2. With a test light (J 34142–B) connected to B+, probe Ignition Coil Module harness connector terminal C. Is the test light ON?	—	Go to Step 7	Go to Step 6
5	Repair the IC circuit. Is the action complete?	—	Go to Step 8	—
6	Repair the open Ignition Coil Module ground circuit. Is the action complete?	—	Go to Step 8	—
7	Replace the faulty Ignition Coil Module. Is the action complete?	—	Go to Step 8	—
8	1. Using the scan tool, select DTC, Clear Info. 2. Start the engine and idle at normal operating temperature. 3. Select DTC, Specific, then enter the DTC number which was set. 4. Operate the vehicle within the conditions for setting this DTC as specified in the supporting text, if applicable. Does the scan tool indicate that this test ran and passed?	—	Go to Step 9	Go to Step 2
9	Using the scan tool, select Capture Info, Review Info. Are any DTCs displayed that have not been diagnosed?	—	Go to the applicable DTC table	System OK

DTC P1361 IC Circuit Low Voltage

30389

Circuit Description

The distributor ignition system provides two timing inputs to the PCM, a high resolution signal (180 pulses per crankshaft revolution) and a low resolution signal (4 pulses per crankshaft revolution). One of the PCMs uses for these signals is to calculate spark timing. This timing signal is sent to the ignition coil module on the IC circuit. Each pulse on the IC circuit triggers the coil module to fire the ignition coil. The secondary ignition voltage then travels through the distributor to the spark plug. The IC signal voltage ranges from about 0.5 volt to 4.5 volts.

Conditions for Setting the DTC

The PCM detects 84 crankshaft revolutions without any IC activity during cranking.

Action Taken When the DTC Sets

- The PCM will illuminate the Malfunction Indicator Lamp (MIL) when the diagnostic runs and fails.
- The PCM will record operating conditions at the time the diagnostic fails. This information will be stored in the Freeze Frame and/or Failure Records.
- The injector will be disabled for the entire ignition cycle.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL OFF after three consecutive drive trips that the diagnostic runs and does not fail.
- A last test failed (Current DTC) will clear when the diagnostic runs and does not fail.

- A History DTC will clear after forty consecutive warm-up cycles, if no failures are reported by this or any other emission related diagnostic.
- PCM battery voltage is interrupted.
- Using a Scan tool.

Diagnostic Aids

Using Freeze Frame and/or Failure Records data may aid in locating an intermittent condition. If the DTC cannot be duplicated, the information included in the Freeze Frame and/or Failure Records data can be useful in determining how many miles since the DTC set. The Fail Counter and Pass Counter

can also be used to determine how many ignition cycles the diagnostic reported a pass and/or a fail. Operate vehicle within the same freeze frame conditions (RPM, load, vehicle speed, temperature etc.) that were noted. This will isolate when the DTC failed. For intermittents, refer to *Symptoms*.

Test Description

Number(s) below refer to step numbers on the diagnostic table.

3. The voltage fluctuates. This feature on the DVM will capture the minimum and maximum voltage of the signal.

DTC P1361 IC Circuit Low Voltage

Step	Action	Value(s)	Yes	No
1	Was the Powertrain On-Board Diagnostic (OBD) System Check performed?	—	Go to Step 2	Go to Powertrain OBD System Check
2	Attempt to start the engine. Does the engine start?	—	Go to Diagnostic Aids	Go to Step 3
3	1. Turn the ignition OFF. 2. Disconnect the Ignition Coil Module harness connector. 3. Using a DVM (J 39200) on DC scale, 40 volt range and PEAK MIN/MAX, measure the voltage between the Ignition Coil Module harness connector terminal B and ground during cranking. Is the voltage within the range shown?	1.0–4.0 V	Go to Step 4	Go to Step 5

Operate the vehicle within the conditions for setting this DTC as specified in the supporting text, if applicable. Does the scan tool indicate that this test ran and passed?	—	Go to Step 9	Go to Step 2
9	Using the scan tool, select Capture Info, Review Info. Are any DTCs displayed that have not been diagnosed?	—	Go to the applicable DTC table	System OK

DTC P1371 DI Low Resolution Circuit

30389

Circuit Description

The distributor ignition system supplies two timing inputs to the PCM, a high resolution signal (180 pulses per one crankshaft revolution) and a low resolution signal (4 pulses per one crankshaft revolution). The PCM can determine if one of the timing inputs is not being received by comparing the two inputs. If the PCM detects the high resolution timing pulse without detecting the low resolution timing pulse, DTC P1371 will set.

The high and low resolution circuits toggle between 0 and 5 volts as the camshaft turns. The following malfunctions to the low resolution circuit will cause a DTC P1371 to set:

- An open.
- A short to voltage.
- A short to ground.
- A defective ignition module within the distributor.

Conditions for Setting the DTC

- The PCM detects a predetermined amount of high resolution pulses before detecting any low resolution pulses.

Action Taken When the DTC Sets

- The PCM will illuminate the Malfunction Indicator Lamp (MIL) when the diagnostic runs and fails.
- The PCM will record operating conditions at the time the diagnostic fails. This information will be stored in the Freeze Frame and/or Failure Records.
- The injector will be disabled for the entire ignition cycle.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL OFF after three consecutive drive trips that the diagnostic runs and does not fail.
- A last test failed (Current DTC) will clear when the diagnostic runs and does not fail.
- A History DTC will clear after forty consecutive warm-up cycles, if no failures are reported by this or any other emission related diagnostic.
- PCM battery voltage is interrupted.
- Using a Scan tool.

Diagnostic Aids

- For any test that requires probing the PCM or a component harness connector, must use the Connector Test Adapter Kit J 35616-A. Using this kit will prevent damage to the harness connector terminals.
- DTC P1371 will set if the high and low resolution circuits are shorted together. Before replacing any components, inspect the low and high resolution circuits for being shorted.
- When an intermittent DTC P1371 occurs, a misfire will be apparent. To locate an intermittent, use the scan tools snapshot feature. Try to duplicate the conditions under which the misfire is present. When reviewing captured data, watch for any abnormal high and low resolution timing pulses.
- If DTC P1351 and/or DTC P1361 is also set with a DTC P1371, and no external fault can be found, replace the PCM. If only DTC P1371 is set and the distributor connections are OK, replace the distributor.

- If distributor components must be replaced, check distributor vent system operation. Refer to *Distributor Ignition System*.
- If a DTC P1371 is not present and a no start condition is present, Refer to *Engine Cranks but Does Not Run*.
- For intermittents, refer to *Symptoms*.

Test Description

Number(s) below refer to step numbers on the diagnostic table.

2. This step verifies if the malfunction is active. If the engine starts, the malfunction is not present at this time.
3. If the harness and connections check out OK, but the engine stalls after reaching higher operating temperatures, return to Step 2 and test the system while the fault is present.
4. Normal voltage may vary slightly from the specified value. A value that is significantly higher or lower indicates a problem. This step isolates the circuit between the test connector and the PCM.
5. Normal voltage may vary slightly from the specified value. A value that is significantly higher or lower indicates a problem. This step isolates the circuit between the test connector and the distributor.

DTC P1371 DI Low Resolution Circuit

Step	Action	Value(s)	Yes	No
1	Was the Powertrain On-Board Diagnostic (OBD) System Check performed?	—	Go to Step 2	Go to Powertrain OBD System Check
2	1. Install the scan tool. 2. Using the scan tool, monitor Engine Speed. 3. Crank the engine. Does the scan tool indicate RPM while cranking the engine?	—	Go to Step 3	Go to Step 4
3	1. Start the engine. 2. With the engine running, move related harnesses and connectors between the distributor and the PCM. Does the engine cut out or stall while moving the various components.	—	Go to Step 4	Go to Diagnostic Aids
4	1. Turn the ignition OFF. 2. Disconnect the ignition system test connector. 3. Turn the ignition ON, use a DVM (J 39200) on DC volts scale, measure voltage on terminal A at the PCM side of the ignition test connector. Does the DVM indicate the voltage specified?	5 V	Go to Step 5	Go to Step 8

DTC P1371 DI Low Resolution Circuit (cont'd)

Step	Action	Value(s)	Yes	No
5	1. Turn the ignition OFF. 2. Reconnect the ignition system test connector. 3. Disconnect Distributor connector. 4. Turn the ignition ON, use a DVM (J 39200) on DC volts scale, measure voltage on terminal A of Distributor electrical connector. Does the DVM indicate voltage specified?	5 V	Go to Step 11	Go to Step 6
6	Is voltage higher than the specified value?	5 V	Go to Step 7	Go to Step 12
7	Repair the short to voltage on Low Resolution signal circuit from PCM to ignition system test connector. Is the action complete?	—	Go to Step 15	—
8	Is the voltage higher than the specified value?	5 V	Go to Step 10	Go to Step 9
9	Repair the open or grounded Low Resolution circuit from the ignition system test connector to the PCM. Was the condition found and repaired?	—	Go to Step 15	Go to Step 14
10	Repair the short to voltage on Low resolution signal circuit from ignition system test connector to Distributor. Is the action complete?	—	Go to Step 15	—
11	Repair the faulty Distributor connection or faulty Distributor. Is the action complete?	—	Go to Step 15	—
12	Repair the open or grounded Low Resolution circuit from ignition system test connector to the Distributor. Was the condition found and repaired?	—	Go to Step 15	Go to Step 14
13	Repair the harness/connections as necessary. Is the action complete?	—	Go to Step 15	—
14	Important: Replacement PCM must be programmed. Refer to <i>PCM Replacement/Programming</i> . Replace the PCM. Is the action complete?	—	Go to Step 15	—
15	1. Using the scan tool, select DTC, Clear Info. 2. Start the engine and idle at normal operating temperature. 3. Select DTC, Specific, then enter the DTC number which was set. 4. Operate the vehicle within the conditions for setting this DTC as specified in the supporting text, if applicable. Does the scan tool indicate that this test ran and passed?	—	Go to Step 16	Go to Step 2
16	Using the scan tool, select Capture Info, Review Info. Are any DTCs displayed that have not been diagnosed?	—	Go to the applicable DTC table	System OK

DTC P1380 ABS DTC Rough Road Data Unstable

Circuit Description

The PCM detects engine misfire by detecting variations in crankshaft deceleration between firing strokes. For accurate detection of engine misfire, the PCM must be able to distinguish between crankshaft deceleration caused by actual misfire and deceleration caused by rough road conditions. The ABS Brake System can detect if the vehicle is on a rough road based on wheel acceleration/deceleration data supplied by the wheel speed sensors. If the ABS system detects rough road above a predetermined threshold, this information is sent to the PCM via serial data (UART). The PCM can then take the rough road into account when calculating misfire. Even if the ABS is malfunctioning and cannot detect rough roads, the misfire diagnostic will continue to run. However, if a misfire DTC is set, this additional DTC will also set indicating that rough road data was not available during the misfire calculation due to an ABS System malfunction.

Conditions for Setting the DTC

- DTCs P0100, P0102, P0103, P0122, P0123, P0335, P0336, P0742 not set.
- Vehicle speed above 5 mph.
- Light to moderate engine load.
- Engine misfire detected (DTC P0300 set).
- An ABS system malfunction exists preventing the PCM from receiving rough road detection data.

Action Taken When the DTC Sets

- The PCM will illuminate the Malfunction Indicator Lamp (MIL) after two consecutive drive trips that the misfire diagnostic runs and fails. This DTC can only set if the MIL is already ON for misfire.
- The PCM will record operating conditions at the time the diagnostic fails. This information will be stored in the Freeze Frame and/or Failure Records.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL OFF after three consecutive drive trips that the misfire diagnostic runs and does not fail.
- If no failures are reported by this or any other non-emission related diagnostic.
- A last test failed (Current DTC) will clear when the diagnostic runs and does not fail.
- PCM battery voltage is interrupted.
- Using a Scan tool.

Diagnostic Aids

Using Freeze Frame and/or Failure Records data may aid in locating an intermittent condition. If the DTC cannot be duplicated, the information included in the Freeze Frame and/or Failure Records data can be useful in determining how many miles since the DTC set. The Fail Counter and Pass Counter can also be used to determine how many ignition cycles the diagnostic reported a pass and/or a fail. Operate vehicle within the same freeze frame conditions (RPM, load, vehicle speed, temperature etc.) that were noted. This will isolate when the DTC failed. For intermittents, refer to *Symptoms*.

Test Description

Number(s) below refer to step numbers on the diagnostic table.

1. The ABS system must be serviced before diagnosing for misfire, because actual engine misfire may or may not exist. The following two examples illustrate how this DTC can be set with or without actual engine misfire:
 - There was actual engine misfire during an ABS system malfunction.
 - The vehicle was driven on a rough road, the ABS system could not detect this due to a malfunction, and the PCM interpreted the variations in crankshaft speed caused by the rough road as misfire.

DTC P1380 ABS DTC Rough Road Data Unstable

Step	Action	Value(s)	Yes	No
1	Was the Powertrain On-Board Diagnostic (OBD) System Check performed?	—	Go to <i>Brakes, Antilock Brake System (ABS)</i>	Go to <i>Powertrain OBD System Check</i>

DTC P1381 Misfire Detected No EBCM/PCM Serial Data

Circuit Description

The PCM detects engine misfire by detecting variations in crankshaft deceleration between firing strokes. For accurate detection of engine misfire, the PCM must be able to distinguish between crankshaft deceleration caused by actual misfire and deceleration caused by rough road conditions. The ABS Brake System can detect if the vehicle is on a rough road based on wheel acceleration/deceleration data supplied by the wheel speed sensors. If the ABS system detects rough road above a predetermined threshold, this information is sent to the PCM via serial data (UART). The PCM can then take the rough road into account when calculating misfire. Even if serial data communication between the ABS System and the PCM is malfunctioning and the PCM can not receive rough road data, the misfire diagnostic will continue to run. However, if a misfire DTC is set, this additional DTC will also set indicating that rough road data was not available during the misfire calculation due to a serial data malfunction.

Conditions for Setting the DTC

- Vehicle speed above 10 mph.
- Engine speed below 3500 RPM.
- Light to moderate engine load.
- Engine misfire detected (DTC P0300 set).
- A serial data malfunction exists preventing the PCM from receiving rough road detection data.
- Conditions met for 20 seconds.

Action Taken When the DTC Sets

- The PCM will illuminate the Malfunction Indicator Lamp (MIL) after two consecutive drive trips that the misfire diagnostic runs and fails. This DTC can only set if the MIL is already ON for misfire.
- The PCM will record operating conditions at the time the diagnostic fails. This information will be stored in the Freeze Frame and/or Failure Records.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL OFF after three consecutive drive trips that the misfire diagnostic runs and does not fail.
- If no failures are reported by this or any other non-emission related diagnostic.
- A last test failed (Current DTC) will clear when the diagnostic runs and does not fail.
- PCM battery voltage is interrupted.
- Using a Scan tool.

Diagnostic Aids

Using Freeze Frame and/or Failure Records data may aid in locating an intermittent condition. If the DTC cannot be duplicated, the information included in the Freeze Frame and/or Failure Records data can be useful in determining how many miles since the DTC set. The Fail Counter and Pass Counter can also be used to determine how many ignition cycles the diagnostic reported a pass and/or a fail. Operate vehicle within the same freeze frame conditions (RPM, load, vehicle speed, temperature etc.) that were noted. This will isolate when the DTC failed. For intermittents, refer to *Symptoms*.

Test Description

Number(s) below refer to step numbers on the diagnostic table.

1. The serial data circuit (UART) must be serviced before diagnosing for misfire, because actual engine misfire may or may not exist. The following two examples illustrate how this DTC can be set with or without actual engine misfire:
 - There was actual engine misfire during a serial data circuit malfunction.
 - The vehicle was driven on a rough road, the PCM could not receive this data from the ABS system due to a serial data circuit malfunction, and the PCM interpreted the variations in crankshaft speed caused by the rough road as misfire.

DTC P1381 Misfire Detected No EBCM/PCM Serial Data

Step	Action	Value(s)	Yes	No
1	Was the Powertrain On-Board Diagnostic (OBD) System Check performed?	—	Go to <i>Brakes, Antilock Brake System (ABS)</i>	Go to <i>Powertrain OBD System Check</i>

DTC P1415 AIR System Bank1

30415

Circuit Description

An AIR pump is used on this vehicle to lower tail pipe emissions on start-up. The PCM supplies a ground to the AIR pump relay, which energizes the AIR pump.

The PCM will run two tests using the HO2S voltages to diagnose the AIR system. Both tests have two parts.

Test one consists of the following:

Part 1

When the AIR pump is enabled, the PCM monitors the HO2S voltage. If the HO2S voltages go below a threshold, the PCM interprets this as an indication that the AIR system is operational.

Part 2

When the AIR pump is disabled, the PCM monitors the HO2S voltages. The HO2S voltages should increase above a threshold and switch normally.

If the PCM did not sense more than a predetermined amount of HO2S rich switches, a malfunction will be reported. If both of these test indicate a pass, no further action is taken. If one of the above tests failed or is inconclusive, the diagnostic will proceed to test two.

Test two consist of the following:

Part 1

During this test the PCM will activate the AIR pump during closed loop operation. When the AIR is activated, the PCM will monitor the HO2S voltages and short term fuel trim values for both banks of the engine. If the AIR system is operating properly, the HO2S voltages should go low and the short term fuel trim should go high.

Part 2

The PCM checks that the HO2S voltages return to above a rich threshold when the air pump is disabled.

If the PCM determines that the HO2S voltages for *both* banks did not respond as expected during the tests, DTC P0410 will set. If only one sensor responded, the PCM will set either a DTC P1415 or P1416 to indicate on which bank the AIR system is inoperative.

Conditions for Setting the DTC

- DTCs P0107, P0108, P0116, P0117, P0118, P0133, P0135, P0153, P0155, P0171, P0172, P0174, P0175, not set.
- Engine operating about 2 seconds.

Test 1

- TP angle not moving more than 1%.
- Engine load less than 6.6%.
- Engine air flow less than 26 grams per second.
- Air fuel ratio greater than 13:1.
- ECT less than 115°C (239°F).
- HO2S bias voltage between 365 mV and 513 mV.
- HO2S voltage does not go below 400 mV for 19 seconds (Engine coolant temperature less than 75°C (167°F) when the engine is started.) or HO2S voltage does not go below 417 mV for 7 seconds (Engine coolant temperature greater than 75°C (167°F) when the engine is started.)
- HO2S voltage does not go above 722 mV for 19 seconds (Engine coolant temperature less than 75°C (167°F) when the engine is started.) or HO2S voltage does not go above 700 mV for 7 seconds (Engine coolant temperature greater than 75°C (167°F) when the engine is started.)

Test 2

- Engine operating longer than 200 seconds.
- Engine speed greater than 600 RPM.
- Maximum air flow 17 gm/s.
- Engine coolant temperature between 60°C (140°F) and 115°C (239°F).
- IAT greater than 10°C (50°C).
- Ignition voltage greater than 11.0 volts.
- Engine load less than 5.5%.
- HO2S voltage does not go below 222 mV within 1.5 seconds.
- Short term fuel trim does not go above a predetermined amount.

Action Taken When the DTC Sets

- The PCM will illuminate the Malfunction Indicator Lamp (MIL) on the second consecutive drive trip that the diagnostic runs and fails.
- The PCM will record operating conditions at the time the diagnostic fails. The first time the diagnostic fails, this information will be stored in Failure Records. If the diagnostic reports a failure on the second consecutive drive trip, the operating conditions at the time of failure will be written to Freeze Frame and the Failure record will be updated.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL OFF after three consecutive drive trips that the diagnostic runs and does not fail.
- A last test failed (Current DTC) will clear when the diagnostic runs and does not fail.
- A History DTC will clear after forty consecutive warm-up cycles, if no failures are reported by this or any other emission related diagnostic.
- PCM battery voltage is interrupted.
- Using a Scan tool.

Diagnostic Aids

- Casting flash in the exhaust manifold may restrict the amount of air flow necessary to affect the HO2S voltage. If this is suspected, remove the air pipe from the manifold and inspect the passage.
- Using Freeze Frame and/or Failure Records data may aid in locating an intermittent condition. If the DTC cannot be duplicated, the information included in the Freeze Frame and/or Failure Records data can be useful in determining how many miles since the DTC set. The Fail Counter and Pass Counter can also be used to determine how many ignition cycles the diagnostic reported a pass and/or a fail. Operate vehicle within the same freeze frame conditions (RPM, load, vehicle speed, temperature etc.) that were noted. This will isolate when the DTC failed.
- For intermittents, refer to *Symptoms*.

Test Description

Number(s) below refer to step numbers on the diagnostic table.

3. A check valve that flows in both directions will cause heat damage to components.

DTC P1415 AIR System Bank1

Step	Action	Value(s)	Yes	No
1	Was the Powertrain On-Board Diagnostic (OBD) System Check performed?	—	Go to Step 2	Go to Powertrain OBD System Check
2	1. Install the scan tool. 2. Start and idle the engine Closed Loop. 3. Turn all the accessories OFF. 4. Using a scan tool, monitor the Bank1 Sensor 1 (Left Front) HO2S voltage display on the Engine 1 Data List. 5. Using a scan tool, enable the AIR pump. 6. Observe and note the Bank1 Sensor 1 (Left Front) HO2S voltage, as the AIR pump is enabled. Does the HO2S voltage drop below the specified value?	350 mV	Go to Diagnostic Aids	Go to Step 3
3	Visually/physically inspect all hoses and pipes for: • Being connected. • Clamps are secure on pipes and hoses. • No kinks, holes, or pinched hoses/pipes. • Components with evidence of heat damage. Did all the above check OK?	—	Go to Step 4	Go to Step 6
4	1. Disconnect the hose from the check valve at the left exhaust manifold. 2. Using a scan tool, enable the AIR pump. Is air present at the hose outlet?	—	Go to Step 7	Go to Step 5
5	Repair the restriction or blockage in AIR hoses/pipes between the left exhaust manifold and the point where the system branches to both sides of the engine. Is the action complete?	—	Go to Step 8	—
6	Repair the condition found. Is the action complete?	—	Go to Step 8	—
7	Replace the check valve. Is the action complete?	—	Go to Step 8	—
8	1. Using the scan tool, select DTC, Clear Info. 2. Start the engine and idle at normal operating temperature. 3. Select DTC, Specific, then enter the DTC number which was set. 4. Operate the vehicle within the conditions for setting this DTC as specified in the supporting text, if applicable. Does the scan tool indicate that this test ran and passed?	—	Go to Step 9	Go to Step 2
9	Using the scan tool, select Capture Info, Review Info. Are any DTCs displayed that have not been diagnosed?	—	Go to the applicable DTC table	System OK

DTC P1416 AIR System Bank2

30415

Circuit Description

An AIR pump is used on this vehicle to lower tail pipe emissions on start-up. The PCM supplies a ground to the AIR pump relay, which energizes the AIR pump.

The PCM will run two tests using the HO₂S voltages to diagnose the AIR system. Both tests have two parts.

Test one consists of the following:

Part 1

When the AIR pump is enabled, the PCM monitors the HO₂S voltage. If the HO₂S voltages go below a threshold, the PCM interprets this as an indication that the AIR system is operational.

Part 2

When the AIR pump is disabled, the PCM monitors the HO₂S voltages. The HO₂S voltages should increase above a threshold and switch normally.

If the PCM did not sense more than a predetermined amount of HO₂S rich switches, a malfunction will be reported. If both of these tests indicate a pass, no further action is taken. If one of the above tests failed or is inconclusive, the diagnostic will proceed to test two.

Test two consists of the following:

Part 1

During this test the PCM will activate the AIR pump during closed loop operation. When the AIR is activated, the PCM will monitor the HO₂S voltages and short term fuel trim values for both banks of the engine. If the AIR system is operating properly, the HO₂S voltages should go low and the short term fuel trim should go high.

Part 2

The PCM checks that the HO2S voltages return to above a rich threshold when the air pump is disabled.

If the PCM determines that the HO2S voltages for *both* banks did not respond as expected during the tests, DTC P0410 will set. If only one sensor responded, the PCM will set either a DTC P1415 or P1416 to indicate on which bank the AIR system is inoperative.

Conditions for Setting the DTC

- DTCs P0107, P0108, P0116, P0117, P0118, P0133, P0135, P0153, P0155, P0171, P0172, P0174, P0175, not set.
- Engine operating about 2 seconds.

Test 1

- TP angle not moving more than 1%.
- Engine load less than 6.6%.
- Engine air flow less than 26 grams per second.
- Air fuel ratio greater than 13:1.
- ECT less than 115°C (239°F).
- HO2S bias voltage between 365 mV and 513 mV.
- HO2S voltage does not go below 400 mV for 19 seconds (Engine coolant temperature less than 75°C (167°F) when the engine is started.) or HO2S voltage does not go below 417 mV for 7 seconds (Engine coolant temperature greater than 75°C (167°F) when the engine is started.)
- HO2S voltage does not go above 722 mV for 19 seconds (Engine coolant temperature less than 75°C (167°F) when the engine is started.) or HO2S voltage does not go above 700 mV for 7 seconds (Engine coolant temperature greater than 75°C (167°F) when the engine is started.)

Test 2

- Engine operating longer than 200 seconds.
- Engine speed greater than 600 RPM.
- Maximum air flow 17 gm/s.
- Engine coolant temperature between 60°C (140°F) and 115°C (239°F).
- IAT greater than 10°C (50°C).
- Ignition voltage greater than 11.0 volts.
- Engine load less than 5.5%.
- HO2S voltage does not go below 222 mV within 1.5 seconds.
- Short term fuel trim does not go above a predetermined amount.

Action Taken When the DTC Sets

- The PCM will illuminate the Malfunction Indicator Lamp (MIL) on the second consecutive drive trip that the diagnostic runs and fails.
- The PCM will record operating conditions at the time the diagnostic fails. The first time the diagnostic fails, this information will be stored in Failure Records. If the diagnostic reports a failure on the second consecutive drive trip, the operating conditions at the time of failure will be written to Freeze Frame and the Failure record will be updated.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL OFF after three consecutive drive trips that the diagnostic runs and does not fail.
- A last test failed (Current DTC) will clear when the diagnostic runs and does not fail.
- A History DTC will clear after forty consecutive warm-up cycles, if no failures are reported by this or any other emission related diagnostic.
- PCM battery voltage is interrupted.
- Using a Scan tool.

Diagnostic Aids

- Casting flash in the exhaust manifold may restrict the amount of air flow necessary to affect the HO2S voltage. If this is suspected, remove the air pipe from the manifold and inspect the passage.
- Using Freeze Frame and/or Failure Records data may aid in locating an intermittent condition. If the DTC cannot be duplicated, the information included in the Freeze Frame and/or Failure Records data can be useful in determining how many miles since the DTC set. The Fail Counter and Pass Counter can also be used to determine how many ignition cycles the diagnostic reported a pass and/or a fail. Operate vehicle within the same freeze frame conditions (RPM, load, vehicle speed, temperature etc.) that were noted. This will isolate when the DTC failed.
- For intermittents, refer to *Symptoms*.

Test Description

Number(s) below refer to step numbers on the diagnostic table.

3. A check valve that flows in both directions will cause heat damage to components.

DTC P1416 AIR System Bank2

Step	Action	Value(s)	Yes	No
1	Was the Powertrain On-Board Diagnostic (OBD) System Check performed?	—	Go to Step 2	Go to Powertrain OBD System Check
2	1. Install scan tool. 2. Engine idling in Closed Loop. 3. Turn all accessories OFF. 4. Using a scan tool, monitor the Bank 2 Sensor 1 (Right Front) HO2S voltage display on the Engine 1 Data List. 5. Using a scan tool, enable the AIR pump. 6. Observe and note the Bank 2 Sensor 1 (Right Front) HO2S voltage, as the AIR pump is enabled. Does the HO2S voltage drop below the specified value?	350 mV	Go to Diagnostic Aids	Go to Step 3
3	Visually/physically inspect all hoses and pipes for: • Being connected. • Clamps are secure on pipes and hoses. • No kinks, holes, or pinched hoses/pipes. • Components with evidence of heat damage. Did all the above check OK?	—	Go to Step 4	Go to Step 6
4	1. Disconnect the hose from the check valve at the right exhaust manifold. 2. Using a scan tool, enable the AIR pump. Is air present at the hose outlet?	—	Go to Step 7	Go to Step 5
5	Repair restriction or blockage in AIR hoses/pipes between the right exhaust manifold and the point where the system branches to both sides of the engine. Is the action complete?	—	Go to Step 8	—
6	Repair the condition found. Is the action complete?	—	Go to Step 8	—
7	Replace the check valve. Is the action complete?	—	Go to Step 8	—
8	1. Using the scan tool, select DTC, Clear Info. 2. Start engine and idle at normal operating temperature. 3. Select DTC, Specific, then enter the DTC number which was set. 4. Operate vehicle within the conditions for setting this DTC as specified in the supporting text, if applicable. Does the scan tool indicate that this test ran and passed?	—	Go to Step 9	Go to Step 2
9	Using the scan tool, select Capture Info, Review Info. Are any DTCs displayed that have not been diagnosed?	—	Go to the applicable DTC table	System OK

DTC P1441 EVAP System Flow During Non-Purge

30414

Circuit Description

The EVAP vacuum switch is a normally closed switch connected to ground, mounted in the vacuum line between the EVAP canister and the EVAP solenoid. 12 volts is supplied to the switch through a pull-up resistor in the PCM. When the PCM commands the EVAP canister purge solenoid valve open (purge ON) and engine vacuum draws the evaporative emissions from the canister, the EVAP vacuum switch opens (signal voltage high) providing feedback to the PCM that the EVAP system is operating. When the PCM commands purge OFF, the EVAP vacuum switch closes (signal voltage low) confirming purging has ceased.

Conditions for Setting the DTC

- DTCs P0100, P0101, P0102, P0103, P0106, P0323, P0325, P0327, P0332, P0335, P0336, P0372, P0400, P0403, P0410, P0412, P0420, P0430, P0441, P0443, P0500, P0502, P0503, P0506, P0507, P0530, P0531, P0719, P0758, P1415, P1642, P1652 not set.
- ECT less than 115°C (239°F)
- IAT greater than 3°C (37°F)

- Engine speed between 500 and 3000 RPM
- TP Angle less than 50%
- MAP less than 70 kPa
- BARO greater than 77 kPa
- Purge not enabled
- The PCM detects high signal voltage on the EVAP vacuum switch signal circuit when the PCM is not commanding purge ON.
- Fault present for 5 seconds

Action Taken When the DTC Sets

- The PCM will illuminate the Malfunction Indicator Lamp (MIL) on the second consecutive drive trip that the diagnostic runs and fails.
- The PCM will record operating conditions at the time the diagnostic fails. The first time the diagnostic fails, this information will be stored in Failure Records. If the diagnostic reports a failure on the second consecutive drive trip, the operating conditions at the time of failure will be written to Freeze Frame and the Failure record will be updated.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL OFF after three consecutive drive trips that the diagnostic runs and does not fail.
- A last test failed (Current DTC) will clear when the diagnostic runs and does not fail.
- A History DTC will clear after forty consecutive warm-up cycles, if no failures are reported by this or any other emission related diagnostic.
- PCM battery voltage is interrupted.
- Using a Scan tool.

Diagnostic Aids

Before replacing any components, visually/physically check for the following:

- Mis-routed harness.
- Rubbed through wire insulation.
- Broken wire inside the insulation.

- Kinked or damaged vacuum hoses.
- Physically damaged system components.
- Inspect components and vacuum lines for traces of carbon or other contaminants. The presence of foreign material may be causing a restriction in the system or preventing the solenoid valve from closing properly. Either condition may cause a DTC to set.

For intermittents, refer to *Symptoms*.

Test Description

Number(s) below refer to step numbers on the diagnostic table.

- Since the vacuum switch only requires a vacuum of only a few inches of *water* to operate (a very small unit of vacuum), a properly operating switch will transition even with the canister end of the hose disconnected and un-plugged.

DTC P1441 EVAP System Flow During Non-Purge

Step	Action	Value(s)	Yes	No
1	Was the Powertrain On-Board Diagnostic (OBD) System Check performed?	—	Go to Step 2	Go to Powertrain OBD System Check
2	Important: This DTC will set if the vacuum lines at the EVAP purge solenoid are reversed. Refer to under hood emission label for proper routing. 1. Turn the ignition ON, engine OFF. 2. Using the scan tool, check the EVAP vacuum switch status. Does the scan tool indicate, EVAP vacuum switch No Purge.	—	Go to Step 3	Go to Step 6
3	1. Start the engine. 2. Using the scan tool, check the EVAP vacuum switch status. Does the EVAP vacuum switch status change to Purge when the engine is started?	—	Go to Step 19	Go to Step 4
4	1. Start the engine. Increase the Idle speed to 1500 RPM. 2. Using the scan tool, command the EVAP canister purge solenoid valve ON and OFF while observing the EVAP vacuum switch status. Important: When the EVAP solenoid is commanded ON then OFF, the scan tool display should change from Purge to No Purge almost immediately. Does the scan tool indicate No Purge within the time period indicated?	5 seconds	Go to Diagnostic Aids- EVAP System	Go to Step 5

DTC P1441 EVAP System Flow During Non-Purge (cont'd)

Step	Action	Value(s)	Yes	No
5	1. Turn the engine OFF. 2. Disconnect the purge hose from the canister (the vacuum line from the EVAP vacuum switch). Refer to <i>EVAP Canister</i> . 3. Start the engine. Increase the Idle speed to 1500 RPM. 4. Using the scan tool, command the EVAP canister purge solenoid valve ON and OFF while observing the EVAP vacuum switch status. Important: When the EVAP solenoid is commanded ON then OFF, the scan tool display should change from Purge to No Purge almost immediately. Does the scan tool indicate No Purge within the time period indicated?	5 seconds	Go to Step 11	Go to Step 12
6	1. Disconnect the EVAP vacuum switch harness connector. 2. With a test light (J 34142-B) connected to B+, probe the ground circuit at the EVAP vacuum switch harness connector. Does the test light illuminate?	—	Go to Step 7	Go to Step 13
7	Connect a fused jumper wire between the EVAP vacuum switch harness connector terminals. Does the scan tool indicate EVAP vacuum switch No Purge?	—	Go to Step 14	Go to Step 8
8	Using a DVM (J 39200) connected to ground, measure voltage at the signal circuit of the EVAP vacuum switch harness connector. Does the DVM indicate voltage near the specified value?	B+	Go to Step 18	Go to Step 9
9	1. Turn the ignition OFF. 2. Disconnect the PCM connector C2. 3. Using a DVM J 39200, check for continuity between the EVAP vacuum switch signal circuit and ground. Does the DVM indicate infinite resistance?	—	Go to Step 10	Go to Step 16
10	Using DVM J 39200, check continuity of the EVAP vacuum switch signal circuit from the vacuum switch harness connector to the PCM connector. Does the DVM indicate resistance is less than the specified value?	5 Ω	Go to Step 20	Go to Step 17
11	Replace the EVAP canister. Refer to <i>EVAP Canister</i> . The EVAP system must be inspected and/or cleaned before replacing any component. Is the action complete?	—	Go to Step 21	—
12	Repair restricted or kinked hose between canister and EVAP vacuum switch. Refer to <i>EVAP System Cleaning</i> for cleaning procedure. Is the action complete?	—	Go to Step 21	—
13	Repair the open ground circuit. Is the action complete?	—	Go to Step 21	—
14	Check connections at the EVAP vacuum switch. Was a problem found and corrected?	—	Go to Step 21	Go to Step 15

DTC P1441 EVAP System Flow During Non-Purge (cont'd)

Step	Action	Value(s)	Yes	No
15	Important: Contamination can cause the switch to fail. Refer to <i>EVAP System Cleaning</i> for inspection/cleaning procedures. Replace the EVAP vacuum switch. Refer to <i>EVAP Purge Vacuum Switch</i> . Is the action complete?	—	Go to Step 21	—
16	Repair the shorted signal circuit to ground. Is the action complete?	—	Go to Step 21	—
17	Repair the open signal circuit. Is the action complete?	—	Go to Step 21	—
18	Check the connections at the PCM. Was a problem found and corrected?	—	Go to Step 21	Go to Step 20
19	Important: Contamination can cause the solenoid to fail open. Refer to <i>EVAP System Cleaning</i> for inspection/cleaning procedures. Replace the EVAP canister purge solenoid valve, refer to <i>EVAP Canister Purge Solenoid Valve</i> . Is the action complete?	—	Go to Step 21	—
20	Important: Replacement PCM must be programmed. Refer to <i>PCM Replacement/Programming</i> . Replace the PCM. Is the action complete?	—	Go to Step 21	—
21	1. Using the scan tool, select DTC, Clear Info. 2. Start the engine and idle at normal operating temperature. 3. Select DTC, Specific, then enter the DTC number which was set. 4. Operate the vehicle within the conditions for setting this DTC as specified in the supporting text, if applicable. Does the scan tool indicate that this test ran and passed?	—	Go to Step 22	Go to Step 2
22	Using the scan tool, select Capture Info, Review Info. Are any DTCs displayed that have not been diagnosed?	—	Go to the applicable DTC table	System OK

DTC P1508 IAC System Low RPM

30418

Circuit Description

The Idle Air Control valve is a PCM controlled stepper motor located on the throttle body. The stepper motor drives a valve pintle which protrudes into a passage that bypasses the throttle plates. To decrease idle speed, the PCM commands the IAC valve pintle to extend. As the pintle approaches its seat, bypass air flow is reduced and idle speed decreases. To increase idle speed, the PCM retracts the IAC valve pintle away from its seat, allowing more air to bypass the throttle plates. One of the PCMs uses for the IAC system is to maintain a desired idle speed, which can vary depending on input to the PCM and other criteria. If the PCM detects engine speed is outside the IAC systems range of control at idle, it will perform an active test while the vehicle is being driven. During this test the PCM commands the IAC valve to move while monitoring MAF. If no change in MAF is detected, the IAC valve is not functioning. If idle RPM was out of IAC System control and the IAC valve does not operate, DTC P1508 is set. If the expected change in MAF had been detected, IAC valve operation would have been verified. Since idle RPM was out of IAC System control but the IAC valve was operational, DTC P0506 would be set.

Conditions for Setting the DTC

- DTCs P0107, P0108, P0122, P0123, P0174, P0175, P0300, P0325 not set.
- Engine running for at least 25 seconds.
- Coolant temperature greater than 60°C (140°F)
- IAT greater than -10°C (14°F)

- Baro greater than 77 kPa
- System voltage between 10 and 17 volts
- Vehicle speed less than 1 mph
- Throttle Angle 0%
- Idle speed below desired RPM
- Conditions met for 1 sec

Then

- Vehicle speed is between 20 and 77 mph.
- MAF between 13 and 35 gm/s
- TPS steady
- RPM steady
- Conditions met for 5 seconds

The active test will then be performed.

- If a 6 gm/s change in MAF is detected, DTC P0506 will be set.
- If a 6 gm/s change in MAF is not detected, DTC P1508 will be set.

Action Taken When the DTC Sets

- The PCM will illuminate the Malfunction Indicator Lamp (MIL) on the second consecutive drive trip that the diagnostic runs and fails.
- The PCM will record operating conditions at the time the diagnostic fails. The first time the diagnostic fails, this information will be stored in Failure Records. If the diagnostic reports a failure on the second consecutive drive trip, the operating conditions at the time of failure will be written to Freeze Frame and the Failure record will be updated.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL OFF after three consecutive drive trips that the diagnostic runs and does not fail.
- A last test failed (Current DTC) will clear when the diagnostic runs and does not fail.
- A History DTC will clear after forty consecutive warm-up cycles, if no failures are reported by this or any other emission related diagnostic.
- PCM battery voltage is interrupted.
- Using a Scan tool.

Diagnostic Aids

Using Freeze Frame and/or Failure Records data may aid in locating an intermittent condition. If the DTC cannot be duplicated, the information included

in the Freeze Frame and/or Failure Records data can be useful in determining how many miles since the DTC set. The Fail Counter and Pass Counter can also be used to determine how many ignition cycles the diagnostic reported a pass and/or a fail. Operate vehicle within the same freeze frame conditions (RPM, load, vehicle speed, temperature etc.) that were noted. This will isolate when the DTC failed. For intermittents, refer to *Symptoms*.

Test Description

Number(s) below refer to step numbers on the diagnostic table.

2. Determines whether or not the engine can achieve the commanded RPM, and if not, whether the RPM is too high or too low.

DTC P1508 IAC System Low RPM

Step	Action	Value(s)	Yes	No
1	Was the Powertrain On-Board Diagnostic (OBD) System Check performed?	—	Go to Step 2	Go to Powertrain OBD System Check
2	1. Start the engine. 2. Using the scan tool, command the RPM up to 1500, down to 500, up to 1500, and then EXIT. Does the engine speed correspond (within 50 RPM) with each command?	—	Go to Diagnostic Aids	Go to Step 3
3	1. Turn the ignition OFF. 2. Disconnect the IAC harness connector and install the appropriate IAC node light from kit J 37027-A. 3. Start the engine. 4. Using the scan tool, command the RPM up to 1500, down to 500 and up to 1500 while observing the node light. Does both of the LEDs on the node light cycle red and green, but never OFF?	—	Go to Step 4	Go to Step 5
4	Important: During the following test it is possible to overextend the IAC valve pintle until it falls out of the worm drive. If this occurs, manually screw the pintle shaft into the worm drive about 2 turns to get it started, align the keyways on the shaft with the keys in the housing and gradually retract the pintle using the IAC driver tool. 1. Turn the ignition OFF. 2. Remove the IAC valve. 3. Connect the IAC valve to the IAC Driver tool from kit J 37027-A. 4. Hold the IAC valve with a finger over the pintle in case it is over extended. Using the driver tool retract and extend the pintle. Does the pintle move steadily with each flash of the IAC driver light?	—	Go to Step 6	Go to Step 7

DTC P1508 IAC System Low RPM (cont'd)

Step	Action	Value(s)	Yes	No
5	Check for the following conditions: - Faulty connection - Open circuit - Short to ground - Short to B+ Is the action complete?	—	Go to Step 8	—
6	Check the IAC passages. Is the action complete?	—	Go to Step 8	—
7	Replace the IAC valve. Refer to <i>IAC Valve</i> . Is the action complete?	—	Go to Step 8	—
8	- Using the scan tool, select DTC, Clear Info. - Start the engine and idle at normal operating temperature. - Select DTC, Specific, then enter the DTC number which was set. - Operate the vehicle within the conditions for setting this DTC as specified in the supporting text, if applicable. Does the scan tool indicate that this test ran and passed?	—	Go to Step 9	Go to Step 2
9	Using the scan tool, select Capture Info, Review Info. Are any DTCs displayed that have not been diagnosed?	—	Go to the applicable DTC table	System OK

DTC P1509 IAC System High RPM

30418

Circuit Description

The Idle Air Control valve is a PCM controlled stepper motor located on the throttle body. The stepper motor drives a valve pintle which protrudes into a passage that bypasses the throttle plates. To decrease idle speed, the PCM commands the IAC valve pintle to extend. As the pintle approaches its seat, bypass air flow is reduced and idle speed decreases. To increase idle speed, the PCM retracts the IAC valve pintle away from its seat, allowing more air to bypass the throttle plates. One of the PCMs uses for the IAC system is to maintain a desired idle speed, which can vary depending on input to the PCM and other criteria. If the PCM detects engine speed is outside the IAC systems range of control at idle, it will perform an active test while the vehicle is being driven. During this test the PCM commands the IAC valve to move while monitoring MAF. If no change in MAF is detected, the IAC valve is not functioning. If idle RPM was out of IAC System control and the IAC valve does not operate, DTC P1509 is set. If the expected change in MAF had been detected, IAC valve operation would have been verified. Since idle RPM was out of IAC System control but the IAC valve was operational, DTC P0507 would be set.

Conditions for Setting the DTC

- DTCs P0107, P0108, P0122, P0123, P0174, P0175, P0300, P0325 not set.
- Engine running for at least 25 seconds.
- Coolant temperature greater than 60°C (140°F)
- IAT greater than -10°C (14°F)

- Baro greater than 77 kPa
- System voltage between 10 and 17 volts
- Vehicle speed less than 1 mph
- Throttle Angle 0%
- Idle speed below desired RPM
- Conditions met for 1 sec

Then

- Vehicle speed is between 20 and 77 mph.
- MAF between 13 and 35 gm/s
- TP Sensor steady
- RPM steady
- Conditions met for 5 seconds

The active test will then be performed.

- If a 6 gm/s change in MAF is detected, DTC P0507 will be set.
- If a 6 gm/s change in MAF is not detected, DTC P1509 will be set.

Action Taken When the DTC Sets

- The PCM will illuminate the Malfunction Indicator Lamp (MIL) on the second consecutive drive trip that the diagnostic runs and fails.
- The PCM will record operating conditions at the time the diagnostic fails. The first time the diagnostic fails, this information will be stored in Failure Records. If the diagnostic reports a failure on the second consecutive drive trip, the operating conditions at the time of failure will be written to Freeze Frame and the Failure record will be updated.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL OFF after three consecutive drive trips that the diagnostic runs and does not fail.
- A last test failed (Current DTC) will clear when the diagnostic runs and does not fail.
- A History DTC will clear after forty consecutive warm-up cycles, if no failures are reported by this or any other emission related diagnostic.
- PCM battery voltage is interrupted.
- Using a Scan tool.

Diagnostic Aids

Using Freeze Frame and/or Failure Records data may aid in locating an intermittent condition. If the DTC cannot be duplicated, the information included

in the Freeze Frame and/or Failure Records data can be useful in determining how many miles since the DTC set. The Fail Counter and Pass Counter can also be used to determine how many ignition cycles the diagnostic reported a pass and/or a fail. Operate vehicle within the same freeze frame conditions (RPM, load, vehicle speed, temperature etc.) that were noted. This will isolate when the DTC failed. For intermittents, refer to *Symptoms*.

Test Description

Number(s) below refer to step numbers on the diagnostic table.

2. Determines whether or not the engine can achieve the commanded RPM, and if not, whether the RPM is too high or too low.

DTC P1509 IAC System High RPM

Step	Action	Value(s)	Yes	No
1	Was the Powertrain On-Board Diagnostic (OBD) System Check performed?	—	Go to Step 2	Go to Powertrain OBD System Check
2	1. Start the engine. 2. Using the scan tool, command the RPM up to 1500, down to 500, up to 1500, and then EXIT. Does the engine speed correspond (within 50 RPM) with each command?	—	Go to Diagnostic Aids	Go to Step 3
3	1. Turn the ignition OFF. 2. Disconnect the IAC harness connector and install the appropriate IAC node light from kit J 37027-A. 3. Start the engine. 4. Using the scan tool, command the RPM up to 1500, down to 500 and up to 1500 while observing the node light. Does both of the LEDs on the node light cycle red and green, but never OFF?	—	Go to Step 4	Go to Step 5
4	Important: During the following test it is possible to overextend the IAC valve pintle until it falls out of the worm drive. If this occurs, manually screw the pintle shaft into the worm drive about 2 turns to get it started, align the keyways on the shaft with the keys in the housing and gradually retract the pintle using the IAC driver tool. 1. Turn the ignition OFF. 2. Remove the IAC valve. 3. Connect the IAC valve to the IAC Driver tool from kit J 37027-A. 4. Hold the IAC valve with a finger over the pintle in case it is over extended. Using the driver tool retract and extend the pintle. Does the pintle move steadily with each flash of the IAC driver light?	—	Go to Step 6	Go to Step 7

DTC P1509 IAC System High RPM (cont'd)

Step	Action	Value(s)	Yes	No
5	Check for the following conditions: - Faulty connection - Open circuit - Short to ground - Short to B+ Is the action complete?	—	Go to Step 8	—
6	Check the IAC passages. Is the action complete?	—	Go to Step 8	—
7	Replace the IAC valve. Refer to <i>IAC Valve</i> . Is the action complete?	—	Go to Step 8	—
8	- Using the scan tool, select DTC, Clear Info. - Start the engine and idle at normal operating temperature. - Select DTC, Specific, then enter the DTC number which was set. - Operate the vehicle within the conditions for setting this DTC as specified in the supporting text, if applicable. Does the scan tool indicate that this test ran and passed?	—	Go to Step 9	Go to Step 2
9	Using the scan tool, select Capture Info, Review Info. Are any DTCs displayed that have not been diagnosed?	—	Go to the applicable DTC table	System OK

DTC P1539 A/C Clutch Status Circuit High Voltage

Circuit Description

When the PCM detects that A/C has been requested, the PCM will activate the A/C clutch relay. When the relay is activated, voltage should be present at both the A/C compressor clutch and the A/C clutch status terminal at the PCM.

If the PCM detects voltage on the A/C clutch status terminal when the A/C has not been requested a DTC P1539 will set.

A short to voltage at any point in the A/C status circuit, or the A/C relay contacts are stuck, will set a DTC P1539. For the A/C system schematic refer to *A/C Controls - C60* or *A/C Controls - C67 and C68*.

Conditions for Setting the DTC

Voltage is detected on the A/C status circuit for more than 5.0 seconds after the PCM has disengaged the A/C clutch relay.

Action Taken When the DTC Sets

- The DTC will be stored in the PCM memory when the diagnostic runs and fails.
- The Malfunction Indicator Lamp (MIL) will not illuminate.
- The PCM will record operating conditions at the time the diagnostic fails. This information will be stored in Failure Records.

Conditions for Clearing the MIL/DTC

- A history DTC will clear after 40 consecutive warm-up cycles, if no failures are reported by this or any other non-emission related diagnostic.
- A last test failed (Current DTC) will clear when the diagnostic runs and does not fail.

- PCM battery voltage is interrupted.
- Using a scan tool.

Diagnostic Aids

- The A/C status circuit goes to the A/C compressor clutch and to the A/C clutch relay. Inspect all circuits going to these components.
- For intermittents, refer to *Symptoms*.

Test Description

Number(s) below refer to step numbers on the diagnostic table.

2. Checks if the malfunction is present. If the scan tool displays A/C status ON, indicates the PCM has detected a voltage on the A/C status circuit with the A/C OFF.
3. If the scan tool displayed YES in the RAN column and INT in the FAIL column, indicates an intermittent condition is present. Inspect A/C status circuit for an intermittent short to B+. Refer to *Symptoms*. Using Freeze Frame and/or Failure Records data may aid in locating an intermittent condition. If the DTC cannot be duplicated, the information included in the Freeze Frame and/or Failure Records data can be useful in determining how many miles since the DTC set. The Fail Counter and Pass Counter can also be used to determine how many ignition cycles the diagnostic reported a pass and/or a fail. Operate vehicle within the same freeze frame conditions (RPM, load, vehicle speed, temperature etc.) that were noted. This will isolate when the DTC failed.
4. If the scan tool displays that the test passed, indicates that the relay is shored internally.

DTC P1539 A/C Clutch Status Circuit High Voltage

Step	Action	Value(s)	Yes	No
1	Was the Powertrain On-Board Diagnostic (OBD) System Check performed?	—	Go to Step 2	Go to Powertrain OBD System Check
2	1. Install the scan tool. 2. Engine idling with A/C OFF. 3. Using a scan tool, monitor A/C Status display on the Engine 1 Data List. Does the scan tool indicate A/C Status as ON?	—	Go to Step 4	Go to Step 3
3	1. Turn the ignition ON, engine OFF, review Freeze Frame and/or Failure Records data for this DTC and note parameters. 2. Turn the ignition OFF for 15 seconds. 3. Start the engine and operate the vehicle within the conditions required for this diagnostic to run, and as close to the conditions recorded in Freeze Frame/Failure Records as possible. Special operating conditions that need to be met before the PCM will run this diagnostic, where applicable, are listed in Conditions for Setting the DTC. 4. Using the scan tool, select DTC, Specific, then enter the DTC number which was set. Does the scan tool indicate that this diagnostic failed this ignition?	—	Go to Step 4	Go to Diagnostic Aids
4	1. Turn the ignition OFF. 2. Remove the A/C clutch relay. 3. Start and idle the engine for 30 seconds. 4. Using a scan tool, select DTC Info, FAIL THIS IGN. Does the scan tool indicate DTC P1539 failed?	—	Go to Step 5	Go to Step 6
5	Repair the A/C clutch status circuit (shorted to B+). Is the action complete?	—	Go to Step 7	—
6	Repair the faulty A/C clutch relay. Refer to <i>A/C Clutch Relay replacement</i> . Is the action complete?	—	Go to Step 7	—
7	1. Using the scan tool, select DTC, Clear Info. 2. Start the engine and idle at normal operating temperature. 3. Select DTC, Specific, then enter the DTC number which was set. 4. Operate the vehicle within the conditions for setting this DTC as specified in the supporting text, if applicable. Does the scan tool indicate that this test ran and passed?	—	Go to Step 8	Go to Step 2
8	Using the scan tool, select Capture Info, Review Info. Are any DTCs displayed that have not been diagnosed?	—	Go to the applicable DTC table	System OK

DTC P1545 A/C Clutch Relay Control Circuit

Circuit Description

Ignition voltage is supplied directly to the A/C compressor clutch relay coil. The PCM controls the relay by grounding the control circuit via an internal switch called a driver. The primary function of the driver is to supply the ground for the component being controlled. Each driver has a fault line which is monitored by the PCM. When the PCM is commanding a component ON, the voltage of the control circuit should be low (near 0 volts). When the PCM is commanding the control circuit to a component OFF, the voltage potential of the circuit should be high (near battery voltage). If the fault detection circuit senses a voltage other than what is expected, the fault line status will change causing the DTC to set.

The relay is used to control the high current flow to the A/C compressor clutch. This allows the PCM driver to only have to handle the relatively low current used by the relay. For the A/C system schematic refer to *A/C Controls - C60* or *A/C Controls - C67 and C68*.

Conditions for Setting the DTC

- DTCs P0106, P0113, P0500, P0502, P0560, P0562, P1133, P1135, P1136, P1153, P1154, P1532, P1539, P1543 not set.
- Engine speed greater than 600 RPM.
- The PCM detects that the commanded state of the driver and the actual state of the control circuit do not match.
- Condition must be present for a minimum of 25.5 seconds.

Action Taken When the DTC Sets

- The DTC will be stored in the PCM memory when the diagnostic runs and fails.
- The Malfunction Indicator Lamp (MIL) will not illuminate.
- The PCM will record operating conditions at the time the diagnostic fails. This information will be stored in Failure Records.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL OFF after three consecutive drive trips that the diagnostic runs and does not fail.
- A last test failed (Current DTC) will clear when the ignition is cycled and the diagnostic runs and does not fail.
- A History DTC will clear after forty consecutive warm-up cycles, if no failures are reported by this or any other emission related diagnostic.
- PCM battery voltage is interrupted.
- Using a Scan tool.

Diagnostic Aids

Using Freeze Frame and/or Failure Records data may aid in locating an intermittent condition. If the DTC cannot be duplicated, the information included in the Freeze Frame and/or Failure Records data can be useful in determining how many miles since the DTC set. The Fail Counter and Pass Counter can also be used to determine how many ignition cycles the diagnostic reported a pass and/or a fail. Operate vehicle within the same freeze frame conditions (RPM, load, vehicle speed, temperature etc.) that were noted. This will isolate when the DTC failed. For intermittents, refer to *Symptoms*.

Test Description

Number(s) below refer to step numbers on the diagnostic table.

2. Listen for an audible click when the relay operates. Be sure that both the ON and the OFF states are commanded. Repeat the commands as necessary.
3. This check can detect a partially shorted coil which would cause excessive current flow. Leaving the circuit energized for 2 minutes allows the coil to warm up. When warm the coil may open (Amps drop to 0), or short (goes above 0.75 Amp).
5. It is important to identify and test the relay coil terminals to avoid improper diagnosis.
13. If no trouble is found in the control circuit or the connection at the PCM, the PCM may be faulty, however, this is an extremely unlikely failure.

DTC P1545 A/C Clutch Relay Control Circuit

Step	Action	Value(s)	Yes	No
1	Was the Powertrain On-Board Diagnostic (OBD) System Check performed?	—	Go to Step 2	Go to Powertrain OBD System Check
2	1. Turn the ignition ON, engine OFF. 2. Using a Scan tool, command the relay ON and OFF. Does the relay turn ON and OFF with each command?	—	Go to Step 3	Go to Step 5
3	1. Turn the ignition OFF. 2. Disconnect the PCM connector containing the relay control circuit. 3. Turn the ignition ON. 4. Using DVM J 39200 on 10 Amp scale, measure current from the relay control circuit in the PCM harness connector to ground for 2 minutes. Does the current draw measure less than the value shown (but not 0)?	0.75 A	Go to Diagnostic Aids	Go to Step 4
4	1. Turn the ignition OFF. 2. Disconnect the relay. 3. Using DVM J 39200, measure resistance from the relay control circuit in the PCM harness connector to ground. Does the DVM display infinite resistance?	—	Go to Step 12	Go to Step 10
5	1. Turn the ignition OFF. 2. Disconnect the relay. 3. Connect the test light J 34142-B between the relay coil terminals in the relay harness connector. 4. Turn the ignition ON. 5. Using a Scan tool, command the relay ON and OFF. Does the test light turn ON and OFF with each command?	—	Go to Step 8	Go to Step 6
6	With the test light connected to ground, probe the battery feed circuits in the relay harness connector. Is the test light ON both terminals?	—	Go to Step 7	Go to Step 11
7	1. Turn the ignition OFF. 2. Reconnect the relay. 3. Disconnect the PCM connector containing the relay control circuit. 4. Turn the ignition ON. 5. With a fused jumper wire connected to ground, probe the relay control circuit in the PCM harness connector. Does the relay operate?	—	Go to Step 9	Go to Step 10
8	Check the connections at the relay. Was a problem found and corrected?	—	Go to Step 14	Go to Step 12
9	Check the connections at the PCM. Was a problem found and corrected?	—	Go to Step 14	Go to Step 13
10	Repair faulty relay control circuit. Is the action complete?	—	Go to Step 14	—
11	Repair the faulty relay battery feed circuit. Is the action complete?	—	Go to Step 14	—

DTC P1545 A/C Clutch Relay Control Circuit (cont'd)

Step	Action	Value(s)	Yes	No
12	Replace the relay. Is the action complete?	—	Go to Step 14	—
13	Important: Replacement PCM must be programmed. Refer to <i>PCM Replacement/Programming</i> . Replace the PCM. Is the action complete?	—	Go to Step 14	—
14	1. Using the scan tool, select DTC, Clear Info. 2. Start the engine and idle at normal operating temperature. 3. Select DTC, Specific, then enter the DTC number which was set. 4. Operate the vehicle within the conditions for setting this DTC as specified in the supporting text, if applicable. Does the scan tool indicate that this test ran and passed?	—	Go to Step 15	Go to Step 2
15	Using the scan tool, select Capture Info, Review Info. Are any DTCs displayed that have not been diagnosed?	—	Go to the applicable DTC table	System OK

DTC P1546 A/C Clutch Status Circuit Low Voltage

Circuit Description

When the PCM detects that A/C has been requested, the PCM will activate the A/C clutch relay. When the relay has been activated, voltage should be present at both the A/C compressor clutch and the A/C clutch status circuit at the PCM. For the A/C system schematic refer to *A/C Controls - C60* or *A/C Controls - C67 and C68*.

Conditions for Setting the DTC

The PCM has commanded the A/C ON and no voltage is detected on the A/C clutch status line for more than 5.0 seconds.

Action Taken When the DTC Sets

- The DTC will be stored in the PCM memory when the diagnostic runs and fails.
- The Malfunction Indicator Lamp (MIL) will not illuminate.
- The PCM will record operating conditions at the time the diagnostic fails. This information will be stored in Failure Records.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL OFF after three consecutive drive trips that the diagnostic runs and does not fail.
- A last test failed (Current DTC) will clear when the ignition is cycled and the diagnostic runs and does not fail.
- A History DTC will clear after forty consecutive warm-up cycles, if no failures are reported by this or any other emission related diagnostic.
- PCM battery voltage is interrupted.
- Using a Scan tool.

Diagnostic Aids

Using Freeze Frame and/or Failure Records data may aid in locating an intermittent condition. If the DTC cannot be duplicated, the information included in the Freeze Frame and/or Failure Records data can be useful in determining how many miles since the DTC set. The Fail Counter and Pass Counter can also be used to determine how many ignition cycles the diagnostic reported a pass and/or a fail. Operate vehicle within the same freeze frame conditions (RPM, load, vehicle speed, temperature etc.) that were noted. This will isolate when the DTC failed. For intermittents, refer to *Symptoms*.

Test Description

Number(s) below refer to step numbers on the diagnostic table.

2. A problem that may prevent the compressor from engaging may or may not cause a DTC P1546.
3. If the scan tool displays that the A/C Status is ON, indicates that the status circuit is OK.
4. Using Freeze Frame and/or Failure Records data may aid in locating an intermittent condition. If the DTC cannot be duplicated, the information included in the Freeze Frame and/or Failure Records data can be useful in determining how many miles since the DTC set. The Fail Counter and Pass Counter can also be used to determine how many ignition cycles the diagnostic reported a pass and/or a fail. Operate vehicle within the same freeze frame conditions (RPM, load, vehicle speed, temperature etc.) that were noted. This will isolate when the DTC failed.
5. Checks whether ignition voltage is available at the relay.
6. Determines if the A/C relay is at fault or the A/C status circuit is at fault. If the A/C clutch engages, indicates that the A/C Status circuit is OK.

DTC P1546 A/C Clutch Status Circuit Low Voltage

Step	Action	Value(s)	Yes	No
1	Was the Powertrain On-Board Diagnostic (OBD) System Check performed?	—	Go to Step 2	Go to Powertrain OBD System Check
2	1. Install the scan tool. 2. Start and idle the engine with the A/C ON. Does the A/C clutch operate properly?	—	Go to Step 3	Go to Step 5
3	Using a scan tool, monitor A/C Status display on the Engine 1 Data List. Does the scan tool indicate A/C Status as ON?	—	Go to Step 4	Go to Step 8
4	1. Turn the ignition ON, engine OFF, review Freeze Frame and/or Failure Records data for this DTC and note parameters. 2. Turn the ignition OFF for 15 seconds. 3. Start the engine and operate the vehicle within the conditions required for this diagnostic to run, and as close to the conditions recorded in Freeze Frame/Failure Records as possible. Special operating conditions that need to be met before the PCM will run this diagnostic, where applicable, are listed in Conditions for Setting the DTC. 4. Using the scan tool, select DTC, Specific, then enter the DTC number which was set. Does the scan tool indicate that this diagnostic failed this ignition?	—	Go to Step 5	Go to Diagnostic Aids
5	1. Turn the ignition OFF 2. Disconnect A/C clutch relay. 3. Turn the ignition ON, engine OFF. 4. Probe the ignition feed circuit at the A/C relay terminal (switch side of relay) with a test light (J 34142-B) to ground. Does the test light illuminate?	—	Go to Step 6	Go to Step 9
6	Using a fused jumper wire, jump the ignition feed circuit to the A/C clutch status circuit at the A/C clutch relay electrical harness. Does the A/C clutch engage?	—	Go to Step 7	Go to Step 10
7	Repair the faulty A/C clutch relay connection or faulty A/C clutch relay. Refer to <i>A/C Relay replacement</i> . Is the action complete?	—	Go to Step 12	—
8	Repair the open A/C clutch status circuit from the splice to the PCM. Was the condition found and corrected?	—	Go to Step 12	Go to Step 11
9	Repair the open ignition feed circuit to A/C relay. Is the action complete?	—	Go to Step 12	—
10	Repair the open in A/C status circuit from A/C relay to splice. Is the action complete?	—	Go to Step 12	—
11	Important: Replacement PCM must be programmed. Refer to <i>PCM Replacement/Programming</i> . Replace the PCM. Is the action complete?	—	Go to Step 12	—

DTC P1546 A/C Clutch Status Circuit Low Voltage (cont'd)

Step	Action	Value(s)	Yes	No
12	- Using the scan tool, select DTC, Clear Info. - Start the engine and idle at normal operating temperature. - Select DTC, Specific, then enter the DTC number which was set. - Operate the vehicle within the conditions for setting this DTC as specified in the supporting text, if applicable. Does the scan tool indicate that this test ran and passed?	—	<i>Go to Step 13</i>	<i>Go to Step 2</i>
13	Using the scan tool, select Capture Info, Review Info. Are any DTCs displayed that have not been diagnosed?	—	Go to the applicable DTC table	System OK

DTC P1641 FC Relay 1 Control Circuit**Circuit Description**

Ignition voltage is supplied directly to the Cooling Fan relay coil. The PCM controls the relay by grounding the control circuit via an internal switch called a driver. The primary function of the driver is to supply the ground for the component being controlled. Each driver has a fault line which is monitored by the PCM. When the PCM is commanding a component ON, the voltage of the control circuit should be low (near 0 volts). When the PCM is commanding the control circuit to a component OFF, the voltage potential of the circuit should be high (near battery voltage). If the fault detection circuit senses a voltage other than what is expected, the fault line status will change causing the DTC to set.

The relay is used to control the high current flow to the cooling fan motors. This allows the PCM driver to only have to handle the relatively low current used by the relay. For the Cooling Fan schematic, refer to *Fan Controls-w/o VO8*.

Conditions for Setting the DTC

- DTCs P0117, P0118, P1539 not set.
- Engine speed greater than 600 RPM.
- The PCM detects that the commanded state of the driver and the actual state of the control circuit do not match.
- Condition must be present for a minimum of 5 seconds.

Action Taken When the DTC Sets

- The PCM will illuminate the Malfunction Indicator Lamp (MIL) when the diagnostic runs and fails.
- The PCM will record operating conditions at the time the diagnostic fails. This information will be stored in the Freeze Frame and/or Failure Records.
- The injector will be disabled for the entire ignition cycle.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL OFF after three consecutive drive trips that the diagnostic runs and does not fail.
- A last test failed (Current DTC) will clear when the diagnostic runs and does not fail.
- A History DTC will clear after forty consecutive warm-up cycles, if no failures are reported by this or any other emission related diagnostic.
- PCM battery voltage is interrupted.
- Using a Scan tool.

Diagnostic Aids

Using Freeze Frame and/or Failure Records data may aid in locating an intermittent condition. If the DTC cannot be duplicated, the information included in the Freeze Frame and/or Failure Records data can be useful in determining how many miles since the DTC set. The Fail Counter and Pass Counter can also be used to determine how many ignition cycles the diagnostic reported a pass and/or a fail. Operate vehicle within the same freeze frame conditions (RPM, load, vehicle speed, temperature etc.) that were noted. This will isolate when the DTC failed. For intermittents, refer to *Symptoms*.

Test Description

Number(s) below refer to step numbers on the diagnostic table.

2. Listen for an audible click when the relay operates. Be sure that both the ON and the OFF states are commanded. Repeat the commands as necessary.
3. This check can detect a partially shorted coil which would cause excessive current flow. Leaving the circuit energized for 2 minutes allows the coil to warm up. When warm the coil may open (Amps drop to 0), or short (goes above .75 Amp).
5. It is important to identify and test the relay coil terminals to avoid improper diagnosis.
13. If no trouble is found in the control circuit or the connection at the PCM, the PCM may be faulty, however, this is an extremely unlikely failure.

DTC P1641 FC Relay 1 Control Circuit

DTC P1642 FC Relay 2 Control Circuit

Circuit Description

Ignition voltage is supplied directly to the Cooling Fan relay coil. The PCM controls the relay by grounding the control circuit via an internal switch called a driver. The primary function of the driver is to supply the ground for the component being controlled. Each driver has a fault line which is monitored by the PCM. When the PCM is commanding a component ON, the voltage of the control circuit should be low (near 0 volts). When the PCM is commanding the control circuit to a component OFF, the voltage potential of the circuit should be high (near battery voltage). If the fault detection circuit senses a voltage other than what is expected, the fault line status will change causing the DTC to set.

The relay is used to control the high current flow to the cooling fan motors. This allows the PCM driver to only have to handle the relatively low current used by the relay. For the Cooling Fan schematic, refer to *Fan Controls-w/o VO8* or *Fan Controls-With VO8*.

Conditions for Setting the DTC

- DTCs P0117, P0118, P1539 not set.
- Engine speed greater than 600 RPM.
- The PCM detects that the commanded state of the driver and the actual state of the control circuit do not match.
- Condition must be present for a minimum of 5 seconds.

Action Taken When the DTC Sets

- The PCM will illuminate the Malfunction Indicator Lamp (MIL) when the diagnostic runs and fails.
- The PCM will record operating conditions at the time the diagnostic fails. This information will be stored in the Freeze Frame and/or Failure Records.
- The injector will be disabled for the entire ignition cycle.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL OFF after three consecutive drive trips that the diagnostic runs and does not fail.
- A last test failed (Current DTC) will clear when the diagnostic runs and does not fail.
- A History DTC will clear after forty consecutive warm-up cycles, if no failures are reported by this or any other emission related diagnostic.
- PCM battery voltage is interrupted.
- Using a Scan tool.

Diagnostic Aids

Using Freeze Frame and/or Failure Records data may aid in locating an intermittent condition. If the DTC cannot be duplicated, the information included in the Freeze Frame and/or Failure Records data can be useful in determining how many miles since the DTC set. The Fail Counter and Pass Counter can also be used to determine how many ignition cycles the diagnostic reported a pass and/or a fail. Operate vehicle within the same freeze frame conditions (RPM, load, vehicle speed, temperature etc.) that were noted. This will isolate when the DTC failed. For intermittents, refer to *Symptoms*.

Test Description

Number(s) below refer to step numbers on the diagnostic table.

2. Listen for an audible click when the relay operates. Be sure that both the ON and the OFF states are commanded. Repeat the commands as necessary.
3. This check can detect a partially shorted coil which would cause excessive current flow. Leaving the circuit energized for 2 minutes allows the coil to warm up. When warm the coil may open (Amps drop to 0), or short (goes above .75 Amp).
5. It is important to identify and test the relay coil terminals to avoid improper diagnosis.
13. If no trouble is found in the control circuit or the connection at the PCM, the PCM may be faulty, however, this is an extremely unlikely failure.

DTC P1643 Engine Speed Output Circuit

30390

Circuit Description

Voltage is applied to the Engine Speed Output circuit by the PCM. The PCM creates the Vehicle Speed Output signal by rapidly grounding this circuit via an internal switch called a driver. The driver operates at the same rate as the Low Resolution signal input. The other components on this circuit recognize the voltage being pulled to ground as an indication of engine speed.

The primary function of the driver is to supply the ground for the component being controlled. Each driver has a fault line which is monitored by the PCM. When the PCM is commanding a component ON, the voltage of the control circuit should be low (near 0 volts). When the PCM is commanding the control circuit to a component OFF, the voltage potential of the circuit should be high (near battery voltage). If the fault detection circuit senses a voltage other than what is expected, the fault line status will change causing the DTC to set.

Conditions for Setting the DTC

- Engine speed greater than 600 RPM.
- The PCM detects that the commanded state of the driver and the actual state of the control circuit do not match.
- Condition must be present for a minimum of 25.5 seconds.

Action Taken When the DTC Sets

- The DTC will be stored in the PCM memory when the diagnostic runs and fails.
- The Malfunction Indicator Lamp (MIL) will not illuminate.
- The PCM will record operating conditions at the time the diagnostic fails. This information will be stored in Failure Records.

Conditions for Clearing the MIL/DTC

- A history DTC will clear after 40 consecutive warm-up cycles, if no failures are reported by this or any other non-emission related diagnostic.
- A last test failed (Current DTC) will clear when the diagnostic runs and does not fail.
- PCM battery voltage is interrupted.
- Using a scan tool.

Diagnostic Aids

Using Freeze Frame and/or Failure Records data may aid in locating an intermittent condition. If the DTC cannot be duplicated, the information included in the Freeze Frame and/or Failure Records data can be useful in determining how many miles since the DTC set. The Fail Counter and Pass Counter can also be used to determine how many ignition cycles the diagnostic reported a pass and/or a fail. Operate vehicle within the same freeze frame conditions (RPM, load, vehicle speed, temperature etc.) that were noted. This will isolate when the DTC failed. For intermittents, refer to *Symptoms*.

Test Description

Number(s) below refer to step numbers on the diagnostic table.

3. Further circuit diagnosis may require I/P removal. The circuit from the PCM to the tachometer must be checked for being open, shorted to ground or voltage. If no trouble is found, follow the appropriate I/P diagnostic procedure.

DTC P1643 Engine Speed Output Circuit

Step	Action	Value(s)	Yes	No
1	Was the Powertrain On-Board Diagnostic (OBD) System Check performed?	—	Go to Step 2	Go to Powertrain OBD System Check
2	With the engine running, does the vehicles tachometer indicate engine RPM?	—	No trouble found. Go to Diagnostic Aids	Go to Step 3
3	1. Turn the ignition OFF. 2. Disconnect PCM connector C1. 3. Install the Signal Generator Tester (J 33431-B) to PCM harness connector terminal C1-13 (one terminal connected to terminal C1-13 and the other to ground). 4. Turn the ignition ON, Tester ON and set to generate a tachometer signal. Does the vehicles tachometer indicate an RPM reading?	—	Go to Step 4	Further diagnosis of circuit required. Go to Repair Procedure in Electrical Diagnosis (8A Cell 82)
4	Check for faulty connections at the PCM. Was a problem found and corrected?	—	Go to Step 6	Go to Step 5
5	Important: Replacement PCM must be programmed. Refer to <i>PCM Replacement/Programming</i> . Replace the PCM. Is the action complete?	—	Go to Step 6	—
6	1. Using the scan tool, select DTC, Clear Info. 2. Start the engine and idle at normal operating temperature. 3. Select DTC, Specific, then enter the DTC number which was set. 4. Operate the vehicle within the conditions for setting this DTC as specified in the supporting text, if applicable. Does the scan tool indicate that this test ran and passed?	—	Go to Step 7	Go to Step 2
7	Using the scan tool, select Capture Info, Review Info. Are any DTCs displayed that have not been diagnosed?	—	Go to the applicable DTC table	System OK

DTC P1652 VSS Output Circuit

30397

Circuit Description

Voltage is applied to the Vehicle Speed Output circuit by the various components which use vehicle speed data. The PCM creates the Vehicle Speed Output signal by rapidly grounding this circuit via an internal switch called a driver. The driver operates at the same rate as the VSS signal input. The various components recognize the voltage being pulled to ground as an indication of vehicle speed.

The primary function of the driver is to supply the ground for the component being controlled. Each driver has a fault line which is monitored by the PCM. When the PCM is commanding a component ON, the voltage of the control circuit should be low

(near 0 volts). When the PCM is commanding the control circuit to a component OFF, the voltage potential of the circuit should be high (near battery voltage). If the fault detection circuit senses a voltage other than what is expected, the fault line status will change causing the DTC to set.

Conditions for Setting the DTC

- Engine speed greater than 600 RPM.
- The PCM detects that the commanded state of the driver and the actual state of the control circuit do not match.
- Condition must be present for a minimum of 25.5 seconds.

Action Taken When the DTC Sets

- The DTC will be stored in the PCM memory when the diagnostic runs and fails.
- The Malfunction Indicator Lamp (MIL) will not illuminate.
- The PCM will record operating conditions at the time the diagnostic fails. This information will be stored in Failure Records.

Conditions for Clearing the MIL/DTC

- A history DTC will clear after 40 consecutive warm-up cycles, if no failures are reported by this or any other non-emission related diagnostic.
- A last test failed (Current DTC) will clear when the diagnostic runs and does not fail.
- PCM battery voltage is interrupted.
- Using a scan tool.

Diagnostic Aids

Using Freeze Frame and/or Failure Records data may aid in locating an intermittent condition. If the DTC cannot be duplicated, the information included in the Freeze Frame and/or Failure Records data can be useful in determining how many miles since the DTC set. The Fail Counter and Pass Counter can also be used to determine how many ignition cycles the diagnostic reported a pass and/or a fail. Operate vehicle within the same freeze frame conditions (RPM, load, vehicle speed, temperature etc.) that were noted. This will isolate when the DTC failed. For intermittents, refer to *Symptoms*.

Test Description

Number(s) below refer to step numbers on the diagnostic table.

3. Further circuit diagnosis may require I/P removal. The circuit from the PCM to the speedometer must be checked for being open, shorted to ground or voltage. If no trouble is found, follow the appropriate I/P diagnostic procedure.

DTC P1652 VSS Output Circuit

Step	Action	Value(s)	Yes	No
1	Was the Powertrain On-Board Diagnostic (OBD) System Check performed?	—	Go to Step 2	Go to Powertrain OBD System Check
2	Important: Do Not perform this test without supporting the lower control arms so that the drive axles are in a normal horizontal position. Running the vehicle with the wheels hanging down at full travel may damage the drive axles. 1. Turn the ignition OFF. 2. Raise the drive wheels. 3. Start the engine. 4. Disable ASR/TCS systems (if so equipped). 5. Engine idling in gear. Does the vehicles speedometer indicate vehicle speed?	—	Go to Diagnostic Aids	Go to Step 3
3	1. Turn the ignition OFF. 2. Disconnect the PCM connector C2. 3. Install the Signal Generator Tester (J 33431-B) to PCM harness connector terminal C2-8 (one terminal connected to terminal C2-8 and the other to ground). 4. Turn the ignition ON, Tester ON and set to generate a vehicle speed signal. Does the vehicles speedometer indicate vehicle speed?	—	Go to Step 4	Further diagnosis of circuit required. Go to- Section 8A-33
4	Check for faulty connections at the PCM. Was a problem found and corrected?	—	Go to Step 6	Go to Step 5

DTC P1652 VSS Output Circuit (cont'd)

Step	Action	Value(s)	Yes	No
5	Important: The replacement PCM must be programmed. Refer to <i>PCM Replacement/Programming</i> . Replace the PCM. Is the action complete?	—	Go to Step 6	—
6	1. Using the scan tool, select DTC, Clear Info. 2. Start the engine and idle at normal operating temperature. 3. Select DTC, Specific, then enter the DTC number which was set. 4. Operate the vehicle within the conditions for setting this DTC as specified in the supporting text, if applicable. Does the scan tool indicate that this test ran and passed?	—	Go to Step 7	Go to Step 2
7	Using the scan tool, select Capture Info, Review Info. Are any DTCs displayed that have not been diagnosed?	—	Go to the applicable DTC table	System OK

DTC P1653 Oil Level Lamp Control Circuit

30428

Circuit Description

Ignition voltage is supplied directly to the Oil Level Lamp. The PCM controls the lamp by grounding the control circuit via an internal switch called a driver. The primary function of the driver is to supply the ground for the component being controlled. Each driver has a fault line which is monitored by the PCM. When the PCM is commanding a component ON, the voltage of the control circuit should be low (near 0 volts). When the PCM is commanding the control circuit to a component OFF, the voltage potential of the circuit should be high (near battery voltage). If the fault detection circuit senses a voltage other than what is expected, the fault line status will change causing the DTC to set.

Conditions for Setting the DTC

- Engine speed greater than 600 RPM.

- The PCM detects that the commanded state of the driver and the actual state of the control circuit do not match.
- Condition must be present for a minimum of 5 seconds.

Action Taken When the DTC Sets

- DTC P1653 will be stored in the PCM memory when the diagnostic runs and fails.
- The Malfunction Indicator Lamp (MIL) will not illuminate.
- The PCM will record operating conditions at the time the diagnostic fails. This information will be stored in Failure Records.

Conditions for Clearing the MIL/DTC

- If no failures are reported by this or any other non-emission related diagnostic.

- A last test failed (Current DTC) will clear when the diagnostic runs and does not fail.
- PCM battery voltage is interrupted.
- Using a Scan tool.

Diagnostic Aids

Using Freeze Frame and/or Failure Records data may aid in locating an intermittent condition. If the DTC cannot be duplicated, the information included in the Freeze Frame and/or Failure Records data can be useful in determining how many miles since the DTC set. The Fail Counter and Pass Counter can also be used to determine how many ignition cycles the diagnostic reported a pass and/or a fail. Operate

vehicle within the same freeze frame conditions (RPM, load, vehicle speed, temperature etc.) that were noted. This will isolate when the DTC failed.

Test Description

Number(s) below refer to step numbers on the diagnostic table.

2. Be sure that both the ON and the OFF states are commanded. Repeat the commands as necessary.
8. If no trouble is found in the control circuit or the connection at the PCM, the PCM may be faulty, however, this is an extremely unlikely failure.

DTC P1653 Oil Level Lamp Control Circuit

Step	Action	Value(s)	Yes	No
1	Was the Powertrain On-Board Diagnostic (OBD) System Check performed?	—	Go to Step 2	Go to Powertrain OBD System Check
2	1. Turn the ignition ON, engine OFF. 2. Using a Scan tool, command the lamp ON and OFF. Does the lamp turn ON and OFF with each command?	—	Go to Diagnostic Aids	Go to Step 3
3	1. Turn the ignition OFF. 2. Disconnect the PCM connector containing the lamp control circuit. 3. Turn the ignition ON. Is the lamp OFF?	—	Go to Step 4	Go to Step 5
4	With a fused jumper wire connected to ground, probe the lamp control circuit in the PCM harness connector. Is the lamp ON?	—	Go to Step 6	Go to Step 7
5	Repair the lamp control circuit for a short to ground. Is the repair complete?	—	Go to Step 9	—
6	Check the connections at the PCM. Was a problem found and corrected?	—	Go to Step 9	Go to Step 8
7	Check for the following conditions: • Faulty bulb (refer to <i>Section 8A</i>). • Open ignition feed to the bulb (refer to <i>Section 8A</i>). • Control circuit open or shorted to B+. Is the repair complete?	—	Go to Step 9	—
8	Important: Replacement PCM must be programmed. Refer to <i>PCM Replacement/Programming</i> Replace the PCM. Is the action complete?	—	Go to Step 9	—
9	1. Using the scan tool, select DTC, Clear Info. 2. Start engine and idle at normal operating temperature. 3. Select DTC, Specific, then enter the DTC number which was set. 4. Operate vehicle within the conditions for setting this DTC as specified in the supporting text, if applicable. Does the scan tool indicate that this test ran and passed?	—	Go to Step 10	Go to Step 2
10	Using the scan tool, select Capture Info, Review Info. Are any DTCs displayed that have not been diagnosed?	—	Go to the applicable DTC table	System OK

DTC P1661 MIL Control Circuit

30387

Circuit Description

Ignition voltage is supplied directly to the Malfunction Indicator Lamp. The PCM controls the lamp by grounding the control circuit via an internal switch called a driver. The primary function of the driver is to supply the ground for the component being controlled. Each driver has a fault line which is monitored by the PCM. When the PCM is commanding a component ON, the voltage of the control circuit should be low (near 0 volts). When the PCM is commanding the control circuit to a component OFF, the voltage potential of the circuit should be high (near battery voltage). If the fault detection circuit senses a voltage other than what is expected, the fault line status will change causing the DTC to set.

Conditions for Setting the DTC

- Engine speed greater than 600 RPM.
- The PCM detects that the commanded state of the driver and the actual state of the control circuit do not match.
- Condition must be present for a minimum of 5 seconds.

Action Taken When the DTC Sets

- The PCM will turn the Malfunction Indicator Lamp (MIL) driver ON when the diagnostic runs and fails. If the MIL circuit becomes operational, the MIL will be 'ON'. Regardless of whether the MIL actually illuminates or not, DTC P1661 will be stored in the PCM memory.
- The PCM will record operating conditions at the time the diagnostic fails. This information will be stored in the Freeze Frame and/or Failure Records.

Conditions for Clearing the MIL/DTC

- The PCM will turn the MIL OFF after three consecutive drive trips that the diagnostic runs and does not fail.
- A last test failed (Current DTC) will clear when the diagnostic runs and does not fail.
- A History DTC will clear after forty consecutive warm-up cycles, if no failures are reported by this or any other emission related diagnostic.
- PCM battery voltage is interrupted.
- Using a Scan tool.

Diagnostic Aids

- If the ignition feed circuit is suspected of being open, check if other bulbs on that circuit illuminate.
- Using Freeze Frame and/or Failure Records data may aid in locating an intermittent condition. If the DTC cannot be duplicated, the information included in the Freeze Frame and/or Failure Records data can be useful in determining how many miles since the DTC set. The Fail Counter and Pass Counter can also be used to determine how many ignition cycles the diagnostic reported a pass and/or a fail. Operate vehicle within the same freeze frame conditions (RPM, load, vehicle speed, temperature etc.) that were noted. This will isolate when the DTC failed.

Test Description

Number(s) below refer to step numbers on the diagnostic table.

2. Be sure that both the ON and the OFF states are commanded. Repeat the commands as necessary.
8. If no trouble is found in the control circuit or the connection at the PCM, the PCM may be faulty, however, this is an extremely unlikely failure.

DTC P1661 MIL Control Circuit

Step	Action	Value(s)	Yes	No
1	Was the Powertrain On-Board Diagnostic (OBD) System Check performed?	—	Go to Step 2	Go to Powertrain OBD System Check
2	1. Turn the ignition ON, engine OFF. 2. Using the Scan tool, command the lamp ON and OFF. Does the lamp turn ON and OFF with each command?	—	Go to Diagnostic Aids - DTC P1661 MIL Control Circuit	Go to Step 3
3	1. Turn the ignition OFF. 2. Disconnect the PCM connector containing the lamp control circuit. 3. Turn the ignition ON. Is the lamp OFF?	—	Go to Step 4	Go to Step 5
4	With a fused jumper wire connected to ground, probe the lamp control circuit in the PCM harness connector. Is the lamp ON?	—	Go to Step 6	Go to Step 7
5	Repair the short to ground in the lamp control circuit. Is the repair complete?	—	Go to Step 9	—
6	Check the connections at the PCM. Was a problem found and corrected?	—	Go to Step 9	Go to Step 8
7	Check for the following conditions: • Faulty bulb • Open ignition feed to the bulb • Control circuit open or shorted to B+. Refer to <i>Repair Procedures in Electrical Diagnosis (8A Cell 5)</i> . Is the repair complete?	—	Go to Step 9	—
8	Important: Replacement PCM must be programmed. Refer to <i>PCM Replacement/Programming</i> . Replace the PCM. Is the action complete?	—	Go to Step 9	—

DTC P1661 MIL Control Circuit (cont'd)

Step	Action	Value(s)	Yes	No
9	1. Using the scan tool, select DTC, Clear Info. 2. Start the engine and idle at normal operating temperature. 3. Select DTC, Specific, then enter the DTC number which was set. 4. Operate the vehicle within the conditions for setting this DTC as specified in the supporting text, if applicable. Does the scan tool indicate that this test ran and passed?	—	Go to Step 10	Go to Step 2
10	Using the scan tool, select Capture Info, Review Info. Are any DTCs displayed that have not been diagnosed?	—	Go to the applicable DTC table	System OK

DTC P1663 Oil Life Lamp Control Circuit

30428

Circuit Description

Ignition voltage is supplied directly to the Change Oil lamp. The PCM controls the lamp by grounding the control circuit via an internal switch called a driver. The primary function of the driver is to supply the ground for the component being controlled. Each driver has a fault line which is monitored by the PCM. When the PCM is commanding a component ON, the voltage of the control circuit should be low (near 0 volts). When the PCM is commanding the control circuit to a component OFF, the voltage potential of the circuit should be high (near battery voltage). If the fault detection circuit senses a voltage other than what is expected, the fault line status will change causing the DTC to set.

The PCM uses the distance the vehicle has traveled, Engine Coolant Temperature (ECT), engine oil temperature and engine revolutions to calculate oil

life. Once a calibrated value is attained, the PCM will ground the lamp control circuit and the Change Oil lamp will illuminate.

The maximum mileage that can be accumulated before the PCM illuminates the Change Oil lamp is 7500 miles. However, the lamp may come ON sooner depending on engine load and temperature (trailer towing, high ambient temperatures, etc.).

Conditions for Setting the DTC

- Engine speed greater than 600 RPM.
- The PCM detects that the commanded state of the driver and the actual state of the control circuit do not match.
- Condition must be present for a minimum of 5 seconds.

Action Taken When the DTC Sets

- DTC P1663 will be stored in the PCM memory when the diagnostic runs and fails.
- The Malfunction Indicator Lamp (MIL) will not illuminate.
- The PCM will record operating conditions at the time the diagnostic fails. This information will be stored in Failure Records.

Conditions for Clearing the MIL/DTC

- If no failures are reported by this or any other non-emission related diagnostic.
- A last test failed (Current DTC) will clear when the diagnostic runs and does not fail.
- PCM battery voltage is interrupted.
- Using a Scan tool.

Diagnostic Aids

Using Freeze Frame and/or Failure Records data may aid in locating an intermittent condition. If the DTC cannot be duplicated, the information included

in the Freeze Frame and/or Failure Records data can be useful in determining how many miles since the DTC set. The Fail Counter and Pass Counter can also be used to determine how many ignition cycles the diagnostic reported a pass and/or a fail. Operate vehicle within the same freeze frame conditions (RPM, load, vehicle speed, temperature etc.) that were noted. This will isolate when the DTC failed.

Test Description

Number(s) below refer to step numbers on the diagnostic table.

2. Be sure that both the ON and the OFF states are commanded. Repeat the commands as necessary.
8. If no trouble is found in the control circuit or the connection at the PCM, the PCM may be faulty, however, this is an extremely unlikely failure.

DTC P1663 Oil Life Lamp Control Circuit

Step	Action	Value(s)	Yes	No
1	Was the Powertrain On-Board Diagnostic (OBD) System Check performed?	—	Go to Step 2	Go to Powertrain OBD System Check
2	1. Turn the Ignition ON, engine OFF. 2. Using a Scan tool, command the lamp ON and OFF. Does the lamp turn ON and OFF with each command?	—	Go to Diagnostic Aids	Go to Step 3
3	1. Turn the ignition OFF. 2. Disconnect the PCM connector containing the lamp control circuit. 3. Turn the ignition ON. Is the lamp OFF?	—	Go to Step 4	Go to Step 5
4	With a fused jumper wire connected to ground, probe the lamp control circuit in the PCM harness connector. Is the lamp ON?	—	Go to Step 6	Go to Step 7
5	Repair the lamp control circuit for a short to ground. Is the repair complete?	—	Go to Step 9	—
6	Check connections at the PCM. Was a problem found and corrected?	—	Go to Step 9	Go to Step 8
7	Check for the following conditions: • Faulty bulb (refer to Section 8A). • Open ignition feed to the bulb (refer to Section 8A). • Control circuit open or shorted to B+. Is the repair complete?	—	Go to Step 9	—
8	Important: Replacement PCM must be programmed. Refer to PCM Replacement/Programming. Replace the PCM. Is the action complete?	—	Go to Step 9	—

DTC P1663 Oil Life Lamp Control Circuit (cont'd)

Step	Action	Value(s)	Yes	No
9	1. Using the scan tool, select DTC, Clear Info. 2. Start engine and idle at normal operating temperature. 3. Select DTC, Specific, then enter the DTC number which was set. 4. Operate vehicle within the conditions for setting this DTC as specified in the supporting text, if applicable. Does the scan tool indicate that this test ran and passed?	—	Go to Step 10	Go to Step 2
10	Using the scan tool, select Capture Info, Review Info. Are any DTCs displayed that have not been diagnosed?	—	Go to the applicable DTC table	System OK

Symptoms

Important Preliminary Checks Before Starting

Before using the Symptom Tables, you should have performed the *Powertrain OBD System Check* and verify all of the following are true:

- The PCM and MIL (Service Engine Soon) are operating correctly.
- There are no DTC(s) stored.
- Scan data is within normal operating range, refer to *Engine Scan Tool Data List*
- Verify the customer complaint, and locate the correct symptom in the table of contents. Check the items indicated under that symptom.

Several of the symptom procedures call for a Careful Visual/Physical Check. The importance of this step cannot be stressed too strongly – it can lead to correcting a problem without further checks and can save valuable time. This check should include:

- PCM grounds for being clean, tight, and in their proper location.
- Vacuum hoses for splits, kinks, and proper connections, as shown on the Vehicle Emission Control Information label. Check thoroughly for any type of leak or restriction.
- Mass Air Flow (MAF) sensor installation. The arrows on the plastic portion of the sensor must point toward the engine.
- Air intake ducts for collapsed or damaged areas.
- Air leaks at throttle body mounting area, Mass Air Flow (MAF) sensor and intake manifold sealing surfaces.
- Ignition wires for cracking, hardness, proper routing and carbon tracking.
- Wiring for proper connections, pinches and cuts.

Intermittents

Problem may or may not turn ON the MIL (Malfunction Indicator Lamp) or store a DTC. DO NOT use the Diagnostic Trouble Code (DTC) tables for intermittent problems. The fault must be present to locate the problem.

Most intermittent problems are caused by faulty electrical connections or wiring. Perform a careful visual/physical check for the following conditions:

- Poor mating of the connector halves or a terminal not fully seated in the connector body (backed out).
- Improperly formed or damaged terminal.

- All connector terminals in the problem circuit should be carefully reformed or replaced to insure proper contact tension.
- Poor terminal to wire connection. This requires removing the terminal from the connector body to check.

Road test the vehicle with a J 39200 Digital Multimeter connected to a suspected circuit. An abnormal voltage when the malfunction occurs, is a good indication that there is a malfunction in the circuit being monitored.

Use a Scan Tool to help detect intermittent conditions. The GM Techline equipment (Scan Tool) have several features that can be used to locate an intermittent condition. Use the following features to find intermittent faults:

- The Snapshot feature can be triggered to capture and store engine parameters within the scan tool when the malfunction occurs. This stored information then can be reviewed by the service technician to see what caused the malfunction.
- Using a Scan Tools Freeze Frame buffer or Failure Records buffer can also aid in locating an intermittent condition. Review and capture the information in the freeze frame or failure record associated with the intermittent DTC being diagnosed. The vehicle can be driven in the conditions that were present when the DTC originally set.

Loss of diagnostic code memory. To check, disconnect MAP sensor and idle engine until the MIL (Malfunction Indicator Lamp) comes ON (The engine speed may require to be increased to 2000 RPM). DTC P0107 should be stored and kept in memory when ignition is turned OFF. If not the PCM is faulty. When this test is completed, DTC P0107 should be cleared from memory.

An intermittent MIL (Malfunction Indicator Lamp) with no stored DTC may be caused by the following:

- Ignition coil shorted to ground and arcing at ignition wires or spark plugs.
- PCM grounds, refer to *PCM wiring diagrams*.

If the intermittent condition exists as a start and then stall, check for DTC(s) relating to the theft deterrent system. Check for improper installation of electrical options such as lights, cellular phones etc.

All Ignition Control (IC) wires should be routed away from secondary ignition wires, distributor, coil, and generator. All wires from the PCM to distributor should have a good connection.

Check for open diode across A/C compressor clutch and for other open diodes.

Hard Start

Checks	Action
DEFINITION: Engine cranks OK, but does not start for a long time. Does eventually run, or may start but immediately dies.	
Preliminary	- Refer to <i>Symptoms</i>, Important Preliminary Checks Before Starting. - Check PCM grounds for being clean, tight and in their proper locations. Refer to <i>PCM wiring diagrams in Electrical Diagnosis</i>. - Search for bulletins.
Sensor/System	- Check Engine Coolant Temperature (ECT) sensor for being shifted in value. Connect a Scan Tool and compare Engine Coolant Temperature with Intake Air Temperature on a cold engine. The ECT and IAT should be within $\pm 3^{\circ}\text{C}$ (5°F) of each other. Check the resistance of the ECT sensor if the temperature is out of range with the IAT sensor. Refer to <i>Temperature vs Resistance</i> for resistance specifications. Replace ECT sensor if the resistance is not within the specification. If the sensor is within the specification, repair ECT signal circuit for high resistance. - Check Mass Air Flow sensor installation. A MAF sensor that is installed in the wrong direction, may cause a hard start. Embossed arrows on the MAF sensor indicate air flow and must point toward the engine. Install MAF in the proper direction. Refer to <i>MAF Sensor, On-Vehicle Service</i>. - Using a Scan Tool, monitor TP sensor voltage. The TP sensor voltage should be less than 0.9 volt. If the TP sensor voltage is greater than 0.9 volt, inspect the ASR/TCS adjuster assembly (if so equipped). Also inspect throttle body and accelerator cables for binding. Refer to <i>Adjuster Assembly Throttle And Cruise Control Cables</i>.
Fuel System	- Check fuel pump relay operation – pump should turn ON for 2 seconds when ignition is turned ON. Refer to <i>Fuel Pump Relay Circuit Diagnosis</i>. - A faulty in-tank fuel pump check valve will allow the fuel in the lines to drain back to the tank after engine is stopped. To check for this condition, refer to <i>Fuel System Diagnosis</i>. - Check both injector fuses for being open. An open injector fuse will cause four injectors not to operate. Replace fuse and inspect injector circuits for an intermittent short to ground. - Check for low fuel pressure. Refer to <i>Fuel System Diagnosis</i>. - Check for restricted fuel filter. Refer to <i>Fuel System Diagnosis</i>. - Check for contaminated fuel. Refer to <i>Alcohol/Contaminants-in-Fuel Testing Procedure</i>.
Ignition System	- Check for proper ignition voltage output with spark tester J 26792. Refer to <i>Distributor Ignition System Check</i>. - Remove spark plugs and check for the following: - Wet plugs - Cracks - Wear - Improper gap - Burned electrodes - Heavy deposits - Refer to <i>Spark Plug Replacement</i>. If spark plugs are gas or oil fouled, the cause of the fouling must be determined before replacing the spark plugs. - Check for bare or shorted ignition wires. Refer to <i>Ignition Wire Replacement</i>. - Check for loose ignition coil ground. Refer to <i>Distributor Ignition System Check</i>. - Spark plugs for proper heat range. Refer to <i>Owners Manual or Section OB</i>. - Check distributor vent system for being restricted or open. Refer to <i>Distributor Vent System Check</i>.

Hard Start (cont'd)

Checks	Action
Engine Mechanical	- Excessive oil in combustion chamber—Leaking valve seals. Refer to <i>Engine Mechanical</i>. - Low cylinder compression. Refer to <i>Engine Mechanical</i>. - Combustion chambers for excessive carbon buildup. Clean using Top engine cleaner. Follow instructions on can. - For incorrect basic engine parts. Inspect the following: - Cylinder heads - Camshaft - Pistons, etc. Refer to <i>Engine Mechanical</i>.
Additional Checks	Using a scan tool, check IAC operation.

Surges/Chuggles

Checks	Action
DEFINITION: Engine power variation under steady throttle or cruise. Feels like the vehicle speeds up and slows down with no change in the accelerator pedal.	
Preliminary	- Refer to <i>Symptoms</i>, Important Preliminary Checks Before Starting. - Search for bulletins. - Check PCM grounds for being clean, tight and in their proper locations. Refer to <i>PCM wiring diagrams in Electrical Diagnosis</i>. - Be sure driver understands transmission torque converter clutch, and A/C compressor operation as explained in the owners manual. Inform customer how TCC and the A/C clutch operates.
Sensor/System	- Check Heated Oxygen Sensors (HO2S). The Heated Oxygen Sensors (HO2S) should respond quickly to different throttle position, if they do not, check the HO2S for silicon or other contaminants from fuel, or use of improper RTV sealant. The sensors may have a white powdery coating and result in a high but false signal voltage (rich exhaust indication). The PCM will then reduce the amount of fuel delivered to the engine causing a severe driveability problem. For more information, refer to <i>Powertrain Control Module</i>. - Check MAF connections. Repair or replace terminals. Refer to <i>Electrical Diagnosis</i> for wiring repair procedures.
Fuel System	- Check for low fuel pressure. Refer to <i>Fuel System Diagnosis</i>. - Check for restricted fuel filter. Refer to <i>Fuel System Diagnosis</i>. - Check for contaminated fuel. Refer to <i>Alcohol/Contaminants-in-Fuel Testing Procedure</i>. - Check each injector harness is connected to the correct injector/cylinder according to the firing order (firing order: 1-8-4-3-6-5-7-2). Relocate injector harnesses as necessary. - Check items which can cause an engine to run rich (long term fuel trim near -14%). For a rich condition, refer to <i>DTC P0132 HO2S Circuit High Voltage Bank1 Sensor1</i> and <i>DTC P0152 HO2S Circuit High Voltage Bank2 Sensor1</i>. - Check items that can cause an engine to run lean (long term fuel trim near 22%). For a lean condition, refer to <i>DTC P0131 HO2S Circuit Low Voltage Bank1 Sensor1</i> and <i>DTC P0151 HO2S Circuit Low Voltage Bank2 Sensor1</i>.

Surges/Chuggles (cont'd)

Checks	Action
Ignition System	- Wetting down the secondary ignition system with water from a spray bottle may help locate damaged or deteriorated components. Look/listen for arcing or misfiring as water is applied. - Check for proper ignition voltage output with spark tester J 26792. Refer to <i>Distributor Ignition System Check</i>. - Remove spark plugs and check for the following: - Wet plugs - Cracks - Wear - Improper gap - Burned electrodes - Heavy deposits - An improper spark plug gap will cause a driveability problem. Refer to <i>Spark Plug Gap specification is Section OB</i>. The spark plug gapping should be done using a wire gauge gap tool (J 41319). Refer to Spark Plug Replacement. If spark plugs are gas or oil fouled, the cause of the fouling must be determined before replacing the spark plugs. Refer to <i>DTC P0172 Fuel Trim System Rich Bank1</i> and <i>DTC P0175 Fuel Trim System Rich Bank2</i> to determine the rich condition or <i>Engine Mechanical</i> for the oil fouling condition. - Check for loose ignition coil ground. Refer to <i>Distributor Ignition System Check</i>. - Spark plugs for proper heat range. Refer to <i>Owners Manual or Section OB</i>. - Check distributor vent system for being restricted or open. Refer to <i>Distributor Vent System Check</i>.
Additional Checks	- Visually (physically) check: Vacuum hoses for splits, kinks, and proper connections and routing as shown on Vehicle Emission Control Information label. - Check TCC operation. TCC applying too soon can cause the engine to spark knock. Refer to <i>Transmission Controls</i>.

Lack of Power, Sluggishness, or Sponginess

Checks	Action
DEFINITION: Engine delivers less than expected power. Little or no increase in speed when the accelerator pedal is pushed down part way.	
Preliminary Checks	- Refer to <i>Symptoms, Important Preliminary Checks Before Starting</i>. - Search for bulletins. - Check PCM grounds for being clean, tight and in their proper locations. Refer to <i>PCM wiring diagrams in Electrical Diagnosis</i>. - Remove and check air filter element for dirt, or for being restricted. Refer to <i>Air Filter Element/Air Cleaner Assembly</i> and replace as necessary.
Fuel System Checks	- Check for low fuel pressure. Refer to <i>Fuel System Diagnosis</i>. - Check for restricted fuel filter. Refer to <i>Fuel System Diagnosis</i>. - Check for contaminated fuel. Refer to <i>Alcohol/Contaminants-in-Fuel Testing Procedure</i>. - Check items which can cause an engine to run rich (long term fuel trim near -14%). For a Rich condition, refer to <i>DTC P0132 HO2S Circuit High Voltage Bank1 Sensor1</i> and <i>DTC P0152 HO2S Circuit High Voltage Bank2 Sensor1</i>. - Check items that can cause an engine to run lean (long term fuel trim near 22%). For a Lean condition, refer to <i>DTC P0131 HO2S Circuit Low Voltage Bank1 Sensor1</i> and <i>DTC P0151 HO2S Circuit Low Voltage Bank2 Sensor1</i>.

Lack of Power, Sluggishness, or Sponginess (cont'd)

Checks	Action
Sensor/System Checks	Using a scan tool, monitor KS system for excessive spark retard activity. Refer to <i>Knock Sensor System</i>.
Ignition System	- Wetting down the secondary ignition system with water from a spray bottle may help locate damaged or deteriorated components. Look/listen for arcing or misfiring as water is applied. - Check for proper ignition voltage output with spark tester J 26792. Refer to Distributor Ignition System for procedure. - Remove spark plugs and check for the following: - Wet plugs - Cracks - Wear - Improper gap - Burned electrodes - Heavy deposits - An improper spark plug gap will cause a driveability problem. Refer to spark plug gap specification in Section OB. The spark plug gapping should be done using a wire gauge gap tool (J 41319). Refer to <i>Spark Plug Replacement</i>. If spark plugs are gas or oil fouled, the cause of the fouling must be determined before replacing the spark plugs. Refer to <i>DTC P0172 Fuel Trim System Rich Bank1</i> or <i>DTC P0175 Fuel Trim System Rich Bank2</i> to determine the Rich condition or <i>Engine Mechanical</i> for the oil fouling condition. - Check for loose ignition coil ground. Refer to <i>Distributor Ignition System Check</i>. - Spark plugs for proper heat range. Refer to <i>Owners Manual</i> or <i>Section OB</i>. - Check distributor vent system for being restricted or open. Refer to <i>Distributor Vent System Check</i>.
Engine Mechanical	- Excessive oil in combustion chamber—Leaking valve seals. Refer to <i>Engine Mechanical</i>. - Low cylinder compression. Refer to <i>Engine Mechanical</i>. - For incorrect basic engine parts. Inspect the following: - Camshaft - Cylinder heads - Pistons, etc. Refer to <i>Engine Mechanical</i>.
Additional Checks	- Check exhaust system for possible restrictions. Check for the following: - Inspect exhaust system for damaged or collapsed pipes. - Inspect mufflers for heat distress or possible internal failure. - For possible plugged Three-Way catalytic converters by comparing exhaust system back pressure on each side of engine. Check back pressure by removing AIR check valves near exhaust manifolds. Refer to <i>Restricted Exhaust System Check</i> and <i>Exhaust System</i>. - Check Torque Converter Clutch (TCC) for proper operation. Refer to <i>Transmission Controls</i>. - TC system cable adjuster assembly. Loss of performance can result from an improperly adjusted system which could prevent the throttle from attaining WOT. Refer to <i>Antilock Brake System (ABS) and Traction Control System</i>. Also inspect the throttle body and accelerator cables for binding.

Detonation/Spark Knock

Checks	Action
DEFINITION: A mild to severe ping, usually worse under acceleration. The engine makes sharp metallic knocks that change with throttle opening.	
Preliminary Checks	• Refer to <i>Symptoms, Important Preliminary Checks Before Starting</i>. • Search for bulletins. • Check PCM grounds for being clean, tight and in their proper locations. Refer to <i>PCM wiring diagrams in Electrical Diagnosis</i>. • If the scan tool readings are normal (refer to supporting text of the Powertrain On-Board Diagnostic (OBD) System Check) and there are no engine mechanical faults. Fill the fuel tank with a premium gasoline that has a minimum octane reading of 92 and re-evaluate vehicle performance.
Fuel System	• Check for low fuel pressure. Refer to <i>Fuel System Diagnosis</i>. • Check for restricted fuel filter. Refer to <i>Fuel System Diagnosis</i>. • Check for contaminated fuel. Refer to <i>Alcohol/Contaminants-in-Fuel Testing Procedure</i>. • Check items which can cause an engine to run rich (long term fuel trim near -14%). For a Rich condition, refer to <i>DTC P0132 HO2S Circuit High Voltage Bank1 Sensor1</i> and <i>DTC P0152 HO2S Circuit High Voltage Bank2 Sensor1</i>. • Check items that can cause an engine to run lean (long term fuel trim near 22%). For a Lean condition, refer to <i>DTC P0131 HO2S Circuit Low Voltage Bank1 Sensor1</i> and <i>DTC P0151 HO2S Circuit Low Voltage Bank2 Sensor1</i>.
Ignition System	• Spark plugs for proper heat range. Refer to <i>Owners Manual or Section OB</i>. • Check distributor vent system for being restricted or open. Refer to <i>Distributor Vent System Check</i>.
Engine Cooling System	Check for obvious overheating problems: • Low engine coolant. • Restricted air flow to radiator, or restricted water flow through radiator. • Inoperative electric cooling fan circuit(s). Refer to <i>Electric Cooling Fan Diagnosis</i>. • Correct coolant solution should be a 50/50 mix of GM 1052753 or equivalent antifreeze coolant and water. Refer to <i>Engine Cooling (6B)</i>.
Engine Mechanical	• Excessive oil in combustion chamber—Leaking valve seals. Refer to <i>Engine Mechanical</i>. • Low cylinder compression. Refer to <i>Engine Mechanical</i>. • Combustion chambers for excessive carbon buildup. Clean using Top engine cleaner. Follow instructions on can. • For incorrect basic engine parts. Inspect the following: – Camshaft – Cylinder heads – Pistons, etc. • Refer to <i>Engine Mechanical</i>.
Additional Checks	• Check Park/Neutral Position (PNP) switch operation. Connect scan tool and monitor PNP signal. The scan tool should indicate P—N— when in park or neutral and —R—OD21 when in any forward gear or reverse. Refer to <i>PNP Switch Check</i>. • Check TCC operation. TCC applying too soon can cause the engine to spark knock. Refer to <i>Transmission Controls</i>.

Hesitation, Sag, Stumble

Checks	Action
DEFINITION: Momentary lack of response as the accelerator is pushed down. Can occur at any vehicle speed. Usually more pronounced when first trying to make the vehicle move, as from a stop sign. May cause the engine to stall if severe enough.	
Preliminary	• Refer to <i>Symptoms, Important Preliminary Checks Before Starting</i>. • Search for bulletins. • Check PCM grounds for being clean, tight and in their proper locations. Refer to <i>PCM wiring diagrams in Electrical Diagnosis</i>.
Sensor/System	• Check MAP sensor operation. • Check EGR for being loose or for a faulty gasket. Check EGR operation for being open all the time. • Using a Scan Tool, monitor TP sensor voltage. The TP sensor voltage should be less than 0.9 volt. If the TP sensor voltage is greater than 0.9 volt, inspect the ASR/TCS adjuster assembly (if so equipped). Also inspect throttle body and accelerator cables for binding. Refer to <i>Adjuster Assembly Throttle And Cruise Control Cables</i>.
Fuel System	• Check for low fuel pressure. Refer to <i>Fuel System Diagnosis</i>. • Check for restricted fuel filter. Refer to <i>Fuel System Diagnosis</i>. • Check for contaminated fuel. Refer to <i>Alcohol/Contaminants-in-Fuel Testing Procedure</i>. • Check injector fuse(s) (Except F car) for being open. An open injector fuse will cause the injectors not to operate. Replace fuse and inspect injector circuits for an intermittent short to ground. • Perform injector balance test. Refer to <i>Fuel Injector Balance Test</i> for procedure. • Check items which can cause an engine to run rich (long term fuel trim near -14%). For a Rich condition, refer to <i>DTC P0132 HO2S Circuit High Voltage Bank1 Sensor1</i> and <i>DTC P0152 HO2S Circuit High Voltage Bank2 Sensor1</i>. • Check items that can cause an engine to run lean (long term fuel trim near 22%). For a Lean condition, refer to <i>DTC P0131 HO2S Circuit Low Voltage Bank1 Sensor1</i> and <i>DTC P0151 HO2S Circuit Low Voltage Bank2 Sensor1</i>.

Hesitation, Sag, Stumble (cont'd)

Checks	Action
Ignition System	- Wetting down the secondary ignition system with water from a spray bottle may help locate damaged or deteriorated components. Look/listen for arcing or misfiring as water is applied. - Check for proper ignition voltage output with spark tester J 26792. Refer to <i>Distributor Ignition System Check</i> for procedure. - Remove spark plugs and check for the following: - Wet plugs - Cracks - Wear - Improper gap - Burned electrodes - Heavy deposits - An improper spark plug gap will cause a driveability problem. Refer to spark plug gap specification in Section OB. The spark plug gapping should be done using a wire gauge gap tool (J 41319). Refer to <i>Spark Plug Replacement</i>. If spark plugs are gas or oil fouled, the cause of the fouling must be determined before replacing the spark plugs. Refer to <i>DTC P0172 Fuel Trim System Rich Bank1</i> and <i>DTC P0175 Fuel Trim System Rich Bank2</i> to determine the Rich condition or <i>Engine Mechanical</i> for the oil fouling condition. - Check for loose ignition coil ground. Refer to <i>Distributor Ignition System Check</i>. - Spark plugs for proper heat range. Refer to <i>Owners Manual or Section OB</i>. - Check distributor vent system for being restricted or open. Refer to <i>Distributor Vent System Check</i>.
Engine Cooling System	Check the engine thermostat for functioning correctly and for proper heat range. Refer to <i>Engine Cooling</i>.
Additional Checks	- Check generator output voltage. Refer to <i>Engine Electrical</i> for procedure. Repair if less than 9 or more than 16 volts. - An EGR valve that is excessively coked, could cause an engine misfire. Remove the EGR valve and clean as necessary. Refer to <i>EGR Valve</i>.

Cuts Out, Misses

Checks	Action
DEFINITION: Steady pulsation or jerking that follows engine speed, usually more pronounced as engine load increases. This condition is not normally felt above 1500 RPM or 48 km/h (30 mph). The exhaust has a steady spitting sound at idle or low speed.	
Preliminary	- Refer to <i>Symptoms, Important Preliminary Checks Before Starting</i>. - Search for bulletins. - Check PCM grounds for being clean, tight and in their proper locations. Refer to <i>PCM wiring diagrams in Electrical Diagnosis</i>. - Remove and check air filter element for dirt, or for being restricted. Refer to <i>Air Filter Element/Air Cleaner Assembly</i> Replace as necessary.

Cuts Out, Misses (cont'd)

Checks	Action
Fuel System	• Perform injector balance test. Refer to <i>Fuel Injector Balance Test</i> for procedure. • Check for low fuel pressure. Refer to <i>Fuel System Diagnosis</i>. • Check for restricted fuel filter. Refer to <i>Fuel System Diagnosis</i>. • Check for contaminated fuel. Refer to <i>Alcohol/Contaminants-in-Fuel Testing Procedure</i>. • Check items which can cause an engine to run rich (long term fuel trim near -14%). For a Rich condition, refer to <i>DTC P0132 HO2S Circuit High Voltage Bank1 Sensor1</i> and <i>DTC P0152 HO2S Circuit High Voltage Bank2 Sensor1</i>. • Check items that can cause an engine to run lean (long term fuel trim near 22%). For a Lean condition, refer to <i>DTC P0131 HO2S Circuit Low Voltage Bank1 Sensor1</i> and <i>DTC P0151 HO2S Circuit Low Voltage Bank2 Sensor1</i>.
Sensor/System	• Using a scan tool, monitor KS system for excessive spark retard activity.
Ignition System	• Wetting down the secondary ignition system with water from a spray bottle may help locate damaged or deteriorated components. Look/listen for arcing or misfiring as water is applied. • Check for proper ignition voltage output with spark tester J 26792. Refer to Distributor Ignition System for procedure. • Remove spark plugs and check for the following: – Wet plugs – Cracks – Wear – Improper gap – Burned electrodes – Heavy deposits • An improper spark plug gap will cause a driveability problem. Refer to spark plug gap specification is Section OB. The spark plug gapping should be done using a wire gauge gap tool (J 41319). Refer to <i>Spark Plug Replacement</i>. If spark plugs are gas or oil fouled, the cause of the fouling must be determined before replacing the spark plugs. Refer to <i>DTC P0172 Fuel Trim System Rich Bank1</i> and <i>DTC P0175 Fuel Trim System Rich Bank2</i> to determine the Rich condition or <i>Engine Mechanical</i> for the oil fouling condition. • Visually/Physically inspect Secondary ignition for the following: – Ignition wires for cross firing. – Ignition wires arcing to ground. – Ignition wires for proper routing. – Distributor cap for cracks or carbon tracking. • Wetting down the secondary ignition system with water from a spray bottle may help locate damaged or deteriorated components. Look/listen for arcing or misfiring as water is applied. • Check for loose ignition coil ground. Refer to <i>Distributor Ignition System Check</i>. • Spark plugs for proper heat range. Refer to <i>Owners Manual or Section OB</i>. • Check distributor vent system for being restricted or open. Refer to <i>Distributor Vent System Check</i>.

Cuts Out, Misses (cont'd)

Checks	Action
Engine Mechanical	• Check engine mechanical for the following: – Check compression. – Sticking or leaking valves. – Worn camshaft lobe(s). – Valve timing. – Bent push rods. – Worn rocker arms. – Broken valve springs. – Excessive oil in combustion chamber—Leaking valve seals. – Low cylinder compression. • For incorrect basic engine parts. Inspect the following: – Camshaft – Cylinder heads – Pistons, etc. Refer to <i>Engine Mechanical</i> for diagnosis procedures.
Additional Checks	• Check exhaust system for possible restrictions. Check for the following: – Inspect exhaust system for damaged or collapsed pipes. – Inspect mufflers for heat distress or possible internal failure. – For possible plugged Three-Way catalytic converters by comparing exhaust system back pressure on each side of engine. Check back pressure by removing AIR check valves near exhaust manifolds. Refer to Restricted Exhaust System Check and Exhaust System. • An engine miss condition can be caused by Electromagnetic Interference (EMI) on the reference circuit. EMI can usually be detected by monitoring engine RPM with a scan tool. A sudden increase in RPM with little change in actual engine RPM change, indicates EMI is present. If a problem exists, check routing of secondary ignition wires, high voltage components (Near Ignition Control circuits). Check distributor ground circuit for being open or loose. • Check for intake and exhaust manifold passages for casting flash. Refer to <i>Engine Mechanical</i>. • An EGR valve that is excessively coked, could cause an engine misfire. Remove the EGR valve and clean as necessary. Refer to <i>EGR Valve</i>.

Poor Fuel Economy

Checks	Action
DEFINITION: Fuel economy, as measured by an actual road test is noticeably lower than expected. Also, economy is noticeably lower than it was on this vehicle at one time, as previously shown by an actual road test.	
Preliminary	• Refer to <i>Symptoms, Important Preliminary Checks Before Starting</i>. • Search for bulletins. • Check PCM grounds for being clean, tight and in the proper locations. Refer to <i>PCM wiring diagrams in Electrical Diagnosis</i>. • Check owners driving habits. • Is A/C ON full time (Defroster mode ON)? – Are tires at correct pressure? – Are excessively heavy loads being carried? – Is acceleration too much, too often? • Remove and check air filter element for dirt, or for being restricted. Refer to <i>Air Filter Element/Air Cleaner Assembly</i> Replace as necessary.
Fuel System	• Perform injector balance test. Refer to <i>Fuel Injector Balance Test</i> for procedure. • Check for low fuel pressure. Refer to <i>Fuel System Diagnosis</i>. • Check for restricted fuel filter. Refer to <i>Fuel System Diagnosis</i>. • Check for contaminated fuel. Refer to <i>Alcohol/Contaminants-in-Fuel Testing Procedure</i>. • Check for incorrect minimum idle speed. Using a scan tool, monitor IAC position. IAC should be between 5 and 50 counts. • Check each injector harness is connected to the correct injector/cylinder according to the firing order (firing order: 1–8–4–3–6–5–7–2). Relocate injector harnesses as necessary. • Check for injectors that are shorted internally. Compare injector resistance. Injector resistance should be within one ohm of each other. Refer to <i>Fuel Injector Coil Test</i>. • Check for fuel in pressure regulator vacuum hose. If fuel is present, replace regulator assembly. Refer to <i>Fuel Pressure Regulator</i>. • Check for foreign material accumulation in the throttle bore, coking on the throttle valve or on the throttle shaft. Also inspect for throttle body tampering. • Check items which can cause an engine to run rich (long term fuel trim near –14%). For a Rich condition, refer to <i>DTC P0132 HO2S Circuit High Voltage Bank1 Sensor1</i> and <i>DTC P0152 HO2S Circuit High Voltage Bank2 Sensor1</i>. • Check items that can cause an engine to run lean (long term fuel trim near 22%). For a Lean condition, refer to <i>DTC P0131 HO2S Circuit Low Voltage Bank1 Sensor1</i> and <i>DTC P0151 HO2S Circuit Low Voltage Bank2 Sensor1</i>.
Sensor/System	Check Air intake system and crankcase for air leaks. • Check Crankcase ventilation valve for proper operation. Place finger over inlet hole in valve end several times. Valve should snap back. If not, replace valve. • Check for proper calibration of speedometer. Connect J 33431–B (Signal Generator) to VSS electrical connector. Ignition ON, tester ON and monitor the speedometer. The speedometer should indicate 86 km/h (54 mph). Refer to <i>8A (Cell 33)</i> • Using a Scan Tool, monitor TP sensor voltage. The TP sensor voltage should be less than 0.9 volt. If the TP sensor voltage is greater than 0.9 volt, inspect the ASR/TCS adjuster assembly (if so equipped). Also inspect throttle body and accelerator cables for binding. Refer to <i>Adjuster Assembly Throttle And Cruise Control Cables</i>. • Using a scan tool, monitor KS system for excessive spark retard activity. Refer to <i>Knock Sensor System</i>.

Poor Fuel Economy (cont'd)

Checks	Action
Ignition System	• Check for proper ignition voltage output with spark tester J 26792. Refer to Distributor Ignition System for procedure. • Remove spark plugs and check for the following: – Wet plugs – Cracks – Wear – Improper gap – Burned electrodes – Heavy deposits • An improper spark plug gap will cause a driveability problem. Refer to spark plug gap specification in Section OB. The spark plug gapping should be done using a wire gauge gap tool (J 41319). Refer to <i>Spark Plug Replacement</i>. If spark plugs are gas or oil fouled, the cause of the fouling must be determined before replacing the spark plugs. Refer to <i>DTC P0172 Fuel Trim System Rich Bank1</i> and <i>DTC P0175 Fuel Trim System Rich Bank2</i> to determine the Rich condition or <i>Engine Mechanical</i> for the oil fouling condition. • Visually/Physically inspect Secondary ignition for the following: – Ignition wires for cross firing. – Ignition wires arcing to ground. – Ignition wires for proper routing. – Distributor cap for cracks or carbon tracking. • Wetting down the secondary ignition system with water from a spray bottle may help locate damaged or deteriorated components. Look/listen for arcing or misfiring as water is applied. • Check for loose ignition coil ground. Refer to <i>Distributor Ignition System Check</i>. • Check distributor vent system for being restricted or open. Refer to <i>Distributor Vent System Check</i>.
Engine Cooling System	• Check engine coolant level for being low. Refer to <i>Engine Cooling</i>. • Check engine thermostat for having a faulty part or for wrong heat range. Refer to <i>Engine Cooling</i>.
Engine Mechanical	• Check engine mechanical for the following: – Check compression. – Sticking or leaking valves. – Worn camshaft lobe(s). – Valve timing. – Bent push rods. – Worn rocker arms. – Broken valve springs. – Excessive oil in combustion chamber—Leaking valve seals. – Low cylinder compression. • For incorrect basic engine parts. Inspect for the following: – Camshaft – Cylinder heads – Pistons, etc. Refer to <i>Engine Mechanical</i> for diagnosis procedures.

Poor Fuel Economy (cont'd)

Checks	Action
Additional Checks	• Visually (physically) check: Vacuum hoses for splits, kinks, and proper connections and routing as shown on Vehicle Emission Control Information label. • Check TCC operation. Using a scan tool should indicate an RPM drop, when the TCC is commanded ON. Refer to <i>Transmission Control Systems</i>. • Check exhaust system for possible restriction. Check for the following: – Inspect exhaust system for damaged or collapsed pipes. – Inspect mufflers for heat distress or possible internal failure. – For possible plugged Three-Way catalytic converters by comparing exhaust system back pressure on each side of engine. Check back pressure by removing AIR check valves near exhaust manifolds. Refer to <i>Restricted Exhaust System Check</i>. • An engine miss condition can be caused by Electromagnetic Interference (EMI) on the reference circuit. EMI can usually be detected by monitoring engine RPM with a scan tool. A sudden increase in RPM with little change in actual engine RPM change, indicates EMI is present. If a problem exists, check routing of secondary ignition wires, high voltage components (Near Ignition Control circuits). Check distributor ground circuit for being open or loose. • Check the Traction Control Adjuster Assembly for being out of adjustment? Refer to <i>Adjuster Assembly-Throttle And Cruise Control Cables</i>. • Check PNP switch circuit . Refer to <i>PNP Switch Check</i>, or use the Tech 1 and be sure the scan tool indicates vehicle is in drive with gear selector in drive or overdrive. • Check for faulty motor mounts. Refer to <i>Engine Mechanical</i> for inspection of mounts. • Check for intake and exhaust manifold passages for casting flash. Refer to <i>Engine Mechanical</i>.

Rough, Unstable, or Incorrect Idle, Stalling

Checks	Action
DEFINITION: Engine runs unevenly at idle. If severe, the engine or vehicle may shake. Engine idle speed may vary in RPM. Either condition may be severe enough to stall the engine.	
Preliminary Checks	• Refer to <i>Symptoms, Important Preliminary Checks Before Starting</i>. • Search for bulletins. • Check PCM grounds for being clean, tight and in their proper locations. Refer to <i>PCM wiring diagrams in Electrical Diagnosis</i>. • Remove and check air filter element for dirt, or for being restricted. Refer to <i>Air Filter Element/Air Cleaner Assembly</i> Replace as necessary.
Fuel System	• Perform injector balance test. Refer to <i>Fuel Injector Balance Test</i> for procedure. • Check for low fuel pressure. Refer to <i>Fuel System Diagnosis</i>. • Check for restricted fuel filter. Refer to <i>Fuel System Diagnosis</i>. • Check for contaminated fuel. Refer to <i>Alcohol/Contaminants-in-Fuel Testing Procedure</i>. • Check for incorrect minimum idle speed. Using a scan tool, monitor IAC position. IAC should be between 5 and 50 counts. • Check each injector harness is connected to the correct injector/cylinder according to the firing order (firing order: 1-8-4-3-6-5-7-2). Relocate injector harnesses as necessary. • Check for injectors that are shorted internally. Compare injector resistance. Injector resistance should be within one ohm of each other. Refer to <i>Fuel Injector Coil Test</i>. • Check for fuel in pressure regulator vacuum hose. If fuel is present, replace regulator assembly. Refer to <i>Fuel Pressure Regulator</i>. • Check for foreign material accumulation in the throttle bore, coking on the throttle valve or on the throttle shaft. Also inspect for throttle body tampering. • Check items which can cause an engine to run rich (long term fuel trim near -14%). For a Rich condition, refer to <i>DTC P0132 HO2S Circuit High Voltage Bank1 Sensor1</i> and <i>DTC P0152 HO2S Circuit High Voltage Bank2 Sensor1</i>. • Check items that can cause an engine to run lean (long term fuel trim near 22%). For a Lean condition, refer to <i>DTC P0131 HO2S Circuit Low Voltage Bank1 Sensor1</i> and <i>DTC P0151 HO2S Circuit Low Voltage Bank2 Sensor1</i>.
Sensor/System	• Check Crankcase ventilation valve for proper operation. Place finger over inlet hole in valve end several times. Valve should snap back. If not, replace valve. • Using a Scan Tool, monitor TP sensor voltage. The TP sensor voltage should be less than 0.9 volt. If the TP sensor voltage is greater than 0.9 volt, inspect the ASR/TCS adjuster assembly (If so equipped). Also inspect throttle body and accelerator cables for binding. Refer to <i>Adjuster Assembly Throttle And Cruise Control Cables</i>. • Using a scan tool, monitor KS system for excessive spark retard activity.

Rough, Unstable, or Incorrect Idle, Stalling (cont'd)

Checks	Action
Ignition System	• Check for proper ignition voltage output with spark tester J 26792. Refer to <i>Distributor Ignition System Check</i> for procedure. • Remove spark plugs and check for the following: – Wet plugs – Cracks – Wear – Improper gap – Burned electrodes – Heavy deposits • An improper spark plug gap will cause a driveability problem. Refer to spark plug gap specification in Section OB. The spark plug gapping should be done using a wire gauge gap tool (J 41319). <i>Refer to Spark Plug Replacement</i>. If spark plugs are gas or oil fouled, the cause of the fouling must be determined before replacing the spark plugs. Refer to <i>DTC P0172 Fuel Trim System Rich Bank1</i> and <i>DTC P0175 Fuel Trim System Rich Bank2</i> to determine the Rich condition or <i>Engine Mechanical</i> for the oil fouling condition. • Visually/Physically inspect Secondary ignition for the following: – Ignition wires for cross firing. – Ignition wires arcing to ground. – Ignition wires for proper routing. – Distributor cap for cracks or carbon tracking. • Wetting down the secondary ignition system with water from a spray bottle may help locate damaged or deteriorated components. Look/listen for arcing or misfiring as water is applied. • Check for loose ignition coil ground. Refer to <i>Distributor Ignition System Check</i> • Check distributor vent system for being restricted or open. Refer to <i>Distributor Vent System Check</i>.
Engine Mechanical	• Check engine mechanical for the following: – Check compression. – Sticking or leaking valves. – Worn camshaft lobe(s). – Valve timing. – Bent push rods. – Worn rocker arms. – Broken valve springs. – Excessive oil in combustion chamber—Leaking valve seals. – Low cylinder compression. • For incorrect basic engine parts. Inspect the following: – Camshaft – Cylinder heads – Pistons, etc. Refer to <i>Engine Mechanical</i> for diagnosis procedures.

Rough, Unstable, or Incorrect Idle, Stalling (cont'd)

Checks	Action
Additional Checks	• Check exhaust system for possible restrictions. Check for the following: – Inspect exhaust system for damaged or collapsed pipes. – Inspect mufflers for heat distress or possible internal failure. – For possible plugged Three-Way catalytic converters by comparing exhaust system back pressure on each side of engine. Check back pressure by removing AIR check valves near exhaust manifolds. Refer to Restricted Exhaust System Check and Exhaust System. • An engine miss condition can be caused by Electromagnetic Interference (EMI) on the reference circuit. EMI can usually be detected by monitoring engine RPM with a scan tool. A sudden increase in RPM with little change in actual engine RPM change, indicates EMI is present. If a problem exists, check routing of secondary ignition wires, high voltage components (Near Ignition Control circuits). Check distributor ground circuit for being open or loose. • Is Traction Control Adjuster Assembly out of adjustment? Refer to <i>Adjuster Assembly–Throttle And Cruise Control Cables</i>. • Check PNP switch circuit . Refer to <i>PNP Switch Check</i>, or use the Tech 1 and be sure the scan tool indicates vehicle is in drive with gear selector in drive or overdrive. • Check for faulty motor mounts. Refer to <i>Engine Mechanical</i> for inspection of mounts. • Check for intake and exhaust manifold passages for casting flash. Refer to <i>Engine Mechanical</i>. • An EGR valve that is excessively coked, could cause an engine misfire. Remove the EGR valve and clean as necessary. Refer to <i>EGR Valve</i>.

Dieseling, Run-On

Checks	Action
DEFINITION: Engine continues to run after key is turned OFF, but runs very rough. If engine runs smooth, check the ignition switch and adjustment.	
Preliminary Checks	• Refer to <i>Symptoms, Important Preliminary Checks Before Starting</i>. • Search for bulletins. • Check PCM grounds for being clean, tight and in their proper locations. Refer to <i>PCM wiring diagrams in Electrical Diagnosis</i>.
Fuel System	• Inspect injectors for leaking. Refer to <i>Fuel System Diagnosis</i> for procedure.

Backfire

Checks	Actions
DEFINITION: Fuel ignites in the intake manifold, or in the exhaust system, making loud popping noise.	
Preliminary Checks	• Refer to <i>Symptoms, Important Preliminary Checks Before Starting</i>. • Search for bulletins. • Check PCM grounds for being clean, tight and in their proper locations. Refer to <i>PCM wiring diagrams in Electrical Diagnosis</i>.
Fuel System	• Check for low fuel pressure. Refer to <i>Fuel System Diagnosis</i>. • Check for restricted fuel filter. Refer to <i>Fuel System Diagnosis</i>. • Check for contaminated fuel. Refer to <i>Alcohol/Contaminants-in-Fuel Testing Procedure</i>. • Check each injector harness is connected to the correct injector/cylinder according to the firing order (firing order: 1-8-4-3-6-5-7-2). Relocate injector harnesses as necessary.
Sensor/System	• Check EGR for being loose or for a faulty gasket. Check EGR operation for being open all the time. Refer to <i>EGR Valve</i>. • Check Secondary Air Injection (AIR) system. • Check Air intake system and crankcase for air leaks. • Check Crankcase ventilation valve for proper operation. Place finger over inlet hole in valve end several times. Valve should snap back. If not, replace valve. • Check for proper calibration of speedometer. Connect Signal Generator (J 33431-B) to VSS electrical connector. Ignition ON, tester ON and monitor the speedometer. The speedometer should indicate 86 km/h (54 mph). Refer to <i>8A (Cell 33)</i>. • Using a Scan Tool, monitor TP sensor voltage. The TP sensor voltage should be less than 0.9 volt. If the TP sensor voltage is greater than 0.9 volt, inspect the ASR/TCS adjuster assembly (if so equipped). Also inspect throttle body and accelerator cables for binding. Refer to <i>Adjuster Assembly Throttle And Cruise Control Cables</i>. • Using a scan tool, monitor KS system for excessive spark retard activity. Refer to <i>Knock Sensor System</i>.

Backfire (cont'd)

Checks	Actions
Ignition System	• Check for proper ignition voltage output with spark tester J 26792. Refer to Distributor Ignition System for procedure. • Check for an intermittent ignition system malfunction in the following circuits: – Intermittent Low resolution circuit. – Intermittent High resolution circuit. – Intermittent Ignition Control circuit. – Using the scan tool's Snapshot feature may help locate an intermittent ignition failure. Review low and high resolution signals. Abnormal low and high resolution signals can cause a backfire on acceleration. Refer to <i>Distributor Ignition System Check</i>. • Remove spark plugs and check for the following: – Wet plugs – Cracks – Wear – Improper gap – Burned electrodes – Heavy deposits • An improper spark plug gap will cause a driveability problem. Refer to spark plug gap specification in Section OB. The spark plug gapping should be done using a wire gauge gap tool (J 41319). Refer to <i>Spark Plug Replacement</i>. If spark plugs are gas or oil fouled, the cause of the fouling must be determined before replacing the spark plugs. Refer to <i>DTC P0172 Fuel Trim System Rich Bank1</i> and <i>DTC P0175 Fuel Trim System Rich Bank2</i> to determine the Rich condition or <i>Engine Mechanical</i> for the oil fouling condition. • Visually/Physically inspect Secondary ignition for the following: – Ignition wires for cross firing. – Ignition wires arcing to ground. – Ignition wires for proper routing. – Distributor cap for cracks or carbon tracking. • Wetting down the secondary ignition system with water from a spray bottle may help locate damaged or deteriorated components. Look/listen for arcing or misfiring as water is applied. • Check for loose ignition coil ground. Refer to <i>Distributor Ignition System Check</i>. • Check distributor vent system for being restricted or open. Refer to <i>Distributor Vent System Check</i>.
Engine Cooling System	• Check engine coolant level for being low. Refer to <i>Engine Cooling</i>. • Check engine thermostat for having a faulty part or for wrong heat range. Refer to <i>Engine Cooling</i>.

Backfire (cont'd)

Checks	Actions
Engine Mechanical	• Check engine mechanical: – Check compression. – Sticking or leaking valves. – Worn camshaft lobe(s). – Valve timing. – Bent push rods. – Worn rocker arms. – Broken valve springs. – Excessive oil in combustion chamber–Leaking valve seals. – Low cylinder compression. • For incorrect basic engine parts. Inspect the following: – Camshaft – Cylinder heads – Pistons, etc. • Refer to <i>Engine Mechanical</i> for diagnosis procedures.
Additional Checks	• Visually (physically) check: Vacuum hoses for splits, kinks, and proper connections and routing as shown on Vehicle Emission Control Information label. • Check Intake and exhaust manifold(s) for casting flash. Refer to <i>Engine Mechanical</i>. • Check TCC operation. The scan tool should indicate an RPM drop when the TCC is commanded ON. Refer to <i>Transmission Control Systems</i>. • Check exhaust system for possible restriction. Check the following: – Inspect exhaust system for damaged or collapsed pipes. – Inspect mufflers for heat distress or possible internal failure. – For possible plugged Three-Way catalytic converters by comparing exhaust system back pressure on each side of engine. Check back pressure by removing AIR check valves near exhaust manifolds. Refer to Restricted Exhaust System Check and Exhaust System. • An engine miss condition can be caused by Electromagnetic Interference (EMI) on the reference circuit. EMI can usually be detected by monitoring engine RPM with a scan tool. A sudden increase in RPM with little change in actual engine RPM change, indicates EMI is present. If a problem exists, check routing of secondary ignition wires, high voltage components (Near Ignition Control circuits). Check distributor ground circuit for being open or loose. • Is Traction Control Adjuster Assembly out of adjustment? Refer to <i>Adjuster Assembly–Throttle And Cruise Control Cables</i>. • Check PNP switch circuit . Refer to <i>PNP Switch Check</i>, or use the Tech 1 and be sure the scan tool indicates vehicle is in drive with gear selector in drive or overdrive. • Check for faulty motor mounts. Refer to <i>Engine Mechanical</i> for inspection of mounts. • Check for intake and exhaust manifold passages for casting flash. Refer to <i>Engine Mechanical</i>.

Restricted Exhaust System Check

Restricted Exhaust System Check

Step	Action	Value(s)	Yes	No
1	Was the Powertrain On-Board Diagnostic (OBD) System Check performed?	—	Go to Step 2	Go to Powertrain OBD System Check
2	1. Remove the AIR check valve on the side of the engine that is suspected of being restricted. 2. Install the Exhaust Back Pressure tester J 35314-A in place of the AIR check valve. 3. Engine idling at normal operating temperature. 4. Observe the exhaust system back pressure reading on the gauge. Does the reading exceed the specified value?	8.6 kPa (1.25 psi)	Go to Step 4	Go to Step 3
3	1. The Exhaust Backpressure Gauge still installed. 2. Increase engine speed to 2000 RPM. 3. Observe the exhaust system back pressure reading on the gauge. Does the reading exceed the specified value?	20.7 kPa (3 psi)	Go to Step 4	If a driveability symptom exists, refer to Symptoms

Restricted Exhaust System Check (cont'd)

Step	Action	Value(s)	Yes	No
4	1. Turn the Engine OFF. 2. Re-install the AIR check valve. 3. Remove the rear HO2S sensor on the side of the engine that is suspected of being restricted. 4. Install the Exhaust Back Pressure tester J 35314-A in place of the HO2S sensor. 5. Start and idle the engine. 6. Increase the engine speed to 2000 RPM. 7. Observe the exhaust system back pressure reading on the gauge. Does the reading exceed the specified value?	20.7 kPa (3 psi)	Go to Step 5	Go to Step 6
5	Repair the restriction in the exhaust system after the Catalytic Converter. Check exhaust system for the following: • Collapsed pipe • Heat distress • Internal muffler failure Is the action completed?	—	System OK	—
6	Replace Catalytic Converter. Refer to <i>Exhaust System</i> Is the action completed?	—	System OK	—

PNP Switch Check

Circuit Description

The Park/Neutral Position (PNP) switch contacts are closed to ground in park and neutral. The PCM applies a voltage (about 12.0 Volts) to the switch. When the gear selector is in park or neutral the PNP switch is closed and the PCM senses low signal voltage (low engine load). When the gear selector is in reverse or a drive range, the PNP switch opens, and the PCM senses high signal voltage (high engine load). The PCM will increase the idle air rate to compensate for the additional load on the engine when the transmission is in gear.

Some of the PCM's other uses for the PNP signal are:

- Vehicle Speed Sensor (VSS) diagnostics
- Exhaust Gas Recirculation (EGR) operation

Diagnostic Aids

- A PNP switch that does not close or an open circuit may cause the engine idle speed to drop when the vehicle is shifted into gear.
- A switch that will not open or the signal circuit shorted to ground will cause the EGR system to be inoperative, possibly resulting in excessive spark knock.
- Inspect all related wiring and connectors including the connections at the PCM. These may cause an intermittent malfunction. Check for damaged, corroded or pushed out terminals.

PNP Switch Check

Step	Action	Value(s)	Yes	No
1	Was the Powertrain On-Board Diagnostic (OBD) System Check performed?	—	Go to Step 2	Go to Powertrain OBD System Check
2	1. Install the scan tool. 2. Turn the Ignition ON, Engine OFF. 3. Transmission in Park. Does the scan tool indicate Park/Neutral (P-N—)?	—	Go to Step 3	Go to Step 4

PNP Switch Check (cont'd)

Step	Action	Value(s)	Yes	No
3	Shift the transmission into drive. Does the scan tool should indicate Drive (-R-OD21)?	—	Refer to <i>Diagnostic Aids - PNP Switch</i>	<i>Go to Step 7</i>
4	1. Disconnect the Park/Neutral Position switch connector. 2. Using a fused jumper wire, jumper harness connector terminals A and B. Does the scan tool indicate Park/Neutral (P-N—)?	—	<i>Go to Step 10</i>	<i>Go to Step 5</i>
5	Using a fused jumper wire connected to ground, probe terminal B in the PNP switch harness connector. Does the scan tool indicate Park/Neutral (P-N—)?	—	<i>Go to Step 13</i>	<i>Go to Step 6</i>
6	1. Leave fused jumper in place. 2. Ignition OFF. 3. Disconnect the PCM connector C3. 4. Using a test light (J 34142-B) connected to B+, probe the PCM harness connector terminal C3-15. Does The test light illuminate?	—	<i>Go to Step 9</i>	<i>Go to Step 11</i>
7	Disconnect the Park/Neutral Position switch connector. Does the scan tool indicate Drive (-R-OD21)?	—	<i>Go to Step 10</i>	<i>Go to Step 8</i>
8	1. Turn the Ignition OFF. 2. Disconnect the PCM connector C3. 3. Turn the Ignition ON. Does the scan tool indicate Drive (-R-OD21)?	—	<i>Go to Step 12</i>	<i>Go to Step 15</i>
9	Check for faulty connections at the PCM. Was the condition found and corrected?	—	<i>Go to Step 16</i>	<i>Go to Step 15</i>
10	Check for faulty connections at the PNP switch or for the PNP switch for being out of adjustment. Was the condition found and corrected?	—	<i>Go to Step 16</i>	<i>Go to Step 14</i>
11	Repair open PNP signal circuit. Is the repair completed?	—	<i>Go to Step 16</i>	—
12	Repair the PNP signal circuit for a short to ground. Is the repair completed?	—	<i>Go to Step 16</i>	—
13	Repair open PNP ground circuit. Is the repair completed?	—	<i>Go to Step 16</i>	—
14	Replace the PNP switch. Is the repair completed?	—	<i>Go to Step 16</i>	—
15	Important: Replacement PCM must be programmed. Refer to <i>PCM Replacement/Programming</i> . Replace the PCM. Is the repair completed?	—	<i>Go to Step 16</i>	—
16	Operate the vehicle within the conditions under which the original symptom was noted. Does the system now operate properly?	—	System OK	<i>Go to Step 2</i>

Power Steering Pressure Switch Check

30422

Circuit Description

The Power Steering Pressure (PSP) switch is a normally open pressure switch located in the high pressure (outlet) hose of the power steering system. The PCM applies a voltage (about 12.0 Volts) to the sensor. When power steering pressure is low the PSP switch is open and the PCM senses high signal voltage (low engine load). When power steering pressure is high, such as during parking maneuvers, etc., the PSP switch closes, and the PCM senses low signal voltage (high engine load). The PCM will increase the idle air rate and retard the timing to compensate for the additional load on the engine.

Diagnostic Aids

- A pressure switch that will not close or an open circuit may cause the engine RPM to drop when power steering loads is high.
- A switch that will not open or the signal circuit shorted to ground may have an adverse effect on idle quality.

Inspect all related wiring and connectors including the connections at the PCM. These may cause an intermittent malfunction. Check for damaged, corroded or pushed out terminals.

Power Steering Pressure Switch Check

Step	Action	Value(s)	Yes	No
1	Was the Powertrain On-Board Diagnostic (OBD) System Check performed?	—	Go to Step 2	Go to Powertrain OBD System Check
2	1. Install the scan tool. 2. Start the engine. Does the scan tool indicate PSP switch Normal?	—	Go to Step 3	Go to Step 4
3	Turn the steering wheel and hold momentarily against stop. Does the scan tool indicate PSP switch High Pressure?	—	Go to Diagnostic Aids	Go to Step 6
4	1. Turn the ignition ON, Engine OFF. 2. Disconnect the PSP switch connector. Does the scan tool indicate PSP switch Normal?	—	Go to Step 14	Go to Step 5
5	1. Turn the ignition OFF. 2. Disconnect the PCM connector C2. 3. Using a test light (J34142-B) connected to B+, probe the PCM harness connector terminal C2-26. Is the test light OFF?	—	Go to Step 15	Go to Step 12

Power Steering Pressure Switch Check (cont'd)

Step	Action	Value(s)	Yes	No
6	1. Disconnect the PSP switch connector. 2. Using a fused jumper wire, jumper the two harness connector terminals together. Does the scan tool indicate PSP switch High Pressure?	—	Go to Step 10	Go to Step 7
7	Using a fused jumper wire connected to ground, probe the signal circuit terminal in the PSP switch harness connector. Does the scan tool indicate PSP switch High Pressure?	—	Go to Step 13	Go to Step 8
8	1. Leave the fused jumper in place. 2. Turn the ignition OFF. 3. Disconnect the PCM connector C2. 4. Using a test light (J 34142-B) connected to B+, probe PCM harness connector terminal C2-26. Does the test light illuminate?	—	Go to Step 9	Go to Step 11
9	Check for faulty connections at the PCM. Was condition found and corrected?	—	Go to Step 16	Go to Step 15
10	Check for faulty connections at the PSP switch. Was condition found and corrected?	—	Go to Step 16	Go to Step 14
11	Repair the open PSP signal circuit. Is the repair complete?	—	Go to Step 16	—
12	Repair the PSP signal circuit for a short to ground. Is the repair complete?	—	Go to Step 16	—
13	Repair open PSP ground circuit. Is the repair complete?	—	Go to Step 16	—
14	Replace the PSP switch. Is the repair complete?	—	Go to Step 16	—
15	Important: The replacement PCM must be reprogrammed. Refer to <i>PCM Replacement/Programming</i> . Replace the PCM. Is the repair complete?	—	Go to Step 16	—
16	Operate the vehicle within the conditions under which the original symptom was noted. Does the system now operate properly?	—	System OK	Go to Step 2

A/C Request Circuit Check

Circuit Description:

The A/C clutch relay is PCM controlled to delay A/C clutch engagement after the A/C is turned ON. This allows the PCM to adjust engine RPM before the A/C clutch engages. The PCM will engage the A/C clutch any time A/C has been requested unless any of the following conditions exist:

- High coolant temperature.
- Low A/C system pressure.
- High A/C system pressure.
- Wide open throttle.
- High engine RPM.

When the heater and A/C control is placed in the A/C mode, a 12 volt signal is sent to the PCM. When the PCM receives this signal the PCM will ground the A/C clutch relay control circuit to energize the A/C relay. This is shown on the scan tool as A/C request YES.

When a request for A/C has been detected by the PCM, the PCM will ground the A/C clutch relay control circuit, the relay contacts will close, and current will flow through the relay to the A/C compressor clutch.

When A/C request has been detected by the PCM, the cooling fan(s) will be turned ON when A/C pressure is above a predetermined pressure. For the system schematic, refer to *A/C Controls - C60* or *A/C Controls - C67 and C68*.

Diagnostic Aids

Before using this table, be sure no PCM DTC(s) are stored. The PCM will not activate the A/C clutch with a stored DTC.

Test Description

Number(s) below refer to number(s) on the diagnostic table.

2. A/C DTCs will disable the A/C system. Repair A/C DTCs before proceeding.
3. If the scan tool displays A/C request as YES, indicates the request circuit is shorted to a voltage.
5. If the test light did not illuminate, indicates a problem with the request circuit between the A/C pressure switch and the control head or the control head is malfunctioning. Refer to *Repair Procedures in Electrical Diagnosis (8A Cell 67)*.

A/C Request Circuit Check

Step	Action	Value(s)	Yes	No
1	Was the Powertrain On-Board Diagnostic (OBD) System Check performed?	—	Go to Step 2	Go to Powertrain OBD System Check
2	Are any A/C DTCs set?	—	Go to applicable DTC table.	Go to Step 3
3	1. Install the scan tool. 2. Engine idling with A/C OFF. 3. Using a scan tool on the ENG 1 data list, monitor A/C request. Does the scan tool indicate A/C request as YES?	—	Go to Step 9	Go to Step 4
4	Turn the ignition ON and A/C ON. Does the scan tool indicate A/C request as YES?	—	Go to Symptoms	Go to Step 5
5	1. Disconnect the A/C pressure cycling switch. 2. Using a DVM J 39200, probe the A/C request circuit (HVAC side of the of the A/C pressure cycling switch electrical connector.) Does the DVM display near the specified voltage?	B+	Go to Step 6	Go to Repair Procedures in Electrical Diagnosis (8A Cell 67).
6	Using a fused jumper wire, jumper terminals A and B together at the A/C pressure cycling switch harness connector. Does the scan tool indicate A/C request as YES?	—	Go to Step 13	Go to Step 7
7	1. Turn the ignition OFF. 2. Disconnect the PCM connector C2. 3. Check the continuity of A/C request circuit between the PCM and the A/C pressure cycling switch. Is the A/C request circuit open?	—	Go to Step 15	Go to Step 8

A/C Request Circuit Check (cont'd)

Step	Action	Value(s)	Yes	No
8	Is the A/C request circuit shorted to ground?	—	Go to Step 16	Go to Step 12
9	Disconnect the A/C pressure cycling switch. Does the scan tool indicate A/C request as YES?	—	Go to Step 10	Go to Repair Procedures in Electrical Diagnosis (8A Cell 67).
10	Using a test light connected to ground, probe the A/C request circuit at the A/C pressure cycling switch harness connector (PCM side). Does the test light illuminate?	—	Go to Step 11	Go to Step 17
11	Repair the A/C request circuit for a short to voltage. Refer to <i>Repair Procedures in Electrical Diagnosis (8A Cell 5)</i> . Is the action completed?	—	System OK	—
12	Check PCM connections. If faulty connections are found, repair as necessary. Refer to <i>Repair Procedures in Electrical Diagnosis (8A Cell 5)</i> . Was a problem found and corrected?	—	System OK	Go to Step 17
13	1. Check connections of the A/C pressure cycling switch harness connector. 2. If faulty connections are found, repair as necessary. Refer to <i>Repair Procedures in Electrical Diagnosis (8A Cell 5)</i> . Was a problem found and corrected?	—	System OK	Go to Step 14
14	Replace the A/C pressure cycling switch. Is the action completed?	—	System OK	—
15	Repair the open A/C request circuit between the switch and the PCM. Refer to <i>Repair Procedures in Electrical Diagnosis (8A Cell 5)</i> . Is the action completed?	—	System OK	—
16	Repair the grounded A/C request circuit between the switch and the PCM. Refer to <i>Repair Procedures in Electrical Diagnosis (8A Cell 5)</i> . Is the action completed?	—	System OK	—
17	Important: Replacement PCM must be programmed. Refer to <i>PCM Replacement/Programming</i> . Replace the PCM. Is the action complete?	—	System OK	—

Electric Cooling Fan Diagnosis

Circuit Description:

The cooling fans are controlled by the PCM based on various inputs. Battery voltage is supplied to the primary and secondary cooling fan relays (switch side). Ignition voltage is supplied to the primary and secondary cooling fan relays (coil side). The PCM controls the cooling fan relays by providing a ground path.

The PCM will enable the engine cooling fans when certain Diagnostic Trouble Codes are set. For the Fan schematic, refer to *Fan Controls-w/o VO8* or *Fan Controls-With VO8*.

Diagnostic Aids

If the owner complained of an overheating problem, it must be determined if the complaint was due to an actual boil over, or the warning indicator light, or engine coolant temperature gage indicated overheating. The gage accuracy can also be checked by comparing the Engine Coolant Temperature (ECT) sensor reading using a scan tool and comparing its reading with the

gage reading. If the engine is actually overheating and the gage indicated overheating, but the cooling fan is not coming ON, the Engine Coolant Temperature (ECT) sensor has probably shifted out of calibration and should be replaced.

If the engine is overheating and the cooling fans are ON, the cooling system should be checked, refer to Section 6B.

The PCM will command fan 1 ON at 107°C (225°F) and OFF at 103°C (218°F) and, fan 2 ON at 111°C (232°F) and OFF at 107°C (225°F).

Test Description

Number(s) below refer to number(s) on the diagnostic table.

- The PCM will enable the engine cooling fans when certain Diagnostic Trouble Codes are set. Go to applicable DTC Table first before proceeding with this table.
- Allow engine coolant temperature to cool below 100°C (212°F) before proceeding with diagnosis diagnoses.

Electric Cooling Fan Functional Check

Step	Action	Value(s)	Yes	No
1	Was the Powertrain On-Board Diagnostic (OBD) System Check performed?		<i>Go to Step 2</i>	Go to Powertrain OBD System Check
2	Are any DTCs set?	—	Go to applicable DTC Table	<i>Go to Step 3</i>
3	1. Install the scan tool. 2. The engine coolant temperature must be below the specified value for all the fan diagnoses. 3. Turn the ignition ON, Engine OFF and A/C OFF. Are the cooling fans OFF?	100°C (212°F)	<i>Go to Step 4</i>	<i>Go to Step 6</i>
4	Using a scan tool, command the cooling fan relay(s) ON. Are both cooling fans ON?	—	<i>Go to Step 5</i>	<i>Go to Step 9</i>
5	With the engine idling, turn the A/C ON. Are the cooling fan(s) ON?	—	System OK	Go to A/C request circuit diagnosis
6	Disconnect the cooling fan relay for the cooling fan that is operating. Does the cooling fan stop?	—	<i>Go to Step 7</i>	<i>Go to Step 8</i>
7	Replace the cooling fan relay. Is the action complete?	—	System OK	—
8	Repair the circuit between the fan relay and the fan motor for a short to voltage. Is the action complete?	—	System OK	—

Electric Cooling Fan Functional Check (cont'd)

Step	Action	Value(s)	Yes	No
9	1. Turn the ignition OFF. 2. Disconnect the cooling fan relay for the cooling fan that is not operating. 3. Turn the ignition ON. 4. Using a test light connected to ground, probe the battery feed side of the cooling fan relay electrical harness, contact side. Does the test light illuminate?	—	Go to Step 10	Go to Step 16
10	Using a fused jumper wire, jumper the cooling fan relay electrical harness from the battery feed circuit to the circuit going to the fan motor (leave jumper installed for the remainder of the steps). Does the cooling fan operate?	—	Go to Step 17	Go to Step 11
11	1. Turn the ignition OFF. 2. Disconnect the cooling fan electrical connector for the fan that did not operate. 3. Turn the ignition ON. 4. Connect a test light across the cooling fan electrical connector terminals. Does the test light illuminate?	—	Go to Step 18	Go to Step 12
12	Probe the cooling fan motor harness connector power feed circuit with a test light connected to ground. Does the test light illuminate?	—	Go to Step 13	Go to Step 15
13	Check the connection at the fan motor harness connector. If a faulty connection is found, repair as necessary. Refer to Repair Procedures in Electrical Diagnosis (8A Cell 5). Was a problem found and corrected?	—	System OK	Go to Step 14
14	Repair open fan motor ground circuit. Refer to Repair Procedures in Electrical Diagnosis (8A Cell 5). Is the action complete?	—	System OK	—
15	Repair open power feed circuit between the fan relay and the cooling fan motor. Refer to Repair Procedures in Electrical Diagnosis (8A Cell 5). Is the action complete?	—	System OK	—
16	Repair open battery feed circuit to the fan relay. Refer to Repair Procedures in Electrical Diagnosis (8A Cell 5). Is the action complete?	—	System OK	—
17	Replace the cooling fan relay. Is the action complete?	—	System OK	—
18	Replace the cooling fan motor. Is the action complete?	—	System OK	—

Distributor Ignition System Check

13750

Diagnostic Aids

An ignition coil wire that is open or shorted to ground can cause a no start condition.

Test Description

Number(s) below refer to step number(s) on the diagnostic table.

Important: The battery should be fully charged prior to any tests.

- Checks for proper output from the distributor ignition system. The spark tester requires a minimum of 25,000 volts to fire. This check can be used in case of an ignition miss, because the system may provide enough voltage to run the engine but not enough to fire a spark plug under heavy load.

- This test will separate the distributor cap, rotor and ignition wires from the ignition coil to help identify a secondary ignition system problem. It is necessary to unscrew the top terminal on the ST-125 spark tester for a proper fit in the distributor end of the coil wire.
- This will determine if the proper available voltage exists in the primary ignition circuit.
- This check will begin to determine if the PCM is providing a signal to the ignition coil module or not. If the PCM is not providing a signal to the ignition coil module, the problem exists between the distributor and PCM.
- If the PCM is detecting low resolution signal pulses and no IC signal was available at the ignition coil module, a problem exists with the PCM or the circuit to the ignition coil module.

13. If the PCM does not detect low resolution signal pulses, the distributor or distributor to PCM circuitry is most likely the problem. The remaining tests will determine if the proper signals are being sent and received from both the distributor and PCM.

22. A grounded coil circuit will cause the ignition fuse to open, and a no-start condition will occur.

Distributor Ignition System Check

Step	Action	Value(s)	Yes	No
1	Was the Powertrain On-Board Diagnostic (OBD) System Check performed?	—	Go to Step 2	Go to Powertrain OBD System Check
2	1. Turn the ignition OFF. 2. Disconnect the tachometer (If so equipped.) 3. Remove an ignition wire from a spark plug. 4. Install the spark tester (J 26792.) 5. While cranking the engine, observe the spark tester. Important: If no spark is coming from the ignition wire, check a second ignition wire. A few sparks and then nothing is considered no spark. Is spark jumping the gap at the spark tester?	—	Go to Step 3	Go to Step 4
3	Remove the spark plugs and inspect for being gas fouled. Are the spark plugs gas fouled?	—	Go to Spark Plug Replacement	Go to Fuel System Diagnosis
4	1. Reconnect the ignition wires to spark plugs. 2. Disconnect the coil wire from the distributor. 3. Connect the spark test to the coil wire. 4. While cranking the engine, observe the spark tester. Is spark jumping the gap at the spark tester?	—	Go to Step 19	Go to Step 5
5	1. Turn the ignition OFF. 2. Disconnect the Ignition Coil Module connector. 3. Turn the ignition ON. 4. Using a DVM (J 39200), measure the voltage at the harness terminals A and D to ground. Do both terminals measure less than the specified value?	10.0V	Go to Step 22	Go to Step 6
6	Is there only one terminal below the specified value?	10.0V	Go to Step 23	Go to Step 7
7	1. Connect the DVM to terminal B of the ignition coil module harness and ground. 2. Set the DVM to the AC scale. 3. While cranking the engine, observe the voltage on the DVM. Is the voltage between the specified values?	1.0– 4.0 V	Go to Step 8	Go to Step 12
8	1. Turn the ignition ON. 2. Using a test light (J 34142–B) connected to B+, probe terminal C of the ignition coil module harness connector. Did the test light illuminate?	—	Go to Step 10	Go to Step 9
9	Repair the Ignition Coil Module ground circuit. Is the repair completed?	—	System OK	—
10	1. Inspect the terminals of the ignition coil module harness connector for proper tension. 2. If a poor connection is found, replace the terminals. Was a poor connection found?	—	System OK	Go to Step 11

Distributor Ignition System Check (cont'd)

Step	Action	Value(s)	Yes	No
11	Replace the Ignition Coil Module. Is the action completed?	—	System OK	—
12	1. Install the scan tool. 2. Using the scan tool, monitor the low resolution signal on the Engine 1 Data List. 3. Crank the engine for 10.0 seconds. Is a low resolution signal indicated on the scan tool?	—	Go to Step 25	Go to Step 13
13	1. Turn the ignition OFF. 2. Disconnect the distributor electrical connector. 3. Turn the ignition ON. 4. Using a test light (J 34142-B) connected to ground, probe terminal C of the distributor harness connector. Did the test light illuminate?	—	Go to Step 14	Go to Step 27
14	Using a DVM (J 39200), check for continuity between the distributor connector terminal D and ground. Does the circuit have continuity?	—	Go to Step 15	Go to Step 28
15	Using a DVM on the DC scale, measure the voltage at the distributor connector terminal A. Is the voltage at the specified value?	5.0V	Go to Step 16	Go to Step 29
16	Using a DVM on the DC scale, measure the voltage at the distributor connector terminal B. Is the voltage at the specified value?	5.0V	Go to Step 17	Go to Step 18
17	Faulty distributor connection or faulty distributor. Is the repair completed?	—	System OK	—
18	1. Inspect the distributor high resolution circuit for an open. 2. If the circuit is found to be open, repair it as necessary. Refer to <i>Electrical Diagnosis 8A Cell 5</i> Was a problem found and corrected?	—	System OK	Go to Step 30
19	Inspect the secondary ignition wires for the following: • Open circuits • Shorted circuits • Poor connections Was a problem found and corrected?	—	System OK	Go to Step 20
20	1. Remove the distributor. Refer Distributor Removal. 2. Inspect cap and rotor for cracks, carbon tracking and interference between the cap and rotor. Refer to Distributor cap, Cover, Rotor and Base Assembly Was a problem found and corrected?	—	System OK	Go to Step 21
21	Replace distributor base assembly. Refer to Distributor cap, Cover, Rotor and Base Assembly. Is the action complete?	—	System OK	—
22	Check the ignition feed circuit to the coil for the following: • Open fuse. • Poor connection at the coil. • Grounded circuit. Did any of the above require a repair?	—	System OK	Go to Step 24

Distributor Ignition System Check (cont'd)

Step	Action	Value(s)	Yes	No
23	1. Inspect the circuit that was less than 10.0 volts for an open or for a grounded circuit. 2. If the circuit is open or grounded, repair it as necessary. Refer to <i>Electrical Diagnosis 8A Cell 5</i> . Was an open or grounded circuit located?	—	System OK	Go to Step 24
24	Replace the ignition coil. Is the action complete?	—	System OK	—
25	1. Turn the ignition OFF. 2. Disconnect the PCM electrical connector. 3. Inspect the Ignition Control terminal for proper tension (At the PCM harness.) 4. If a poor connection is found, replace faulty terminal. Refer to <i>Electrical Diagnosis 8A Cell 5</i> . Was a problem found and corrected?	—	System OK	Go to Step 26
26	1. Inspect the ignition control circuit for an open. 2. If the circuit is found to be open, repair it as necessary. Refer to <i>Electrical Diagnosis 8A Cell 5</i> . Was a problem found and corrected?	—	System OK	Go to Step 30
27	1. Inspect the distributor ignition feed circuit for an open. 2. If the circuit is found to be open, repair it as necessary. Refer to <i>Electrical Diagnosis 8A Cell 5</i> . Was a problem found and corrected?	—	System OK	Go to Step 30
28	1. Inspect the distributor ground circuit for an open. 2. If the circuit is found to be open, repair it as necessary. Refer to <i>Electrical Diagnosis 8A Cell 5</i> . Was a problem found and corrected?	—	System OK	Go to Step 30
29	1. Inspect the distributor low resolution circuit for an open or a grounded circuit. 2. If the circuit is found to be open or grounded, repair it as necessary. Refer to <i>Electrical Diagnosis 8A Cell 5</i> . Was a problem found and corrected?	—	System OK	Go to Step 30
30	Check for a poor connection at the PCM and replace terminal if necessary. Was a problem found and corrected?	—	System OK	Go to Step 31
31	Important: Replacement PCM must be programmed. Refer to <i>PCM Replacement/Programming</i> . Replace the PCM. Is the action complete?	—	System OK	—

Distributor Vent System Check

30050

Legend

- (1) Clean Air Supply Hose (from air intake duct)
- (2) Vacuum Supply from Intake Manifold
- (3) Check Valve
- (4) Rocker Cover
- (5) Vent System Harness
- (6) AIR Pump
- (7) Check Valve Filter
- (8) Air Intake Duct
- (9) Distributor

Circuit Description

The distributor is equipped with a fresh air vent system. When the engine is started, vacuum that the engine produces pulls fresh air in from the air intake duct. A constant supply of fresh air is needed within the distributor. An inoperative distributor vent system may cause premature distributor failure.

Diagnostic Aids

If the check valve/filter or the check valve is installed backwards the system will not function. Verify flow direction is toward the manifold using a hand held vacuum pump at the check valve and the check valve/filter ports. Vacuum should hold in one direction and not the other. If vacuum holds or does not hold in both direction, for either component, that component is faulty.

Test Description

Number(s) below refer to step number(s) on the diagnostic table.

2. Check for a blocked or restricted vacuum source.
5. Check for a blocked, restricted or collapsed hoses. Check the connections at the distributor cap for a blockage. Check for a faulty check valve or check valve/filter.
6. Check for damaged or leaking hoses or connections. Check the seal between the distributor cap and the distributor. Also, check the distributor cap for cracks or other damage.

Distributor Vent System Check

Step	Action	Value(s)	Yes	No
1	Was the Powertrain On-Board Diagnostic (OBD) System Check performed?	—	Go to Step 2	Go to Powertrain OBD System Check
2	1. Disconnect the distributor vacuum hose at the intake manifold. 2. Connect a hand held vacuum pump to the distributor vacuum hose. 3. Apply vacuum and observe vacuum pump gauge. Does the vacuum not build up or bleed off quickly?	—	Go to Step 3	Go to Step 5
3	1. With the vacuum pump still connected, disconnect the distributor clean air supply hose from the air intake duct and plug it with a suitable stopper. 2. Apply 34 kPa (10 in. Hg) of vacuum and observe the vacuum pump gauge. Does the vacuum hold?	—	Go to Step 4	Go to Step 6

Distributor Vent System Check (cont'd)

Step	Action	Value(s)	Yes	No
4	1. Remove the stopper from the clean air supply hose. 2. Disconnect the vacuum pump. 3. Connect the vacuum pump to the clean air supply hose. 4. Apply 34 kPa (10 in. Hg) of vacuum and observe the vacuum pump gauge. Does the vacuum hold?	—	System OK	Go to Step 7
5	Repair the distributor vent system for a blockage or restrictions. Is the action complete?	—	System OK	—
6	Repair the distributor vent system for vacuum leaks. Is the action complete?	—	System OK	—
7	Replace the faulty check valve. Is the action complete?	—	System OK	—

Fuel Tank Leak Check

Important:

- Before attempting the Fuel Tank Leak Check place a dry chemical (Class B) fire extinguisher near the work area.
- Before removing the fuel tank for a suspected leak, make sure the fuel pipes are not leaking onto the fuel tank. Once removed, make sure fuel is not leaking around the fuel sender gasket.
- This check requires a fuel sender assembly and a fuel sender gasket to be installed in the fuel tank.

1. Disconnect the negative battery cable.
2. Relieve the fuel system pressure. Refer to the Fuel Pressure Relief Procedure.

3. Drain the fuel tank. Refer to Draining Fuel Tank.
4. Remove the fuel tank. Refer to Fuel Tank and Fuel Filler Pipe Replacement.
5. Cap the fuel feed pipe, the fuel return pipe, and the EVAP pipe on the fuel sender assembly.
6. Connect a piece of hose to the filler pipe nipple and plug the opposite end.
7. Submerge the fuel tank in water or apply a soap solution to the outside of the fuel tank.
8. Apply 35 kPa (5 psi) air pressure to the vent hose on the fuel tank. Air bubbles appearing from the fuel tank indicate a leak.
9. Replace the fuel tank if it is leaking. Refer to Fuel Tank and Fuel Filler Pipe Replacement.

Fuel Injector Balance Test

17713

Legend

- (1) First Reading
- (2) Second Reading

Injector Balance Test Example

Cylinder	1	2	3	4	5	6
1st Reading	296 kPa (43 psi)	296 kPa (43 psi)	296 kPa (43 psi)	296 kPa (43 psi)	296 kPa (43 psi)	296 kPa (43 psi)
2nd Reading	131 kPa (19 psi)	117 kPa (17 psi)	124 kPa (18 psi)	145 kPa (21 psi)	131 kPa (21 psi)	130 kPa (10 psi)
Amount of Drop	165 kPa (24 psi)	179 kPa (26 psi)	172 kPa (25 psi)	151 kPa (22 psi)	165 kPa (24 psi)	166 kPa (24 psi)
Average Range: 156–176 kPa (22.5–25.5 psi)	Injector OK	Faulty injector - too much fuel drop	Injector OK	Faulty injector - too little fuel drop	Injector OK	Injector OK

Test Description

Caution: In order to reduce the risk of fire and personal injury, wrap a shop towel around the fuel pressure connection. The towel will absorb any fuel leakage that occurs during the connection of the fuel pressure gauge. Place the towel in an approved container when the connection of the fuel pressure gauge is complete.

- 4. The engine coolant temperature must be below the operating temperature in order to avoid irregular fuel pressure readings due to Hot Soak fuel boiling.

- 5. The fuel pressure should be within the specified range. If the fuel pressure is not within the specified range, go to *Fuel System Diagnosis*
- 6. The fuel pressure should reach a steady value. If the fuel pressure does not reach a steady value, go to *Fuel System Diagnosis*
- 7. If the pressure drop value for each fuel injector is within 10 kPa (1.5 psi) of the average pressure drop value, the fuel injectors are flowing properly. Calculate the pressure drop value for each fuel injector by subtracting the second pressure reading from the first pressure reading. Refer to the illustration above.

Fuel Injector Balance Test

Step	Action	Value(s)	Yes	No
1	Was the Powertrain On-Board Diagnostic (OBD) System Check performed?	—	Go to Step 2	Go to Powertrain OBD System Check
2	Was the Fuel Injector Coil Test Procedure performed?	—	Go to Step 3	Go to Fuel Injector Coil Test
3	Is the engine coolant temperature above the specified value?	94 °C (201 °F)	Go to Step 4	Go to Step 5
4	Allow the engine to cool below the specified value. Is the engine coolant temperature below the specified value?	94 °C (201 °F)	Go to Step 5	—
5	Caution: In order to reduce the risk of fire and personal injury, wrap a shop towel around the fuel pressure connection. The towel will absorb any fuel leakage that occurs during the connection of the fuel pressure gauge. Place the towel in an approved container when the connection of the fuel pressure gauge is complete. 1. Connect the J34730 fuel pressure gauge to the fuel pressure test port. 2. Energize the fuel pump using either the fuel pump test connector or the scan tool. 3. Place the bleed hose of the fuel pressure gauge into an approved gasoline container. 4. Bleed the air out of the fuel pressure gauge. 5. Observe the reading on the fuel pressure gauge. Is the fuel pressure within the specified limits?	284–325 kPa (41–47 psi)	Go to Step 6	Go to Fuel System Diagnosis
6	Turn the fuel pump OFF. Does the fuel pressure remain constant?	—	Go to Step 7	Go to Fuel System Diagnosis

Fuel Injector Balance Test (cont'd)

Step	Action	Value(s)	Yes	No
7	1. Connect the J 39021 fuel injector tester to a fuel injector. 2. Set the amperage supply selector switch on the fuel injector tester to the Balance Test 0.5–2.5 amp position. 3. Turn the fuel pump ON then OFF in order to pressurize the fuel system. 4. Record the fuel pressure indicated by the fuel pressure gauge after the fuel pressure stabilizes. This is the 1st pressure reading (refer to (1) in the illustration). 5. Energize the fuel injector by depressing the Push to Start Test button on the fuel injector tester. 6. Record the fuel pressure indicated by the fuel pressure gauge after the fuel pressure gauge needle has stopped moving. This is the 2nd pressure reading (refer to (2) in the illustration). 7. Repeat Steps 1 through 6 for each fuel injector. 8. Subtract the 2nd pressure reading from the 1st pressure reading for one fuel injector. The result is the pressure drop value. 9. Obtain a pressure drop value for each fuel injector. 10. Add all of the individual pressure drop values. This is the total pressure drop. 11. Divide the total pressure drop by the number of fuel injectors. This is the average pressure drop. Does any fuel injector have a pressure drop value that is either higher than the average pressure drop or lower than the average pressure drop by the specified value?	10 kPa (1.5 psi)		
			Go to Step 8	Go to Symptoms
8	Notice: Do not repeat any portion of this test before running the engine in order to prevent the engine from flooding Re-test any fuel injector that does not meet the specification. Refer to the procedure in Step 7. Does any fuel injector still have a pressure drop value that is either higher than the average pressure drop or lower than the average pressure drop by the specified value?	10 kPa (1.5 psi)		
			Go to Step 9	Go to Symptoms
9	Replace the faulty fuel injector(s). Refer to the Fuel Injector procedure. Is the replacement complete?	—	System OK	—

Fuel Injector Coil Test
(ECT Within 10-35 Degrees C)

17707

Test Description

Caution: In order to reduce the risk of fire and personal injury, wrap a shop towel around the fuel pressure connection. The towel will absorb any fuel leakage that occurs during the connection of the fuel pressure gauge. Place the towel in an approved container when the connection of the fuel pressure gauge is complete.

2. The engine coolant temperature affects the ability of the fuel injector tester to detect a faulty fuel injector. If the engine coolant temperature is NOT between 10°C and 35°C (50°F and 95°F), go to *Fuel Injector Coil Test*
3. The first second of the voltage displayed by the DVM may be inaccurate due to the initial current surge, therefore, record the lowest voltage displayed by the DVM after the first second of the test. The voltage displayed by the DVM should be within the specified range (refer to the Example). The voltage displayed

by the DVM may increase throughout the test as the fuel injector windings warm and the resistance of the fuel injector windings changes. An erratic voltage reading (large fluctuations in voltage that do not stabilize) indicates an intermittent connection within the fuel injector.

Resistance Ohms		Voltage Specification at 10°C–35°C (50°F–95°F)	
11.8–12.6		5.7–6.6V	
Fuel Injector Number	Voltage Reading	Pass/Fail	
1	6.3	P	
2	5.9	P	
3	6.2	P	
4	6.1	P	
5	4.8	F	
6	6.0	P	

Fuel Injector Coil Test (ECT Within 10-35 Degrees C)

Step	Action	Value(s)	Yes	No
1	Was the Powertrain On-Board Diagnostic (OBD) System Check performed?	—	Go to Step 2	Go to Powertrain OBD System Check
2	1. Connect the scan tool. 2. Check the engine coolant temperature. Is the engine coolant temperature within the specified limits?	10°C–35°C (50°F–95°F)	Go to Step 3	Go to Fuel Injector Coil Test
3	1. Turn the ignition OFF. Notice: In order to prevent flooding of a single cylinder and possible engine damage, relieve the fuel pressure before performing the fuel injector coil test procedure. 2. Relieve the fuel pressure. Refer to the Fuel Pressure Relief Procedure. 3. Access the fuel injector electrical connectors as required. 4. Connect the J 39021 fuel injector tester to B+ and ground. 5. Set the amperage supply selector switch on the fuel injector tester to the Coil Test 0.5 amp position. 6. Connect the leads from the J 39200 Digital Volt Meter (DVM) to the fuel injector tester. Refer to the illustration associated with the test description. 7. Set the DVM to the tenths scale (0.0). 8. Connect the fuel injector tester to a fuel injector. Important: Check the engine coolant temperature again to ensure that the correct chart is being used. 9. Press the Push to Start Test button on the fuel injector tester. 10. Observe the voltage reading on the DVM. Important: The voltage reading may rise during the test. 11. Record the lowest voltage observed after the first second of the test. 12. Repeat Steps 8 through 11 for each fuel injector. Did any fuel injector have an erratic voltage reading (large fluctuations in voltage that do not stabilize) or a voltage reading outside of the specified limits?	5.7–6.6V	Go to Step 4	Go to Fuel Injector Balance Test
4	Replace the faulty fuel injector(s). Refer to the Fuel Injector procedure. Is the replacement complete?	—	Go to Fuel Injector Balance Test	—

Fuel Injector Coil Test (ECT Outside 10-35 Degrees C)

17707

Test Description

Caution: In order to reduce the risk of fire and personal injury, wrap a shop towel around the fuel pressure connection. The towel will absorb any fuel leakage that occurs during the connection of the fuel pressure gauge. Place the towel in an approved container when the connection of the fuel pressure gauge is complete.

- The engine coolant temperature affects the ability of the fuel injector tester to detect a faulty fuel injector. If the engine coolant temperature is between 10°C–35°C (50°F–95°F), go to *Fuel Injector Coil Test*.
- The first second of the voltage displayed by the DVM may be inaccurate due to the initial current surge, therefore, record the lowest voltage displayed by the DVM after the first second of the test. The voltage displayed by the DVM may increase throughout the test as the fuel injector windings warm and the resistance of the fuel injector windings changes. An erratic voltage reading (large fluctuations in voltage that do not stabilize) indicates an intermittent connection within the fuel injector. From the voltages recorded, identify the highest

voltage, excluding any voltages above 9.5 volts. Subtract each voltage that is not above 9.5 volts from the highest voltage. Record each subtracted value (refer to the Example). The subtracted value for any fuel injector must not exceed 0.6 volt. A fuel injector with a subtracted value that is greater than 0.6 volt is considered faulty and must be replaced. A fuel injector with a recorded voltage above 9.5 volts is also considered faulty and must be replaced.

Highest Voltage Reading		Acceptable Subtracted Value Above/Below 10°C–35°C (50°F–95°F)	
7.1 V		0.6 V	
Injector Number	Voltage	Subtracted Value	Pass/Fail
1	9.8	—	F
2	6.6	0.5	P
3	6.9	0.2	P
4	5.8	1.3	F
5	7.0	0.1	P
6	7.1	0.0	P

Fuel Injector Coil Test (ECT Outside 10-35 Degrees C)

Step	Action	Value(s)	Yes	No
1	Was the Powertrain On-Board Diagnostic (OBD) System Check performed?	—	Go to Step 2	Go to Powertrain OBD System Check
2	1. Connect the scan tool. 2. Check the engine coolant temperature. Is the engine coolant temperature outside the specified limits?	10°C–35°C (50°F–95°F)	Go to Step 3	Go to Fuel Injector Coil Test
3	1. Turn the ignition OFF. Notice: In order to prevent flooding of a single cylinder and possible engine damage, relieve the fuel pressure before performing the fuel injector coil test procedure. 2. Relieve the fuel pressure. Refer to the Fuel Pressure Relief Procedure. 3. Access the fuel injector electrical connectors as required. 4. Connect the J 39021 fuel injector tester to B+ and ground. 5. Set the amperage supply selector switch on the fuel injector tester to the Coil Test 0.5 amp position. 6. Connect the leads from the J 39200 Digital Volt Meter (DVM) to the fuel injector tester. Refer to the illustration associated with the test description. 7. Set the DVM to the tenths scale (0.0). 8. Connect the fuel injector tester to a fuel injector. Important: Check the engine coolant temperature again to ensure that the correct chart is being used. 9. Press the Push to Start Test button on the fuel injector tester. 10. Observe the voltage reading on the DVM. Important: The voltage reading may rise during the test. 11. Record the lowest voltage observed after the first second of the test. 12. Repeat Steps 8 through 11 for each fuel injector. 13. Identify the highest voltage reading recorded other than those above 9.5 volts. 14. Subtract any other voltage reading recorded from the highest voltage reading recorded. 15. Repeat Step 14 for all the remaining fuel injectors. Is any value that resulted from subtraction greater than the specified value?	0.6V	Go to Step 4	Go to Fuel Injector Balance Test
4	Replace any fuel injector that had any of the following: • A subtracted value exceeding 0.6 volts. • An initial reading above 9.5 volts. • An erratic reading. Refer to the Fuel Injector Procedure. Is the replacement complete?	—	Go to Fuel Injector Balance Test	—

Alcohol/Contaminants-in-Fuel Testing Procedure

Alcohol-in-fuel can be detrimental to fuel system components and may cause driveability problems such as hesitation, lack of power, stall, no start, etc. The problems may be due to fuel system corrosion and subsequent fuel filter plugging, deterioration of rubber components, and/or air-fuel mixture leaning. Commercial fuel uses various types and concentrations of alcohol. Some types of alcohol are more detrimental to fuel system components than others. If you suspect an excessive amount of alcohol in the fuel as the cause of a driveability condition, use the Alcohol-in-Fuel Testing Procedure to detect the presence of alcohol in the fuel.

Alcohol-in-Fuel Testing Procedure

Draw the fuel sample from the bottom of the tank in order to detect any water present in the tank. The sample should be bright and clear. If the sample appears cloudy, or contaminated with water (as indicated by a water layer at the bottom of the sample), Do Not use this procedure. Go to Fuel System Cleaning.

1. Using a 100 ml cylinder with 1 ml graduation marks, fill with fuel to the 90 ml mark.
2. Add 10 ml of water to bring the total fluid volume to 100 ml. Install a stopper on the cylinder.
3. Shake the cylinder vigorously for 10 to 15 seconds.
4. Carefully loosen the stopper to release the pressure.
5. Close the stopper and shake the cylinder vigorously again for 10 to 15 seconds.
6. Put the graduated cylinder on a level surface for approximately 5 minutes to allow adequate liquid separation.

If alcohol is present in the fuel, the volume of the lower layer (which would now contain both alcohol and water) will be greater than 10 ml. For example, if the volume of the lower layer increases to 15 ml, it indicates at least 5 percent alcohol in the fuel. The actual amount of alcohol may be somewhat greater because this procedure does not extract all of the alcohol from the fuel.

Repair Instructions

PCM Replacement/Programming

Service of the PCM should normally consist of either replacement of the PCM or EEPROM programming. If the diagnostic procedures call for the PCM to be replaced, PCM should be checked first to see if it is the correct part. If it is, remove the faulty PCM and install the new service PCM. The KS module from the old PCM must be transferred to the new PCM.

THE SERVICE PCM EEPROM WILL NOT BE PROGRAMMED. DTC P0601 and P0602 indicates the EEPROM is not programmed or has malfunctioned.

Important: When replacing the production PCM with a service PCM (controller), it is important to transfer the broadcast code and production PCM number to the service PCM label. Do not record on PCM cover. This will allow positive identification of PCM parts throughout the service life of the vehicle.

Important: To prevent internal PCM damage, the ignition must be OFF when disconnecting or reconnecting power to PCM (for example, battery cable, PCM pigtail, PCM fuse, jumper cables, etc.).

Removal Procedure

Notice: To prevent possible electrostatic discharge damage to the PCM, do not touch the connector pins or soldered components on the circuit board.

Notice: The ignition should always be OFF when installing or removing the PCM connectors.

1. Remove the air cleaner assembly (2) from the top of the PCM (1).

29983

2. Remove the PCM (4) from the PCM mounting hardware (1 and 3).

29994

3. Disconnect the Harness connectors (1) from the PCM (2).
4. Remove the PCM (2) from the engine compartment.

29977

5. Remove the KS Module access cover.
6. Remove the KS Module.

13490

13490

Installation Procedure

Notice: To prevent possible electrostatic discharge damage to the PCM, do not touch the connector pins or soldered components on the circuit board.

Notice: The ignition should always be OFF when installing or removing the PCM connectors.

1. Install the KS Module into the PCM.
2. Install the KS Module access cover.

29977

3. Connect the Harness Connectors (1) to the PCM (2).
4. Install the PCM into the vehicle.

29994

5. Install the PCM mounting hardware (1 and 3) to the PCM (4).

6. Install the air cleaner assembly (2) to the top of the PCM (1).
7. If a new PCM is being installed, program the EEPROM.

EEPROM Programming

1. Setup – Ensure that the following conditions have been met:
 - The battery is fully charged.
 - The ignition is ON.
 - The Vehicle Interface Module cable connection at the DLC is secure.
2. Program the PCM using the latest software matching the vehicle. Refer to Techline terminal/equipment users instructions.
3. If the PCM fails to program, proceed as follows:
 - Ensure that all PCM connections are OK.
 - Check the Techline terminal/equipment for the latest software version.
 - Attempt to program the PCM. If the PCM still cannot be programmed properly, replace the PCM. The replacement PCM must be programmed.

29983

Functional Check

1. Perform On-Board Diagnostic System Check.
2. Start engine and run for one minute.
3. Scan for DTCs using the scan tool.
4. If DTC P0325 sets, the KS module is not fully seated, is missing, or is faulty.

ECT Sensor

Removal Procedure

1. Drain the engine coolant. Refer to Section 6B.
2. Remove the air inlet duct (5).

30029

13642

3. Disconnect the electrical connector from the ECT sensor (2).

Important: Care must be taken when handling the Engine Coolant Temperature (ECT) sensor. Damage to the ECT sensor will affect proper operation of the fuel injection system.

4. Remove the ECT sensor (2) from the engine coolant pump (1).

13642

Installation Procedure

Important: Care must be taken when handling the Engine Coolant Temperature (ECT) sensor. Damage to the ECT sensor will affect proper operation of the fuel injection system.

1. Coat the Engine Coolant Temperature (ECT) sensor threads with sealer P/N 1052080 or equivalent.
2. Install the ECT sensor (2) into the engine coolant pump (1).

Tighten

Tighten the ECT sensor to 23 N.m (17 lb ft).

30029

3. Connect the ECT sensor electrical connector.
4. Install the air inlet duct.
5. Refill the engine coolant. Refer to Section 6B.
6. Start the engine and check for leaks.
7. Recheck the engine coolant level.

MAF Sensor

Removal Procedure

Important: Take care when handling the MAF. Do not dent, puncture, or otherwise damage the Honeycomb located at the air inlet end of the MAF. Do not touch the sensing elements or allow anything (including cleaning solvents and lubricants) to come in contact with them. A small amount of GM lubricant (P/N=99855406) may be used on the air duct only, to aid in installation. Do not drop or roughly handle the MAF.

1. Disconnect the MAF sensor electrical connector.
2. Loosen air duct clamps and remove the MAF sensor (6).

30029

Installation Procedure

Important: Embossed arrows on MAF sensor indicate proper air flow direction and must point toward the engine.

1. Install the MAF sensor into the air duct.

Tighten

Tighten the air duct clamps to 4 N·m (36 lb in).

2. Connect the electrical connector to the MAF sensor.

30029

MAP Sensor

Removal Procedure

1. Remove the appearance cover.
2. Disconnect the MAP sensor electrical connector (3).
3. Remove the Hold down bolts (1).
4. Remove the MAP sensor (2) from the intake manifold (4).

13485

13485

30087

Installation Procedure

1. Install the New MAP sensor seal (5), lightly coated with clean engine oil.
2. Install the MAP sensor (2) to the intake manifold (4).
3. Install the Hold down bolts (1).

Tighten

Tighten the MAP sensor bolts to 6 N.m (50 lb in)

4. Connect the MAP sensor electrical connector (3).
5. Install the Appearance cover.

Heated Oxygen Sensor (HO2S) Bank 1 Front and Rear Sensors

Notice: The Heated Oxygen Sensors each use a permanently attached pigtail and connector. This pigtail should not be removed from the heated oxygen sensor. Damage or removal of the pigtail or connector could affect proper operation of the heated oxygen sensor.

Important: Take care when handling the heated oxygen sensor. The in-line electrical connector and louvered end must be kept free of grease, dirt or other contaminants. Also, avoid using cleaning solvents of any type. Do not drop or roughly handle the heated oxygen sensor/catalyst monitor. A dropped sensor is a bad sensor.

Removal Procedure

Important: The heated oxygen sensor may be difficult to remove when engine temperature is below 48°C (120°F). Excessive force may damage threads in exhaust manifold or exhaust pipe. It may be necessary to lower the exhaust system to gain sufficient access to an HO2S and/or its connector. Refer to Section 6F, Exhaust System.

1. Raise the vehicle.
2. Disconnect the left (*front/rear*) HO2S electrical connector.
3. Carefully back out the left (*front/rear*) heated oxygen sensor.

Installation Procedure

Important: A special anti-seize compound is used on the heated oxygen sensor threads. The compound consists of graphite suspended in fluid and glass beads. The graphite will burn away, but the glass beads will remain, making the sensor easier to remove. New or service sensors will already have the compound applied to the threads. If a sensor is removed from an engine and if for any reason is to be reinstalled, the threads must have anti-seize compound applied before reinstallation.

1. Coat the threads of the heated oxygen sensor with anti-seize compound P/N 12377953, or equivalent if necessary.
2. Install the left (*front/rear*) heated oxygen sensor.

Tighten

Tighten the left (*front/rear*) HO2S to 41 N·m (30 lb ft).

3. Connect the left (*front/rear*) HO2S electrical connector.
4. Lower the Vehicle.

Heated Oxygen Sensor (HO2S) Bank 2 Front and Rear Sensors

Notice: The Heated Oxygen Sensors each use a permanently attached pigtail and connector. This pigtail should not be removed from the heated oxygen sensor. Damage or removal of the pigtail or connector could affect proper operation of the heated oxygen sensor.

Important: Take care when handling the heated oxygen sensor. The in-line electrical connector and louvered end must be kept free of grease, dirt or other contaminants. Also, avoid using cleaning solvents of any type. Do not drop or roughly handle the heated oxygen sensor/catalyst monitor. A dropped sensor is a bad sensor.

Removal Procedure

Important: The HO2S sensor may be difficult to remove when the engine temperature is below 48°C (120°F). Excessive force may damage threads in exhaust manifold or exhaust pipe. It may be necessary to lower the exhaust system to gain sufficient access to an HO2S and/or its connector. Refer to *Section 6F, Exhaust System*.

1. Raise the vehicle.
2. Disconnect the right (*front/rear*) HO2S electrical connector.
3. Carefully back out the right (*front/rear*) HO2S from the exhaust.

30087

30080

30080

Installation Procedure

Important: A special anti-seize compound is used on the HO2S sensor threads. The compound consists of graphite suspended in fluid and glass beads. The graphite will burn away, but the glass beads will remain, making the sensor easier to remove. New or service sensors will already have the compound applied to the threads. If a sensor is removed from an engine and if for any reason is to be reinstalled, the threads must have anti-seize compound applied before reinstallation.

1. Coat the threads of the HO2S with anti-seize compound P/N 12377953, or equivalent.
2. Install the right (*front/rear*) HO2S.

Tighten

Tighten the right (*front/rear*) HO2S to 41 N·m (30 lb ft).

3. Connect the right (*front/rear*) HO2S electrical connector.
4. Lower the Vehicle.

TP Sensor

Removal Procedure

1. Remove the resonator.
2. Disconnect the TP sensor electrical connector.
3. Remove the TP sensor attaching screws.

Notice: The TP sensor is an electrical component. Do Not soak the TP sensor in any liquid cleaner or solvent as damage may result.

4. Remove the TP sensor.

35849

Installation Procedure

1. Install the TP sensor on the throttle body with the throttle valve in the closed position. Make sure the TP sensor lever lines up with the TP sensor drive lever on the throttle shaft.
2. Install the TP sensor attaching screws.

Torque

Tighten the TP sensor attaching screws to 2 N·m (18 lb in).

3. Connect the TP sensor electrical connector.
4. Install the resonator.

35849

IAT Sensor

Removal Procedure

1. Disconnect the IAT sensor electrical connector.
2. Carefully back out IAT sensor from the intake air duct.

13643

Installation Procedure

1. Install the IAT sensor to the intake air duct.
2. Connect the IAT sensor Electrical connector.

13643

Air Filter Element/Air Cleaner Assembly

Removal Procedure

1. Remove the fasteners from the air cleaner cover (2).
2. Lift the air cleaner cover (2), MAF sensor and the resonator as a unit.
3. Remove the air filter element (3).
4. Inspect the air filter element (3) for dust, dirt and water. Clean or replace if as necessary. Refer to Section OB.

30029

30029

Installation Procedure

Notice: If the Mass Air Flow (MAF) sensor is installed backwards, the system will go rich. An arrow cast into the plastic portion of the sensor indicates proper air flow direction. The arrow must point toward the engine.

1. Install the air filter element (3) into the air cleaner housing (4).
2. Position the air cleaner cover (2), MAF sensor (6) and the resonator (7) back into place.
3. Connect the fasteners to the air cleaner cover (2).
4. Check the clamps at the MAF sensor (6) and tighten as necessary.
5. Check joints between the ducts, resonators and the throttle body for possible leaks. Repair as necessary.

21306

Accelerator Controls (Accelerator Control Cable)

Removal Procedure

1. Disconnect the accelerator cable (4) from the accelerator pedal lever (3).
2. Disconnect the accelerator cable retainer (2).
3. Squeeze the accelerator cable cover tangs (1) and push the cable through the dash panel (bulkhead).
4. Disconnect the accelerator cable (4) from the retaining clip on the resonator bracket (3).
5. Remove the accelerator cable (4) from the accelerator cable bracket (2) and the throttle body (1).

21309

Installation Procedure

Notice: In order to prevent possible interference and damage, flexible components (hoses, wires, conduits, etc.) must not be routed within 50 mm (2) of moving parts, unless the routing is positively controlled.

1. Install the accelerator cable (4) through the dash panel (bulkhead).
2. Install the accelerator cable retainer (2).
3. Install the accelerator cable (4) on the accelerator pedal lever (3).

21306

4. Install the accelerator cable (4) to the accelerator cable bracket (2) and the throttle body (1).
5. Install the accelerator cable (4) into the retaining clip on the resonator bracket (3).
6. Inspect for complete throttle opening and closing positions by operating the accelerator pedal. The throttle should operate freely without bind between full closed throttle and wide open throttle.
7. Check for poor carpet fit under the accelerator pedal.

21309

Accelerator Controls (Accelerator pedal)

Removal Procedure

1. Remove the accelerator pedal push on nut.
2. Remove the accelerator pedal from the accelerator pedal lever.

Installation Procedure

1. Install the accelerator pedal and spring to the accelerator pedal lever.
2. Install a new push on nut to the accelerator pedal lever.
3. Inspect for complete throttle opening and closing positions by operating the accelerator pedal. The throttle should operate freely without bind between full closed throttle and wide open throttle.
4. Check for poor carpet fit under the accelerator pedal.

35845

IAC Valve

Removal Procedure

1. Remove the resonator.
2. Disconnect the distributor ventilation vacuum line at the air intake duct.
3. Disconnect the electrical connector from the IAT sensor.
4. Remove the air intake duct.
5. Disconnect the IAC valve electrical connector.
6. Remove the IAC valve attaching screws.
7. Remove the IAC valve.

Notice:

- Do Not push or pull on the IAC valve pintle on IAC valves that have been in service. The force required to move the pintle may damage the threads on the worm drive.
 - Do Not soak the IAC valve in any liquid cleaner or solvent, as damage may result.
8. Clean the IAC valve O-ring sealing surface, the pintle valve seat, and the air passage.
 - Clean the IAC valve using GM cleaner 1052626 or GM X-66A. Use a shop towel or parts brush to remove heavy deposits.
 - If the air passage has heavy deposits, remove the throttle body for complete cleaning.
 - Shiny spots on the pintle or seat are normal, and do not indicate misalignment or a bent pintle shaft.
 9. Inspect the IAC valve O-ring for cuts, cracks, or distortion. Replace the O-ring if it is damaged.

Installation Procedure

Important: If installing a new IAC valve, be sure to replace it with an identical part. The pintle shape of the IAC valve and the diameter of the IAC valve are designed for the specific application.

1. Measure the distance between the tip of the IAC valve pintle and the mounting surface (1). If the distance is greater than 28 mm, use finger pressure to slowly retract the pintle. The force required to retract the pintle of a new valve will not cause damage to the valve.

12637

2. Lubricate the IAC valve O-ring with clean engine oil.
3. Install the IAC valve.
4. Apply Loctite 262 to the IAC valve attaching screw threads if necessary.
5. Install the IAC valve attaching screws.

Tighten

Tighten the IAC valve attaching screws to 3 N.m (27 lb in).

6. Connect the IAC valve electrical connector.
7. Install the air intake duct.
8. Connect the IAT sensor electrical connector.
9. Connect the distributor ventilation vacuum line to the air intake duct.
10. Install the resonator.
11. Reset the IAC valve pintle position.
 - 11.1. Depress the accelerator pedal slightly.
 - 11.2. Start the engine.
 - 11.3. Release the accelerator pedal.
 - 11.4. Run the engine for 5 seconds.
 - 11.5. Turn the ignition OFF for 10 seconds.
 - 11.6. Restart the engine.
 - 11.7. Check for proper idle operation.

35845

Throttle Body Assembly**Removal Procedure**

An eight-digit part identification number (3) is stamped on the throttle body casting. Refer to this number if servicing, or part replacement is required.

A build date is stamped on the throttle body which indicates the day of year (1) and the year (2) that the throttle body was manufactured.

12654

12592

1. Disconnect the negative battery cable.
2. Partially drain the cooling system.
3. Remove the resonator.
4. Disconnect the electrical connector from the IAT sensor.
5. Disconnect the distributor ventilation vacuum line from the air intake duct.
6. Remove the air intake duct.
7. Disconnect the electrical connectors from the TP sensor and the IAC valve.
8. Disconnect the vacuum lines from the throttle body.
9. Disconnect the coolant hoses from the throttle body.
10. Disconnect the accelerator control cable and the cruise control cable from the throttle body.
11. Remove the throttle body attaching bolts.
12. Remove the throttle body and the gasket. Discard the gasket.

Notice: Use care in cleaning the old gasket material from the machined aluminum surfaces as sharp tools may damage the sealing surfaces.

Important:

- Do Not soak the throttle body in cold immersion type cleaner. The throttle valves have a factory applied sealing compound (DAG material is applied to the outside edge of each valve and the throttle bore) to prevent air bypass at closed throttle. Strong solvents or brushing will remove the material. To clean the throttle body following disassembly, use a spray type cleaner such as GM X-66A or GM 1052626. Use a shop towel to remove heavy deposits.
 - The TP sensor and the IAC valve are electrical components and should NOT come in contact with solvent or cleaner, as damage may result.
13. Clean the gasket sealing surfaces.

Restoration
Parts

Installation Procedure

1. Install the throttle body with a new gasket.
2. Install the throttle body attaching bolts.

Tighten

Tighten the throttle body attaching bolts to 25 N·m (18 lb ft).

3. Connect the accelerator control cable and the cruise control cable.
4. Connect the coolant hoses to the throttle body.
5. Connect the vacuum lines to the throttle body.
6. Connect the electrical connectors to the TP sensor and the IAC valve.
7. Install the air intake duct.
8. Connect the distributor ventilation vacuum line to the air intake duct.
9. Connect the electrical connector to the IAT sensor.
10. Install the resonator.
11. Refill the cooling system.
12. Connect the negative battery cable.
13. With the engine OFF, check to see that the accelerator pedal is free. Depress the accelerator pedal to the floor and release.
14. Reset the IAC valve pintle position.
 - 14.1. Depress the accelerator pedal slightly.
 - 14.2. Start the engine.
 - 14.3. Release the accelerator pedal.
 - 14.4. Run the engine for 5 seconds.
 - 14.5. Turn the ignition OFF for 10 seconds.
 - 14.6. Restart the engine.
 - 14.7. Check for proper idle operation.

Idle Air Control Valve/Coolant Cover Asm**Removal Procedure**

1. Disconnect the negative battery cable.
2. Remove the throttle body from the intake manifold.

12592

12592

35845

3. Remove the IAC valve.

35848

4. Remove the idle air control valve/coolant cover assembly screws.
5. Remove the idle air control valve/coolant cover assembly and the gasket. Discard the gasket.
6. Clean the gasket sealing surfaces.
7. Inspect the gasket sealing surfaces for corrosion or damage that would cause a coolant leak. Replace the idle air control valve/coolant cover assembly or the throttle body if necessary.

35848

Installation Procedure

1. Install a new gasket.
2. Install the idle air control valve/coolant cover assembly.
3. Install the idle air control valve/coolant cover assembly screws.

Tighten

Tighten the idle air control valve/coolant cover assembly screws to 3.2 N·m (28 lb in).

4. Install the IAC valve.

35845

5. Install the throttle body to the intake manifold.
6. Connect the negative battery cable.

12592

Clean Air Cover and Gasket

Removal Procedure

1. Remove the resonator.
2. Remove the clean air cover attaching screws.
3. Remove the clean air cover and the gasket.
4. Discard the gasket.
5. Clean the gasket sealing surfaces.

35850

35850

Installation Procedure

1. Install a new gasket.
2. Install the clean air cover.
3. Install the clean air cover attaching screws.

Tighten

Tighten the clean air cover attaching screws to 3.2 N·m (28 lb in).

4. Install the resonator.

12770

In-Line Fuel Filter

Removal Procedure

Important:

- There is no service interval for fuel filter replacement. Only replace a restricted fuel filter.
- Inspect the fuel tank internally and clean the fuel tank if you find a restricted fuel filter.

1. Disconnect the negative battery cable.
2. Relieve the fuel system pressure. Refer to the Fuel System Pressure Relief Procedure.
3. Raise the vehicle.
4. Clean all the fuel filter connections and the surrounding areas before disconnecting the fuel pipes in order to avoid possible contamination of the fuel system.
5. Remove the fuel filter bracket attaching bolt.
6. Disconnect the quick-connect fittings from the fuel filter. Refer to Servicing Quick-Connect Fittings.
7. Remove the fuel filter.

Installation Procedure

1. Remove the protective caps from the new filter.
2. Install the new plastic connector retainers on the filter inlet and outlet tubes. Install the retainers in the same positions as on the old filter noting the direction of fuel flow arrow.
3. Connect the quick-connect fittings to the fuel filter. Refer to Servicing Quick-Connect Fittings.
4. Trap the fuel filter over the return pipe and install the filter to the frame with the attaching bolt.

Tighten

Tighten the fuel filter attaching bolt to 10 N·m (89 lb in).

5. Lower the vehicle.
6. Tighten the fuel filler cap.
7. Connect the negative battery cable.
8. Inspect for leaks.
 - 8.1. Turn the ignition switch ON for 2 seconds.
 - 8.2. Turn the ignition switch OFF for 10 seconds.
 - 8.3. Turn the ignition switch ON.
 - 8.4. Check for fuel leaks.

12770

Draining Fuel Tank

Caution:

- **Never drain or store fuel in an open container due to the possibility of fire or explosion.**
- **When draining the fuel tank, slowly insert and Do Not force the hand operated pump device in the fuel tank. Forcing the pump device can cause the fuel pump to dislocate from the fuel sender assembly.**

1. Remove the fuel filler cap.
2. Use a hand operated pump device to drain as much fuel through the fuel filler pipe as possible.
3. Install the fuel filler cap.

GM Restoration Parts

12664

12661

Fuel Tank

Removal Procedure

Caution: Provide additional support when a vehicle is on a hoist:

- Before removing parts, support the opposite end. This helps prevent the vehicle from slipping off.
- Before removing major components, chain the vehicle frame to the hoist pads at the same end as the removal. This helps avoid a tip-off.

Failure to follow these precautions could cause vehicle damage, serious personal injury, or death.

1. Disconnect the negative battery cable.
2. Relieve the fuel system pressure. Refer to the Fuel Pressure Relief Procedure.
3. Drain the fuel tank. Refer to Draining Fuel Tank.
4. Raise the vehicle.
5. Remove the lower fuel tank shield attaching screws and the lower fuel tank shields from the upper fuel tank shield.
6. Wipe the vent hose connection at the fuel filler vent pipe.
7. Disconnect the vent hose (1) and the clamp (2).
8. Wipe the fuel filler pipe connection at the fuel tank.
9. Disconnect the fuel filler pipe (4) and the clamp (3).

10. Wipe the EVAP hose connection at the fuel sender.

Notice:

- Replace nylon fuel feed or return pipes if the pipe becomes kinked and cannot be straightened.
- Do Not attempt to repair sections of nylon fuel pipes. Replace the pipes if they are damaged.

11. Disconnect the EVAP hose (1) and the clamp (2).
12. Disconnect the fuel feed (3) and the fuel return (4) quick-connect fittings from the fuel sender assembly. Refer to Servicing Quick-Connect Fittings.
13. Disconnect the fuel sender electrical connector.
14. With the aid of an assistant, support the fuel tank.

Notice: Do Not bend the fuel tank straps. Bending the fuel tank straps may damage the straps.

15. Remove the fuel tank strap front attaching bolts and the fuel tank.
16. Place the fuel tank in a suitable work area.
17. If the fuel filler pipe needs to be replaced, remove the fuel filler pipe attaching screws, the ground strap (Wagon only), and the fuel filler pipe.
18. Remove the fuel sender assembly from the fuel tank. Refer to Fuel Sender Assembly Replacement.
19. Remove the fuel tank vent hose.

Installation Procedure

1. Install the fuel tank vent hose.
2. Install the fuel sender assembly to the fuel tank. Refer to Fuel Sender Assembly Replacement.
3. If the fuel filler pipe was replaced, install the fuel filler pipe, the ground strap (Wagon only), and the fuel filler pipe attaching screws.

Tighten

- Tighten the fuel filler pipe attaching screws to 6 N·m (53 lb in) (Except Wagon) and 1.9 N·m (17 lb in).
- Tighten the fuel filler pipe ground strap screw (Wagon only) to 4 N·m (35 lb in).

4. With the aid of an assistant, position and support the fuel tank.
5. Install the front fuel tank strap attaching bolts.

Tighten

Tighten the front fuel tank strap attaching bolts to 32 N·m (24 lb ft).

6. Connect the fuel filler pipe (4) and the clamp (3).
7. Connect the fuel tank vent hose (1) and the clamp (2).

12666

12661

12666

12664

8. Connect the fuel sender electrical connector.
9. Connect the fuel feed (3) and the fuel return (4) quick-connect fittings to the fuel sender assembly. Refer to Servicing Quick-Connect Fittings.
10. Connect the EVAP hose (1) and the clamp (2).

11. Install the lower fuel tank shields on the upper fuel tank shield with the attaching screws.

Tighten

Tighten the lower fuel tank shield attaching screws to 1 N.m (9 lb in).

12. Lower the vehicle.
13. Refill the fuel tank.
14. Install the fuel filler cap.
15. Connect the negative battery cable.
16. Inspect for leaks.
 - 16.1. Turn the ignition switch ON for two seconds.
 - 16.2. Turn the ignition switch OFF for ten seconds.
 - 16.3. Turn the ignition switch ON.
 - 16.4. Check for fuel leaks.

Fuel System Cleaning

Fuel Tank Cleaning

Important:

- Only use oil free compressed air to blow out the fuel pipes.
- Inspect the fuel tank internally and clean the fuel tank if you find a plugged fuel filter.

1. Disconnect the negative battery cable.
2. Relieve the fuel system pressure. Refer to the Fuel Pressure Relief Procedure.
3. Drain the fuel tank. Refer to Draining Fuel Tank.
4. Remove the fuel tank. Refer to Fuel Tank Replacement.

5. Remove the fuel sender assembly. Refer to Fuel Sender Assembly Replacement.
6. Inspect the fuel pump strainer. Replace a contaminated strainer and inspect the fuel pump.
7. Inspect the fuel pump inlet for dirt and debris. Replace the fuel pump if you find dirt or debris in the fuel pump inlet.
Important: When flushing the fuel tank, handle the fuel and water mixture as a hazardous material. Handle the fuel and water mixture in accordance with all applicable local, state, and federal laws and regulations.
8. Flush the fuel tank with hot water.
9. Pour the water out of the fuel sender assembly opening. Rock the tank to be sure that removal of the water from the tank is complete.
10. Install the fuel sender assembly. Refer to Fuel Sender Assembly Replacement.
11. Install the fuel tank. Refer to Fuel Tank Replacement.
12. Refill the fuel tank.
13. Install the fuel filler cap.
14. Connect the negative battery cable.
15. Inspect for leaks.
 - 15.1. Turn the ignition switch ON for 2 seconds.
 - 15.2. Turn the ignition switch OFF for 10 seconds.
 - 15.3. Turn the ignition switch ON.
 - 15.4. Check for fuel leaks.

Fuel Sender Assembly

Removal Procedure

Caution: To reduce the risk of fire and personal injury that may result from a fuel leak, always replace the fuel sender gasket when reinstalling the fuel sender assembly.

Notice: Do Not handle the fuel sender assembly by the fuel pipes. Due to the length of the fuel pipes, the amount of leverage generated by handling the fuel pipes could damage the joints.

1. Disconnect the negative battery cable.
2. Relieve the fuel system pressure. Refer to the Fuel Pressure Relief Procedure.
3. Drain the fuel tank. Refer to Draining Fuel Tank.
4. Remove the fuel tank. Refer to Fuel Tank and Fuel Filler Pipe Replacement.
5. Remove the fuel sender assembly retaining nuts (1), the retaining ring (2), the fuel sender assembly (3), and the gasket (4). Discard the gasket.
6. Clean the gasket sealing surfaces.

21301

Installation Procedure

1. Position the new gasket (4) on the fuel tank (5).

Important: Do Not fold over or twist the fuel pump strainer when installing the fuel sender assembly as this will restrict fuel flow. Also, assure that the fuel pump strainer does not block full travel of the float arm.

2. Install the fuel sender assembly (3), the retaining ring (2), and the fuel sender retaining nuts (1).

Tighten

Tighten the fuel sender assembly retaining nuts alternately and evenly to 3 N.m (27 lb in).

3. Install the fuel tank. Refer to Fuel Tank and Fuel Filler Pipe Replacement.
4. Add fuel.
5. Install the fuel filler cap.
6. Connect the negative battery cable.
7. Inspect for leaks.

7.1. Turn the ignition switch ON for 2 seconds.

7.2. Turn the ignition switch OFF for 10 seconds.

7.3. Turn the ignition switch ON.

7.4. Check for fuel leaks.

Fuel Sender Assembly Service

Removal Procedure

1. Disconnect the negative battery cable.
2. Relieve the fuel system pressure. Refer to the Fuel Pressure Relief Procedure.
3. Drain the fuel tank. Refer to Draining Fuel Tank.
4. Remove the fuel tank. Refer to Fuel Tank and Fuel Filler Pipe Replacement.
5. Remove the fuel sender assembly. Refer to Fuel Sender Assembly Replacement.
6. Note the position of the fuel strainer (9) on the fuel pump (7).
7. Support the fuel sender assembly (6) with one hand and grasp the strainer (9) with the other hand.
8. Rotate the strainer in one direction and pull the strainer off the pump. Discard the strainer after inspection.
9. Inspect the strainer. Replace a contaminated strainer and clean the fuel tank.
10. Inspect the fuel pump inlet for dirt and debris. If found, replace the fuel pump.
11. If the fuel pump is being replaced, proceed to Step 12.
12. Loosen the clamp (4) and remove the fuel feed hose (3) from the fuel pump outlet.
13. Remove the terminal retainer.

21304

14. Disconnect the fuel pump electrical connector and the electrical connector from the bottom of the sender cover.
 15. Remove the retainer clip (1) from the fuel return pipe.
 16. Remove the fuel pump and fuel level sensor assembly and the spring (2) from the fuel sender.
 17. Remove the housing cover (5) from the fuel pump housing (8).
 18. Remove the fuel pump (7) from the fuel pump housing (8).
- Notice:** Do Not run the fuel pump unless the fuel pump is submerged in fuel.
19. If the fuel level sensor is being replaced, proceed to Step 20.
 20. Slide the fuel level sensor (10) from the retainers on the fuel pump housing (8).

Installation Procedure

1. Install the fuel level sensor (10) to the fuel pump housing (8).
 2. Install the fuel pump (7) and the isolator into the fuel pump housing (8).
- Important:** The small hole in the housing cover (5) aligns over the fuel level sensor (10).
3. Install the housing cover (5) to the fuel pump housing (8).
- Important:** The fuel pump and fuel level sensor assembly must be aligned directly under the fuel sender cover.
4. Slide the fuel pump and fuel level sensor assembly and spring (2) onto the fuel return pipe.
 5. Compress the spring (2) and install the retainer clip (1) through the fuel return pipe.
 6. Connect the fuel feed hose (3) to the fuel pump outlet. Tighten the clamp (4) so that 5 to 8 teeth are engaged.
 7. Connect the fuel pump electrical connector and the electrical connector to the bottom of the sender cover.
 8. Install the terminal retainer.

Important: Always install a new pump strainer when replacing the fuel pump.

9. Install a new fuel pump strainer in the same position as noted during disassembly. Push on the outer edge of the strainer ferrule until the strainer is fully seated.
10. Install the fuel sender assembly. Refer to Fuel Sender Assembly Replacement.
11. Install the fuel tank. Refer to Fuel Tank and Fuel Filler Pipe Replacement.
12. Add fuel.

13. Install the fuel filler cap.
14. Connect the negative battery cable.
15. Inspect for leaks.
 - 15.1. Turn the ignition switch ON for 2 seconds.
 - 15.2. Turn the ignition switch OFF for 10 seconds.
 - 15.3. Turn the ignition switch ON.
 - 15.4. Check for fuel leaks.

Fuel Pressure Connection Valve

Removal Procedure

1. Clean the area around the fuel pressure connection with GM X-30A or equivalent.
2. Disconnect the negative battery cable.
3. Relieve the fuel system pressure. Refer to the Fuel Pressure Relief Procedure.
4. Remove the fuel pressure connection valve assembly.

12763

Installation Procedure

1. Install the fuel pressure connection valve assembly.
2. Tighten the fuel filler cap.
3. Connect the negative battery cable.
4. Inspect for leaks.
 - 4.1. Turn the ignition switch ON for 2 seconds.
 - 4.2. Turn the ignition switch OFF for 10 seconds.
 - 4.3. Turn the ignition switch ON.
 - 4.4. Check for fuel leaks.

12763

Fuel Outlet Tube

Removal Procedure

1. Disconnect the negative battery cable.
2. Relieve the fuel system pressure. Refer to the Fuel Pressure Relief Procedure.
3. Remove the fuel rail assembly. Refer to Fuel Rail Assembly.

21302

4. Remove the fuel tube bracket attaching screw and the fuel tube bracket.

12764

5. Remove the fuel outlet tube retainer clip (4).
6. Remove the fuel outlet tube (5) from the pressure regulator (1).
7. Remove the O-ring (3) from the fuel outlet tube (5). Discard the O-ring.

13652

13652

Installation Procedure

1. Lubricate the new O-ring (3) with clean engine oil.
2. Install the O-ring (3) on the fuel outlet tube (5).
3. Push the fuel outlet tube (5) into the pressure regulator (1).
4. Install the fuel outlet tube retainer clip (4).

12764

5. Install the fuel tube bracket and the attaching screw.

Tighten

Tighten the fuel tube bracket attaching screw to 5 N·m (44 lb in).

21302

6. Install the fuel rail assembly. Refer to Fuel Rail Assembly.
7. Tighten the fuel filler cap.
8. Connect the negative battery cable.
9. Inspect for leaks.
 - 9.1. Turn the ignition switch ON for 2 seconds.
 - 9.2. Turn the ignition switch OFF for 10 seconds.
 - 9.3. Turn the ignition switch ON.
 - 9.4. Check for fuel leaks.

Fuel Crossover Tube

Removal Procedure

1. Disconnect the negative battery cable.
2. Relieve the fuel system pressure. Refer to the Fuel Pressure Relief Procedure.
3. Remove the fuel rail assembly. Refer to Fuel Rail Assembly.
4. Remove the fuel tube bracket attaching screw and the fuel tube bracket.
5. Remove the crossover tube retainer attaching screws (4) and the crossover tube retainers (3).
6. Remove the crossover tube (2) from the fuel rails.
7. Remove the O-rings (1) from the crossover tube (2). Discard the O-rings.

21302

12764

12581

12581

Installation Procedure

1. Lubricate the new crossover tube O-rings (1) with clean engine oil.
2. Install the O-rings (1) on the crossover tube (2).
3. Install the crossover tube (2) into the fuel rail sections.
4. Install the crossover tube retainers (3) and the attaching screws (4).

Tighten

Tighten the crossover tube retainer attaching screws to 5 N·m (44 lb in).

12764

5. Install the fuel tube bracket and the attaching screw.

Tighten

Tighten the fuel tube bracket attaching screw to 5 N·m (44 lb in).

21302

6. Install the fuel rail assembly. Refer to Fuel Rail Assembly.
7. Tighten the fuel filler cap.
8. Connect the negative battery cable.
9. Inspect for leaks.
 - 9.1. Turn the ignition switch ON for 2 seconds.
 - 9.2. Turn the ignition switch OFF for 10 seconds.
 - 9.3. Turn the ignition switch ON.
 - 9.4. Check for fuel leaks.

Fuel Injector

Removal Procedure

Important:

- Use care in removing the fuel injectors to prevent damage to the electrical connector pins on the injector and to prevent damage to the nozzle. Service the fuel injector as a complete assembly only. The fuel injector is an electrical component. Do Not immerse the fuel injector in any type of cleaner.
 - The engine oil may be contaminated with fuel if the fuel injectors are leaking.
1. Disconnect the negative battery cable.
 2. Relieve the fuel system pressure. Refer to the Fuel Pressure Relief Procedure.
 3. Remove the fuel rail assembly. Refer to Fuel Rail Assembly.
 4. Spread the injector retainer clip to release the injector from the fuel rail.
 5. Remove the fuel injector.
 6. Discard the injector retainer clip.
 7. Remove the injector O-ring seals from both ends of the injector. Discard the O-ring seals. Save the O-ring backup for use in reinstallation.

21302

12772

12639

Installation Procedure

Important:

- When ordering new fuel injectors, be sure to order the correct injector for the application being serviced.
- The upper and lower fuel injector O-rings use different part numbers. To identify the correct O-ring, the upper O-ring is black and the lower O-ring is brown. Both O-rings are the same size but consist of different material.
- The fuel injector lower O-ring uses a nylon collar, called the O-ring backup, to properly position the O-ring on the injector. Always reinstall the O-ring backup, or the sealing O-ring may move on the injector when installing the fuel rail and result in a possible vacuum leak.

The fuel injector assembly (1) is stamped with a part number identification (2) and a build date code (3). The build date code consists of the month (4) 1-9 (Jan-Sept) O, N, D, (Oct, Nov, Dec); day (5); and year (6).

12642

1. Lubricate the new injector O-ring seals with clean engine oil.
2. Install the new injector O-ring seals on the injector.
3. Install a retainer clip on the injector. Position the clip on the right side of the injector electrical connector.
4. Push the fuel injector into the fuel rail injector socket with the electrical connector facing outward. The retainer clip locks on to a flange on the fuel rail.

5. Install the fuel rail assembly. Refer to Fuel Rail Assembly.
6. Tighten the fuel filler cap.
7. Connect the negative battery cable.
8. Inspect for leaks.
 - 8.1. Turn the ignition switch ON for 2 seconds.
 - 8.2. Turn the ignition switch OFF for 10 seconds.
 - 8.3. Turn the ignition switch ON.
 - 8.4. Check for fuel leaks.

21302

Fuel Pressure Regulator

Removal Procedure

1. Disconnect the negative battery cable.
2. Relieve the fuel system pressure. Refer to the Fuel Pressure Relief Procedure.
3. Remove the fuel rail assembly. Refer to Fuel Rail Assembly.

21302

4. Remove the fuel tube bracket attaching screw and the fuel tube bracket.

12764

13652

13652

5. Remove the pressure regulator attaching screw (2) and the pressure regulator (1).
6. Remove the fuel outlet tube retainer clip (4).
7. Remove the fuel outlet tube (5) from the pressure regulator (1).
8. Remove the pressure regulator inlet O-ring (9). Discard the pressure regulator inlet O-ring.
9. Remove the fuel outlet tube O-ring (3). Discard the fuel outlet tube O-ring.
10. Inspect the filter screen (8) for contamination. Remove the filter screen with a small pick and discard the filter screen if it is dirty.

Installation Procedure

1. Lubricate the new pressure regulator inlet O-ring (9) with clean engine oil.
2. Install the pressure regulator inlet O-ring (9) on the pressure regulator (1).
3. Lubricate the new fuel outlet tube O-ring (3) with clean engine oil.
4. Install the fuel outlet tube O-ring (4) on the fuel outlet tube (5).
5. Install the fuel outlet tube (5) into the pressure regulator (1).
6. Install the fuel outlet tube retainer clip (4).
7. Push the pressure regulator (1) into the fuel rail.
8. Apply Loctite 262 to the pressure regulator attaching screw (6) if necessary.
9. Install the pressure regulator attaching screw (2).

Tighten

Tighten the pressure regulator attaching screw to 10 N·m (89 lb in).

10. Install the fuel tube bracket and the attaching screw.

Tighten

Tighten the fuel tube bracket attaching screw to 5 N·m (44 lb in).

12764

11. Install the fuel rail assembly. Refer to Fuel Rail Assembly.
12. Tighten the fuel filler cap.
13. Connect the negative battery cable.
14. Inspect for leaks.
 - Turn the ignition switch ON for 2 seconds.
 - Turn the ignition switch OFF for 10 seconds.
 - Turn the ignition switch ON.
 - Check for fuel leaks.

21302

Fuel Rail Assembly

Removal Procedure

Tools Required

J 37088-A, tool set, Fuel Line Quick-Connect Separator

An eight digit identification number (1) is stamped on the fuel rail assembly. Refer to this model identification number if servicing or part replacement is required.

The nine digit number stamped on the fuel rail assembly indicates the day (2) and year (3) that the fuel rail was built, the plant code (4), the shift ID (5), and the source code (6).

12762

21302

Notice:

- Use care in removing the fuel rail assembly to prevent damage to the injector electrical connector terminals and the injector spray tips. When the fuel rail is removed, support the fuel rail in order to avoid damaging the fuel rail components.
 - Prevent dirt and other contaminants from entering open pipes and passages. Cap the fittings and plug the holes when servicing.
 - The upper and lower O-rings are different colors (black and brown). Install the black O-ring in the upper position on the injector. Install the brown O-ring in the lower position on the injector. The O-rings are the same size but are made of different materials.
1. Disconnect the negative battery cable.
 2. Relieve the fuel system pressure. Refer to the Fuel Pressure Relief Procedure.
 3. Remove the resonator.
 4. Before removal, clean the fuel rail assembly with a spray type engine cleaner, GM X-30A or equivalent, if necessary. Follow the package instructions. Do Not soak fuel rails in liquid cleaning solvent.
 5. Disconnect the quick-connect fittings from the fuel rail. Refer to Servicing Quick-Connect Fittings.
 6. Disconnect the vacuum lines from the fuel pressure regulator and the EVAP canister purge solenoid.
 7. Disconnect the electrical harness and cables from the routing clips on the resonator bracket (2).
 8. Remove the resonator bracket (2).
 9. Disconnect the electrical connectors from the fuel injectors. Identify the connectors to their corresponding injectors to ensure correct sequential injector firing order after reassembly.
 10. Remove the fuel rail assembly (3).
 11. Remove the injector lower O-ring seal (brown) from the spray tip end of each injector.
 12. Discard the O-ring seals. Save the O-ring backups.

Installation Procedure

Important: The fuel injector lower O-ring uses a nylon collar, called the O-ring backup, to properly position the O-ring on the injector. Always reinstall the O-ring backup, or the sealing O-ring may move on the injector when installing the fuel rail and result in a possible vacuum leak.

1. Lubricate the new lower injector O-ring seals (brown).
2. Install the new O-ring seals on the spray tip end of each injector.
3. Install the fuel rail assembly (3) to the intake manifold.
4. Install the resonator bracket (2).
5. Install the fuel rail and resonator bracket attaching bolts (1).

Tighten

Tighten the fuel rail and resonator bracket attaching bolts to 10 N·m (89 lb in).

6. Install the injector electrical connectors.
 - Install each connector on the proper injector to ensure correct sequential injector firing order.
 - Rotate the injectors as required in order to avoid stretching the wire harness.
7. Install the electrical harness and cables into the routing clips on the resonator bracket (2).
8. Connect the vacuum lines to the fuel pressure regulator and the EVAP canister purge solenoid.
9. Connect the quick-connect fittings to the fuel rail fuel pipes. Refer to Servicing Quick-Connect Fittings.
10. Tighten the fuel filler cap.
11. Connect the negative battery cable.
12. Inspect for leaks.
 - 12.1. Turn the ignition switch ON for 2 seconds.
 - 12.2. Turn the ignition switch OFF for 10 seconds.
 - 12.3. Turn the ignition switch ON.
 - 12.4. Check for fuel leaks.

Fuel Pressure Relief Procedure

Tool Required

J 34730-1A Fuel Pressure Gauge

Caution:

- ***In order to reduce the risk of fire and personal injury, it is necessary to relieve the fuel system pressure before servicing fuel system components.***
- ***After relieving system pressure, a small amount of fuel may be released when servicing fuel pipes or connections. In order to reduce the chance of personal injury, cover fuel pipe fittings with a shop towel before disconnecting the fuel pipes in order***

21302

- *After relieving system pressure, a small amount of fuel may be released when servicing fuel pipes or connections. In order to reduce the chance of personal injury, cover fuel pipe fittings with a shop towel before disconnecting the fuel pipes in order to catch any fuel that may leak out. Place the towel in an approved container when the disconnect is completed.*

1. Turn the ignition OFF.
2. Disconnect the negative battery cable in order to avoid possible fuel discharge if an accidental attempt is made to start the engine.
3. Loosen the fuel filler cap in order to relieve the fuel tank vapor pressure.
4. Connect the J 34730-1A fuel pressure gauge to the fuel pressure valve. Wrap a shop towel around the fitting while connecting the gauge in order to avoid spillage.
5. Install the bleed hose of the gauge into an approved container.
6. Open the valve on the gauge to bleed the system pressure. Fuel connections are now safe for servicing.
7. Drain any fuel remaining in the gauge into an approved container.

Fuel Hose and Pipes (Fuel Feed and Return Pipes)

Removal Procedure

Tools Required

J 37088-A, Tool Set, Fuel Line Quick-Connect Separator

Notice:

- Replace nylon fuel feed or return pipes if the pipe becomes kinked and cannot be straightened.
- Do Not attempt to repair sections of nylon fuel pipes. Replace the pipes if they are damaged.

1. Disconnect the negative battery cable.
2. Relieve the fuel system pressure. Refer to the Fuel Pressure Relief Procedure.
3. Disconnect the quick-connect fittings at the fuel rail. Refer to Servicing Quick-Connect Fittings.
4. Remove the fuel feed and return pipes from the retaining clip at the brake booster.
5. Raise the vehicle.
6. Disconnect the quick-connect fittings at the fuel filter (3). Refer to Servicing Quick-Connect Fittings.

21305

7. Remove the lower fuel tank shield attaching screws and the lower fuel tank shields.

12664

8. Remove the fuel feed, return, and EVAP pipe underbody retainer.
9. Disconnect the quick-connect fittings (3 and 4) at the fuel sender. Refer to Servicing Quick-Connect Fittings.

12666

10. Disconnect the fuel feed and return pipes from the retaining clips (4).
11. Remove the fuel feed and return pipes. Note the position of the pipes for installation.

21305

21305

12666

12664

Installation Procedure

Caution: To Reduce the Risk of Fire and Personal Injury:

- If nylon fuel pipes are nicked, scratched or damaged during installation, they must be replaced.
- When installing new fuel pipes, Do Not hammer directly on the fuel harness body clips as this may damage the nylon pipes resulting in a possible fuel leak.

1. Lower the vehicle.
2. Insert the rear ends of the fuel feed pipe (1) and fuel return pipe (2) into the top forward frame hole (5).
3. Raise the vehicle.
4. Route the pipes in the same position as noted during disassembly.
5. Connect the quick-connect fittings (3 and 4) at the fuel sender.
6. Install the fuel feed, return, and EVAP pipe underbody retainer.

7. Install the lower fuel tank shields and the tank shield attaching screws.

Tighten

Tighten the lower fuel tank shield attaching screws to 1 N.m (9 lb in).

8. Connect the quick-connect fittings at the fuel filter (3).
9. Close all the retaining clips (4).
10. Lower the vehicle.
11. Install the fuel feed and return pipes into the retaining clip at the brake booster.
12. Connect the quick-connect fittings to the fuel rail. Refer to Servicing Quick-Connect Fittings.
13. Connect the negative battery cable.
14. Inspect for leaks.
 - 14.1. Turn the ignition switch ON for 2 seconds.
 - 14.2. Turn the ignition switch OFF for 10 seconds.
 - 14.3. Turn the ignition switch ON.
 - 14.4. Check for fuel leaks.

21305

Fuel Hose and Pipes (EVAP Pipes)

Removal Procedure

Notice:

- Replace nylon pipes if the pipes become kinked and cannot be straightened.
- Do Not attempt to repair sections of nylon pipes. Replace the pipes if they are damaged.
- When replacing EVAP pipes, always replace the pipes with original equipment or parts that meet the GM specifications for those parts.
- When replacing EVAP hoses, always replace the hoses with original equipment or parts that meet the GM specifications for those parts. Use only reinforced fuel resistant hose which is identified with the word "Fluoroelastomer" or "GM 6163-M" on the hose.

1. Raise the vehicle.
2. Remove the fuel feed, return, and EVAP pipe underbody retainer.
3. Disconnect the EVAP pipe and the clamp (2) from the fuel sender.

12666

35841

4. Disconnect the EVAP pipe (4) from the retaining clips (3). Note the position of the EVAP pipe for installation.
5. Lower the vehicle.
6. Disconnect the EVAP pipe hose end clamp at the EVAP canister.
7. Disconnect the EVAP pipe from the forward pipe retaining clips (1).
8. Remove the EVAP pipe (4).

35841

Installation Procedure

1. Insert the rear end of the EVAP pipe (4) into the top forward frame hole (2). Load the pipe until the formed pipe/conduit reaches into the hole.
2. Install the EVAP pipe into the forward pipe retaining clips (1).
3. Connect the EVAP pipe hose end and clamp to the EVAP canister.
4. Raise the vehicle.
5. Install the new EVAP pipe (4) into the retaining clips (3) in the same position as noted during disassembly.

12666

6. Connect the EVAP pipe and clamp (2) at the fuel sender.
7. Install the fuel feed, return, and EVAP pipe underbody retainer.
8. Lower the vehicle.

Fuel Pump Relay

Removal Procedure

1. Remove the underhood electrical center cover.
2. Remove the fuel pump relay.

Installation Procedure

1. Install the fuel pump relay.
2. Install the underhood electrical center cover.

Servicing Quick Connect Fittings

Removal Procedure

Tools Required

J37088 Tool Set, Fuel Line Quick-Connect Separator

Important: Relieve the fuel system pressure before servicing any fuel system connection. Refer to the Fuel Pressure Relief Procedure.

1. Slide the dust cover from the quick-connect fitting.

12773

2. Grasp both sides of the fitting. Twist the female connector 1/4 turn in each direction to loosen any dirt within the fitting.

12775

12776

Caution: Wear safety glasses when using compressed air, as flying dirt particles may cause eye injury.

3. Blow dirt out of the fitting using compressed air.

12780

4. Choose the correct tool from J37088 Tool Set for the size of the fitting. Insert the tool into the female connector, then push inward to release the locking tabs.

12782

Notice: If it is necessary to remove rust or burrs from a fuel pipe, use emery cloth in a radial motion with the pipe end in order to prevent damage to the O-ring sealing surface.

- Using a clean shop towel, wipe off the male pipe end.
 - Inspect both ends of the fitting for dirt and burrs. Clean or replace components as required.
5. Pull the connection apart.

Installation Procedure

Caution: To Reduce the Risk of Fire and Personal Injury:

Before connecting the fitting, always apply a few drops of clean engine oil to the male pipe end. This will ensure proper reconnection and prevent a possible fuel leak. (During normal operation, the O-rings located in the female connector will swell and may prevent proper reconnection if not lubricated.)

1. Apply a few drops of clean engine oil to the male pipe end.
2. Push both sides of the fitting together to cause the retaining tabs to snap into place.
3. Once installed, pull on both sides of the fitting to make sure the connection is secure.

12784

12786

12787

12789

4. Reposition the dust cover over the quick-connect fitting.

11485

Crankshaft Position Sensor

Removal Procedure

1. Raise the vehicle.
2. Disconnect the Crankshaft Position (CKP) sensor electrical connector.
3. Remove the CKP sensor retaining screw.
4. Remove the CKP sensor.

11485

Installation Procedure

1. Install the crankshaft position sensor.
2. Install the crankshaft position sensor retaining screw.

Tighten

Tighten the CKP sensor to 4–6 N·m (35–53 lb in).

3. Connect the electrical connector.

Knock Sensor (Bank 1)**Removal Procedure**

Caution: Engine coolant may be hot. The knock sensor is mounted in the engine block cooling passage. Engine coolant in the block will drain when the knock sensor is removed.

1. Drain the engine coolant. Refer to Engine Cooling (6B).
2. Raise the vehicle.
3. Disconnect the knock sensor wiring harness connector from the knock sensor.
4. Remove the knock sensor from the engine block.

Installation Procedure

1. Install the knock sensor (6) into the engine block. Be sure the threads are clean. Do not apply thread sealant to the sensor threads.

Tighten

Torque the KS to 19 N.m (14 lb ft).

2. Connect the KS wiring harness connector to the knock sensor.
3. Lower the vehicle.
4. Refill the Engine coolant. Refer to Engine Cooling (6B).

Knock Sensor (Bank 2)**Removal Procedure**

Caution: Engine coolant may be hot. The knock sensor is mounted in the engine block cooling passage. Engine coolant in the block will drain when the knock sensor is removed.

1. Drain the engine coolant. Refer to Engine Cooling (6B).
2. Raise the vehicle.
3. Disconnect the knock sensor wiring harness connector from the knock sensor.
4. Remove the knock sensor from the engine block.

Installation Procedure

1. Install the knock sensor into the engine block. Be sure the threads are clean. Do not apply thread sealant to the sensor threads.

Tighten

Torque the KS to 19 N.m (14 lb. ft.).

2. Connect the KS wiring harness connector to the knock sensor.
3. Lower the vehicle.
4. Refill the Engine coolant. Refer to Engine Cooling (6B).

Restoration
Parts

13490

Knock Sensor Module

Removal Procedure

Notice: To prevent possible electrostatic discharge damage to the PCM and KS module, Do Not touch the connector pins or soldered components on the circuit board.

1. Remove the PCM from the mounting bracket, refer to *PCM Replacement/Programming*
2. Remove the knock sensor module access cover.

13517

Notice: To prevent possible electrostatic discharge damage to the PCM, do not touch the connector pins or soldered components on the circuit board.

3. Remove the knock sensor module.

13517

Installation Procedure

Notice: To prevent possible electrostatic discharge damage to the PCM, do not touch the connector pins or soldered components on the circuit board.

1. Install the knock sensor module.

2. Install the access cover.
3. Install the PCM to the mounting bracket, refer to *PCM Replacement/Programming*

13490

EGR Valve

Removal Procedure

1. Remove the vacuum line from the EGR Valve (1).
2. Remove the EGR Valve retaining nuts from the intake manifold (3).

Notice: If EGR passages in the inlet manifold indicate excessive build-up of deposits, the passages should be cleaned. Care should be taken to ensure that all loose particles are completely removed to prevent them from clogging the EGR valve or from being ingested into the engine.

Clean using the following procedure:

- With a wire wheel, buff the exhaust deposits from the mounting surface and around the valve.
- Look for exhaust deposits in the valve outlet. Remove deposit buildup with a screwdriver.
- Clean mounting surfaces of intake manifold and valve assembly.

3. Remove the EGR valve (1).

13641

13641

Installation Procedure

1. Install the EGR Valve (1) on the intake manifold (3) using a new gasket (2).

Tighten

Tighten the EGR Valve Bolts to 22 N.m (16 lb ft).

2. Connect the vacuum hose to the EGR Valve (1).

13486

EGR Vacuum Control Signal Solenoid Valve

Removal Procedure

1. Disconnect the electrical connector at the solenoid valve (1).
2. Disconnect the vacuum hose harness (3).
3. Remove the Nut and solenoid valve (1) from the intake manifold (4).

13486

Installation Procedure

1. Install the solenoid valve (1) and bracket to the intake manifold (4).

Tighten

Tighten the Nut to 34 N.m (25 lb ft).

2. Connect the vacuum hose harness (3).
3. Connect the electrical connector to the solenoid valve (1).

EVAP Canister

Removal Procedure

1. Raise the vehicle.
2. Remove the access panel.
3. Disconnect the hoses from the canister.
4. Remove the canister (2) from the canister bracket.
5. Remove the canister (2) from the vehicle.

30013

Installation Procedure

1. Install the canister (2) to the bracket.
2. Connect the hoses to the canister (2).
3. Install the access panel.
4. Lower the vehicle.

30013

EVAP System Cleaning

Cleaning Procedure

1. Turn the ignition off.
2. Remove the purge solenoid and the vacuum switch from the vehicle.
3. Lightly tap the purge solenoid and the vacuum switch on a clean work area looking for carbon particles or carbon dust exiting either of the vacuum ports.
4. If no carbon release is evident, reinstall the components and continue with published service manual DTC procedures.
5. If carbon is being released from either component, continue with this service procedure.

13571

30013

6. Remove the charcoal canister from the vehicle.
7. Ensure the main cylinder valve is turned off on the EVAP purge/pressure diagnostic station J 41413.
8. Disconnect the black hose that connects the nitrogen cylinder to the cart J 41413 at the pressure regulator by unscrewing the knurled nut on the regulator.
9. Using a section of vacuum line, connect one end over the open fitting of the J 41413 pressure regulator.
10. Turn on the main nitrogen cylinder valve and connect the remaining end to the purge solenoid end of the EVAP purge line at the vehicle. Continue to blow any debris from the purge line for 15 seconds.
11. Return the EVAP Pressure/Purge Diagnostic Station J 41413 to its original condition by re-installing the black hose disconnected in step 8.
12. Manifold vacuum vehicles proceed with published service manual diagnostics.
13. Connect a scan tool and display data parameter EVAP vacuum switch.
14. Start the engine and allow to reach operating temperature.
15. Open throttle until engine speed reaches 2000 RPM.
16. If the EVAP vacuum switch changes state Go to Step 19.
17. If vacuum switch does not change state repair low source vacuum condition by performing a complete throttle body service including cleaning of the purge port(s) and Go to Step 14.
18. If EVAP vacuum switch does change state, proceed with published service manual diagnostics.
19. Connect the EVAP diagnostic cart J 41413 to the vehicle EVAP service port and turn the four position switch to Purge.
20. Start the engine and allow to reach operating temperature.
21. Open throttle until engine speed reaches 2000 RPM.
22. Note the H2O vacuum gauge on the EVAP cart. Vacuum should read greater than 15in. H2O.
23. If vacuum is less than 15in. H2O, perform a complete throttle body service including cleaning of the purge port(s) as outlined in the service manual and Go to Step 20.
24. If vacuum is greater than 15in. H2O, continue with published service diagnostics.

EVAP Purge Vacuum Switch

Removal Procedure

1. Disconnect the electrical connector.
2. Remove the vacuum lines (4) from the EVAP vacuum switch (3).

13571

3. Remove the EVAP vacuum switch (1) from the bracket (2).

21173

Installation Procedure

1. Install the New EVAP vacuum switch (1) to the bracket (2).

21173

13571

2. Connect the vacuum lines (4) to the EVAP vacuum switch (3).
3. Connect the electrical connector.

13571

EVAP Canister Purge Solenoid Valve

Removal Procedure

1. Disconnect the electrical connector
2. Disconnect the hoses (4) from the solenoid valve (1).
3. Remove the bracket and solenoid (1) from the intake manifold (2).

13571

Installation Procedure

1. Install the solenoid valve (1) to the intake manifold (2).

Tighten

Tighten the Fastener to 5.8 N.m (52 lb in).

2. Connect the electrical connector to the solenoid valve (1).
3. Connect the hoses to the solenoid valve (1).

EVAP Canister Hoses

Refer to Vehicle Emission Control Information label for routing of EVAP canister hoses.

Air Pump**Removal Procedure**

1. Disconnect the electrical connector from the AIR pump (2).

21176

2. Remove the outlet (5) and inlet (4) hoses from the AIR pump (3).

21174

21176

3. Remove the Air pump mounting bolts (3) from the bracket.
4. Remove the Air pump (2).

21176

Installation Procedure

1. Install the AIR pump (2) to bracket.
2. Install the mounting bolts (3).

Tighten

Tighten the AIR Pump Bolts to 5.6 N.m (50 lb in).

21174

3. Connect the outlet (5) and inlet (4) hoses to the AIR pump (3).
4. Connect the electric connector to AIR pump (3).
5. Check the AIR system for proper operation.

Air Check Valve and Pipes (Bank 1)

Removal Procedure

1. Loosen the check valve clamp (3).
2. Disconnect the AIR hose from the check valve (3).
3. Disconnect the left check valve pipe.
4. Unscrew the check valve from the AIR pipe (3).
5. Before replacing a check valve, test the valve for proper operation.
 - 5.1. Install a vacuum pump to the nipple side of the check valve, AIR pump side.
 - 5.2. Pump the vacuum pump to 10 inches Hg. and observe the gauge.
 - 5.3. If the vacuum bleeds down to zero within 5 seconds, replace the check valve.

21189

Installation Procedure

1. Screw the check valve (3) onto the AIR pipe.
- Tighten**
Tighten the Check valve to the AIR pipe 23 N.m (17 lb ft).
2. AIR pipe to the exhaust manifold.
3. Install the air hose to the check valve (3).
4. Install the check valve clamp (2).

21189

Air Check Valve and Pipes (Bank 2)

Removal Procedure

1. Remove the clamps (2) and AIR hoses from the AIR system right pipe (3).
2. Remove the right check valve pipe.
3. Unscrew the check valve (1) from the AIR pipe.
4. Before replacing a check valve, test the valve for proper operation.
 - 4.1. Install a vacuum pump to the nipple side of the check valve, AIR pump side.
 - 4.2. Pump the vacuum pump to 10 inches Hg. and observe the gauge.
 - 4.3. If the vacuum bleeds down to zero within 5 seconds, replace the check valve.

21189

21189

Installation Procedure

1. Screw the check valve (1) onto the AIR pipe.
Tighten
Tighten the Check valve to 23 N.m (17 lb ft).
2. Connect the right AIR pipe to the exhaust manifold.
3. Install the Hose and clamp to the check valve (1).
4. Check the AIR system for proper operation.

21174

Air Check Valve and Pipes (Cross Under Pipe)

Removal Procedure

1. Loosen the AIR clamps.
2. Remove the AIR hoses (1) to the check valves (both sides)
3. Loosen the AIR clamp at the AIR pump outlet (5).
4. Remove the outlet hose (5) at the AIR pump (3).
5. Raise the vehicle.
6. Remove the fasteners to the AIR cross under pipe (2) bracket, both sides.
7. Cut the cross under pipe near center of the oil pan to aid in removal.
8. Remove the cross under pipe.

21174

Installation Procedure

Important: The new cross under pipe must be cut similarly to the old pipe before installation.

1. Install the cross under pipe.
2. Use the appropriate length of 5/8 inch heater hose to join both halves of the cross under pipe. Clamp both ends of the hose securely with stainless steel clamps.
3. Install the fasteners to the AIR cross under pipe (2) bracket, both sides.
4. Lower the vehicle.
5. Install the outlet hose (5) at the AIR pump (3).
6. Tighten the AIR clamp at the AIR pump outlet hose (5).
7. Install the AIR hoses (1) to the check valves (both sides)
8. Tighten the AIR clamp at the check valves and AIR pipes.
9. Check the AIR system for proper operation and for leaks.

Air Vacuum Bleed Valve**Removal Procedure**

1. Disconnect the electrical connector from the solenoid (2).
2. Disconnect the vacuum harness (3) from the solenoid (2).
3. Remove the Solenoid (2).

21172

Installation Procedure

1. Install the solenoid (2).
2. Connect the vacuum harness (3) to the solenoid (2).
3. Connect the electrical connector to the solenoid (2).

21172

Description and Operation

Powertrain Control Module

The Control Module refers to the Powertrain Control Module (PCM) or the Vehicle Control Module (VCM). The control module is designed to maintain exhaust emission levels to Federal or California standards while providing excellent driveability and fuel efficiency. Review the components and wiring diagrams in order to determine which systems are controlled by each specific control module. The control module monitors numerous engine and vehicle functions. The control module controls the following operations:

- Fuel control
- Ignition Control (IC)
- Knock Sensor (KS) system
- Automatic transmission shift functions
- Cruise Control Enable (if so equipped)
- Generator (if so equipped)
- Evaporative Emission (EVAP) Purge
- A/C Clutch Control
- Cooling Fan Control

Control Module Function

The Control Module supplies a buffered voltage to various sensors and switches. The input and output devices in the control module include an analog to digital converters, signal buffers, counters, and special drivers. The Control Module controls most components with electronic switches which complete a ground circuit when turned ON. These switches are arranged in groups of 4 and 7 called one of the following:

- Quad Driver Module
- Output Driver Modules

The surface mounted Quad Driver Module can independently control up to 4 outputs (Control Module) terminals. The Output Driver Modules can independently control up to 7 outputs. Not all outputs are always used.

Use of Circuit Testing Tools

Do not use a test lamp in order to diagnose the Powertrain electrical systems unless specifically instructed by the diagnostic procedures. Use the Connector Test Adapter Kit, J 35616 whenever diagnostic procedures call for probing any connectors.

Control Module Service Precautions

The control module is designed to withstand normal current draws associated with vehicle operations. Avoid overloading any circuit. When testing for opens or shorts, do not ground any of the control module circuits unless instructed. When testing for opens or shorts, do not apply voltage to any of the control module circuits unless instructed. Only test these circuits with a digital voltmeter J 39200, while the control module connectors remain connected to the control module.

Aftermarket (Add-On) Electrical And Vacuum Equipment

Aftermarket (Add-On) Electrical and Vacuum Equipment is defined as any equipment installed on a vehicle after leaving the factory that connects to the vehicle's electrical or vacuum systems. No allowances have been made in the vehicle design for this type of equipment.

Notice: Do not add on any Add-On vacuum operated equipment to this vehicle.

Notice: Connect the Add-On electrical operated equipment to the vehicle's electrical system at the battery (power and ground).

Add-On electrical equipment, even when installed to these strict guidelines, may still cause the Powertrain system to malfunction. This may also include equipment not connected to the vehicle's electrical system such as portable telephones and radios. Therefore, the first step in diagnosing any Powertrain problem is to eliminate all Aftermarket electrical equipment from the vehicle. After this is done, if the problem still exists, diagnose the problem in the normal manner.

Electrostatic Discharge Damage

Notice: In order to prevent possible Electrostatic Discharge damage to the PCM, Do Not touch the connector pins or the soldered components on the circuit board.

Electronic components used in the control systems are often designed in order to carry very low voltage. Electronic components are susceptible to damage caused by electrostatic discharge. Less than 100 volts of static electricity can cause damage to some electronic components. There are several ways for a person to become statically charged. The most common methods of charging are by friction and by induction. An example of charging by friction is a person sliding across a car seat. Charging by induction occurs when a person with well insulated shoes stands near a highly charged object and momentarily touches ground. Charges of the same polarity are drained off leaving the person highly charged with the opposite polarity. Static charges can cause damage; therefore, it is important to use care when handling and testing electronic components.

Engine Controls Information

The driveability and emissions information describes the function and operation of the control module. The emphasis is placed on the diagnosis and repair of problems related to the system.

Engine Components, Wiring Diagrams, and Diagnostic Tables (DTCs):

- Component Locations
- Wiring Diagrams
- Control Module Terminal End View and Terminal Definitions

- OnBoard Diagnostic (OBD) System Check
- Diagnostic Trouble Code Tables (DTCs)

The Component System includes the following items:

- Component and circuit description
- On-vehicle service for each sub-system
- Functional checks and Diagnostic Tables
- How To Use Electrical Systems Diagnostic Information

The DTCs also contain diagnostic support information containing circuit diagrams, circuit or system information, and helpful diagnostic information.

Maintenance Schedule

Refer to the General Motors Maintenance Schedule in Section 0B of the appropriate service manual for the maintenance that the owner or technician should perform in order to retain emission control performance.

Visual and Physical Underhood Inspection

Perform a careful visual and physical underhood inspection when performing any diagnostic procedure or diagnosing the cause of an emission test failure. This can often lead to repairing a problem without further steps. Use the following guidelines when performing a visual and physical inspection:

- Inspect all vacuum hoses for the following conditions:
 - Correct routing
 - Pinches
 - Cuts
 - Disconnects
- Inspect hoses that are difficult to see beneath the air cleaner, A/C compressor, generator, etc.
- Inspect all wires in the engine compartment for the following items:
 - Proper connections
 - Burned or chafed spots
 - Pinched wires
 - Contact with sharp edges
 - Contact with hot exhaust manifolds

This visual and physical inspection is very important. Perform the inspection carefully and thoroughly.

Basic Knowledge Of Tools Required

Notice: Lack of basic knowledge of this powertrain when performing diagnostic procedures could result in incorrect diagnostic performance or damage to powertrain components. Do not attempt to diagnose a powertrain problem without this basic knowledge.

A basic understanding of hand tools is necessary in order to effectively use this information.

System Status and Drive Cycle For Inspection/Maintenance

The System Status selection is included in the scan tool System Info menu.

Several states require that the I/M 240 (OBD II system) pass on-board tests for the major diagnostics prior to having a vehicle emission inspection. This is also a requirement to renew license plates in some areas.

Using a scan tool, the technician can observe the System Status (complete or not complete) in order to verify that the vehicle meets the criteria to comply with local area requirements. Using the System Status display, any of the following systems or combination of systems may be monitored for I/M Readiness:

- The Catalyst
- The HO2S
- The HO2S Heater
- The EGR System
- The AIR system

Following a DTC info clear, System Status will clear only for the systems affected by any DTCs stored. Following a battery disconnect or a Control Module replacement, all System Status information will clear.

Important: The System Status display indicates only whether or not the test has been completed. The System Status display does not necessarily mean that the test has passed. If a Failed Last Test indication is present for a DTC associated with one of the above systems, that test is failed; diagnosis and repair is necessary in order to meet the I/M 240 requirement. Verify that the vehicle passes all of the diagnostic tests associated with the displayed System Status' prior to returning the vehicle to the customer. Refer to the Typical OBD II Drive Cycle table (more than one drive cycle may be needed) to use as a guide to complete the I/M 240 System Status tests.

Typical OBD II Drive Cycle

Diagnostic Time Schedule for I/M Readiness	
Vehicle Drive Status	What is Monitored?
Cold Start, coolant temperature less than 50°C (122°F)	—
Idle 2.5 minutes in Drive (Auto) Neutral (Man), A/C and rear defogger ON	HO2S Heater, Misfire, Secondary Air, Fuel Trim, EVAP Purge
A/C off, accelerate to 90 km/h (55 mph), 1/2 throttle.	Misfire, Fuel Trim, Purge
3 minutes of Steady State - Cruise at 90 km/h (55 mph)	Misfire, EGR, Secondary Air, Fuel Trim, HO2S, EVAP Purge
Clutch engaged (Man), no braking, decelerate to 32 km/h (20 mph)	EGR, Fuel Trim, EVAP Purge
Accelerate to 90–97 km/h (55–60 mph), 3/4 throttle	Misfire, Fuel Trim, EVAP Purge
5 minutes of Steady State Cruise at 90–97 km/h (55–60 mph)	Catalyst Monitor, Misfire, EGR, Fuel Trim, HO2S, EVAP Purge
Decelerate, no breaking. End of Drive Cycle	EGR, EVAP Purge
Total time of OBD II Drive Cycle 12 minutes	—

Primary System Based Diagnostics

There are primary system based diagnostics which evaluate the system operation and their effect on vehicle emissions. The primary system based diagnostics are listed below with a brief description of the diagnostic functionality.

Oxygen Sensor Diagnosis

Diagnose the Fuel Control Heated Oxygen Sensors are for the following conditions:

- Heater Performance (time to activity on cold start)
- Slow Response
- Response Time (time to switch R/L or L/R)
- Inactive Signal (output steady at bias voltage - approximately 450 mV)
- Signal Fixed High
- Signal Fixed Low

Diagnose the Catalyst Monitor Heated Oxygen Sensors for the following functions:

- Heater Performance (time to activity on cold start)
- Signal fixed low during steady state conditions.
- Inactive Sensor.

Fuel Control Heated Oxygen Sensors

The main function of the fuel control heated oxygen sensor is to provide the control module with exhaust stream information in order to allow proper fueling and maintain emissions within the mandated levels. After the sensor reaches the operating temperature, the sensor generates a voltage inversely proportional to the amount of oxygen present in the exhaust gases.

The control module uses the signal voltage from the fuel control heated oxygen sensors in a closed loop in order to adjust the fuel injector pulse width. While in a closed loop, the Control Module can adjust fuel delivery in order to maintain an air to fuel ratio which allows the best combination of emission control and driveability.

If the oxygen sensor pigtail wiring, connector or terminal are damaged, replace the entire oxygen sensor assembly. Do not attempt to repair the wiring, connector, or terminals. In order for the sensor to function properly, the sensor must have a clean air reference provided to it. This clean air reference is obtained by way of the oxygen sensor wires. Any attempt to repair the wires, connectors or terminals could result in the obstruction of the air reference. Any attempt to repair the wires, connectors or terminals could degrade oxygen sensor performance.

Catalyst Monitor Heated Oxygen Sensors

In order to control emissions of Hydrocarbons (HC), Carbon Monoxide (CO), and Oxides of Nitrogen (NOx), the system uses a three-way catalytic converter. The catalyst within the converter promotes a chemical reaction which oxidizes the HC and CO present in the exhaust gas, converting them into harmless water vapor and carbon dioxide. The catalyst also reduces NOx, converting it to nitrogen.

The Control Module has the ability to monitor this process using the post heated oxygen sensors. The pre-sensors produce an output signal which indicates the amount of oxygen present in the exhaust gas entering the three-way catalytic converter. The post sensor produces an output signal which indicates the oxygen storage capacity of the catalyst; this in turn indicates the catalyst's ability to convert exhaust gases efficiently. If the catalyst is operating efficiently, the pre HO2S signal will be far more active than that produced by the post HO2S.

In addition to catalyst monitoring, the post heated oxygen sensor has a limited role in controlling fuel delivery. If the post HO2S signal indicates a high or low oxygen content for an extended period of time while in a closed loop, the Control Module adjusts the fuel delivery slightly in order to compensate.

Catalyst Monitor Diagnostic Operation

The OBD II catalyst monitor diagnostic measures oxygen storage capacity. In order to do this, the heated sensors are installed before and after the Three-Way Catalyst (TWC). Voltage variations between the sensors allow the control module to determine the catalyst emission performance.

As a catalyst becomes less effective in promoting chemical reactions, the catalyst's capacity to store and release oxygen generally degrades. The OBD II catalyst monitor diagnostic is based on an correlation between conversion efficiency and oxygen storage capacity.

A good catalyst (e.g. 95% hydrocarbon conversion efficiency) shows a relatively flat output voltage on the post-catalyst Heated Oxygen Sensor (HO2S). A degraded catalyst (65 % hydrocarbon conversion) shows a greatly increased activity in output voltage from the post catalyst HO2S.

The post-catalyst HO2S is used to measure the oxygen storage and release capacity of the catalyst. A high oxygen storage capacity indicates a good catalyst; low oxygen storage capacity indicates a failing catalyst. The TWC and the HO2S must be at operating temperature in order to achieve correct oxygen sensor voltages like those shown in the Post-Catalyst HO2S Outputs graphic.

The catalyst monitor diagnostic is sensitive to the following conditions:

- Exhaust leaks
- HO2S Contamination
- Alternate fuels

Exhaust system leaks may cause the following results:

- Prevent a degraded catalyst from failing the diagnostic
- Cause a false failure for a normally functioning catalyst
- Prevent the diagnostic from running

Some of the contaminants that may be encountered are phosphorus, lead, silica, and sulfur. The presence of these contaminants prevents the TWC diagnostic from functioning properly.

Three-Way Catalyst Oxygen Storage Capacity

14442

The control module must monitor the Three-Way catalyst system (TWC) for efficiency. In order to accomplish this, the control module monitors the pre-catalyst and post-catalyst oxygen sensors. When the TWC is operating properly, the post-catalyst (2) oxygen sensor will have significantly less activity than the pre-catalyst (1) oxygen sensor. The TWC stores oxygen as needed during its normal reduction and oxidation process. The TWC releases oxygen as needed during its normal reduction and oxidation process. The control module calculates the oxygen storage capacity using the difference between the pre-catalyst and post-catalyst oxygen sensor's voltage levels.

14446

Whenever the voltage levels of the post-catalyst (2) oxygen sensor nears the voltage levels that of the pre-catalyst (1) oxygen sensor, the catalysts efficiency is degraded.

Stepped or staged testing levels allow the control module to statistically filter test information. This prevents falsely passing or falsely failing the oxygen storage capacity test. The calculations performed by the on-board diagnostic system are very complex. For this reason, do not use post catalyst oxygen sensor activity in order to determine the oxygen storage capacity unless directed by the electronic service information

Three stages are used in order to monitor catalyst efficiency. Failure of the first stage indicates that the catalyst requires further testing in order to determine catalyst efficiency. Failure of the second stage indicates that the catalyst may be degraded. The third stage then looks at the inputs from the pre and post O₂ sensors more closely before determining if the catalyst is indeed degraded. This further statistical processing is done to increase the accuracy of oxygen storage capacity type monitoring. Failing the first (stage 0) or second (stage 1) test Does Not indicate a failed catalyst. The catalyst may be marginal or the fuel sulfur content could be very high.

Aftermarket HO₂S characteristics may be different from the original equipment manufacturer sensor. This may lead to a false pass or a false fail of the catalyst monitor diagnostic. Similarly, if an Aftermarket catalyst does not contain the same amount of cerium as the original part, the correlation between oxygen storage and conversion efficiency may be altered enough to set a false DTC.

Evaporative Emission (EVAP) Purge System Vacuum Switch

The EVAP system uses a switch located in the purge line between the canister and the EVAP canister purge solenoid valve in order to detect when the purge is occurring. This switch senses the flow from the engine through the purge valve. When no purge is present, the switch is closed, applying a 12 volt signal to the control module as a NO PURGE signal. When canister purging occurs, the switch opens, interrupting off the 12 volt signal to the control module. A scan tool display will indicate that purge is occurring.

Clogging of the canister fresh air vent could allow the purge hose between the switch and canister to trap vacuum with the purge valve closed. This would result in a diagnostic indication of a purge valve stuck open or a vacuum switch failure. Similarly, leaks or blockages in the purge hoses may result in misdiagnosis of the purge valve or vacuum switch.

When an EVAP canister purge solenoid valve diagnostic trouble code sets, check the canister fresh air vent, vacuum switch and the integrity of all purge hoses prior to servicing the valve.

Misfire Monitor Diagnostic Operation

The misfire monitor diagnostic is based on crankshaft rotational velocity (reference period) variations. The control module determines crankshaft rotational velocity using the crankshaft position sensor and camshaft position sensor. When a cylinder misfires the crankshaft slows down momentarily. By monitoring the crankshaft and camshaft position sensor signals, the control module can calculate when a misfire occurs.

For a non-catalyst damaging misfire, the diagnostic is required to monitor a misfire present for between 1000–3200 engine revolutions.

For catalyst damage misfire, the diagnostic responds to the misfire within 200 engine revolutions.

Rough roads may cause false misfire detection. A rough road applies torque to the drive wheels and drive train. This torque can intermittently decrease the crankshaft rotational velocity. The Control module detects this as a false misfire.

On automatic transmission equipped vehicles, the Torque Converter Clutch (TCC) will disable whenever a misfire is detected. Disabling the TCC isolates the engine from the rest of the drive line and minimizes the effect of the drive wheel inputs on crankshaft rotation.

When the TCC has disabled as a result of misfire detection, the TCC will re-enabled after approximately 3200 engine revolutions if no misfire is detected. The TCC remains disabled whenever the misfire is detected, with or without a DTC set. This allows the misfire diagnostic to reevaluate the system.

During a transmission high temperature condition, the misfire diagnostic will disable, and the TCC will operate normally. This avoids further increasing the temperature of the transmission.

17379

Whenever a cylinder misfires, the misfire diagnostic counts the misfire and notes the crankshaft position at the time it the misfire occurred. These misfire counters are basically a file on each engine cylinder.

A current and a history misfire counter is maintained for each cylinder. The misfire current counters (Misfire Cur #1 -8) indicate the number of firing events out of the last 200 cylinder firing events which were misfires. The misfire current counters displays real time data without a misfire DTC stored. The misfire history counters (Misfire Hist #1 - 8) indicate the total number of cylinder firing events which were misfires. The misfire history counters displays 0 until the misfire diagnostic has failed and a DTC P0300 is set. Once the misfire DTC sets, the misfire history counters will be updated every 200 cylinder firing events.

The Misfire counters graphic illustrates how these misfire counters are maintained. If the misfire diagnostic reports a failure, the Diagnostic Executive reviews all of the misfire counters before reporting a DTC. This way, the Diagnostic Executive reports the most current information.

When crankshaft rotation is erratic, the control module detects a misfire condition. Because of this erratic condition, the data that is collected by the diagnostic can sometimes incorrectly identify which cylinder is misfiring. The Misfire Counters graphic shows there are misfires counted from more than one cylinder. Cylinder #1 has the majority of counted misfires. In this case, the Misfire Counters would identify cylinder #1 as the misfiring cylinder. The misfires in the other counters were just background noise caused by the erratic rotation of the crankshaft. If the number of accumulated is sufficient for the diagnostic to identify a true misfire, the diagnostic will set DTC P0300 - Misfire Detected.

Use Techline equipment to monitor misfire counter data on OBD II compliant vehicles. Knowing which specific cylinders misfired can lead to the root cause, even when dealing with a multiple cylinder misfire. Using the information in the misfire counters, identify which cylinders are misfiring. If the counters indicate cylinders number 1 and 4 misfired, look for a circuit or component common to both cylinders number 1 and 4 such as an open ignition coil in an electronic ignition system.

Misfire counter information is located in the Specific Eng. menu, Misfire Data sub-menu of the of the data list.

The misfire diagnostic may indicate a fault due to a temporary fault not necessarily caused by a vehicle emission system malfunction. Examples include the following items:

- Contaminated fuel
- Running out of fuel
- Fuel fouled spark plugs
- Basic engine fault

Fuel Trim System Monitor Diagnostic Operation

This system monitors the averages of short-term and long-term fuel trim values. If these fuel trim values stay at their limits for a calibrated period of time, a malfunction is indicated. The fuel trim diagnostic compares the averages of short-term fuel trim values and long-term fuel trim values to rich and lean thresholds. If either value is within the thresholds, a pass is recorded. If either value is outside their thresholds, a rich or lean DTC will set.

In order to meet OBD II requirements, the control module uses weighted fuel trim cells in order to determine the need to set a fuel trim DTC. A fuel trim DTC can only be set if fuel trim counts in the weighted fuel trim cells exceed specifications. This means that the vehicle could have a fuel trim problem which is causing a concern under certain conditions (i.e. engine idle high due to a small vacuum leak or rough due to a large vacuum leak) while it operates fine at other times. No fuel trim DTC would set (although an engine idle speed DTC or HO2S DTC may set). Remember, use a scan tool in order to observe fuel trim counts while the problem is occurring.

Remember, a fuel trim DTC may be triggered by a list of vehicle faults. Make use of all information available (other DTCs stored, rich or lean condition, etc.) when diagnosing a fuel trim fault.

Comprehensive Component Monitor Diagnostic

Comprehensive component monitoring diagnostics are required to monitor emissions-related input and output Powertrain components. The CARB OBD II Comprehensive Component Monitoring List of Components Intended To Illuminate The MIL is a list of components, features or functions that could fall under this requirement.

Input Components

The Control Module monitors the input components for circuit continuity and out-of-range values. This includes performance checking. Performance checking refers to indicating a fault when the signal from a sensor does not seem reasonable (i.e. a Throttle Position (TP) sensor that indicates high throttle position at low engine loads or MAP voltage). The input components may include but are not limited to the following sensors:

- The Vehicle Speed Sensor (VSS)
- The Crankshaft Position (CKP) sensor
- The Knock Sensor (KS)
- The Throttle Position (TP) sensor
- The Engine Coolant Temperature (ECT) sensor
- The Camshaft Position (CMP) sensor
- The Manifold Absolute Pressure (MAP) sensor
- The Mass Air Flow (MAF) sensor

In addition to the circuit continuity and rationality check, the ECT sensor is monitored for its ability to achieve a steady state temperature to enable closed loop fuel control.

Output Components

Diagnose the output components for the proper response to control module commands. Components where functional monitoring is not feasible will be monitored for circuit continuity and out-of-range values if applicable.

Output components to be monitored include, but are not limited to the following circuits:

- The Idle Air Control (IAC) Motor
- The Control module controlled EVAP Canister Purge Valve
- The Electronic transmission controls
- The A/C relay
- The Cooling fan relay
- The VSS output
- The MIL control
- The Cruise control inhibit

California Air Resources Board (CARB) OBD II Comprehensive Component Monitoring List of Components Intended to Illuminate MIL

Important: Not all vehicles have these components.

Components Intended to Illuminate MIL
Transmission Range (TR) Mode Pressure Switch
Transmission Turbine Speed Sensor (HI/LO)
Transmission Vehicle Speed Sensor (HI/LO)
Transmission Vehicle Speed Sensor (HI/LO)
Ignition Sensor (Cam Sync, Diag)
Ignition Sensor Hi Res (7x)
Knock Sensor (KS)
Engine Coolant Temperature (ECT) Sensor
Intake Air Temperature (IAT) Sensor
Throttle Position (TP) Sensor A, B
Manifold Absolute Pressure (MAP) Sensor
Mass Air Flow (MAF) Sensor
Automatic Transmission Temperature Sensor
Transmission Torque Converter Clutch (TCC) Control Solenoid
Transmission TCC Enable Solenoid
Transmission Shift Solenoid A
Transmission Shift Solenoid B
Transmission 3/2 Shift Solenoid
Ignition Control (IC) System
Idle Air Control (IAC) Coil
Evaporative Emission Purge Vacuum Switch
Evaporative Emission Canister Purge (EVAP Canister Purge)

Wiring Harness Service

The control module harness electrically connects the control module to the various solenoids, switches, and sensors in the vehicle engine room and passenger compartment.

Replace the wire harnesses with the proper part number replacement. When splicing signal wires into a harness, use the wiring that has high temperature insulation.

Consider the low amperage and voltage levels utilized in the Powertrain control systems. Make the best possible bond at all splices. Use rosin-core solder in these areas.

Molded-on connectors require complete replacement of the connector. Splice a new connector into the harness. Replacement connectors and terminals are listed in Group 8.965 in the Standard Parts Catalog.

For wiring repair, refer to *Wiring Repairs*.

Connectors and Terminals

In order to prevent shorting between opposite terminals, use care when probing a connector and when replacing terminals. Damage to the components could result.

Always use jumper wires between connectors for circuit checking.

Never probe through Weather-Pack seals.

Use the tachometer adapter J 35812, or the equivalent, which provides a convenient connection to the tachometer lead. The connector test adapter kit J 35616, or the equivalent, contains an assortment of flexible connectors used to probe terminals during diagnosis. Fuse remover and test tool BT-8616, or the equivalent, is used for removing a fuse and to adapt the fuse holder to a meter for diagnosis.

Open circuits are often difficult to locate by sight because oxidation or terminal misalignment are hidden by the connectors. Merely wiggling a connector on a sensor, or in the wiring harness may temporarily correct the open circuit. Oxidized or loose connections may cause intermittent problems.

Be certain the type of connector and terminal before making any connector or terminal repair.

Weather-Pack and Com-Pack III terminals look similar, but are serviced differently.

PCM Function

Powertrain Control Module

13489

Legend

- (1) Powertrain Control Module (PCM)
- (2) PCM Connector C3 (Gray/Clear)
- (3) Knock Sensor Module Access Cover
- (4) PCM Connector C4 (Blue)
- (5) PCM Connector C2 (Black)
- (6) PCM Connector C1 (Red)

The Powertrain Control Module (PCM) is located in the engine compartment. The PCM is the control center of the vehicle. It controls the following:

- Fuel metering system.
- Transmission shifting.
- Ignition timing.
- On-board diagnostics for powertrain functions.

The PCM constantly looks at the information from various sensors, and controls the systems that affect vehicle performance. The PCM also performs the diagnostic function of the system. It can recognize operational problems. The PCM also alerts the driver through the MIL (Malfunction Indicator Lamp). When the PCM detects a malfunction, it stores a diagnostic trouble code (DTC). A DTC stored, will identify the problem areas. This will aid the technician in making repairs.

The PCM consists of two parts: a controller (the PCM without the Knock Sensor module) and the Knock Sensor module.

The PCM supplies either 5 or 12 volts to power various sensors or switches. This is done through resistances in the PCM. The resistance is so high in value that a test light will not light when connected to the circuit. In some cases, even an ordinary shop voltmeter will not give an accurate reading because its resistance is too low. Therefore, a digital voltmeter (J 39200) with at least 10 megohms input impedance is required to ensure accurate voltage readings.

The PCM controls output circuits such as the injectors, IAC, cooling fan relays, etc. by controlling the ground or power feed circuit through transistors or a device called an Output Driver Module.

EEPROM

The Electronically Erasable Programmable Read Only Memory (EEPROM) is a permanent memory that is physically soldered within the PCM. The EEPROM contains program and calibration information that the PCM needs to control powertrain operation.

Unlike the PROM used in past applications, the EEPROM is not replaceable. If the PCM is replaced, the new PCM will need to be programmed. Techline equipment containing the correct program and calibration for the vehicle, is required to program the PCM.

Short Term Fuel Trim

The short term fuel trim is a PCM erasable memory register. The neutral value for the short term fuel trim is 0%. Any deviation from 0% indicates the short term fuel trim is changing the injector pulse width. The amount of pulse width change depends on how far the short term fuel trim value is from 0%. The short term fuel trim is rich when the scan tool indicates -99%. The short fuel trim is lean when the

scan tool indicates 99%. The short term fuel trim changes the pulse width by varying the Closed Loop factor of the base pulse width equation. As the PCM monitors the oxygen sensors input, it is constantly varying the short term fuel trim value. The value is updated very quickly, therefore, the short term fuel trim only corrects for short term mixture trends. The correction of long term mixture trends is the function of long term fuel trim.

When the PCM determines that the Short Term Fuel Trim is out of the operating range, the following DTCs will set:

- DTC P0171 Bank 1 Too Lean.
- DTC P0172 Bank 1 Too Rich.
- DTC P0174 Bank 2 Too Lean.
- DTC P0175 Bank 2 Too Rich.

Long Term Fuel Trim

The long term fuel trim is a matrix of cells arranged by RPM and MAP. Each cell of the long term fuel trim is a register like the short term fuel trim. As the engine operating conditions change, the PCM will switch from cell to cell to determine what long term fuel trim factor to use in the base pulse width equation.

While in any given cell, the PCM also monitors the short term fuel trim. If the short term fuel trim is far enough from 0%, the PCM will change the long term fuel trim value. Once the long term fuel trim value is changed, it should force the short term fuel trim back toward 0%. If the mixture is still not correct (as judged by the HO2S), the short term fuel trim will continue to have a large deviation from the ideal 0%. In this case, the long term fuel trim value will continue to change until the short term fuel trim becomes balanced. Both the short term fuel trim and long term fuel trim have limits which vary by calibration. If the mixture is off enough so that long term fuel trim reaches the limit of its control and still cannot correct the condition, the short term fuel trim would also go to its limit of control in the same direction. If the mixture is still not corrected by both short term fuel trim and long term fuel trim at their extreme values, a Fuel Trim Diagnostic Trouble Code (DTC) will likely result. When the PCM determines that the Long Term Fuel Trim is out of the operating range, the following DTCs will set:

- DTC P0171 Bank 1 Too Lean.
- DTC P0172 Bank 1 Too Rich.
- DTC P0174 Bank 2 Too Lean.
- DTC P0175 Bank 2 Too Rich.

Under the conditions of power enrichment, the PCM sets the short term fuel trim to 0% and freezes it there until power enrichment is no longer in effect. This is done so the Closed Loop factor and the long term fuel trim will not try to correct for the commanded richness of power enrichment.

Speed Density System

Three specific data sensors provide the PCM with the basic information for fuel management portion of its operation. That is three specific signals to the PCM establish the engine speed and air density factors. The engine speed signal comes from the distributor high resolution circuit. The PCM uses this information to determine engine speed (RPM). Air density is derived from IAT and MAP sensor inputs. The IAT sensor measures the air temperature that is entering the engine. The IAT signal works in conjunction with the MAP sensor to determine air density. As the intake manifold pressure increases, the air density in the intake manifold also increases and additional fuel is required. This information from the IAT and MAP sensors is used by the PCM to control injector pulse width.

The speed density system is only needed when there is a Mass Air Flow (MAF) sensor malfunction. If the PCM detects a malfunction with the MAF sensor circuit, the PCM will default to speed density fuel management.

Information Sensors

All of the sensors and input switches can be diagnosed using a scan tool. The following is a short description of how the sensors and switches can be diagnosed by using a scan tool. The scan tool can also be used to compare the values for a normal running engine with the engine being diagnosed.

Engine Coolant Temperature (ECT) Sensor

13578

Legend

- (1) ECT Electrical Connector
- (2) Connector Tab
- (3) Engine Coolant Temperature (ECT) Sensor

The engine coolant temperature sensor is a thermistor (a resistor which changes value based on temperature) mounted in the engine coolant pump. Low coolant temperature produces a high resistance (100,000 ohms at $-40^{\circ}\text{C}/-40^{\circ}\text{F}$) while high temperature causes low resistance (70 ohms at $130^{\circ}\text{C}/266^{\circ}\text{F}$).

The PCM supplies a 5 volt signal to the engine coolant temperature sensor through a resistor in the PCM and measures the voltage. The voltage will be high when the engine is cold. The voltage will be low when the engine is hot. By measuring the voltage, the PCM calculates the engine coolant temperature. Engine coolant temperature affects most systems the PCM controls.

The scan tool displays engine coolant temperature in degrees. After engine startup, the temperature should rise steadily to about 90°C (194°F) then stabilize when thermostat opens. If the engine has not been run for several hours (overnight), the engine coolant temperature and intake air temperature displays should be close to each other. When the PCM detects a malfunction in the ECT sensor circuit, the following DTCs will set:

- DTC P0117 circuit low.
- DTC P0118 circuit high.
- DTC P0125 excessive time to Closed Loop.
- DTC P1114 circuit intermittent low.
- DTC P1115 circuit intermittent high.

Service Category Specifications contains a table to check for sensor resistance values relative to temperature.

Mass Air Flow (MAF) Sensor

13487

The Mass Air Flow (MAF) sensor measures the amount of air which passes through it. The PCM uses this information to determine the operating condition of the engine, to control fuel delivery. A large quantity of air indicates acceleration. A small quantity of air indicates deceleration or idle.

The scan tool reads the MAF value and displays it in grams per second (gm/Sec). At idle, it should read between 6 gm/Sec – 9 gm/Sec on a fully warmed up engine. Values should change rather quickly on acceleration, but values should remain fairly stable at any given RPM. When the PCM detects a malfunction in the MAF sensor circuit, the following DTCs will set:

- DTC P0100 circuit malfunction.
- DTC P0101 system performance.
- DTC P0102 frequency low.
- DTC P0103 frequency high.

Intake Air Temperature (IAT) Sensor

13643

Legend

- (1) Intake Air Temperature (IAT) Sensor
- (2) Electrical Harness Connector

The Intake Air Temperature (IAT) sensor is a thermistor which changes value based on the temperature of air entering the engine. Low temperature produces a high resistance (100,000 ohms at $-40^{\circ}\text{C}/-40^{\circ}\text{F}$). A high temperature causes low resistance (70 ohms at $130^{\circ}\text{C}/266^{\circ}\text{F}$). The PCM supplies a 5.0 volt signal to the sensor through a resistor in the PCM and measures the voltage. The voltage will be high when the incoming air is cold, and low when the air is hot. By measuring the voltage, the PCM calculates the incoming air temperature. The IAT sensor signal is used to adjust spark timing according to incoming air density.

The scan tool displays temperature of the air entering the engine, which should read close to ambient air temperature when engine is cold. The temperature should rise as underhood temperature increases. If the engine has not been run for several hours (overnight) the IAT sensor temperature and engine coolant temperature should read close to each other. If the PCM detects a malfunction in the IAT sensor circuit, the following DTCs will set:

- DTC P0112 circuit low.
- DTC P0113 circuit high.
- DTC P1111 circuit intermittent high.
- DTC P1112 circuit intermittent low.

Manifold Absolute Pressure (MAP) Sensor

13693

Legend

- (1) Electrical Connector
- (2) Manifold Absolute Pressure (MAP) Sensor

The Manifold Absolute Pressure (MAP) sensor responds to changes in the intake manifold pressure. The pressure changes as a result of engine load and speed. The map sensor converts this to a voltage output.

A closed throttle on engine coast down would produce a relatively low map output voltage. A wide open throttle would produce a high map output voltage. This high output voltage is produced because the pressure inside the manifold is the same as outside the manifold. The MAP is inversely proportional to what is measured on a vacuum gage. The MAP sensor is used for the following:

- Altitude determination.
- Ignition timing control.
- EGR diagnostic.
- Speed density fuel management default.

When the PCM detects a malfunction in the MAP sensor circuit, the following DTCs will set:

- DTC P0106 circuit performance malfunction.
- DTC P0107 circuit low.
- DTC P0108 circuit high.
- DTC P1107 intermittent circuit low.

Heated Oxygen Sensors (HO2S) Cutaway

13576

Legend

- (1) Four Wire In-Line Connector

- (13) Gripper

Front Heated Oxygen Sensors (HO2S)

The Heated Oxygen Sensors are mounted in the exhaust system where they can monitor the oxygen content of the exhaust gas stream. The oxygen present in the exhaust gas reacts with the sensor to produce a voltage output. This voltage should constantly fluctuate from approximately 100 mV (high oxygen content – lean mixture) to 900 mV (low oxygen content – rich mixture). The heated oxygen sensor voltage can be monitored with a scan tool. By monitoring the voltage output of the oxygen sensor, the PCM calculates what fuel mixture command to give to the injectors (lean mixture – low HO2S voltage = rich command, rich mixture – high HO2S voltage = lean command).

When the PCM detects an HO2S signal circuit that is low, the PCM will set the following DTCs:

- DTC P0131 Bank 1 left front HO2S.
- DTC P0151 Bank 2 right front HO2S.
- DTC P0137 Bank 1 left rear HO2S.
- DTC P0157 Bank 2 right rear HO2S.

When the PCM detects an HO2S signal circuit that is high, the PCM will set the following DTCs:

- DTC P0132 Bank 1 left front HO2S.
- DTC P0152 Bank 2 right front HO2S.
- DTC P0138 Bank 1 left rear HO2S.
- DTC P0158 Bank 2 right rear HO2S.

When the PCM detects no HO2S activity, the PCM will set the following DTCs:

- DTC P0134 Bank 1 left front HO2S.
- DTC P0154 Bank 2 right front HO2S.
- DTC P0140 Bank 1 left rear HO2S.
- DTC P0160 Bank 2 right rear HO2S.

A fault in the heated oxygen sensor heater element or its ignition feed or ground will result in an increase in time to Closed Loop fuel control. This may cause increased emissions, especially at start-up. When the PCM detects a malfunction in the HO2S heater circuits, the following DTCs will set:

- DTC P0135 Bank 1 left front HO2S heater.
- DTC P0155 Bank 2 right front HO2S heater.
- DTC P0141 Bank 1 left rear HO2S heater.
- DTC P0161 Bank 2 right rear HO2S heater.

The PCM also has the ability to detect HO2S response, switching, transition time, and incorrect ratio voltage problems. If a HO2S response switching, transition time, or ratio problem is detected, the PCM will store a DTC that indicates degraded HO2S performance.

Rear Heated Oxygen Sensors (HO2S)

To control emissions of Hydrocarbons (HC), Carbon Monoxide (CO), and Oxides of Nitrogen (NOx), a three-way catalytic converter is used. The catalyst within the converter promotes a chemical reaction which oxidizes the HC and CO present in the exhaust gas, converting them into harmless water vapor and carbon dioxide. The catalyst also reduces NOx, converting it to nitrogen. The PCM has the ability to monitor this process using the Bank 1 HO2S 2 and the Bank 2 HO2S 2 heated oxygen sensors. The front HO2S sensors produces an output signal which indicates the amount of oxygen present in the exhaust gas entering the three-way catalytic converter. The rear HO2S sensors produces an output signal which indicates the oxygen storage capacity of the catalyst; this in turn indicates the catalysts ability to convert exhaust gases efficiently. If the catalyst is operating efficiently, the front sensors will produce a far more active signal than that produced by the rear sensors.

The catalyst monitor sensors operate the same as the fuel control sensors. Although the Bank 1 HO2S 2 and Bank 2 HO2S 2 sensors main function is catalyst monitoring, they also play a limited role in fuel control. If a sensor output indicates a voltage either above or below the 450 millivolt bias voltage for an extended period of time, the PCM will make a slight adjustment to fuel trim to ensure that fuel delivery is correct for catalyst monitoring

Throttle Position (TP) Sensor

13572

Legend

- (1) Powertrain Control Module (PCM)
- (2) Throttle Position (TP) Sensor
- (3) Throttle Valve

The Throttle Position (TP) sensor is a potentiometer. The TP sensor is connected to the throttle shaft on the throttle body. By monitoring the voltage on the signal line, the PCM calculates throttle position. As the throttle valve angle is changed (accelerator pedal moved), the TP sensor signal also changes. At a closed throttle position, the output of the TP sensor is low. As the throttle valve opens, the output increases so that at Wide Open Throttle (WOT), the output voltage should be above 4.0 volts.

The PCM calculates fuel delivery based on throttle valve angle (driver demand). A broken or loose TP sensor may cause intermittent bursts of fuel from an injector. This may cause an unstable idle because the PCM detects the throttle is moving.

When the PCM detects a malfunction with the TP sensor circuits, the following DTCs will set:

- DTC P0121 circuit performance malfunction.
- DTC P0122 circuit low.
- DTC P0123 circuit high.
- DTC P1121 intermittent circuit high.
- DTC P1122 intermittent circuit low.

EVAP Purge Vacuum Switch

13498

The EVAP Purge Vacuum Switch is used by the PCM to monitor EVAP canister purge solenoid operation and purge system integrity. The EVAP Purge Vacuum Switch should be closed to ground with no vacuum present (0% EVAP Purge PWM). With EVAP Purge PWM at 25% or greater, the EVAP Purge Vacuum Switch should open.

An incorrect EVAP Purge system flow should set a DTC P0441. A continuous purge condition with no purge commanded by the PCM should set a DTC P1441. Refer to Evaporative Emission (EVAP) Control System for a complete description of the EVAP system.

Knock Sensors (KS)

13635

The Knock Sensor (KS) system is used to detect engine detonation. The PCM will retard the spark timing based on the signals from the KS module. The Knock Sensor(s) produce an AC voltage that is sent to the KS module. The amount of AC voltage produced is proportional to the amount of knock.

An operating engine produces a normal amount of engine mechanical vibration (Noise). The knock sensor(s) will produce an AC voltage signal from this Noise. When an engine is operating, the PCM will learn the minimum and maximum frequency of the noise the engine produces. When the PCM determines that this frequency is less than or greater than the expected amount, a knock sensor DTC will set.

A/C Request Signal

The A/C request circuit signals the PCM when an A/C mode is selected at the A/C control head. The PCM uses this information enable the A/C compressor clutch and to adjust the idle speed before turning ON the A/C clutch. If this signal is not available to the PCM, the A/C compressor will be inoperative.

Refer to A/C Clutch Circuit Diagnosis for A/C wiring diagrams and diagnosis of A/C electrical system.

A/C Refrigerant Pressure Sensor

This signal is used by the PCM to enable the cooling fans when head pressure reaches a predetermined amount. If a fault is present in the A/C refrigerant pressure sensor circuit, DTC P0530 or P0531 will set. When the PCM sets a DTC, the A/C compressor clutch will be disabled.

Power Steering Pressure (PSP) Switch

29971

Legend

- (1) Engine Coolant Pump
- (2) Engine Coolant Temperature Sensor Electrical Connector
- (3) AIR Pump
- (4) AIR Pump Electrical Connector
- (5) Power Steering Pressure Switch Electrical Connector
- (6) Power Steering Pressure Switch
- (7) Engine Coolant Temperature Sensor

This signal is used by the PCM to increase the idle speed when the vehicle is in a parking maneuver. The PSP switch is a normally open switch. When the power steering pressure is high, the switch will close. When the switch closes, the PCM will increase idle speed to compensate for the additional load.

Park/Neutral Position (PNP) Switch (Automatic Transmission)

Important: Vehicle should not be driven with the PNP switch disconnected, as idle quality will be affected. Having the switch disconnected may also cause a VSS DTC to set.

The PNP switch indicates to the PCM when the transmission is in park, neutral, or drive. This information is used for the EGR and IAC valve operation. Refer to Electrical Diagnosis for more information on the PNP switch. The PNP switch is part of the neutral/start and backup light switch assembly. Refer to Park/Neutral Position Switch diagnosis.

Vehicle Speed Sensor (VSS)

13640

The Vehicle Speed Sensor (VSS) is a pulse counter type input that informs the PCM how fast the vehicle is being driven. The VSS system uses an inductive sensor mounted in the tail housing of the transmission and a toothed reluctor wheel on the tail shaft. As the reluctor rotates, the teeth alternately interfere with the magnetic field of the sensor creating an induced voltage pulse.

The VSS produces an AC voltage signal that increases with vehicle speed. The PCM processes this signal and sends it to the following components:

- Instrument Panel.
- Radio control head.
- Chime Module.
- Cruise Control Module.

Crankshaft Position Sensor (CKP)

11485

The crankshaft position sensor provides the PCM with crankshaft speed and crankshaft position. The PCM utilizes this information to determine if an engine Misfire is present. The PCM monitors the CKP sensor for momentarily drop in crankshaft speed to determine if a misfire is occurring. When the PCM detects a misfire, a DTC P0300 will set.

The PCM also monitors the CKP sensor signal circuit for malfunctions. The PCM monitors CKP signal and the High and Low resolution signals. The PCM calculates these signals to determine a ratio. When the PCM detects that the ratio is out of normal operating range, the PCM will set a DTC P0335 or a DTC P0336.

A/C Clutch Circuit

In order to improve engine operation, and protect the A/C compressor and A/C clutch during Wide Open Throttle (WOT) performance, the A/C compressor operation is controlled by the PCM.

This A/C system consists of the following components:

- The heater and A/C control
- The A/C pressure cycling switch
- The A/C refrigerant pressure sensor
- The A/C clutch relay
- The A/C compressor clutch
- The PCM.

The A/C refrigerant pressure cycling switch is closed when there is sufficient system pressure (depending on refrigerant charge and ambient temperature). When the heater and A/C control is placed in the A/C mode, a request signal is sent to the PCM. The PCM will then energize the A/C clutch relay, unless abnormally high or low A/C pressure is detected by the A/C refrigerant pressure sensor. The PCM will also turn the cooling fans ON when A/C is requested. The A/C clutch relay is controlled by the PCM so that the PCM can increase idle speed before turning ON the clutch or disable the clutch during WOT, or high coolant temperature.

The PCM will energize the A/C clutch whenever the engine is running less than 4100 RPM and A/C has been requested, unless any of the following conditions are met:

- Wide Open Throttle (WOT).
- A/C head pressure greater than 431 psi or less than 0 psi (as determined by the A/C refrigerant pressure sensor).
- Ignition voltage less than 10 volts.
- Engine speed greater than 5550 RPM for 180 seconds.
- ECT greater than 124°C (256°F).

The A/C Request Table should be used for diagnosing the A/C request circuit only. Refer to Section 1B or 1C of the appropriate service manual should be used for diagnosing the refrigerant portion of the system.

The scan tool will be used in diagnosing the system. The PCM has the ability to display the following parameters:

- A/C request input to the PCM
- A/C compressor status
- A/C system pressure
- A/C clutch ON or OFF status

Refer to Heater Ventilation and Air Conditioning (HVAC) for service procedures.

Knock Sensor System

Knock Sensor

13635

Varying octane levels in today's gasoline can cause detonation in some engines. Detonation is sometimes called spark knock. Detonation is caused by an uncontrolled explosion (burn) in the combustion chamber. This uncontrolled explosion could produce a flame front opposite that of the normal flame front produced by the spark plug. The rattling sound normally associated with detonation is the result of two or more opposing pressures (flame fronts) colliding within the combustion chamber. Though light detonation is sometimes considered normal, heavy detonation could result in engine damage.

To control spark knock, a Knock Sensor (KS) system is used. This system is designed to retard spark timing up to 20° to reduce spark knock in the engine. This allows the engine to use maximum spark advance to improve driveability and fuel economy.

The Knock system has the following components:

- KS module.
- Knock sensor(s)

The knock sensor system is used to detect engine detonation. The PCM will retard the spark timing based on signals from the KS module. The knock sensor(s) produce an AC voltage which is sent to the KS module. The amount of AC voltage produced by the sensors is determined by the amount of knock. This signal voltage is input to the PCM. The PCM then adjusts the Ignition Control (IC) to reduce spark knocking.

Knock Sensor Cutaway

Legend

- (1) Shunt Resistor
- (2) Piezo Crystal

The scan tool has several positions for diagnosing the KS circuit.

- KS activity indicates whether or not a knock signal is being detected by the knock sensors. The scan tool will display YES when a knock is detected.
- Knock retard indicates the amount of spark the PCM is removing from the IC spark advance in response to the signal from the knock sensors.
- Spark Indicates the amount of spark advance being commanded by the PCM on the IC circuit.

DTC P0325 indicates that the KS module is malfunctioning or is missing. DTCs P0327 and P0332 indicates that a Knock sensor or Knock sensor circuit is malfunctioning. If these DTCs are set, Refer to applicable DTC table.

Electric Cooling Fan

General Description

The electric cooling fan(s) are used to cool engine coolant flowing through the radiator. They are also used to cool the refrigerant flowing through the A/C condenser.

Operation

The electric cooling fan(s) are controlled by the PCM. The PCM controls the ground path for the cooling fan relay(s). The relay(s) are used to control the high current flow to power the cooling fan motors. The PCM determines operation of the independent fans based on various sensor inputs.

Primary Cooling Fan (Fan 1)

The primary cooling fan is controlled by the PCM based on the following inputs:

- The A/C system
- The Engine Coolant Temperature (ECT) sensor
- The Vehicle Speed Sensor (VSS).

The PCM will turn the primary cooling fan ON when any of the following conditions exist at idle:

- Certain PCM Diagnostic Trouble Codes (DTCs) are set.
- ECT above 107°C (225°F).
- A/C head pressure above 225 psi.

Once the primary fan has been turned ON by the Engine Coolant Temperature (ECT) sensor, the PCM will turn the fan OFF when that temperature has dropped about 4°C (7°F). If the primary cooling fan has been turned ON by high A/C head pressure, the PCM will turn the fan OFF when the pressure has dropped to 180 psi. The minimum ON time for the primary cooling fan is 50 seconds.

Secondary Cooling Fan (Fan 2)

The secondary cooling fan is controlled by the PCM based on the following inputs:

- The A/C system
- The Engine Coolant Temperature (ECT) sensor
- The Vehicle Speed Sensor (VSS).

The PCM will turn the secondary cooling fan ON when any of the following conditions exist at idle:

- Certain PCM Diagnostic Trouble Codes (DTCs) set.
- ECT above 111°C (232°F).
- A/C head pressure above 248 psi.

Once the secondary fan has been turned ON by the ECT, the PCM will turn the fan OFF when that temperature has dropped about 4°C (7°F). If the secondary cooling fan has been turned ON by high A/C head pressure, the PCM will turn the fan OFF when the pressure has dropped to 203 psi. The minimum ON time for the secondary cooling fan is 26 seconds.

Important: Vehicles equipped with option VO8 (Heavy Duty Cooling), will have one mechanical fan (primary) and one electric fan (secondary).

Diagnosis

The following diagnostic table will diagnose the contact side of the cooling fan relays. The driver side of the cooling fan relays (Coil side of relay) will be diagnosed using DTCs P1641 and P1642.

Distributor Ignition System

The distributor ignition system controls fuel combustion by providing a spark to ignite the compressed air/fuel mixture at the correct time. To provide improved engine performance, fuel economy, and control of exhaust emissions, the PCM controls distributor spark advance (timing) with an Ignition Control (IC) system. Only the IC system will be described here. Additional information on the system is found in Ignition System (6D).

To properly control ignition/combustion timing the PCM needs to know:

- Camshaft position.
- Engine speed (RPM).
- Engine load (manifold pressure or vacuum).
- Atmospheric (barometric) pressure.
- Engine coolant temperature.
- The amount of detonation.

Distributor Ignition System

21190

Legend

- (1) Ignition Coil Wire
- (2) Ignition Coil Module
- (3) Ignition Coil
- (4) Distributor

The distributor ignition system is a net build distributor (no timing adjustment) that provides angle based timing information to the PCM for individual cylinder spark timing. The ignition module is capable of providing both 4X and 180X timing pulses each crankshaft revolution. Using these timing pulses, the PCM processes ignition spark timing and sends an IC signal to the ignition coil module to activate the secondary ignition system.

The PCM provides the distributor with the following:

- Ignition voltage circuit.
- Ground circuit.
- Two 5 volt reference voltages to the ignition control module.

As the camshaft turns (during crank or run), a slotted two-track timing disk is rotated inside the ignition control module. Each time a slot in either track of the disk is properly aligned, the ignition control module will pulse one of the 5 volt reference voltages to ground. A reference signal is generated each time the PCM detects that the reference voltages have been grounded by the ignition control module. When the PCM detects reference signals, ignition timing can be processed.

The PCM will also compare the 4X and the 180X signals to each other to determine the location of the number one cylinder and top dead center. In addition, if only one signal is being received by the PCM a Diagnostic Trouble Code (DTC) will be set. DTC P1371 will be set if the 4X signal is missing and DTC P0372 will be set if the 180X signal is missing. The vehicle will not run if the 4X (Reference) signal is not available at the PCM for processing.

The Ignition Control (IC) system consists of the following:

- Camshaft Position Sensor
- Ignition Coil
- Ignition Coil Module
- Powertrain Control Module.

These circuits perform the following functions:

- Low resolution signal reference.
 - This provides the PCM with reference signals, firing order, and camshaft position information. If the low resolution signal circuit becomes open or grounded, the engine will not run because the PCM will not operate the ignition coil module, fuel pump, or the fuel injectors.
 - A DTC P1371 will set if the PCM receives high resolution signal references without the low resolution signals. If the engine cranks but will not start, refer to *Engine Cranks but Does Not Run*.

- High resolution signal reference.
 - This provides the PCM with detailed reference signals and crankshaft position information.
 - If this circuit becomes opens or grounded a DTC P0372 will set and the engine will still run.
 - When there is a malfunction with the high resolution circuit, excessive crank times will be experienced.
- System ground.
 - This circuit is grounded at the PCM and provides ground for the distributor to generate low and high resolution signal reference signals.
- If this circuit becomes open, the engine will not run since there will be no reference information.
- Ignition Control (IC).
 - This circuit controls the ignition coil ON and OFF time. It signals the ignition coil module to begin primary coil dwell current when the IC is high. The ignition coil module shuts OFF ignition coil current when the signal goes low.
 - If this circuit becomes open, shorted to voltage, or grounded, the engine will not start and a DTC P1351 or P1361 will set.

Ignition Wire Harness Assembly Routing

13492

Legend

- | | |
|-----------------|--------------------------|
| (1) Cylinder #1 | (5) Cylinder #5 |
| (2) Cylinder #2 | (6) Cylinder #6 |
| (3) Cylinder #3 | (7) Cylinder #7 |
| (4) Cylinder #4 | (8) Cylinder #8 |
| | (9) Distributor Assembly |

Results of Incorrect Operation

An open IC circuit will set a DTC P1351. A grounded IC circuit will set a DTC P1361. An open or grounded IC circuit will result in an engine cranks but will not run. An open or ground in the low resolution signal circuit will set a DTC P1371 and the engine will not start. If the high resolution signal circuit becomes open or grounded a DTC P0372 would set. This will cause reduced performance and poor fuel economy.

An inoperative distributor vent system may cause premature distributor failure. To check system operation perform *Distributor Vent System Check*.

The PCM uses information from the MAP and engine coolant temperature sensor in addition to RPM to calculate spark advance as follows:

- Cold engine = More spark advance.
- Engine under minimum load based on RPM and low amount of air flow – More spark advance.
- Hot engine = Less spark advance.

- Engine under heavy load based on RPM and high amount of air flow – Less spark advance.

For removal and replacement of ignition system components, refer to Section 6D4, Ignition System.

The description, operation and repair procedures of the distributor ignition system components are found in Service Category Ignition Systems. For misfire or ignition control check, refer to the following DTCs:

- P0300
- P0323
- P0372
- P1351
- P1361
- P1371

Air Intake System

Air Intake System

Important: If the Mass Air Flow (MAF) sensor is installed backwards, the system will go rich. An arrow cast into the plastic portion of the sensor indicates proper air flow direction. The arrow must point toward the engine.

The Air intake system draws outside air through the filter element. The air cleaner assembly is remotely mounted. The air is then ducted to the MAF sensor, a resonator (for quieter engine operation) and the intake duct to the throttle body. An additional resonator is attached to the top of the intake duct to further eliminate intake noise. The air then flows into the intake manifold, through the cylinder heads and into the cylinders.

Fuel Supply Components

The fuel tank stores the fuel supply. An electric fuel pump, located in the fuel tank with the fuel level sensor assembly, pumps fuel through an in-line fuel filter to the fuel rail assembly. The pump provides fuel at a pressure greater than is needed by the injectors. The fuel pressure regulator, part of the fuel rail assembly, keeps fuel available to the injectors at a regulated pressure. A separate pipe returns unused fuel to the fuel tank.

Fuel Tank

The fuel tank stores fuel for the vehicle. The fuel tank is located behind the rear wheels and is held in place by two metal straps and a cross strap attached to the underbody. The tank shape includes a reservoir to maintain a constant supply of fuel around the fuel pump strainer during low fuel conditions and aggressive vehicle maneuvers. The fuel tank is molded from high density polyethylene. When working on or near the fuel tank, be sure to observe important information molded on the bottom of the tank.

Fuel Tank Filler Pipe

The fuel tank filler pipe outlet is positioned at the rear of the vehicle. The fuel filler pipe has a built-in restrictor and deflector in order to prevent refueling with leaded fuel.

Fuel Filler Cap

The filler pipe has a threaded-type cap. The threaded part of the cap requires several turns counterclockwise to remove. A torque-limiting device prevents the cap from being over tightened. To install the cap, turn the cap clockwise until you hear a clicking noise. This indicates that the cap is correctly torqued and fully seated.

Notice: If a fuel filler cap requires replacement, use only a cap with the same features. Failure to use the correct cap can result in a serious malfunction of the system.

Fuel Sender Assembly

21312

The fuel sender assembly is inside the fuel tank attached to the top of the fuel tank. The fuel sender assembly consists of the following major components:

- The fuel sender (1).
- The fuel pump (3).
- The fuel pump strainer (2).

Fuel Sender

The fuel sender consists of a float, a wire float arm, a rheostat, and a roll-over valve. Fuel level is sensed by the position of the float and float arm which operate the 90 ohm rheostat. As the float position changes, the amount of current passing through the rheostat varies, thus changing the gauge reading on the instrument panel. The EVAP pipe of the fuel sender has a pressed in roll-over valve. The roll-over valve prevents fuel from entering the evaporative emission canister if the vehicle rolls over by shutting OFF the EVAP pipe to the canister.

Fuel Pump

The fuel pump attaches to the fuel sender assembly inside the fuel tank. The fuel pump is an electric medium pressure twin turbine pump. The fuel pump pumps fuel to the fuel rail assembly at a specified flow and pressure. Excess fuel returns to the fuel tank by the return pipe. The fuel pump delivers a constant flow of fuel to the engine even during low fuel conditions and aggressive vehicle maneuvers. The PCM controls the electric fuel pump operation through a fuel pump relay.

Fuel Pump Strainer

The fuel pump strainer attaches to the lower end of the fuel pump. The fuel pump strainer is made of woven plastic. The functions of the fuel pump strainer are to filter contaminants and to wick fuel. The fuel pump strainer is self-cleaning and normally requires no maintenance. Fuel stoppage at this point indicates that the fuel tank contains an abnormal amount of sediment or water. Clean the fuel tank and replace a plugged fuel pump strainer with a new one.

In-Line Fuel Filter

12628

The fuel feed pipe has a steel fuel filter installed ahead of the fuel injection system. The paper filter element (2) traps particles in the fuel that may damage the injection system. The filter housing (1) is made to withstand maximum fuel system pressure, exposure to fuel additives, and changes in temperature. Quick-connect type fittings are used at both ends of the filter. There is no service interval for fuel filter replacement. Replace a restricted fuel filter.

Nylon Fuel Pipes

Nylon fuel pipes are designed to perform the same job as the steel or flexible fuel pipes or hoses that they replace. Nylon pipes are constructed to withstand maximum fuel system pressure, exposure to fuel additives, and changes in temperature. There are two sizes of nylon fuel pipes used: 3/8" ID for the fuel feed, and 5/16" ID for the fuel return.

The fuel feed and return pipes are assembled as a harness. Retaining clips hold the pipes together and provide a means for attaching the pipes to the vehicle. Heat resistant rubber hose and/or corrugated plastic conduit protect the sections of the pipes that are exposed to chafing, high temperature or vibration.

Nylon fuel pipes are somewhat flexible and can be formed around gradual turns under the vehicle. However, if nylon fuel pipes are forced into sharp bends, the pipes will kink and restrict the fuel flow. Also, once exposed to fuel, nylon pipes may become stiffer and are more likely to kink if bent too far. Take special care when working on a vehicle with nylon fuel pipes.

Caution: In Order To Reduce the Risk of Fire and Personal Injury: Always cover nylon fuel pipes with a wet towel before using a torch near them. Also, never expose the vehicle to temperatures higher than 115°C (239°F) for more than one hour, or more than 90°C (194°F) for any extended period. Take care not to nick or scratch the nylon fuel pipes. If damaged, they must be replaced.

Quick-Connect Fittings

Quick-connect fittings provide a simplified means of installing and connecting fuel system components. The fittings consist of a unique female connector and a compatible male pipe end. O-rings, located inside the female connector, provide the fuel seal. Integral locking tabs or fingers hold the fittings together.

EVAP Pipes and Hoses

The EVAP pipe extends from the fuel sender assembly to the evaporative emission canister. The EVAP pipe is made of nylon pipe. The EVAP pipe connects to the fuel sender assembly and the evaporative emission canister with fuel resistant rubber hoses.

Caution: To Reduce the Risk of Fire and Personal Injury:

- **Always cover nylon vapor pipes with a wet towel before using a torch near them. Also, never expose the vehicle to temperatures higher than 115°C (239°F) for more than one hour, or more than 90°C (194°F) for any extended period.**
- **Take care not to nick or scratch the nylon vapor pipes. If damaged, replace the nylon vapor pipes.**

Fuel Metering Modes of Operation

Modes of Operation

The PCM looks at voltages from several sensors to determine how much fuel to give the engine. The fuel is delivered under one of several conditions called modes. The PCM controls all modes.

Starting Mode

With the ignition switch in the ON position (before engaging the starter), the PCM energizes the fuel pump relay for two seconds allowing the fuel pump to build up pressure. The PCM first checks speed density, then switches to the Mass Air Flow (MAF) sensor. The PCM also uses the Engine Coolant Temperature (ECT), Throttle Position (TP), and Manifold Absolute Pressure (MAP) sensors to determine the proper air/fuel ratio for starting. This ranges from 1.5:1 at -36°C (-33°F) to 14.7:1 at 94°C (201°F) running temperature. The PCM controls the amount of fuel delivered in the starting mode by changing the pulse width of the injectors. This is done by pulsing the injectors for very short times.

Clear Flood Mode

If the engine floods, clear the engine by pushing the accelerator pedal down all the way. The PCM then pulses the injectors at an air/fuel ratio of 20:1. The PCM holds this injector rate as long as the throttle stays wide open and the engine speed is below 300 RPM. If the throttle position becomes less than 80 percent, the PCM returns to the starting mode.

Run Mode

The run mode has two conditions called Open Loop and Closed Loop. When the engine is first started, and engine speed is above a predetermined RPM, the system begins Open Loop operation. The PCM ignores the signal from the HO₂S and calculates the air/fuel ratio based on inputs from the ECT, MAF, MAP, and TP sensors. The system stays in Open Loop until meeting the following conditions:

- Both HO₂S have varying voltage output, showing that they are hot enough to operate properly. (This depends on temperature.)
- The ECT sensor is above a specified temperature.
- A specific amount of time has elapsed after starting the engine.

Specific values for the above conditions exist for each different engine, and are stored in the Electrically Erasable Programmable Read Only Memory (EEPROM). The system begins Closed Loop operation after reaching these values. In Closed Loop, the PCM calculates the air/fuel ratio (injector on-time) based on the signal from various sensors, but mainly the HO₂S. This allows the air/fuel ratio to stay very close to 14.7:1.

Acceleration Mode

When the driver pushes on the accelerator pedal, air flow into the cylinders increases rapidly, while fuel flow tends to lag behind. To prevent possible hesitation, the PCM increases the pulse width to the injectors to provide extra fuel during acceleration. The PCM determines the amount of fuel required based on throttle position, coolant temperature, manifold air pressure, mass air flow and engine speed.

Deceleration Mode

When the driver releases the accelerator pedal, air flow into the engine is reduced. The PCM looks at the corresponding changes in throttle position, manifold air pressure and mass air flow. The PCM shuts OFF fuel completely if the deceleration is very rapid, or for long periods (such as long closed throttle coast-down). The fuel shuts OFF in order to protect the warm-up three-way catalytic converters.

Battery Voltage Correction Mode

When battery voltage is low, the PCM compensates for the weak spark delivered by the distributor in the following ways:

- Increasing the amount of fuel delivered.
- Increasing the idle RPM.
- Increasing ignition dwell time.

Fuel Cutoff Mode

To prevent possible engine damage from over-speed, the PCM cuts off fuel from the injectors when the engine speed is above approximately 5500 RPM. To prevent tire damage on vehicles equipped with base tires, the PCM also cuts off fuel from the injectors at vehicle speeds above 108 mph. Also, see Rapid Deceleration in Deceleration Mode.

Fuel Metering System Components

The fuel metering system consists of the following parts:

- The fuel supply components (fuel tank, pump, pipes).
- The fuel pump electrical circuit.
- The fuel rail.
- The fuel injectors.
- The fuel pressure regulator.
- The throttle body.
- The Idle Air Control (IAC) valve.
- The Throttle Position (TP) sensor.

The fuel tank stores the fuel supply. An electric fuel pump, located in the fuel tank with the fuel level sensor assembly, pumps fuel through an in-line fuel filter to the fuel rail assembly. The pump provides fuel at a pressure greater than is needed by the injectors. The fuel pressure regulator, part of the fuel rail assembly, keeps fuel available to the injectors at a regulated pressure. A separate pipe returns unused fuel to the fuel tank.

Fuel Pump Electrical Circuit

When the ignition switch is in the ON position (before engaging the starter), the PCM energizes the fuel pump relay for two seconds, causing the fuel pump to pressurize the fuel system. If the PCM does not receive ignition reference pulses (engine cranking or running) within two seconds, it shuts OFF the fuel pump relay, causing the fuel pump to stop.

Fuel Rail Assembly

The fuel rail assembly attaches to the engine intake manifold. The fuel rail assembly performs the following functions:

- It positions the injectors (2) in the intake manifold.
- It distributes fuel evenly to the injectors.
- It integrates the fuel pressure regulator (1) into the fuel metering system.

Fuel Injectors

The top-feed fuel injector assembly is a solenoid operated device, controlled by the PCM, that meters pressurized fuel to a single engine cylinder. The PCM energizes the injector solenoid (3), which opens a ball valve (1), allowing fuel to flow past the ball valve, and through a recessed flow director plate (2). The director plate has six machined holes that control the fuel flow, generating a conical spray pattern of finely atomized fuel at the injector tip. Fuel is directed at the intake valve, causing it to become further atomized and vaporized before entering the combustion chamber. An injector stuck partly open can cause a loss of pressure after engine shutdown. Consequently, long cranking times would be noticed on some engines.

Fuel Pressure Regulator Assembly

The fuel pressure regulator is a diaphragm operated relief valve with fuel pump pressure on one side, and regulator spring pressure and intake manifold vacuum on the other side. The fuel pressure regulator maintains a constant pressure differential across the injectors at all times. The pressure regulator compensates for engine load by increasing fuel pressure as engine vacuum drops. With the ignition ON and the engine OFF (zero vacuum), system fuel pressure at the pressure test connection should be 284–325 kPa (41–47 psi). If the pressure is too low, poor performance could result. If the pressure is too high, excessive odor and a Diagnostic Trouble Code (DTC) P0132, P0152, P0172 or P0175 may result. Table A-7 has information on diagnosing fuel pressure conditions.

Accelerator Controls

The accelerator control system is cable operated. There are no linkage adjustments, therefore use the specific cable for each application.

Throttle Body Assembly

21314

The throttle body assembly attaches to the intake manifold. The throttle body controls air flow into the engine, thereby controlling engine output. The vehicle operator opens the throttle valves within the throttle body through the accelerator controls. During engine idle, the throttle valves are almost closed. A fixed air bypass orifice and the Idle Air Control (IAC) valve (1) handle the air flow control. Engine coolant flows through the coolant cavity on the bottom of the throttle body in order to prevent throttle valve icing during cool weather operation. The throttle body also provides the location for mounting the Throttle Position (TP) sensor (2) and for sensing changes in engine vacuum due to throttle valve position. Vacuum ports are located at, above, or below the throttle valve to generate vacuum signals needed by various components.

Idle Air Control (IAC) Valve

10172

The purpose of the IAC valve is to control engine idle speed, while preventing stalls due to changes in engine load. The IAC valve, mounted in the throttle body, controls a portion of the bypass air. An orifice located between the throttle valves also supplies a constant amount of bypass air. By moving a conical valve known as a pintle, in, towards the seat (to decrease air flow); or out, away from the seat (to increase air flow), a controlled amount of air can be bypassed. If engine speed is too low, more air is bypassed to increase RPM. If engine speed is too high, less air is bypassed to decrease RPM. The PCM moves the IAC valve in small steps, called counts. These can be measured and displayed by a scan tool, which plugs into the Data Link Connector (DLC). The PCM calculates the proper position of the IAC valve during idle based on battery voltage, coolant temperature, engine load, and engine RPM. If the RPM drops below specification and the throttle valve is closed, the PCM senses a near stall condition and calculates a new valve position in order to prevent stalling.

- Engine idle speed is a function of total air flow into the engine. Idle speed is based on IAC valve pintle position + crankcase ventilation valve flow + throttle valve opening + bypass orifice air flow + calibrated vacuum loss through accessories.
- Controlled idle speed is programmed into the PCM, which determines the correct IAC valve pintle position to maintain the desired idle speed for all engine operating conditions and loads.
- The minimum idle air rate is set at the factory with a stop screw. This setting allows enough air flow by the throttle valves to cause the IAC valve pintle to be positioned a calibrated number of steps (counts), from the seat, during controlled idle operation.
- If the IAC valve is disconnected and reconnected with the engine running, the idle speed may be wrong. If this occurs, reset the IAC valve by depressing the accelerator pedal slightly, start and run the engine for five seconds, then turn the ignition OFF for ten seconds.

Throttle Position (TP) Sensor

The TP sensor attaches to the side of the throttle body opposite the throttle lever. It senses the throttle valve angle and relays that information to the PCM. The PCM requires knowledge of throttle angle to generate the required injector control signals (pulses).

EVAP Control System

The Evaporative Emission (EVAP) control system used on all vehicles is the charcoal canister storage method. This method transfers fuel vapor from the fuel tank to an activated carbon (charcoal) storage device (canister) to hold the vapors when the vehicle is not operating. When the engine is running, the fuel vapor is purged from the carbon element by intake air flow and consumed in the normal combustion process.

Fuel Vapor Canister

Legend

- (1) Tank Tube
- (2) Air Tube (Fresh Air Inlet)
- (3) Purge Tube

The Evaporative Emission (EVAP) control system uses a 1500 cc charcoal canister to absorb fuel vapors from the gas tank.

When gasoline vapor builds enough to overcome the spring tension of the EVAP pressure control valve, the vapor will flow to the canister where it is absorbed and stored by the charcoal. Under certain operating conditions the PCM will command the purge solenoid valve to open. This allows the vapor to flow into the intake manifold for combustion.

This system has a remote mounted canister purge control solenoid valve. The PCM operates this solenoid valve to control vacuum to the canister. Under cold engine or idle conditions, the solenoid valve is closed, which prevents vacuum from being applied to the canister. The PCM activates (or opens) the solenoid valve and allows purge under the following conditions:

- Engine is warm.
- After the engine has been running a specified period of time.
- Above a specified road speed.
- Above a specified throttle opening.

EVAP Pressure Control Valve

13645

Legend

- (1) Control Tube
- (2) Tube to Canister
- (3) Umbrella Valve
- (4) Restriction
- (5) Tube to Fuel Tank
- (6) Diaphragm
- (7) Diaphragm Spring

Evaporative Emission (EVAP) Pressure Control Valve

This system uses an in-line EVAP pressure control valve as a pressure relief valve. When vapor pressure in the tank exceeds approximately 5 kPa (.7 psi) the diaphragm valve opens, allowing vapors to vent to the canister. A 1.14 mm (0.045 inch) orifice in the passage leading to the canister tube causes pressure to drop slowly, preventing the valve from oscillating (buzzing). When the tank pressure drops below 5 kPa (.7 psi), the valve closes causing vapors to be held in the fuel tank.

Results of Incorrect Operation

- Poor idle, stalling and poor driveability can be caused by the following:
 - Inoperative purge solenoid valve.
 - Damaged canister.
 - Hoses split, cracked and, or not connected to the proper tubes.

- Evidence of fuel loss or fuel vapor odor can be caused by:
 - Liquid fuel leaking from fuel lines.
 - Cracked or damaged canister.
 - Inoperative canister control valve.
 - Vacuum hoses that are:
 - Disconnected.
 - Mis-routed–routed.
 - Kinked.
 - Deteriorated or damaged vapor hoses.

If the solenoid valve is open, or is not receiving power, the canister can purge to the intake manifold at the incorrect time. This can allow extra fuel during warm-up, which can cause rough or unstable idle.

EVAP Vacuum Switch

EVAP Purge Vacuum Switch

The EVAP Purge Vacuum Switch is used by the PCM to monitor EVAP canister purge solenoid operation and purge system integrity. The EVAP Purge Vacuum Switch should be closed to ground with no vacuum present (0% EVAP Purge PWM). With EVAP Purge PWM at 25% or greater, the EVAP Purge Vacuum Switch should open.

An incorrect EVAP Purge system flow should set a DTC P0441. A continuous purge condition with no purge commanded by the PCM should set a DTC P1441. Refer to Evaporative Emission (EVAP) Control System for a complete description of the EVAP system.

The Evaporative Emission (EVAP) canister purge solenoid valve and the EVAP Vacuum switch diagnosis is covered in the following DTCs:

- P0441
- P0443
- P1441

EVAP Control System Schematic

Visual Check of EVAP Canister

If cracked or damaged, replace EVAP canister.

Evaporative Emission (EVAP) Pressure Control Valve

With a hand vacuum pump, apply approximately 51 kPa (15 in. Hg) to the control vacuum tube. After ten seconds, there should be at least 17 kPa (5 in. Hg) vacuum remaining. Be sure the hand vacuum pump being used does not have an internal leak and the hose connections to control vacuum tube and pump are secure. If after 10 seconds there is less than 17 kPa (5 in. Hg) vacuum, the valve must be replaced.

With 51 kPa (15 in. Hg) vacuum still applied to the control vacuum tube, attach a short piece of hose to the valve's tank tube side. Blow into the tube. You should feel the air pass through the valve. If air does not pass through, the valve must be replaced.

Secondary Air Injection System

The Secondary Air Injection (AIR) system helps reduce Hydrocarbon (HC), Carbon Monoxide (CO), and Oxides of Nitrogen (NOx) exhaust emissions. It also heats up the warm up 3-way catalytic converters quickly on engine start-up so conversion of exhaust gases can occur sooner.

The system includes the following:

- **AIR pump** – The AIR pump is mounted to the lower left front of the engine Compartment and supplies the air to the AIR system. The electric air pump pressurizes air from the engine and pumps it to the check valves near the exhaust manifolds. The AIR pump is controlled by the PCM. Battery voltage to the AIR pump is controlled by the AIR pump relay. An integral stop valve prevents air flow through the pump during OFF periods. When the PCM provides a ground circuit for the secondary AIR pump relay, battery voltage is allowed to power up the AIR pump and integral stop valve.
- **Vacuum Bleed Valve** – This valve helps prevent vacuum buildup within the AIR system, which could prevent the integral stop valve from opening. The bleed valve is controlled by the air pump relay and will be energized when the AIR pump is commanded ON. If the vacuum relief system is not functioning, the vacuum will cause the AIR pump integral valve not to open. This may result in no AIR flow to the exhaust manifolds or delay the delivery of air which may not allow the diagnostic to pass.
- **Check valves** – The check valves prevent back flow of exhaust gases into the AIR pump in the event of an exhaust backfire.
- **Necessary plumbing.**
 - Hoses
 - Pipes
 - Clamps

- (5) Check Valve
- (6) AIR Injection Pipe
- (7) Intake Manifold
- (8) AIR Injection Pipe
- (9) AIR Bleed Valve Solenoid Valve
- (10) Air to Exhaust Ports
- (11) Fresh Air Intake Pipe

The AIR pump with integral stop valve is controlled by the PCM. The PCM will turn ON the AIR pump by providing the ground to complete the circuit which energizes the AIR pump relay. When air to the exhaust ports is desired, the PCM turns ON both the integral stop valve and AIR pump.

The PCM turns ON the AIR pump during startup any time engine coolant temperature is above 15°C (59°F). The AIR pump will operate for a maximum of 240 seconds, or until the system enters Closed Loop operation. At the same time the PCM turns the AIR pump OFF, it also de-energizes the integral stop valve solenoid so no air is directed to the exhaust ports.

The air system will be disabled under the following conditions:

- When the PCM recognizes a problem and sets a diagnostic trouble code.
- When the fuel system is operating in Closed Loop.
- The AIR pump has been ON for 240 seconds.
- Engine Speed is greater than 2825 RPM.
- MAP is greater than 96 kPa with VSS over 60 mph.
- MAP is less than 20 kPa.
- ECT less than -8.5°C (17°F).
- Warm up 3-way catalytic converters over temperature detected.
- Short and long term fuel trim are not in their normal ranges.
- Power enrichment is detected.

Results of Incorrect Operation

If no air (oxygen) flow enters the exhaust stream at the exhaust ports, HC and CO emission levels will be too high.

Air flowing to the exhaust ports at all times could increase temperature of the warm up 3-way catalytic converter.

Diagnostic Trouble Codes P0410, P0412, P1415, and P1416 will set if there is a malfunction in the following components:

- The AIR pump.
- The AIR pump relay.
- Hoses or pipes that are leaking.
- The Check valves that are leaking.
- Circuits going to the AIR pump and the AIR pump relay.
- The vacuum bleed valve.

AIR System (Typical)

29965

Legend

- (1) AIR Pump
- (2) AIR Check Valve
- (3) Exhaust Manifold
- (4) Exhaust Manifold

AIR Pump

The AIR pump is a regenerative turbine type which is permanently lubricated and requires no periodic maintenance.

The engine should be at normal operating temperature in neutral at idle. Using the scan tool enable the AIR pump. Select HO2S voltages for both Bank 1 and Bank 2 HO2S. The HO2S voltages for both sensors should remain under 350 mV because air is being directed to the exhaust ports. If the HO2S voltages remain low during the Output Test, the AIR pump and integral stop valve are operating satisfactorily. If the HO2S voltage does not remain low when the AIR pump is enabled, inspect for the following:

- For a seized AIR pump.
- Hoses, pipes and all connections for leaks and proper routing.
- For air flow going to the exhaust ports.
- AIR pump for proper mounting.
- Hoses and Pipes for deterioration or holes.

Hoses and Pipes

If a leak is suspected on the pressure side of the system or if a hose or pipe has been disconnected on the pressure side, the connections should be checked for leaks with a soapy water solution. With the AIR pump running, bubbles will form if a leak exists.

Check Valve

Caution: Before proceeding with the next check, make sure the check valve is cooled off. Also, tap on the check valve to remove any debris that may be inside the valve.

A check valve should be inspected whenever the hose is disconnected or whenever check valve failure is suspected. (An AIR pump that had become inoperative and had shown indications of having exhaust gases in the outlet port would indicate check valve failure.)

Blow through the check valve (toward the cylinder head) then attempt to suck back through the check valve. Flow should only be in one direction (toward the exhaust manifold). Replace valve which does not operate properly.

EGR System

The exhaust gas recirculation (EGR) system is used to lower Nox (Oxides of Nitrogen) emission levels that are caused by high combustion temperatures and excessive oxygen. The valve does this by decreasing combustion temperature and displacing oxygen.

The main element of the system is the EGR. The valve is mounted on the intake manifold. The is operated by engine vacuum.

The EGR valve feeds small amounts of exhaust gas back into the combustion chamber.

EGR Flow

13637

Legend

- (1) EGR Valve
- (2) Exhaust Gas
- (3) Intake Air
- (4) Ported Vacuum

The EGR valve is opened by vacuum to let exhaust gas flow into the intake manifold. The exhaust gas then moves with the air/fuel mixture into the combustion chamber. If a large amount of exhaust gas enters the combustion chamber, combustion will not occur. For this reason, very little exhaust gas is allowed to pass through the EGR valve. The EGR valve is usually open during warm engine operation when the vehicle is above idle speed.

The EGR vacuum control has a vacuum solenoid valve that is controlled by pulse width modulation. This means the PCM turns the solenoid valve ON and OFF many times a second and varies the amount of ON time to vary the amount of vacuum applied to the EGR valve.

The PCM uses information from the following sensors/inputs to regulate the EGR solenoid valve:

- ECT sensor
- MAP sensor
- RPM
- TP sensor
- IAT sensor
- VSS
- Negative backpressure EGR valves will have a N stamped on the top side of the valve after the part number.
- Positive backpressure EGR valves will have a P stamped on the top side of the valve after the part number.
- Port EGR valves have no identification stamped after the part number.

Negative Backpressure EGR Valve

13573

Legend

- (1) EGR Valve
- (2) Air Bleed Hole
- (3) Vacuum Port
- (4) Large Spring
- (5) Small Spring
- (6) Exhaust Gas
- (7) Intake Air
- (8) Diaphragm

The EGR valve used on this engine is a negative backpressure valve. It varies the amount of exhaust gas flow into the manifold depending on the manifold vacuum and variations in the exhaust backpressure.

The diaphragm on this EGR valve has an internal vacuum bleed hole which is held closed by a small spring when there is no exhaust backpressure. The amount of vacuum to the valve is controlled by an PCM controlled solenoid valve.

Engine vacuum opens the EGR valve against the pressure of a large spring. When vacuum combines with negative exhaust backpressure, the vacuum bleed hole opens and the EGR valve closes.

The following DTCs will diagnose the EGR system:

- DTC P0400—EGR System
- DTC P0403—EGR Solenoid Control Circuit

Too much EGR flow dilutes the fresh intake air/fuel mixture causing the engine to operate roughly or stall. With too much flow (at idle, cruise, or cold operation) tends to weaken combustion and may result in any of the following conditions:

- Engine stops after cold start.
- Engine stops at idle after deceleration.
- Vehicle surges during cruise.
- Rough idle.

Too little or no EGR flow allows combustion temperatures to get too high during acceleration and load conditions. This could cause the following:

- Spark knock (detonation).
- Engine overheating.
- Emission test failure.

Crankcase Ventilation System

A closed crankcase ventilation system is used to provide a more complete scavenging of crankcase vapors. Fresh air from the air cleaner is supplied to the crankcase, mixed with blow-by gases and then passed through a crankcase ventilation valve into the intake manifold.

Typical Crankcase Ventilation Valve Flow

13575

Legend

- (1) To Intake Manifold
- (2) Crankcase Ventilation Valve Hose
- (3) Positive Crankcase Ventilation Valve (PCV)
- (4) Crankcase Vent Hose
- (5) To Throttle Body

The primary control is through the crankcase ventilation valve which meters the flow at a rate depending on manifold vacuum. To maintain idle quality, the crankcase ventilation valve restricts the flow when intake manifold vacuum is high. If abnormal operating conditions arise, the system is designed to allow excessive amounts of blow-by gases to back flow through the crankcase vent tube into the engine air inlet to be consumed by normal combustion.

PCV Cutaway

13636

Legend

(1) Check Valve

Results of Incorrect Operation

A plugged PCV valve or hose may cause:

- Rough idle.
- Stalling or slow idle speed.
- Oil leaks.
- Sludge in engine.

A leaking valve or hose would cause:

- Rough idle.
- Stalling.
- High idle speed.

Reaction Carrier Pinion Gear End Play

5504

1. Check the pinion end play. The end play must not exceed 0.61 mm (0.024 in).

Inspect the reaction carrier for the following conditions:

- Pinion gear damage
- Proper pinion staking
- Excessive pinion washer wear
- Keystoned pinion gears

2. Ensure that the pinions turn freely.

Input Carrier Pinion End Play

Inspection Procedure

5469

1. Check the pinion end play. The end play must not exceed 0.61 mm (0.024 in).
2. Inspect the input carrier for pinion gear damage, proper pin stake and keystone pinion gears. Pinions must rotate freely.

Torque Converter End Play Check**Tools Required**

- J 8001 Dial Indicator
- J 26900-13 Dial Indicator Post
- J 35138 End Play Checking Tool

7775

1. Inspect the torque converter and replace if any of the following conditions exist:

- Evidence of damage to the pump assembly.
- Metal particles are found after flushing the cooler and cooler lines.
- External leaks in the hub area.
- Converter pilot is broken, damaged or poor fit into the crankshaft.
- Converter hub is scored or damaged.
- Internal damage to the stator.
- Contamination from engine coolant.
- Excessive end play.

Important: The torque converter should not be replaced if the fluid has an odor, discoloration or no evidence of metal or clutch plate material. Flushing the torque converter is not recommended.

2. Install the torque converter end play checking tool and the dial indicator.
 - The end play for a 245 mm torque converter should be 0–0.5 mm (0–0.020 in).
 - The end play for a 298 mm torque converter should be 0–0.6 mm (0–0.024 in).

Diagnostic Information and Procedures

Functional Test Procedure

Step	Action	Value(s)	Yes	No
DEFINITION: Diagnose and verify the customer's complaint				
1	1. Perform <i>Transmission Fluid Checking Procedure</i> . 2. Fill the reservoir to the suggested level. Is the fluid level correct?	—	Go to Step 2	—
2	Check for PCM trouble codes, both current and history. Are PCM trouble codes present?	—	Go to Malfunction Trouble Code	Go to Step 3
3	1. Perform <i>Electrical/Garage Shift Procedure</i> . 2. Perform <i>Road Test Procedure</i> . Was the condition duplicated?	—	Go to Step 4	Go to Step 12
4	Is a harsh or soft shift condition present?	—	Go to Step 7	Go to Step 5
5	Is the vehicle's performance poor?	—	Go to Torque Converter Evaluation	Go to Step 6
6	Is the engagement into Drive or Reverse delayed or missing?	—	Go to Step 7	Go to Step 9
7	Perform <i>Line Pressure Check Procedure</i> . Is the line pressure correct?	—	Go to Step 8	Refer to Symptom Diagnosis Charts
8	Inspect the transmission wire harness connectors and the transmission range switch. Was the problem found and corrected?	—	System OK	Refer to Symptom Diagnosis Charts
9	Is vibration or noise a problem?	—	Refer to Flywheel/Torque Converter Vibration Test	Go to Step 10
10	Is the fluid leaking?	—	Refer to Fluid Leak Diagnosis	Go to Step 11
11	Are other transmission conditions present?	—	Refer to Symptom Diagnosis Charts	Go to Step 12
12	The condition is intermittent. Re-examine the complaint.	—	Exit Table	—

Transmission Fluid Checking Procedure

Step	Action	Value(s)	Yes	No
DEFINITION: Diagnose transmission fluid conditions by color				
1	Check the fluid color. Is the fluid color red?	—	Go to Step 2	Go to Step 11
2	Is the fluid level satisfactory?	—	Go to Step 20	Go to Step 3
3	Check the fluid. Is the fluid foamy?	—	Go to Step 8	Go to Step 4
4	Check the fluid level. The proper fluid level should be in the middle of the X-hatch. Is the level high?	—	Go to Step 9	Go to Step 5
5	Fluid will be low. Add fluid to the proper fluid level. Is the fluid level satisfactory?	—	Go to Step 6	—
6	Check for external leaks. Refer to <i>Fluid Leak Diagnosis</i> . Did you find any leaks?	—	Go to Step 7	Go to Step 20
7	Correct the leak condition. Did you correct the leak condition?	—	Go to Step 20	—
8	Is the fluid level too high?	—	Go to Step 9	Go to Step 10
9	Remove excess fluid to the proper fluid level. Is the fluid level satisfactory?	—	Go to Step 20	—
10	Check for contaminants in the fluid. Drain the fluid to determine the source of the contamination. Did you drain the fluid?	—	Go to Step 15	—
11	Is the fluid color non-transparent pink?	—	Go to Step 12	Go to Step 13
12	Replace the cooler. Is the replacement complete?	—	Go to Step 15	—
13	The fluid color should be light brown. Transmission fluid may turn dark with normal use. This does not always indicate oxidation or contamination. Is the fluid color light brown?	—	Go to Step 14	—
14	Drain the fluid to determine if the fluid is contaminated. A very small amount of material in the bottom pan is a normal condition, but large pieces of metal or other material in the bottom pan require a transmission overhaul. Was the fluid contaminated?	—	Go to Step 15	Go to Step 18
15	Overhaul the transmission. Refer to the Unit Repair Section. Is the overhaul complete?	—	Go to Step 16	—
16	Flush the cooler. Has the cooler been flushed?	—	Go to Step 17	—
17	Add new fluid. Is the procedure complete?	—	Go to Step 19	—
18	Change the fluid and the filter. Is this procedure complete?	—	Go to Step 19	—
19	Is the fluid level satisfactory? If not, correct as necessary.	—	Go to Step 20	—
20	Perform the Functional Test. Is the Functional Test completed?	—	System OK	—

Line Pressure Check Procedure

13267

Line pressures are calibrated for two sets of gear ranges – Drive-Park-Neutral, and Reverse. This allows the transmission line pressure to be appropriate for different pressure needs in different gear ranges:

Gear Range	Line Pressure Range
Drive, Park or Neutral	55–189 psi
Reverse	64–324 psi

Before performing a line pressure check, verify that the pressure control solenoid for the transmission is receiving the correct electrical signal from the PCM:

1. Install a scan tool.
2. Start the engine and set the parking brake.
3. Check for diagnostic trouble codes, including the diagnostic code for a stored pressure control solenoid.
4. Repair the vehicle if necessary. Include the following areas:
 - Inspect the fluid level.
 - Inspect the manual linkage at the transmission.
 - Install or connect the TECH 1 scan tool.
 - Install or connect the oil pressure gage at the line pressure tap.
5. Put the gear selector in Park and set the parking brake.
6. Start the engine and allow the engine to warm up at idle.
7. Access the PCS Control test on the TECH 1 scan tool.
8. Increase DESIRED PCS in 0.1-amp increments. Read the corresponding line pressure on the pressure gage. Allow the pressure to stabilize for 5 seconds after each current change.
9. Compare your data to the Drive-Park-Neutral line pressure chart below.

Notice: The transmission may experience harsh, soft or mushy shifts for up to two days later.

Caution: *Keep the brakes applied at all times in order to prevent unexpected vehicle motion.*

If your pressure readings differ greatly from the line pressure chart, refer to the Diagnosis Charts.

The TECH 1 scan tool is only able to control the pressure control solenoid in Park and Neutral with the vehicle stopped. This protects the clutches from extremely high or low pressures in Drive or Reverse ranges.

Pressure Control Solenoid Current (Amp)	Approximate Line Pressure (PSI)
0.02	170–190
0.10	165–185
0.20	160–180
0.30	155–175
0.40	148–168
0.50	140–160
0.60	130–145
0.70	110–130
0.80	90–115
0.90	65–90
0.98	55–65

The pressures in the table assume an engine speed of 1500 RPM and a temperature of 66°C (150°F). The pressure will vary with a change in temperature.

Electrical/Garage Shift Procedure

Perform this preliminary test before a hoist test or a road test in order to make sure that the electronic control inputs are connected and operating. If you do not check the inputs before operating the transmission, you could misdiagnose a simple electrical condition as a major transmission condition.

A scan tool provides valuable information and must be used on the HYDRA-MATIC 4L60-E transmission for accurate diagnosis.

1. Move the gear selector to PARK, (P) and set the parking brake.
2. Connect the scan tool to the DLC terminal.
3. Start the engine.
4. Connect the power to the scan tool.
5. Verify that the following signals are present:
 - Engine speed
 - Trans Output Speed
 - Vehicle Speed
 - A/B/C RNG
 - PRNDL Select
 - Desired PCS
 - Actual PCS
 - PCS Duty Cycle

- Brake Switch
 - 4WD Low Switch (4WD Only)
 - Engine Coolant Temp
 - Trans Fluid Temp
 - Throttle Angle
 - System Volts
6. Monitor the BRAKE SWITCH signal while tapping the brake pedal with your foot. The BRAKE SWITCH should be on when the pedal is depressed. The brake switch should come off when the brake pedal is released.
 7. Monitor the PRNDL SELECT signal and move the gear selector through all of the ranges.
 8. Verify that the PRNDL SELECT value matches the gear range indicated on the instrument panel or console. Gear selections should be immediate and not harsh.
 9. Move the gear selector to neutral and monitor the THROTTLE ANGLE signal while increasing and decreasing the engine RPM with the accelerator pedal. The THROTTLE ANGLE should increase with the engine RPM.

Road Test Procedure

- Perform the road test using a scan tool.
- Perform this test when the traffic and the road conditions permit. Observe all safety regulations.

1. Start the engine.
2. Depress the brake pedal.

Important: Gear selections should be immediate and not harsh.

3. Move the gear selector as follows:
 - 3.1. Park to Reverse.
 - 3.2. Reverse to Neutral.
 - 3.3. Neutral to D4.
4. Perform the same procedure as instructed previously in the road test:
 - Upshifts and TCC apply.
 - The part throttle detent downshift
 - The full throttle detent downshift
 - Manual downshifts
 - Coasting downshifts
 - Manual gear range selection

Use the scan tool in order to see if any transmission malfunction codes have been set. If so, perform the transmission test. After repairing the vehicle, perform the road test and verify that no codes have been set again. If no codes have been set and the condition remains, refer to the Diagnosis Charts contained in this section. If the condition is suspected to originate in the torque converter, refer to *Torque Converter Clutch Diagnosis* Torque Converter Clutch Diagnosis.

Upshift Control and TCC Apply

The PCM calculates the upshift points based primarily on two inputs: THROTTLE ANGLE and VEHICLE SPEED. When the PCM says a shift should occur, an electrical signal goes to the shift solenoids which in turn move the valves to perform the upshift.

The shift speed charts reference the THROTTLE ANGLE instead of MIN THROTTLE or WOT in order to make the shift speed measurement more uniform and accurate. Use a scan tool in order to monitor the THROTTLE ANGLE. Some scan tools are programmed in order to record shift point information. Check the instruction manual in order to see if this test is available.

With the gear selection in D4, do the following:

1. Look at the shift speed chart contained in this section and choose a percent throttle angle of 15 or 20.
2. Set up the scan tool in order to monitor the THROTTLE ANGLE and the VEHICLE SPEED.
3. Accelerate to the chosen throttle angle and hold the throttle steady.

Important: Shift speeds may vary due to the slight hydraulic delays responding to electronic controls. A change from the original equipment tire size also affects the shift speeds.

Note when the TCC applies. This should occur in third or fourth gear. If the apply is not noticed by an ROM drop, refer to the Preliminary Torque Converter Clutch diagnosis.

The TCC should not apply unless the transmission has reached a minimum operating temperature of 18° C TRAN TEMP and an engine coolant temp of 60° C.

4. As the transmission upshifts, note the shift speed and the commanded gear changes for the following:
 - 2nd gear
 - 3rd gear
 - 4th gear
5. Repeat steps 1-4, using several different throttle angles.

Full Throttle Detent Downshift

At vehicle speeds of 64–88 km/h (40–55 mph) in fourth gear, quickly increase the throttle angle to the maximum position.

Verify that the following conditions are met:

- The TCC releases.
- The transmission downshifts to 2nd gear immediately.
- The 1-2 shift solenoid turns off. The 2-3 shift solenoid is on.

Part Throttle Detent Downshift

At vehicle speeds of 64–88 km/h (40–55 mph) in fourth gear, quickly increase the throttle angle.

Verify that the following conditions are met:

- The TCC releases.
- The transmission downshifts to 3rd gear immediately.
- The 1-2 shift solenoid turns off.

Coasting Downshifts

1. With the gear selector in D4, accelerate to the 4th gear with the TCC applied.
2. Release the accelerator pedal. Lightly apply the brakes. Observe that the following occurs:
 - The TCC releases
 - The downshifts occur at speeds shown on the shift speed chart.

Manual Downshifts

The shift solenoids do not control the initial downshift during the 4-3 and the 3-2 manual downshifts. All manual downshifts are hydraulic except the 2-1. The solenoid states will change during or shortly after a manual downshift is selected.

1. At vehicle speeds of 64–88 km/h (40–55 mph) in fourth gear, release the accelerator pedal while moving the gear selector to D3. Observe the following:
 - The TCC releases.
 - The transmission downshifts to 3rd gear immediately.
 - The engine slows down the vehicle.
2. Move the gear selector back to D4 and accelerate to 64–72 km/h (40–45 mph). Release the accelerator while moving the gear selector to D2 and observe that:
 - The TCC releases.
 - The transmission downshifts to the 2nd gear immediately.
 - The engine slows down the vehicle.
3. Move the gear selector back to D4 and accelerate to 48 km/h (30 mph). Release the accelerator pedal while moving the gear selector to D1 and observe the following conditions:
 - The TCC releases.
 - The transmission downshifts to 1st gear immediately.
 - The engine slows down the vehicle.

Manual Gear Range Selection

Upshifts in the manual gear ranges are controlled by the shift solenoids.

Perform the following tests by accelerating at 10°–15° TP Sensor.

Manual Third (D3)

With the vehicle stopped, move the gear selector to D3 and accelerate in order to observe:

- 1-2 shift
- 2-3 shift

Manual Second (D2)

1. With the vehicle stopped, move the gear selector to the D2 position and accelerate in order to observe if the transmission starts and remains in second gear.
2. Accelerate to 40 km/h (35 mph) and observe the following:
 - The 2-3 shift does not occur.
 - The TCC does not apply.

Manual First (D1)

1. With the vehicle stopped, move the gear selector to D1.
2. Accelerate to 32 km/h (20 mph).
3. Observe the following conditions:
 - No upshifts occur.
 - The TCC does not apply.
 - You can upshift out of first at the fuel cut-off.

Reverse

With the engine stopped, move the gear selector to R and slowly accelerate in order to observe if the 1-2 and the 2-3 shift solenoids are on.

Use a scan tool in order to see if any transmission trouble codes have been set. Refer to Trouble Codes diagnosis in this section and repair the vehicle as directed. After repairing the vehicle, perform the hoist test and verify that the code has not set again.

If the transmission is not performing well and no trouble codes have been set, there may be an intermittent condition. Check all electrical connections for damage or a loose fit. Some scan tools have a snapshot test which can help catch an intermittent condition that doesn't occur long enough to set a code.

You may want to read Electronic Component Diagnosis in this section in order to become familiar with the transmission conditions caused by transmission electrical malfunctions.

If no trouble codes have been set and the condition is suspected to be hydraulic, take the vehicle on a road test.

Noise and Vibration Analysis

A noise or vibration that is noticeable when the vehicle is in motion may not be caused by the transmission.

A noise or vibration that is noticeable while the vehicle is in the P (Park) or the N (Neutral) position with the engine at idle, but is less noticeable as the RPM increases, may be the result of poor engine performance.

Inspect the following components for the conditions stated:

- Tires and wheels — Uneven wear; imbalance; mixed sizes.

- Suspension components — alignment and wear; loose fasteners. Refer to Section 3C.
- Engine mounts — damage; loose bolts.
- Transmission case mounting holes — Missing bolts, nuts, and studs; stripped threads; cracks.
- Flywheel — Missing or loose bolts; cracks; imbalance. For flywheel balancing, refer to *Engine Flywheel Replacement* in Engine Mechanical.
- Torque converter — Missing or loose bolts or lugs; missing or loose balance weights; imbalance.

Flywheel/Torque Converter Vibration Test

Inspection Procedure

Notice: Some Engine/Transmission combinations cannot be balance in this manner, due to the limited clearances between the transmission torque converter bolts and the engine. Be sure that the bolts do not bottom out in the lug nuts, or the transmission converter cover could be dented, and cause internal damage.

1. Start the engine.
2. Place the transmission in P (Park) or N (Neutral).
3. Run the engine at idle speed.
4. Observe the vibration.
5. Shut OFF the engine.

Removal Procedure

1. Disconnect the negative battery cable. Refer to the *Battery Disconnect Caution* in General Information.
2. Raise the vehicle. Refer to Section 0A.
3. Support the vehicle with safety stands.
4. Remove the starter motor. Refer to *Starter Motor Replacement* in Engine Electrical.

13902

5. Remove the converter cover bolts.
6. Remove the converter cover.

13908

7. Remove the torque converter to flywheel bolts. Discard the flywheel bolts.

13910

8. Rotate the torque converter 120° (1/3 turn).

Installation Procedure

13908

Notice: Be sure that the bolts do not bottom out in the lug nuts, or the transmission converter cover could be dented, and cause internal damage.

Important: Hand start all torque converter to flywheel bolts before torquing. This will ensure proper alignment and avoid cross threading.

1. Install the flywheel to torque converter bolts.
Use new flywheel to torque converter bolts with retaining compound removed from the first three threads of each bolt.

Tighten

Tighten the bolts to 63 N.m (46 lb ft).

Refer to *Fastener Notice* in General Information.

13902

2. Install the converter cover and the bolts.

Tighten

Tighten the bolts to 10 N.m (89 lb in).

3. Install the starter. Refer to *Starter Motor Replacement* in Engine Electrical.
4. Lower the vehicle.
5. Connect the negative battery cable.

Tighten

Tighten the cable to 15 N.m (11 lb ft).

6. Start the engine and check for vibration. Repeat this procedure until the best possible balance is obtained.

Torque Converter Clutch Diagnosis

In order to properly diagnose the Torque Converter Clutch (TCC) system, perform all of the electrical testing first. Then do the hydraulic testing.

The TCC is applied by fluid pressure, which is controlled by a solenoid inside of the automatic transmission assembly. The solenoid is energized by completing an electrical circuit through a combination of switches and sensors.

Functional Check Procedure

1. Install a tachometer or a scan tool.
2. Operate the vehicle until you reach proper operating temperature.
3. Drive the vehicle at 80–88 km/h (50–55 mph) with a light throttle (road load).
4. Maintaining the throttle, lightly touch the brake pedal. Check for the release of the TCC and a slight increase in engine speed (RPM).
5. Release the brake. Slowly accelerate and check for a re-apply of the converter clutch and a slight decrease in engine speed (RPM).

Torque Converter Evaluation

Torque Converter Stator

The torque converter stator roller clutch can have one of two different types of malfunctions:

- Stator assembly freewheels in both directions.
- Stator assembly remains locked up at all times.

Condition A — Poor Acceleration Low Speed

The car tends to have a poor acceleration from a standstill. At speeds above 50–55 km/h (30–35 mph), the car may act normal. If you note poor acceleration, you should first determine that the exhaust system is not blocked and the transmission is in first gear when starting out.

If the engine freely accelerates to high RPM in NEUTRAL (N), you can assume that the engine and exhaust system are normal. Checking for poor performance in DRIVE and REVERSE helps determine if the stator is freewheeling at all times.

Condition B — Poor Acceleration High Speed

Engine RPM and car speed are limited or restricted at high speeds. Performance when accelerating from a standstill is normal. The engine may overheat. Visual examination of the converter may reveal a blue color from overheating.

If the converter has been removed, the stator roller clutch can be checked by inserting two fingers into the splined inner race of the roller clutch and try to turn the race in both directions. The inner race should turn freely clockwise, but the inner race should not turn or be very difficult to turn counterclockwise.

Noise

Torque converter whine usually is noticed when the vehicle is stopped and the transmission is in DRIVE or REVERSE. The noise increases when the engine RPM increases. The noise stops when the vehicle is moving or when the torque converter clutch is applied because both halves of the converter are turning at the same speed.

Perform a stall test to make sure the noise actually is coming from the converter:

1. Place a foot on the brake.
2. Put the gear selector in DRIVE.

Important: This noise should not be confused with the pump whine noise which is usually noticeable in PARK, NEUTRAL and all other gear ranges. Pump whine varies with pressure ranges.

3. Depress the accelerator to approximately 1200 RPM for no more than six seconds.
A torque converter noise increases under this load.
4. The torque converter should be replaced under any of the following conditions:
 - External leaks in the hub weld area
 - The converter hub is scored or damaged.
 - The converter pillar is broken or damaged or fits poorly into the crankshaft.
 - You find steel particles after flushing the cooler and cooler lines.
 - The pump is damaged or the steel particles are found in the converter.
 - The vehicle has TCC shudder and/or no TCC apply. Replace only after you have made all of the hydraulic and electrical diagnoses. (Converter clutch material may be glazed).
 - The converter has an imbalance which cannot be corrected. (Refer to the Converter Vibration Test Procedure).
 - The converter is contaminated with engine coolant containing antifreeze.
 - Internal failure of stator roller clutch
 - Excess end play.
 - Heavy clutch debris due to overheating (blue converter)
 - Steel particles or clutch lining material found in fluid filter or on magnet when no internal parts in the unit are worn or damaged - indicates that the lining material came from the converter.
5. The torque converter should not be replaced if any of the following conditions exist:
 - The oil has an odor, is discolored, and there is no evidence of metal or clutch facing particles.
 - The threads in one or more of the converter bolt holes are damaged. Correct with thread insert.
 - Transmission failure did not display evidence of damage or worn internal parts, steel particles or the clutch plate lining material in the unit and inside the fluid filter.
 - The vehicle has been exposed to high mileage (only). The exception may be where the torque converter clutch damper plate lining has seen excess wear by the vehicles operated in heavy and/or constant traffic, such as a taxi, deliver or police use.

Torque Converter Clutch Shudder

The key to diagnosing the Torque Converter Clutch (TCC) shudder is to note when the shudder happens and under what conditions:

The TCC shudder should not only occur during the APPLY and/or RELEASE of the converter clutch, and SELDOM after the TCC plate is fully applied.

While the TCC is Applying or Releasing

If the shudder occurs while the TCC is applying, the problem can be within the transmission or the torque converter. Something is not allowing the clutch to release, or the TCC is trying to release and apply the clutch at the same time. This could be caused by leaking turbine shaft seals, a restricted release orifice, a distorted clutch or a housing surface due to long converter bolts, or defective friction material on the TCC plate.

Shudder Occurs after the TCC has Applied

Important: Once the TCC is applied there is no torque converter (fluid coupling) assistance. Engine or driveline vibrations could be unnoticeable before the TCC engagement.

When the shudder occurs after the TCC has applied, most of the time there is nothing wrong with the transmission. As mentioned above, once the TCC has been applied, it is very unlikely that it will slip. Engine problems may go unnoticed under light throttle and load, but engine problems may become noticeable after TCC apply when going up a hill or accelerating, due to the mechanical coupling between the engine and the transmission.

Inspect the following components in order to avoid misdiagnosis of the TCC shudder and possibly disassembling a transmission and/or replacing a torque converter unnecessarily:

1. Spark plugs - Inspect for cracks, high resistance or broken insulator.
2. Plug wires - Look in each end. If there is a red dust (ozone) or a black substance (carbon) present, then the wires are bad. Also look for a white discoloration of the wire indicating arcing during hard acceleration.
3. Distributor cap and rotor - Look for broken or uncrimped parts.
4. Coil - Look for black on bottom indication arching while engine is misfiring.
5. Fuel injector - Filter may be plugged.
6. Vacuum leak - Engine won't get correct amount of fuel and may run rich or lean, depending on where the leak is located.
7. EGR valve - Valve may let in too much unburnable exhaust has causes engine to run lean.
8. MAP/MAF sensor - Like the vacuum leak, the engine won't get the correct amount of fuel for proper engine operation.
9. Carbon on intake valves - Restricts proper flow or air/fuel mixture into cylinders.
10. Flat cam - Valves don't open enough to let proper fuel/air mixture into cylinders.
11. Oxygen sensor - May command engine too rich or too lean for too long.
12. Fuel pressure - May be too low.
13. Engine mounts - Vibration of mounts can be multiplied by TCC engagement.

14. Axle joints - Check for vibration.
15. TPS – TCC apply and release depends on TPS in many engines. IF TPS is out of specification, TCC may remain applied during the initial engine crowd.
16. Cylinder balance - Bad piston rings or valves that seal poorly can cause low power in a cylinder.
17. Fuel contamination - Causes poor engine performance.

Tech 1 Data Value Examples

If you have completed the On-Board Diagnostic (OBD) system check, if the diagnostics are functioning properly and if no DTCs display, you may use the Typical Scan Values in the table below for comparison within the appropriate transmission. These typical values are an average of display values recorded from normally operating vehicles. They represent the display from a normally functioning system.

You should never use a scan tool that displays faulty data. The problem should be reported to the manufacturer. The use of a faulty scan tool can result in misdiagnosis and the unnecessary replacement of parts.

Only the parameters listed below are used in this manual for diagnosing. If a scan tool displays other parameters, the values are not recommended by General Motors for use in diagnosis.

Scan tests are performed under the following driving conditions:

- Idle
- Lower radiator hose is hot
- Closed throttle
- Park or Neutral
- Closed Loop
- Accessories OFF

Tech 1 Data Value Examples

Tech 1 Parameter	Units Displayed	Typical Scan Values
MAP	kPa, V	20–48 kPa, 1–2V, depending upon altitude
BARO	kPa, V	70–100 kPa, 3.5–4.5V, depending upon altitude
TP Sensor	volts	0.30–0.90V
TP Angle	percent	0%
A/C Clutch	ON/OFF	OFF
Cruise Enabled	ON/OFF	OFF
Hot Mode	ON/OFF	OFF
Adaptable Shift	Yes/No	No
Curr TAP Memory	-16 to +16	varies
Current TAP	0–16	varies
Long Shift Delay	Yes/No	No
Long Shift Time	Yes/No	No
TP Range	Normal/Exceeded	Normal
Standard TAP	Yes/No	No
VSS Delta	Normal/Exceeded	Normal
TP Delta	Normal/Exceeded	Normal
Engine Run Time	hr/min/sec	depends on time since start-up
Ignition 1	volts	13–15V
Gear Ration	ratio	varies
Current Gear	1,2,3,4	1
ECT	C° (F°)	85°–105° C (185°–220° F)
TFT	C° (F°)	82°–94° C (180°–200° F)
TFT Sensor	volts	varies with the outside temperature
TCC Slip Speed	RPM	+/- 50 RPM from the Engine Speed
TCC Brake Sw	Applied/Released	Released
TCC Duty Cycle	Percentage	0%
TCC Enable	On/Off	Off
TCC Duty Open	Yes/No	No

Tech 1 Data Value Examples (cont'd)

Tech 1 Parameter	Units Displayed	Typical Scan Values
TCC Duty Shorted	Yes/No	No
TCC Enable Open	Yes/No	No
TCC Enable Short	Yes/No	No
1/2 Sol.	On/Off	On
2/3 Sol.	On/Off	On
1/2 Sol. Open	Yes/No	No
1/2 Sol. Short	Yes/No	No
2/3 Sol. Open	Yes/No	No
2/3 Sol. Short	Yes/No	No
3/2 Down Shift	Yes/No	No
3/2 DS Open	Yes/No	No
3/2 DS Shorted	Yes/No	No
1/2 Shift Time	seconds	0.00
2/3 Shift Time	seconds	0.00
1/2 Shift Error	seconds	0.00
2/3 Shift Error	seconds	0.00
3/4 Shift Time	seconds	0.00
Latest Shift	seconds	0.00
Latest Shift Err	seconds	0.00
Speed Ratio	ratio	0.00
Upshift Request	Yes/No	No
Upshift in Prog	Yes/No	No
Upshift Desired	Yes/No	No
DS Requested	Yes/No	No
DS in Progress	Yes/No	No
DS Desired	Yes/No	No
3/2 Started	Yes/No	No
3/2 in Progress	Yes/No	No
Vehicle Speed	km/h, mph	0, 0
Engine Speed	RPM	+/- 100 RPM from Desired Engine Speed
PC Act. Current	amps	varies (0.1–1.1 amps)
PC Ref Current	amps	varies (0.1–1.1 amps)
PC Duty Cycle	percentage	40–60%
Power Enrichment	Yes/No	No
KickDown Enabled	Yes/No	No
DTC Set This Ign	Yes/No	No
TR Switch	Invalid, Reverse, Overdrive, Dr 3, Dr 2, Low, Park	Park, Neutral
Traction Control	Inactive/Active	Inactive
Trans. OSS	RPM	0
TFP Switch	On/Off	Off/On/Off
TCC Stator Temp	Normal/High	Normal

Internal Wiring Harness Check**Test Description****Tools Required**

- J 39775 4L60E Jumper Harness
- J 39200 Digital Multimeter
- J 35616 Connector Test Adapter Kit

Important: Resistance values in this chart are given for 20°C (68°F). In order to check the resistance of components at other temperatures, refer to *Component Resistance*. This procedure cannot be used for checking the Automatic Transmission Fluid Pressure Manual Valve Position Switch (TFP Val Position Sw.) circuit, or the Automatic Transmission Fluid Temperature (TFT) Sensor circuit. Refer to *Pressure Switch Assembly Resistance Check*, for those circuits.

Internal Wiring Harness Check

Step	Action	Value(s)	Yes	No
1	1. Install a J 39775 Jumper Harness on the transmission 20-way connector. 2. Using a J 39200 DVOM and a J 35616 Connector Test Adapter Kit, measure the resistance between terminals A and E (1-2 Shift Solenoid Valve). Is the resistance within the values indicated?	19-24Ω	Go to Step 3	Go to Step 2
2	1. Disconnect the 1-2 Shift Solenoid Valve (1-2 SS Valve) from the Automatic Transmission Wiring Harness Assembly. 2. Using the J 39200 DVOM, measure the resistance of the 1-2 SS Valve. Is the resistance within the values indicated?	19-24Ω	Go to Step 13	Go to Step 16
3	Measure the resistance between terminals B and E (2-3 Shift Solenoid Valve). Is the resistance within the values indicated?	19-24Ω	Go to Step 5	Go to Step 4
4	1. Disconnect the 2-3 Shift Solenoid Valve (2-3 SS Valve) from the Automatic Transmission Wiring Harness Assembly. 2. Using the J 39200 DVOM, measure the resistance of the 2-3 SS Valve. Is the resistance within the values indicated?	19-24Ω	Go to Step 13	Go to Step 16
5	Measure the resistance between terminals T and E (Torque Converter Clutch (TCC) Solenoid Valve). Is the resistance within the values indicated?	21-26Ω	Go to Step 6	Go to Step 15
6	Measure the resistance between terminals U and E (Torque Converter Clutch Pulse Width Modulation (TCC PWM) Solenoid Valve). Is the resistance within the values indicated?	10-11Ω	Go to Step 8	Go to Step 7
7	1. Disconnect the TCC PWM Solenoid Valve from the Automatic Transmission Wiring Harness Assembly. 2. Using the J 39200 DVOM, measure the resistance of the TCC PWM Solenoid Valve. Is the resistance within the values indicated?	10-11Ω	Go to Step 13	Go to Step 16
8	Measure the resistance between terminals S and E (3-2 Shift Solenoid Valve assembly). Is the resistance within the values indicated?	20-24Ω	Go to Step 10	Go to Step 9
9	1. Disconnect the 3-2 Shift Solenoid Valve assembly (3-2 SS Valve Assy.) from the Automatic Transmission Wiring Harness Assembly. 2. Using the J 39200 DVOM, measure the resistance of the 3-2 SS Valve Assy. Is the resistance within the values indicated?	20-24Ω	Go to Step 13	Go to Step 16

Internal Wiring Harness Check (cont'd)

Step	Action	Value(s)	Yes	No
10	Measure the resistance between terminals C and D (Pressure Control Solenoid Valve). Is the resistance within the values indicated?	3–5Ω	Go to Step 12	Go to Step 11
11	1. Disconnect the Pressure Control Solenoid Valve (PC Sol Valve) from the Automatic Transmission Wiring Harness Assembly. 2. Using the J 39200 DVOM, measure the resistance of the PC Sol Valve. Is the resistance within the values indicated?	3–5Ω	Go to Step 13	Go to Step 16
12	Using the J 39200 DVOM and the J 35616 Connector Test Adapter Kit, measure the resistance from each pin of the A/T Wiring Harness Assy. at the Automatic Transmission 20-way connector to the transmission case. Is the resistance more than the value indicated?	50kΩ	System OK	Go to Step 15
13	Inspect for a short to ground. 1. Using the J 39200 DVOM and the J 35616 Connector Test Adapter Kit, measure the resistance from each pin of the A/T Wiring Harness Assy. at the Automatic Transmission 20-way connector to the transmission case. 2. Inspect for a chafed wire that could short to bare metal or other wiring. 3. If diagnosing for a possible intermittent condition, move or massage the A/T Wiring Harness Assy. while observing the test equipment for a change. Is a short to ground (low resistance) indicated?	—	Go to Step 15	Go to Step 14
14	Inspect for high resistance. 1. Inspect the A/T Wiring Harness Assy. for poor electrical connections at the Automatic Transmission 20-way connector. Inspect for bent, backed-out, or damaged terminals, and weak terminal tension. 2. Inspect the A/T Wiring Harness Assy. for poor electrical connections at the component connectors. Inspect for bent, backed-out, or damaged terminals, and weak terminal tension. 3. If diagnosing for a possible intermittent condition, move or massage the A/T Wiring Harness Assy. while observing the test equipment for a change. Is a high resistance (open) condition indicated?	—	Go to Step 15	—
15	Replace the Automatic Transmission Wiring Harness Assembly. Is the replacement complete?	—	Verify the repair and exit the table	—
16	Replace the component. Is the replacement complete?	—	Verify the repair and exit the table	—

Component Resistance

Component	Pass Thru Pins	Res 20°C	Res 100°C	Res to Grd (Case)
1-2 Shift Solenoid Valve	A, E	19-24 Ω	24-31 Ω	Greater than 250 K Ω
2-3 Shift Solenoid Valve	B, E	19-24 Ω	24-31 Ω	Greater than 250 K Ω
TCC Solenoid Valve	T, E	21-26 Ω	26-33 Ω	Greater than 250 K Ω
TCC PWM Solenoid Valve	U, E	10-11 Ω	13-15 Ω	Greater than 250 K Ω
3-2 Shift Solenoid Valve Ass'y	S, E	20-24 Ω	29-32 Ω	Greater than 250 K Ω
Pressure Control Solenoid	C, D	3-5 Ω	4-7 Ω	Greater than 250 K Ω
Transmission Fluid Pressure (TFP) Manual Valve Position Switch	Refer to <i>Pressure Switch Assembly Resistance Check</i> .			
*Transmission Fluid Temperature (TFT) Sensor	M, L	3088-3942 Ω	159.3-198.0 Ω	Greater than 10 M Ω
Vehicle Speed Sensor	A, B VSS CONN	1150-1250 Ω	1725-1825 Ω	Greater than 10 M Ω
Important: The resistance of this device is necessarily temperature dependant and will therefore vary far more than any other device. Refer to Transmission Fluid Temperature Sensor portion of <i>Electronic Component Description</i> .				

Pressure Switch Assembly Resistance Check

Test Description

Tools Required

- J 39775 4L60E Jumper Harness
- J 39200 Digital Multimeter
- J 35616 Connector Test Adapter Kit

Important: Whenever the transmission 20-way connector is disconnected and the engine is running, multiple DTCs will set. Be sure to clear these codes when you are finished with this procedure.

Important: This procedure tests the Automatic Transmission Fluid Pressure Manual Valve Position Switch (TFP Val. Position Sw.) circuits and the Automatic Transmission Fluid Temperature (TFT) Sensor circuit. Do not use this procedure to test other Automatic Transmission circuits, refer to 4L60-E Automatic Transmission Internal Wiring Harness check.

Pressure Switch Assembly Resistance Check

Step	Action	Value(s)	Yes	No
1	1. Connect J 39775 Jumper Harness to the transmission 20-way connector. 2. Using J 39200 DVOM and J 35616 Connector Test Adapter Kit, measure the resistance from terminal N to the transmission case. Is the resistance greater than the value indicated?	50K Ω	Go to Step 3	Go to Step 2
2	1. Disconnect the internal transmission wiring harness from the TFP Val Position Sw. 2. Measure the resistance from terminal C of the TFP Val Position Sw to the switch housing. Is the resistance greater than the value indicated?	50K Ω	Go to Step 12	Go to Step 14
3	Measure the resistance from terminal R to the transmission case. Is the resistance less than the value listed?	200 Ω	Go to Step 5	Go to Step 4
4	1. Disconnect the internal transmission wiring harness from the TFP Val Position Sw. 2. Measure the resistance from terminal E of the TFP Val Position Sw to the switch housing. Is the resistance less than the value indicated?	200 Ω	Go to Step 12	Go to Step 14
5	Measure the resistance from terminal P to transmission case. Is the resistance greater than the value indicated?	50K Ω	Go to Step 7	Go to Step 6
6	1. Disconnect the internal transmission wiring harness from the TFP Val Position Sw. 2. Measure the resistance from terminal D of the TFP Val Position Sw to the switch housing. Is the resistance greater than the value indicated?	50K Ω	Go to Step 12	Go to Step 14
7	1. Run the engine at Idle. 2. Set the parking brake. 3. Place the gear select lever in the Reverse position. 4. Measure the resistance from terminal N to the transmission case. Is the resistance less than the value indicated?	200 Ω	Go to Step 8	Go to Step 14
8	1. Place the gear select lever in the Low (D1) position. 2. Measure the resistance from terminal N to the transmission case. Is the resistance less than the value listed?	200 Ω	Go to Step 9	Go to Step 14

Pressure Switch Assembly Resistance Check (cont'd)

Step	Action	Value(s)	Yes	No
9	1. Place the gear select lever in Manual Third (D3) position. 2. Measure the resistance from terminal R to the transmission case. Is the resistance greater than the value listed?	50K Ω	Go to Step 10	Go to Step 14
10	1. Place the gear select lever in Drive (D4) position. 2. Measure the resistance from terminal P to the transmission case. Is the resistance less than the value listed?	200 Ω	Go to Step 11	Go to Step 14
11	1. Place the gear select lever in Manual Second (D2) position. 2. Measure the resistance from terminal P to the transmission case. Is the resistance greater than the value listed?	50K Ω	No problem found, exit table	Go to Step 14
12	Inspect for high resistance: 1. Inspect the transmission wiring for poor electrical connections at the transmission 20-way connector and at the TFP Val Position Sw. 2. Look for possible bent, backed out, deformed, or damaged terminals. 3. Check for weak terminal tension. Was a high resistance condition found?	—	Verify repair and go to Step 1	Go to Step 13
13	Replace the internal transmission wiring harness. Refer to On-Vehicle Service. Is the replacement complete?	—	Verify repair and go to Step 1	—
14	Replace the TFP Val Position Sw. Refer to On-Vehicle Service. Is the replacement complete?	—	Verify repair and go to Step 1	—

Electronic Component Malfunctions

This table gives some general information about electronic component malfunctions. Use this information to become familiar with possible conditions caused by transmission/vehicle electrical components. Refer to the Diagnosis Charts for more specific information.

Hydra-Matic 4L60-E Electronic Component Malfunctions

COMPONENT/SYSTEM	CAN EFFECT
Throttle Position Sensor	• Shift Pattern (erratic). • Shift quality (firm or soft). • Engine (rough)
Automatic Transmission Output Shaft Speed Sensor	• Shift Pattern (erratic). • TCC Sol Valve apply (at wrong time). • Shift quality (harsh or soft).
Transmission Fluid Pressure (TFP) Manual Valve Position Switch	• TCC Sol Valve apply (no apply if diagnostic code is set). • Shift pattern (no fourth gear in hot mode). • Shift quality (harsh). • Line pressure (high). • Manual downshift (erratic).
Automatic Transmission Fluid Temperature (TFT) Sensor	• TCC Sol Valve control (on or off). • Shift quality (harsh or soft.).
Engine Coolant Temperature Sensor	• TCC Sol Valve control (no apply). • Shift quality (harsh).
Shift Solenoid valves	Gear application (wrong gear, only two gears, no shift).
Brake Switch	• TCC apply (no apply). • No 4th gear if in hot mode.
System Voltage	• Line pressure (high). • Gear application (third gear only). • TCC control (no apply). • No 4th gear if in hot mode).
3-2 Control Shift Solenoid Valve Assembly	• Gear application (third gear only). • 3-2 Downshifts (flare or tie-up).
Pressure Control Solenoid	• Line pressure (high or low) • Shift quality (harsh or soft).
TCC Sol Valve	• TCC Sol Valve apply (no apply) • No 4th gear if in hot mode.
Cruise Control	Delays 3-4 upshift and TCC apply during heavy throttle.
Acceleration Slip Regulation (ASR)	Downshifts.

Oil Pressure High or Low

Checks	Causes
Oil Pump Assembly	• Pressure regulator valve stuck. • Pressure regulator valve spring. • Rotor guide omitted or misassembled. • Rotor cracked or broken. • Reverse boost valve or sleeve stuck, damaged or incorrectly assembled. • Orifice hole in pressure regulator valve plugged. • Sticking slide or excessive rotor clearance. • Pressure relief ball not seated or damaged. • Porosity in pump cover or body. • Wrong pump cover. • Pump faces not flat. • Excessive rotor clearance.
Oil Filter	• Intake pipe restricted by casting flash. • Cracks in filter body or intake pipe. • O-ring seal missing, cut or damaged. • Wrong grease sued on rebuild.
Valve Body	• Manual valve scored or damaged. • Spacer plate or gaskets incorrect, misassembled or damaged. • Face not flat. • 2-3 Shift valve stuck. • Checkballs omitted or misassembled.
Pressure Control Solenoid	• Damage to pins
Pressure Switch Assembly	• Contamination • Damaged seals.
Case	• Case to valve body face not flat

Harsh Shifts

Checks	Causes
Throttle Position Sensor	Open or shorted circuit.
Vehicle Speed Sensor	Open or shorted circuit.
Pressure Switch Assembly	• Contamination • Damaged seals
Trans Fluid Temperature Sensor	Open or shorted circuit.
Engine Coolant Temperature Sensor	Open or shorted circuit.
Pressure Control Solenoid	• Damage to pins • Contamination

Inaccurate Shift Points

Checks	Causes
Oil Pump Assembly	• Stuck pressure regulator valve. • Sticking pump slide.
Valve Body Assembly	Spacer plate or gaskets misassembled, damaged or incorrect
Case	• Porous or damaged valve body pad. • 2-4 Servo Assembly. – 2-4 accumulator porosity – Damaged servo piston seals. – Apply pin damaged or improper length. • 2-4 Band Assembly. – Burned – Anchor pin not engaged.
Throttle Position Sensor	• Disconnected • Damage
Vehicle Speed Sensor	• Disconnected • Damaged • Bolt not tightened
4WD Low Switch	• Disconnected • Damaged.

Slips in 1st Gear

Checks	Causes
Forward Clutch Assembly	• Clutch plates worn • Porosity or damage in forward clutch piston • Forward clutch piston inner and outer seals missing, cut or damaged. • Damaged forward clutch housing. • Forward clutch housing retainer and ball assembly not sealing or damaged.
Forward Clutch Accumulator	• Piston seal missing, cut or damaged. • Piston out of its bore. • Porosity in the piston or valve body. • Stuck abuse valve.
Input Housing and Shaft Assembly	Turbine shaft seals missing, cut or damaged.
Valve Body	• 1-2 Accumulator valve stuck. • Face not flat, damaged lands or interconnected passages. • Spacer plate or gaskets incorrect, mispositioned or damaged.
Low Roller Clutch	• Damage to lugs to inner ramps. • Rollers not free moving. • Inadequate spring tension. • Damage to inner splines. • Lube passage plugged.
Torque Converter	Stator roller clutch not holding.

Slips in 1st Gear (cont'd)

Checks	Causes
1-2 Accumulator Assembly	• Porosity in piston or 1-2 Accumulator cover and pin assembly. • Damaged ring grooves on piston. • Piston seal missing, cut or damaged. • Valve body to spacer plate gasket at 1-2 Accumulator cover, missing or damaged. • Leak between piston and pin. • Broken 1-2 Accumulator spring.
Line Pressure	(See Causes of High or Low Oil Pressure).
2-4 Servo Assembly	4th Servo piston in backwards.

Slipping or Rough 1-2 Shift

Checks	Causes
Valve Body Assembly	• 1-2 Shift valve train stuck. • Gaskets or spacer plate incorrect, mispositioned or damaged. • 1-2 Accumulator valve stuck. • Face not flat.
2-4 Servo Assembly	• Apply pin too long or too short. • 2nd servo apply piston seal missing, cut or damaged. • Restricted or missing oil passages. • Servo bore in case damaged.
2nd Accumulator	• Porosity in 1-2 accumulator housing or piston. • Piston seal or groove damaged. • Nicks or burrs in 1-2 accumulator housing. • Missing or restricted oil passage.
2-4 Band	Worn or mispositioned.
Oil Pump Assembly or Case	Faces not flat.

No 2-3 Shift or 2-3 Shift Slips, Rough or Hunting

Checks	Causes
Valve Body Assembly	• 1-2 Shift valve train stuck. • Gaskets or spacer plate incorrect, mispositioned or damaged. • 1-2 Accumulator valve stuck. • Face not flat.
2-4 Servo Assembly	• Apply pin too long or too short. • 2nd servo apply piston seal missing, cut or damaged. • Restricted or missing oil passages. • Servo bore in case damaged.
2nd Accumulator	• Porosity in 1-2 accumulator housing or piston. • Piston seal or groove damaged. • Nicks or burrs in 1-2 accumulator housing. • Missing or restricted oil passage.
2-4 Band	Worn or mispositioned.
Oil Pump Assembly or Case	Faces not flat.

3-2 Flare or Tie-Up

Checks	Causes
3-2 Control Solenoid	• Shorted or damaged. • Contamination • Damaged Seal

No 3-4 Shift, Slips or Rough 3-4 Shift

Checks	Causes
Oil Pump Assembly	• Pump cover retainer and ball assembly omitted or damaged • Faces not flat
Valve Body Assembly	• Valves stuck – 2-3 Shift valve train – Accumulator valve – 1-2 Shift valve train – 3-2 Control valve • Spacer plate or gaskets incorrect, mispositioned or damaged
2-4 Servo Assembly	• Incorrect band apply pin. • Missing or damaged servo seals. • Porosity in piston, cover or case. • Damaged piston seal grooves. • Plugged or missing orifice cup plug.
Case	• 3rd Accumulator retainer and ball assembly leaking. • Porosity in 3-4 accumulator piston or bore. • 3-4 Accumulator piston seal or seal grooves damaged. • Plugged or missing orifice cup plug. • Restricted oil passage.
Input Housing Assembly	Refer to Slipping 2-3 Shift.
2-4 Band Assembly	Worn or misassembled

No Reverse or Slips in Reverse

Checks	Causes
Input Housing Assembly	• 3-4 Apply ring stuck in applied position. • Forward clutch not releasing • Turbine shaft seals missing, cut or damaged
Manual Valve Link	Disconnect
Valve Body Assembly	• 2-3 Shift valve stuck. • Manual linkage not adjusted • Spacer plate and gaskets incorrect, mispositioned or damaged. • Lo overrun valve stuck • Orificed cup plug restricted, missing or damaged.

No Reverse or Slips in Reverse (cont'd)

Checks	Causes
Reverse Input Clutch Assembly	• Clutch plate worn. • Reverse input housing and drum assembly cracked at weld. • Clutch plate retaining ring out of groove. • Return spring assembly retaining ring out of groove. • Seals cut or damaged • Restricted apply passage • Porosity in piston • Belleville plate installed incorrectly • Excessive clutch plate travel • Oversized housing
Lo and Reverse Clutch	• Clutch plates worn • Porosity in piston • Seals damaged. • Return spring assembly retaining ring mispositioned • Restricted apply passage

No Part Throttle or Delayed Downshifts

Checks	Causes
Input Housing Assembly	• 3-4 Apply ring stuck in applied position. • Forward clutch not releasing • Turbine shaft seals missing, cut or damaged
Manual Valve Link	Disconnect
Valve Body Assembly	• 2-3 Shift valve stuck. • Manual linkage not adjusted • Spacer plate and gaskets incorrect, mispositioned or damaged. • Lo overrun valve stuck • Orificed cup plug restricted, missing or damaged.
Reverse Input Clutch Assembly	• Clutch plate worn. • Reverse input housing and drum assembly cracked at weld. • Clutch plate retaining ring out of groove. • Return spring assembly retaining ring out of groove. • Seals cut or damaged • Restricted apply passage • Porosity in piston • Belleville plate installed incorrectly • Excessive clutch plate travel • Oversized housing
Lo and Reverse Clutch	• Clutch plates worn • Porosity in piston • Seals damaged. • Return spring assembly retaining ring mispositioned • Restricted apply passage

Harsh Garage Shift

Checks	Causes
Valve Body Assembly	• Orifice cup plug missing • Checkball missing

No Overrun Braking - Manual 3-2-1

Checks	Causes
External Linkage	Not adjusted properly
Valve Body Assembly	• 4-3 Sequence valve stuck. • Checkball mispositioned • Spacer plate and gaskets incorrect, damaged or mispositioned
Input Clutch Assembly	• Turbine shaft oil passages plugged or not drilled. • Turbine shaft seal rings damaged. • Turbine shaft sealing balls loose or missing. • Turbine shaft sealing balls loose or missing. • Porosity in forward or overrun clutch piston. • Overrun piston seals cut or damaged. • Overrun piston checkball not sealing.

No TCC Apply

Checks	Causes
Electrical	• 12 Volts not supplied to transmission • Outside electrical connector damaged. • Inside electrical connector, wiring harness or solenoid damaged. • Electrical short (pinched solenoid wire). • Solenoid not grounded.
Converter	Internal damage.
Oil Pump Assembly	• Converter clutch valve stuck or assembled backwards. • Converter clutch valve retaining ring mispositioned. • Pump to case gasket mispositioned • Orifice cup plug restricted or damaged • Solenoid O-ring seal cut or damaged. • High or uneven bolt torque (pump body to cover).
Input Housing and Shaft	• Turbine shaft O-ring seal cut or damaged. • Turbine shaft retainer and ball assembly restricted or damaged.
Pressure Switch Assembly	• Contamination • Damaged seals.
Valve Body Assembly	• TCC signal valve stuck • Solenoid O-ring leaking
Solenoid Screen	Blocked

Torque Converter Clutch Shudder

Checks	Causes
Electrical	• 12 Volts not supplied to transmission • Outside electrical connector damaged. • Inside electrical connector, wiring harness or solenoid damaged. • Electrical short (pinched solenoid wire). • Solenoid not grounded.
Converter	Internal damage.
Oil Pump Assembly	• Converter clutch valve stuck or assembled backwards. • Converter clutch valve retaining ring mispositioned. • Pump to case gasket mispositioned • Orifice cup plug restricted or damaged • Solenoid O-ring seal cut or damaged. • High or uneven bolt torque (pump body to cover).
Input Housing and Shaft	• Turbine shaft O-ring seal cut or damaged. • Turbine shaft retainer and ball assembly restricted or damaged.
Pressure Switch Assembly	• Contamination • Damaged seals.
Valve Body Assembly	• TCC signal valve stuck • Solenoid O-ring leaking
Solenoid Screen	Blocked

No Park

Checks	Causes
Parking Linkage	• Actuator rod assembly bent or damaged. • Actuator rod spring binding or improperly crimped. • Actuator rod not attached to inside detent lever. • Parking lock bracket damaged or not torqued properly • Inside detent lever not torqued properly. • Parking pawl binding or damaged

Oil Out the Vent

Checks	Causes
Oil Pump	Chamber in pump body rotor pocket
Miscellaneous	Fluid level - overfilled.

Vibration in Reverse and Whining Noise in Park

Checks	Causes
Oil Pump	Chamber in pump body rotor pocket
Miscellaneous	Fluid level - overfilled.

Fluid Leak Diagnosis

General Method

1. Verify that the leak is transmission fluid.
2. Thoroughly clean the suspected leak area.
3. Operate the vehicle for 24 km (15 mi), or until normal operating temperatures are reached.
4. Park the vehicle over clean paper or cardboard.
5. Shut OFF the engine.
6. Look for fluid spots on the paper.
7. Make the necessary repairs.

Powder Method

1. Thoroughly clean the suspected leak area with solvent.
2. Apply an aerosol type powder, such as foot powder, to the suspected leak area.
3. Operate the vehicle for 24 km (15 mi), or until normal operating temperatures are reached.
4. Shut OFF the engine.
5. Inspect the suspected leak area.
6. Trace the leak path through the powder in order to find the source of the leak.
7. Make the necessary repairs.

Dye and Black Light Method

A fluid dye and black light kit is available from various tool manufacturers.

1. Follow the manufacturer's instructions in order to determine the amount of dye to use.
2. Detect the leak with the black light.
3. Make the necessary repairs.

Repairing the Leak

Pinpoint the leak and trace it back to the source. You must determine the cause of the leak in order to repair the leak properly. For example, if you replace a gasket, but the sealing flange is bent, the new gasket will not repair the leak. You must also repair the bent flange. Before you attempt to repair a leak, check for the following conditions, and make repairs as necessary:

Gaskets

- Fluid level/pressure is too high
- Plugged vent or drain-back holes
- Improperly tightened fasteners
- Dirty or damaged threads
- Warped flanges or sealing surface
- Scratches, burrs, or other damage to the sealing surface
- Damaged or worn gasket
- Cracking or porosity of the component
- Improper sealant used, where applicable
- Incorrect gasket

Seals

- Fluid level/pressure is too high
- Plugged vent or drain-back holes
- Damaged seal bore (scratched, burred, or nicked)
- Damaged or worn seal
- Improper installation
- Cracks in component
- Manual or output shaft surface is scratched, nicked, or damaged
- Loose or worn bearing causing excess seal wear

Possible Points of Fluid Leaks

Transmission Oil Pan

- Incorrectly tightened oil pan bolts.
- Improperly installed or damaged oil pan gasket.
- Damaged oil pan or mounting face.
- Incorrect oil pan gasket.

Case Leak

- Damaged or missing fill tube seal.
- Mislocated fill tube bracket.
- Damaged vehicle speed sensor seal.
- Damaged manual shift seal.
- Loose or damaged oil cooler connector fittings.
- Worn or damaged propeller shaft oil seal.
- Loose line pressure pipe plug.
- Porous casting.

Leak at the Torque Converter End

- Converter leak in the weld area.
- Converter seal lip cut. Check the converter hub for damage.
- Converter seal bushing moved forward and damaged.
- Converter seal garter spring missing from the seal.
- Porous casting of the transmission case or the oil pump.

Leak at the Vent Pipe or the Fluid Fill Tube

- Overfilled system.
- Water or coolant in the fluid. The fluid will appear milky.
- Transmission case porous.
- Incorrect fluid level indicator.
- Plugged vent.
- Drain-back holes plugged.
- Mispositioned oil pump to case gasket, if equipped.

Leak Inspection Points

27187

Legend

- | | |

Case Porosity Repair

1. Clean the leak area with solvent.
2. Allow the area to air dry.

Caution: Epoxy adhesive may cause skin irritations and eye damage. Read and follow all information on the container label as provided by the manufacturer.

3. Mix a sufficient amount of epoxy adhesive, P/N 1052533, or equivalent.

Follow the manufacturer's recommendations.

4. While the transmission case is hot, apply the epoxy adhesive with a clean, dry soldering acid brush.
5. Allow the epoxy adhesive to cure for three hours before starting the engine.
6. Repeat the fluid leak diagnosis procedures in order to determine if the leak is fixed.

Malfunction Trouble Code

DTC	Description	DTC Type*	Default Action
P0502	Vehicle Speed Sensor (VSS) Circuit – Low Input	A	• DTC P0502 stores in PCM memory • Second gear only • Maximum line pressure • Freeze shift adapts from being updated • Inhibit TCC Sol Valve engagement
P0560	System Voltage Malfunction	D	• DTC P0560 stores in PCM memory • All transmission output devices are off except the TCC PWM solenoid and the 3–2 control solenoid • Freeze shift adapts from being updated
P0712	Automatic Transmission Fluid Temperature (TFT) Sensor Circuit – Low Input (High Temperature Indicated)	B	• DTC P0712 is stored in PCM memory • Transmission temperature defaults to 135°C (275°F) • Freeze shift adapts from being updated
P0713	Automatic Transmission Fluid Temperature (TFT) Sensor Circuit – High Input (Low Temperature Indicated)	B	• DTC P0713 is stored in PCM memory • Transmission temperature defaults to 135°C (275°F) • Freeze shift adapts from being updated
P0719	TCC Sol Valve Brake Switch Circuit – Low Input	A	• DTC P0719 is stored in PCM memory • The brake switch is closed (12 volts) with the brake pedal released • Inhibit TCC Sol Valve engagement • Inhibit 4th gear if in hot mode • Freeze shift adapts from being updated
P0724	TCC Sol Valve Brake Switch Circuit – High Input	D	• DTC P0724 is stored in PCM memory • Freeze shift adapts from being updated
P0742	Torque Converter Clutch (TCC) System Stuck ON	A	• DTC P0742 is stored in PCM memory • Freeze shift adapts from being updated
P0748	Pressure Control Solenoid (PCS) – Electrical	D	• DTC P0748 is stored in PCM memory • Freeze shift adapts from being updated
P0751	1–2 Shift Solenoid Valve – Performance	B	• DTC P0751 is stored in PCM memory • D2 line pressure • Freeze shift adapts from being updated
P0753	1–2 Shift Solenoid Valve – Electrical	A	• DTC P0753 is stored in PCM memory • Maximum line pressure • Freeze shift adapts from being updated

Malfunction Trouble Code (cont'd)

DTC	Description	DTC Type*	Default Action
P0756	2-3 Shift Solenoid Valve – Performance	B	• DTC P0756 is stored in PCM memory • Maximum line pressure • Inhibit TCC Sol Valve engagement • Freeze shift adapts from being updated
P0758	2-3 Shift Solenoid Valve – Electrical	A	• DTC P0758 is stored in PCM memory • Default to 3rd gear • Freeze shift adapts from being updated • Maximum line pressure • Inhibit TCC Sol Valve engagement
P1572	Traction Control Circuit Active Too Long in Park/Neutral	A	• DTC P1572 is stored in PCM memory • TCC is OFF • Freeze shift adapts from being updated • Inhibit 4th gear in Hot mode
P1810	Automatic Transmission Fluid Pressure (TFP) Manual Valve Position Switch Circuit Malfunction	B	• DTCC 1810 is stored in PCM memory • D2 line pressure • D4 shift pattern • Freeze shift adapts from being updated
P1812	Transmission Fluid Overtemperature	D	• DTC P1812 is stored in PCM memory • Freeze shift adapts from being updated
P1860	TCC PWM Sol Valve Circuit – Electrical	A	• DTC P1860 is stored in PCM memory • Inhibit TCC Sol Valve engagement • Inhibit 4th gear in Hot mode • Maximum line pressure • Freeze shift adapts from being updated
P1864	TCC Sol Valve Circuit – Electrical	A	• DTC P1864 is stored in PCM memory • Inhibit TCC Sol Valve engagement • Inhibit 4th gear in Hot mode • Freeze shift adapts from being updated
P1870	Transmission Component Slipping	A	• DTC P1870 is stored in PCM memory • Inhibit TCC Sol Valve engagement • Maximum line pressure • Inhibit 4th gear in Hot mode • Freeze shift adapts from being updated
P1886	3-2 Shift Solenoid Valve Assembly Circuit—Electrical	A	• DTC P1886 is stored in PCM memory • Inhibit TCC Sol Valve engagement • Maximum line pressure • Inhibit 4th gear in Hot mode • Freeze shift adapts from being updated

*DTC Types:

A – Emission-related, turns the MIL ON after the first failure.

B – Emission-related, turns the MIL ON after two consecutive trips with failure.

C – Non-emission-related, turns the service lamp ON after the first failure.

D – Non-emission-related, no lamps.

Diagnostic Information and Procedures

DTC P0502 Vehicle Speed Sensor Circuit
Low Input

42252

Circuit Description

The VSS provides vehicle speed information to the PCM. The VSS is a Permanent Magnet (PM) generator. The VSS produces a pulsing AC voltage. The AC voltage level and the number of pulses increase as the speed of the vehicle increases. The PCM converts the pulse to vehicle speed. A scan tool can display the vehicle speed.

When the PCM detects a low vehicle speed when there is a high engine speed in a drive gear range, then DTC P0502 sets. DTC P0502 is a type A DTC.

Conditions for Setting the DTC

- No MAP DTCs P0107 or P0108
- No TP DTCs P0122 or P0123
- No TFP Valve Position Switch DTC P1810
- Not in Park or Neutral
- The TP angle is greater than 17%.
- The engine vacuum is 50–80 kPa.
- The engine speed is 3000–5500 RPM.
- The transmission output speed is less than 250 RPM.
- All conditions met for 3 seconds

Action Taken When the DTC Sets

- The PCM commands second gear only.
- The PCM commands maximum line pressure.
- The PCM freezes shift adapts from being updated.

- The PCM inhibits TCC Solenoid Valve engagement.
- The PCM illuminates the Malfunction Indicator Lamp (MIL).

Conditions for Clearing the MIL/DTC

- The PCM turns OFF the MIL after three consecutive ignition cycles without a failure reported.
- A scan tool can clear the DTC from the PCM history. The PCM clears the DTC from the PCM history if the vehicle completes 40 warm-up cycles without a failure reported.
- The PCM cancels the DTC default actions when the fault no longer exists and the ignition is OFF long enough in order to power down the PCM.

Diagnostic Aids

- A VSS DTC P0502 sets when no vehicle speed is detected at start-off.
- Inspect the wiring for poor electrical connections at the PCM. Look for the following conditions:
 - A bent terminal
 - A backed out terminal
 - A damaged terminal
 - Poor terminal tension
 - A chafed wire
 - A broken wire inside the insulation

- When diagnosing for an intermittent short or open condition, massage the wiring harness while watching test equipment for a change.
- Test circuits 400 and 401 for Electromagnetic Interferences (EMI) induced by a wiring harness incorrectly routed too near the spark plug wires.
- An incorrect calibration may set DTC P0502. Refer to service bulletins to ensure that the calibration is current.
- Inspect for a damaged VSS.
- Inspect for damaged transmission rotor teeth.
- Ensure that the VSS is correctly aligned and torqued securely to the transmission case.

Test Description

The numbers below refer to the step numbers on the diagnostic chart.

2. You must disable the traction control system in order to perform this step. The traction control system turns ON if the ignition switch is cycled OFF then ON. Ensure that you have disabled the traction control system.
3. This Step verifies the integrity of the VSS.
4. This Step verifies the integrity of the VSS circuit.

DTC P0502 Vehicle Speed Sensor Circuit Low Input

Step	Action	Value(s)	Yes	No
1	Was the Powertrain On-Board Diagnostic (OBD) System Check performed?	—	Go to Step 2	Go to <i>Powertrain OBD System Check</i> , Section 6E
2	1. Install the scan tool. 2. With the engine OFF, turn the ignition switch to the RUN position. Important: Before clearing DTCs, use the scan tool in order to record Freeze Frame and Failure Records for reference. The Clear Info function will erase the data. 3. Record the DTC Freeze Frame and Failure Records. 4. Raise the drive wheels. 5. Start the engine. 6. Disable the traction control system. 7. Place the transmission in any drive range. With the drive wheels rotating, does the Trans Output Speed increase with the drive wheel speed?	—	Go to Diagnostic Aids	Go to Step 3
3	1. Turn the ignition switch to the OFF position. 2. Disconnect the C1 (red) PCM connector. 3. Connect the <i>J 39200</i> DVOM between harness connector terminals C1-31 and C1-32. 4. Select the AC Volts option. 5. Rotate the rear wheels. Ensure that the driveshaft is turning. Is the voltage measurement greater than the specified value?	0.5V	Go to Step 11	Go to Step 4
4	Measure the resistance between the harness connector terminals C1-31 and C1-32. Is the measured resistance greater than the specified value?	2700Ω	Go to Step 5	Go to Step 6
5	Inspect circuits 400 and 401 for a poor connection or an open circuit. Repair the circuits if necessary. Refer to Electrical Diagnosis, Section 8A. Did you find and correct a problem?	—	Go to Step 13	Go to Step 8
6	Is the resistance measured between the harness connector terminals C1-31 and C1-32 less than the specified value?	1480Ω	Go to Step 7	Go to Step 8

DTC P0502 Vehicle Speed Sensor Circuit Low Input (cont'd)

Step	Action	Value(s)	Yes	No
7	Inspect circuits 400 and 401 for a short to ground. Inspect circuits 400 and 401 for a shorted together condition. Repair the circuits if necessary. Refer to Electrical Diagnosis, Section 8. Did you find and correct a problem?	—	Go to Step 13	Go to Step 8
8	1. Reconnect the C1 (red) PCM connector. 2. Disconnect the VSS harness from the VSS. 3. Measure the resistance between the VSS terminals A and B. Is the measured resistance within the specified range?	1480–2700Ω	Go to Step 11	Go to Step 9
9	1. Remove the VSS. 2. Inspect the Automatic Transmission output speed sensor rotor for damage or misalignment. Did you find and correct a problem?	—	Go to Step 13	Go to Step 12
10	Replace the VSS. Refer to <i>Vehicle Speed Sensor Replacement</i> . Is the replacement complete?	—	Go to Step 13	—
11	Inspect the PCM connector terminals for the following conditions: 1. Damaged connector pins 2. Backed out connector pins 3. Weak terminal tension 4. Repair the connectors if necessary. Did you find and correct a problem?	—	Go to Step 13	Go to Step 12
12	Replace the PCM. Refer to <i>PCM Replacement/Programming</i> , Section 6 Is the replacement complete?	—	Go to Step 13	—
13	1. After the repair is complete, select DTC. 2. Select Clear Info. 3. Ensure that the transmission output speed is greater than 251 RPM for 2 seconds. 4. Select Specific DTC. Enter DTC P0502. Has the test run and passed?	—	System OK	Begin the diagnosis again. Go to Step 1

DTC P0560 System Voltage Malfunction Low

42253

Circuit Description

Circuit 539 is the ignition voltage feed for the PCM. Circuit 440 is the battery voltage feed for the PCM.

When the PCM detects an excessively low or high voltage, then DTC P0560 sets. DTC P0560 is a type D DTC.

Conditions for Setting the DTC

The system voltage is low:

- The engine speed is greater than 1000 RPM.
- The system voltage is less than 10 volts at a maximum transmission temperature of 150°C (302°F).
- The system voltage is less than 7.3 volts at a minimum transmission temperature of -40°C (-40°F).
- All conditions are met for 4 seconds.

A high system voltage causes DTC P0560 to set, if the system voltage is greater than 17 volts for 2 seconds.

Action Taken When the DTC Sets

- All transmission output devices are OFF except the TCC PWM Solenoid Valve and the 3-2 Shift Solenoid Valve Assembly.
- The freeze shift adapts from being updated.

- The PCM will not illuminate the Malfunction Indicator Lamp (MIL).

Conditions for Clearing the DTC

- A scan tool can clear the DTC from the PCM history. The PCM clears the DTC from the PCM history if the vehicle completes 40 warm-up cycles without a failure reported.
- The PCM cancels the DTC default actions when the fault no longer exists and the ignition is OFF long enough in order to power down the PCM.

Diagnostic Aids

- Charging the battery with a battery charger may set DTCs. Jumpstarting an engine may set DTCs.
- If DTCs set when you operate an accessory, inspect the applicable wiring for faulty connections. If DTCs set when you operate an accessory, inspect the applicable wiring for excessive current draw.
- Inspect the starter solenoid for faulty connections.
- Examine the starter solenoid fusible link.
- Inspect the generator for a damaged terminal.
- Inspect the belts for damage.
- Inspect the belt for correct tension.

Test Description

The numbers below refer to the step numbers on the diagnostic chart.

4. This Step tests the charging system voltage.
5. This Step tests the battery voltage input at the PCM.
7. This Step tests the ignition voltage input at the PCM.

DTC P0560 System Voltage Malfunction Low

Step	Action	Value(s)	Yes	No
1	Was the Powertrain On-Board Diagnostic (OBD) System Check performed?	—	Go to Step 2	Go to <i>Powertrain OBD System Check</i> , Section 6E
2	1. Install the scan tool. 2. With the engine OFF, turn the ignition switch to the RUN position. Important: Before clearing DTCs, use the scan tool in order to record the Freeze Frame and the Failure Records for reference. The Clear Info function will erase the data. 3. Record the DTC Failure Records. Important: If any other DTCs are present, refer to the applicable diagnostic charts before continuing. 4. Using the <i>J 39200</i> DVOM, measure the battery voltage across the battery terminals. Record the measurement for future reference. Is the measured voltage higher than the specified value?	10.5 volts	Go to Step 3	Go to <i>Battery Diagnosis</i> , Section 6D1
3	Start the engine. Warm the engine to the normal operating temperature. Did the generator (check engine) lamp illuminate?	—	Go to <i>Charging System Diagnosis</i> , Section 6D3	Go to Step 4
4	1. Increase the engine speed to 1000-1500 RPM. 2. Observe the scan tool system voltage. Is the system voltage within the specified range?	12-15 volts	Go to Step 5	Go to <i>Charging System Diagnosis</i> , Section 6D3
5	1. Turn the ignition switch to the OFF position. 2. Disconnect the C2 (black) PCM connector (additional DTCs will set). 3. With the engine OFF, turn the ignition switch to the RUN position. 4. Using the <i>J 39200</i> DVOM and the <i>J 35616</i> Connector Test Adapter Kit, measure the battery voltage input at PCM connector terminals C2-15 and C2-31. Is there a voltage variance between the voltage measured at the battery (taken in Step 2) and at the terminals C2-15 and C2-31 that is greater than the specified value?	0.5 volts	Go to Step 6	Go to Step 7
6	Repair the high resistance condition in circuit 440. Refer to <i>Electrical Diagnosis</i>, Section 8. Have you repaired the circuit?	—	Go to Step 11	—

DTC P0560 System Voltage Malfunction Low (cont'd)

Step	Action	Value(s)	Yes	No
7	1. Disconnect the C4 (blue) PCM connector. 2. Measure the ignition voltage input at the PCM connector terminals C2-30 and C4-3. Is there a voltage variance between the voltage measured at the battery (taken in Step 2) and at the terminals C2-30 and C4-3 that is greater than the specified value?	0.5 volts	Go to Step 8	Go to Step 9
8	Repair the high resistance condition in circuit 539. refer to Electrical Diagnosis, Section 8A. Have you repaired the circuit?	—	Go to Step 11	—
9	Examine PCM connector terminals C2-15, C2-31, C2-30, and C4-3 for the following conditions: • Damaged connector pins • Backed out connector pins • Weak terminal tension Did you find and correct a problem?	—	Go to Step 11	Go to Step 10
10	Replace the PCM. Refer to <i>PCM Replacement/Programming</i> , Section 6. Is the replacement complete?	—	Go to Step 11	—
11	1. After the repair is complete, select DTC. 2. Select Clear Info. 3. Operate the vehicle under the following conditions: • Start the vehicle and warm to normal operating temperature. • The PCM must see a system voltage between 10 and 16 volts. 4. Select Specific DTC. Enter DTC P0560. Has the test run and passed?		System OK	Begin the diagnosis again. Go to Step 1

DTC P0712 Fluid Temperature Sensor CKT Low Input

42254

Circuit Description

The Automatic Transmission Fluid Temperature (TFT) sensor is a negative coefficient thermister within the Automatic Transmission Fluid Pressure (TFP) Manual Valve Position Switch. The TFT sensor controls the signal voltage from the PCM. The PCM supplies a 5-volt reference signal to the sensor on circuit 1227. When the transmission fluid is cold, the sensor resistance is high, and the PCM detects high signal voltage. As the transmission fluid temperature increases, the sensor resistance decreases and the detected voltage decreases. At the transmission's normal operating temperature of 100°C (212°F), the voltage is approximately 1.5–2 volts.

When the PCM detects a continuous short to ground in the TFT signal circuit or the TFT sensor, then DTC P0712 sets. DTC P0712 is a type B DTC.

Conditions for Setting the DTC

- The system voltage is 10–17 volts.
- The ignition is ON.
- The TFT sensor indicates a voltage less than 0.196 volts.
- All conditions met for 10 seconds

Action Taken When the DTC Sets

- The transmission default temperature will be 135°C (275°F).
- The freeze shift adapts from being updated.
- The PCM illuminates the Malfunction Indicator Lamp (MIL).

Conditions for Clearing the MIL/DTC

- The PCM turns OFF the MIL after three consecutive ignition cycles without a failure reported.
- A scan tool can clear the DTC from the PCM history. The PCM clears the DTC from the PCM history if the vehicle completes 40 warm-up cycles without a failure reported.
- The PCM cancels the DTC default actions when the fault no longer exists and the ignition is OFF long enough in order to power down the PCM.

Diagnostic Aids

- If a transmission fluid overtemperature DTC P1812 is also set, inspect the transmission cooling system for blockage and restrictions.
- Inspect the harness routing for a short to ground in circuit 1227. The scan tool TFT display should rise steadily to about 100 °C (212 °F), then stabilize.
- Inspect the wiring for poor electrical connections at the PCM. Look for the following conditions:
 - A bent terminal
 - A backed out terminal
 - A damaged terminal
 - Poor terminal tension
 - A chafed wire
 - A broken wire inside the insulation
- When diagnosing for an intermittent short or open condition, massage the wiring harness while watching test equipment for changes.
- Use the temperature versus resistance scale in order to test the TFT sensor at the various temperatures. Test the TFT sensor at the various temperatures in order to eliminate the possibility of a skewed (mis-scaled) sensor. A skewed sensor could result in delayed garage shifts or TCC complaints.
- Inquire about the customer's driving habits, trailer towing, etc. . .

°C	°F	OHMS
Temperature vs Resistance Values (Approximate)

-20	-4	28680
-30	-22	52700
-40	-40	100700

Test Description

The numbers below refer to the step numbers on the diagnostic chart.

- This Step tests for a short to ground and for a skewed sensor.
- This Step creates an open. The Step uses the open in order to test for an internal fault within the transmission.
- This Step verifies that the resistance of the TFT wiring and the TFT Sensor is within specifications at 20 °C (68 °F). In order to verify the resistance at other transmission fluid temperatures, you must refer to the 4L60-E TFT vs Resistance chart.

DTC P0712 Fluid Temperature Sensor CKT Low Input

Step	Action	Value(s)	Yes	No
1	Was the Powertrain On-Board Diagnostic (OBD) System Check performed?	—	Go to Step 2	Go to Powertrain OBD System Check, Section 6E
2	Check the transmission fluid. Refer to <i>Transmission Fluid Checking Procedure</i> . Have you performed the fluid checking procedure?	—	Go to Step 3	Go to Transmission Fluid Checking Procedure
3	1. Install the scan tool. 2. With the engine OFF, turn the ignition switch to the RUN position. Important: Before clearing the DTCs, use the scan tool in order to record the Freeze Frame and Failure Records for reference. The Clear Info function will erase the data. 3. Record the DTC Freeze Frame and Failure Records. Does the scan tool display a TFT Sensor signal voltage less than the voltage specified?	0.196 volts	Go to Step 4	Go to Diagnostic Aids
4	1. Turn the ignition switch to the OFF position. 2. Disconnect the transmission 20-way connector. 3. Turn the ignition switch to the RUN position. Does the TFT Sensor signal voltage change to match the voltage specified?	4.92 volts	Go to Step 5	Go to Step 9
5	1. Install the J 39775 Jumper Harness on the transmission side of the 20-way connector. 2. Using the J 39200 DVOM and J 35616 Connector Test Adapter Kit, measure the resistance between terminals L and M. 3. This resistance range is valid at 20°C (68°F). In order to verify the TFT Sensor at other temperatures, refer to the TFT Resistance Chart. Is the resistance within specifications?	3088–3941Ω	Go to Diagnostic Aids	Go to Step 6
6	1. Remove the transmission oil pan. Refer to <i>Oil Pan Replacement</i>. 2. Inspect the automatic transmission wiring harness for a short to ground. Refer to Electrical Diagnosis, Section 8. Did you find and correct a problem?	—	Go to Step 8	Go to Step 7
7	1. Disconnect the automatic transmission wiring harness at the TFT sensor. 2. Measure the resistance of the TFT sensor. 3. This resistance range is valid at 20°C (68°F). In order to verify the TFT Sensor at other temperatures, refer to the TFT Resistance Chart. Is the resistance within specifications?	3088–3941Ω	Go to Diagnostic Aids	Go to Step 8
8	Replace the TFP Valve Position Switch. Refer to Automatic Transmission Fluid Pressure Manual Valve Position Switch Replacement. Is the replacement complete?	—	Go to Step 12	—
9	Check circuit 1227 for a short to ground. Refer to Electrical Diagnosis, section 8. Did you find and correct a problem?	—	Go to Step 12	Go to Step 10

DTC P0712 Fluid Temperature Sensor CKT Low Input (cont'd)

Step	Action	Value(s)	Yes	No
10	Inspect the PCM connector terminals for the following conditions: • Damaged connector pins • Backed out connector pins • Weak terminal tension Repair the connectors if necessary. Did you find and correct a problem?	—	Go to Step 12	Go to Step 11
11	Replace the PCM. Refer to <i>PCM Replacement/Programming</i> , Section 6. Is the replacement complete?	—	Go to Step 12	—
12	1. After the repair is complete, select DTC. 2. Select Clear Info. 3. Ensure that the TFT sensor indicates a voltage greater than 0.33 volts for 2 seconds. 4. Select Specific DTC. Enter DTC P0712. Has the test run and passed?	—	System OK	Begin the diagnosis again. Go to Step 1

DTC P0713 Fluid Temperature Sensor CKT High Input

42254

Circuit Description

The Automatic Transmission Fluid Temperature (TFT) sensor is a negative coefficient thermistor within the Automatic Transmission Fluid Pressure (TFP) Manual Valve Position Switch. The TFP controls the signal voltage from the PCM. The PCM supplies a 5-volt reference signal to the TFT sensor on circuit 1227. When the transmission fluid is cold, the sensor resistance is high, and the PCM detects high signal voltage. As the transmission fluid warms, the sensor resistance decreases and the detected voltage decreases. At the transmission's normal operating temperature of 100°C (212°F) the voltage is approximately 1.5 –2 volts.

When the PCM detects a continuous open or short to power in the TFT signal circuit or the TFT sensor, then DTC P0713 sets. DTC P0713 is a type B DTC.

Conditions for Setting the DTC

- The system voltage is 10–17 volts.
- The ignition is ON.
- The TFT sensor indicates a voltage greater than 4.94 volts.
- All conditions met for 50 seconds

Action Taken When the DTC Sets

- The transmission default temperature becomes 135°C (275°F).
- The freeze shift adapts from being updated.
- The PCM illuminates the Malfunction Indicator Lamp (MIL).

Conditions for Clearing the MIL/DTC

- The PCM turns OFF the MIL after three consecutive ignition cycles without a failure reported.
- A scan tool can clear the DTC from the PCM history. The PCM clears the DTC from the PCM history if the vehicle completes 40 warm-up cycles without a failure reported.
- The PCM cancels the DTC default actions when the fault no longer exists and the ignition is OFF long enough in order to power down the PCM.

Diagnostic Aids

- Inspect the harness for a faulty connection or an open in circuit 1227.
- Inspect the wiring for poor electrical connections at the PCM. Inspect the wiring at the 20-way harness. Look for the following conditions:
 - A bent terminal
 - A backed out terminal
 - A damaged terminal
 - Poor terminal tension
 - A chafed wire
 - A broken wire inside the insulation
- When diagnosing for an intermittent short or open condition, massage the wiring harness while watching test equipment for changes.
- The scan tool displays the transmission fluid temperature in degrees. After the transmission is operating, the temperature should rise steadily to about 100°C (212°F).
- Use the temperature versus resistance scale in order to test the TFT sensor at various temperatures. Test the TFT sensor at the various temperatures in order to eliminate the possibility of a skewed (mis-scaled) sensor. A skewed sensor can result in firm shifts or TCC complaints.

°C	°F	OHMS

-40	-40	100700

Test Description

The numbers below refer to the step numbers on the diagnostic chart.

3. This Step verifies that a problem exists in the TFT sensor circuit.
4. This Step simulates a TFT sensor DTC P0712. If the PCM receives the low signal voltage (indicating high temperature), and the scan tool displays 146°C (296°F) or greater, then the PCM and wiring are functioning normally.
5. This Step tests the TFT sensor and the Automatic Transmission wiring harness.

DTC P0713 Fluid Temperature Sensor CKT High Input

Step	Action	Value(s)	Yes	No
1	Was the Powertrain On-Board Diagnostic (OBD) System Check performed?	—	Go to Step 2	Go to Section 6E
2	Check the transmission fluid. Refer to <i>Transmission Fluid Checking Procedure</i> . Have you checked the fluid?	—	Go to Step 3	Go to <i>Transmission Fluid Checking Procedure</i>
3	1. Install the scan tool. 2. With the engine OFF, turn the ignition switch to the RUN position. Important: Before clearing the DTCs, use the scan tool in order to record the Freeze Frame and the Failure Records for reference. The Clear Info function will erase the data. 3. Record the DTC Freeze Frame and Failure Records. Does the scan tool display a TFT Sensor signal voltage greater than the specified voltage?	4.94 volts	Go to Step 4	Go to Diagnostic Aids
4	1. Turn the ignition switch to the OFF position. 2. <i>Automatic Transmission</i> Disconnect the transmission 20-way connector. 3. Install the J 39775 Jumper Harness on the engine side of the 20-way connector. 4. Install a fused jumper wire from the terminal L to the terminal M on the engine harness. 5. Turn the ignition switch to the RUN position. Does the TFT Sensor signal voltage decrease to less than the specified value?	0.196 volts	Go to Step 5	Go to Step 9
5	1. Turn the ignition switch to the OFF position. 2. Install the J 39775 Jumper Harness on the transmission side of the 20-way connector. 3. Using the J 39200 DVOM and J 35616 Connector Test Adapter Kit, measure the resistance between the terminal L and the terminal M. Important: This resistance range is valid at 20 °C (68 °F). In order to verify the TFT sensor at other temperatures, refer to the TFT Resistance Chart. Is the resistance within specifications?	3088–3941Ω	Go to Diagnostic Aids	Go to Step 6
6	1. Remove the transmission oil pan. Refer to <i>Oil Pan Replacement</i>. 2. Check the automatic transmission wiring harness for an open. Refer to Electrical Diagnosis, Section 8A. Have you found and corrected a problem?	—	Go to Step 13	Go to Step 7
7	1. Disconnect the automatic transmission wiring harness at the TFT sensor. 2. Measure the resistance of the TFT sensor. Important: This resistance range is valid at 20 °C (68 °F). In order to verify the TFT sensor at other temperatures, refer to the TFT Resistance Chart. Is the resistance within specifications?	3088–3941Ω	Go to Diagnostic Aids	Go to Step 8
8	Replace TFP Valve Position Switch. Is the replacement complete?	—	Go to Step 13	—

DTC P0713 Fluid Temperature Sensor CKT High Input (cont'd)

Step	Action	Value(s)	Yes	No
9	Check circuit 1227 for an open. Check circuit 1227 for a short to B+. Refer to Electrical Diagnosis, Section 8A. Have you found and corrected a problem?	—	<i>Go to Step 13</i>	<i>Go to Step 10</i>
10	Check circuit 455 for an open. Refer to Electrical Diagnosis, Section 8A. Have you found and corrected a problem?	—	<i>Go to Step 13</i>	<i>Go to Step 11</i>
11	Inspect the PCM connector terminals for the following conditions: • Damaged connector pins • Backed out connector pins • Weak terminal tension Repair the connectors if necessary. Did you find and correct a problem?	—	<i>Go to Step 13</i>	<i>Go to Step 12</i>
12	Replace the PCM. Refer to Section 6. Is the replacement complete?	—	<i>Go to Step 13</i>	—
13	1. After the repair is complete, select DTC. 2. Select Clear Info. 3. Ensure that the TFT sensor indicates a voltage less than 4.92 volts for 2 seconds. 4. Select Specific DTC. Enter DTC P0713. Has the test run and passed?	—	System OK	<i>Begin the diagnosis again. Go to Step 1</i>

DTC P0719 TCC Brake Switch Circuit Low

42256

Circuit Description

The TCC/Shift Interrupt switch indicates the status of the brake pedal. This normally-closed switch within the brake switch assembly supplies a B+ signal on the circuit 420 to the PCM. Applying the brake pedal opens the signal voltage circuit. The PCM de-energizes the TCC Solenoid Valve when the PCM receives the signal.

When the PCM detects an open brake switch during accelerations, then DTC P0719 sets. DTC P0719 is a type A DTC.

Conditions for Setting the DTC

- No VSS DTC P0502
- The PCM detects an open TCC/Shift Interrupt switch/circuit (0 volts) for 15 minutes without going off for 2 seconds, and the following events occur seven consecutive times:

The vehicle speed is less than 8 km/h (5 mph);

Then the vehicle speed is 8–32 km/h (5 and 20 mph) for 6 seconds;

Then the vehicle speed is greater than 32 km/h (20 mph) for 4 seconds.

Action Taken When the DTC Sets

- The TCC/Shift Interrupt switch remains closed (12 volts) with the brake pedal released.
- The PCM inhibits engagement of the TCC Solenoid Valve.
- The PCM Inhibits 4th gear if in hot mode
- The PCM freezes shift adapts from being updated.
- The PCM illuminates the Malfunction Indicator Lamp (MIL).

Conditions for Clearing the MIL/DTC

- The PCM turns OFF the MIL after three consecutive ignition cycles without a failure reported.

- A scan tool can clear the DTC from the PCM history. The PCM clears the DTC from the PCM history if the vehicle completes 40 warm-up cycles without a failure reported.
- The PCM cancels the DTC default actions when the fault no longer exists and the ignition is OFF long enough in order to power down the PCM.

Diagnostic Aids

- Inspect the wiring for any poor electrical connections at the PCM. Inspect the wiring at the brake switch assembly. Look for the following conditions:
 - A bent terminal
 - A backed out terminal
 - A damaged terminal
 - Poor terminal tension
 - A chafed wire
 - A broken wire inside the insulation
- When diagnosing for an intermittent short or an open condition, massage the wiring harness while watching the test equipment for changes.
- Ask the customer about the customer's driving habits. Ask if the customer has any unusual driving conditions (e.g. stop-and-go, expressway, etc.).
- Check for the most current calibration ID. Check for the latest bulletins.
- Inspect the brake switch assembly for proper mounting and adjustment.

Test Description

The numbers below refer to the step numbers on the diagnostic chart.

- This Step tests for voltage at the brake switch assembly.
- This Step verifies that the TCC/Shift Interrupt switch is functioning normally.
- This Step verifies that circuit 420 is functioning normally at the PCM.

DTC P0719 TCC Brake Switch Circuit Low

Step	Action	Value(s)	Yes	No
1	Was the Powertrain On-Board Diagnostic (OBD) System Check performed?	—	<i>Go to Step 2</i>	Go to <i>Powertrain OBD System Check</i>
2	1. Install the scan tool. 2. With the engine OFF, turn the ignition switch to the RUN position. 3. If an ABS code is set, inspect the applicable fuse. Repair the fuse if necessary. Important: Before clearing the DTCs, use the scan tool in order to record the Freeze Frame and the Failure Records for reference. The Clear Info function will erase the data. 4. Record the DTC Freeze Frame and Failure Records. 5. Apply the brake pedal. Release the brake pedal. When you apply the brake pedal, does the scan tool display the TCC Brake Switch as Applied; then as Released when you release the brake?	—	Go to Diagnostic Aids	<i>Go to Step 3</i>
3	1. Connect a test lamp to ground. 2. Probe ignition feed circuit 639 at the brake switch assembly. Does the test lamp illuminate?	—	<i>Go to Step 4</i>	<i>Go to Step 5</i>
4	1. Connect a test lamp to ground. 2. Probe circuit 420 at the brake switch assembly. Does the test lamp illuminate?	—	<i>Go to Step 6</i>	<i>Go to Step 7</i>
5	Repair the open condition in ignition feed circuit 639 to the brake switch Assembly. Refer to Electrical Diagnosis, Section 8A. If the CHI Body 1 fuse is open, examine circuit 420 for a short to ground. Is the repair complete?	—	<i>Go to Step 15</i>	—
6	Apply the brake pedal. Is the test lamp OFF when you apply the brake pedal?	—	<i>Go to Step 9</i>	<i>Go to Step 8</i>
7	Inspect the brake switch Assembly for incorrect adjustment. Did you find and correct a problem?	—	<i>Go to Step 15</i>	<i>Go to Step 10</i>
8	Inspect circuit 420 for a short to B+. Did you find and correct a problem?	—	<i>Go to Step 15</i>	<i>Go to Step 10</i>
9	1. Release the brake pedal. 2. Turn the ignition switch to the OFF position. 3. Disconnect the C3 (clear) PCM connector. 4. With the engine OFF, turn the ignition switch to the RUN position. 5. Connect a test lamp to ground and probe the PCM connector C3-14. Did the test lamp illuminate?	—	<i>Go to Step 11</i>	<i>Go to Step 12</i>
10	Replace the brake switch Assembly. Refer to Brake switch Assembly Replacement. Is the replacement complete?	—	<i>Go to Step 15</i>	

DTC P0719 TCC Brake Switch Circuit Low (cont'd)

Step	Action	Value(s)	Yes	No
11	1. Turn the ignition switch to the OFF position. 2. Reconnect the C3 (clear) PCM connector. 3. Turn the ignition switch to the RUN position. 4. Apply the brake pedal. Release the brake pedal. With the brake applied, does the scan tool display TCC Brake Switch as Applied, then Released with the brake pedal released?	—	Go to Diagnostic Aids	Go to Step 13
12	Repair the open condition in circuit 420 from the TCC brake switch to the PCM. Refer to Electrical Diagnosis, Section 8A. Is the repair complete?	—	Go to Step 15	
13	Inspect the PCM connector terminals for the following conditions: • Damaged connector pins • Backed out connector pins • Weak terminal tension Repair the connectors if necessary. Did you find and correct a problem?	—	Go to Step 15	Go to Step 14
14	Replace the PCM. Refer to <i>PCM Replacement/Programming</i> , Section 6. Is the replacement complete?	—	Go to Step 15	
15	1. After the repair is complete, select DTC. 2. Select Clear Info. 3. Ensure that the TCC/brake switch signal indicates 0 volts for 2 seconds with the brake pedal applied. 4. Select Specific DTC. Enter DTC P0719. Has the test run and passed?	—	System OK	Begin the diagnosis again. Go to Step 1

DTC P0724 TCC Brake Switch Circuit High

42256

Circuit Description

The TCC/Shift Interrupt switch indicates the brake pedal status. This normally-closed switch within the Brake Switch Assembly, supplies a B+ signal on circuit 420 to the PCM. The signal voltage circuit opens when you apply the brakes. The PCM uses this signal to de-energize the TCC Solenoid Valve.

When the PCM detects a closed brake switch during a deceleration, then DTC P0724 sets. DTC P0724 is a type D DTC.

Conditions for Setting the DTC

- No VSS DTC P0502
- The PCM detects a closed TCC/Shift Interrupt switch/circuit (12 volts) for 2 seconds and the following events occur seven consecutive times:
 - The vehicle speed is greater than 32 km/h (20 mph) for 6 seconds;
 - Then the vehicle speed is between 8 and 32 km/h (5 and 20 mph) for 4 seconds;
 - Then the vehicle speed is less than 8 km/h (5 mph).

Action Taken When the DTC Sets

- The freeze shift adapts from being updated.
- The PCM will NOT illuminate the Malfunction Indicator Lamp (MIL).

Conditions for Clearing the DTC

- A scan tool can clear the DTC from the PCM history. The PCM clears the DTC from the PCM history if the vehicle completes 40 warm-up cycles without a failure reported.
- The PCM cancels the DTC default actions when the fault no longer exists and the ignition is OFF long enough in order to power down the PCM.

Diagnostic Aids

- Inspect the wiring for any poor electrical connections at the PCM. Inspect the wiring at the brake switch assembly. Look for the following conditions:
 - A bent terminal
 - A backed out terminal
 - A damaged terminal
 - Poor terminal tension
 - A chafed wire
 - A broken wire inside the insulation
- When diagnosing for an intermittent short or an open condition, massage the wiring harness while watching the test equipment for changes.
- Ask the customer about the customer's driving habits. Ask if the customer has any unusual driving conditions (e.g. stop-and-go, expressway, etc.).
- Check for the most current calibration ID. Check for the latest bulletin.
- Inspect the brake switch assembly for proper mounting and adjustment.

Test Description

The numbers below refer to the step numbers on the diagnostic chart.

3. This Step tests for voltage at the brake switch Assembly.
6. This Step tests the TCC/Shift Interrupt switch.

DTC P0724 TCC Brake Switch Circuit High

Step	Action	Value(s)	Yes	No
1	Was the Powertrain On-Board Diagnostic (OBD) System Check performed?	—	Go to Step 2	Go to Powertrain OBD System Check
2	1. Install the scan tool. 2. With the engine OFF, turn the ignition switch to the RUN position. Important: Before clearing the DTCs, use the scan tool in order to record the Freeze Frame and the Failure Records for reference. The Clear Info function will erase the data. 3. Record the DTC Freeze Frame and Failure Records. 4. Apply the brake pedal. Release the brake pedal. When you apply the brake pedal, does the scan tool display the TCC Brake Switch as Applied; then as Released when you release the brake?	—	Go to Diagnostic Aids	Go to Step 3
3	1. Connect the test lamp to ground. 2. Probe ignition feed circuit 639 at the brake switch Assembly. Did the test lamp illuminate?	—	Go to Step 4	Go to Step 5
4	1. Connect the test lamp to ground. 2. Probe circuit 420 at the brake switch assembly. Did the test lamp illuminate?	—	Go to Step 6	Go to Step 8
5	Repair the open in ignition feed circuit 639 to the brake switch assembly. Is the repair complete?	—	Go to Step 13	—
6	Apply the brake pedal. Is the test lamp OFF when you apply the brake pedal?	—	Go to Step 7	Go to Step 9
7	1. Apply the brake pedal. 2. Release the brake pedal. Does the scan tool display TCC Brake Switch as Applied when you apply the brake, and does the scan tool display Released when you release the brake pedal?	—	Go to Diagnostic Aids	Go to Step 11
8	Examine the brake switch assembly for proper adjustment. Did you find and correct a problem?	—	Go to Step 13	Go to Step 10
9	Inspect circuit 420 for a short to B+. Refer to Electrical Diagnosis, Section 8. Did you find a short?	—	Go to Step 13	Go to Step 10
10	Replace the brake switch assembly. Refer to Brake Switch Assembly Replacement. Is the replacement complete?	—	Go to Step 13	—
11	Inspect the PCM connector terminals for the following conditions: • Damaged connector pins • Backed out connector pins • Weak terminal tension Repair the connectors if necessary. Did you find and correct a problem?	—	Go to Step 13	Go to Step 12

DTC P0724 TCC Brake Switch Circuit High (cont'd)

Step	Action	Value(s)	Yes	No
12	Replace the PCM. Refer to <i>PCM Replacement/Programming</i> , Section 6. Is the replacement complete?	—	Go to Step 13	—
13	1. After the repair is complete, select DTC. 2. Select Clear Info. 3. Ensure that the TCC brake switch signal indicates 12 volts for 2 seconds with the brake pedal released. 4. Select Specific DTC. Enter DTC P0724. Has the test run and passed?	—	System OK	Begin the diagnosis again. Go to Step 1.

DTC P0742 TCC Stuck On

42257

Circuit Description

The PCM energizes the TCC Solenoid Valve by creating a ground path on circuit 422. When grounded (energized) by the PCM, the TCC Solenoid Valve stops converter signal oil exhaust. Converter signal oil pressure will increase. Increased converter signal oil pressure will move the TCC valve. The TCC Solenoid Valve will de-energize when the PCM no longer provides a ground path. When the TCC Solenoid Valve is de-energized, the valve will release fluid and release the TCC.

When the PCM detects a low torque converter slip when the TCC is OFF, then DTC P0742 sets. DTC P0742 is a type A DTC.

Conditions for Setting the DTC

DTC P0742 will set if the following conditions occur once per TCC cycle, three consecutive times.

- No TP DTCs P0122 or P0123
- No VSS DTC P0502
- No TFP Valve Position Switch DTC P1810
- No TCC PWM Solenoid Valve DTC P1860
- No TCC Solenoid Valve DTC P1864
- The TP angle is greater than 13%.
- The engine speed is greater than 450 RPM for greater than 2 seconds and less than 5500 RPM.

- The engine vacuum is between 40 and 80 kPa.
- The commanded gear is not 1st.
- The gear range is D4, D3, or D2.
- The TCC is commanded OFF.
- The TCC slip speed is between -20 and 20 RPM for greater than 5.6 seconds.

Action Taken When the DTC Sets

- The PCM freezes shift adapts from being updated.
- The PCM illuminates the Malfunction Indicator Lamp (MIL).

Conditions for Clearing the MIL/DTC

- The PCM turns OFF the MIL after three consecutive ignition cycles without a failure reported.
- A scan tool can clear the DTC from the PCM history. The PCM clears the DTC from the PCM history if the vehicle completes 40 warm-up cycles without a failure reported.
- The PCM cancels the DTC default actions when the fault no longer exists and the ignition is OFF long enough in order to power down the PCM.

Diagnostic Aids

- The TCC may mechanically stick ON with the parking brake applied and any gear range selected. In this case, the TCC fluid will mechanically apply the TCC. Mechanically applying the TCC may cause an engine stall.
- A stuck TP sensor will set this code.

Test Description

The numbers below refer to the step numbers on the diagnostic chart.

- This Step tests the TCC for a mechanical malfunction. When the PCM commands the TCC Solenoid Valve OFF, the slip speed should increase.

DTC P0742 TCC Stuck On

Step	Action	Value(s)	Yes	No
1	Was the Powertrain On-Board Diagnostic (OBD) System Check performed?	—	Go to Step 2	Go to Powertrain OBD System Check
2	1. Install the scan tool. 2. With the engine OFF, turn the ignition switch to the RUN position. Important: Before clearing the DTCs, use the scan tool in order to record the Freeze Frame and the Failure Records for reference. The Clear Info function will erase the data. 3. Record the DTC Freeze Frame and Failure Records. 4. Use the scan tool in order to verify the TP Sensor operation. Are the TP Sensor values within the range shown?	0.6 - 5.0 volts	Go to Step 3	Go to Diagnostic Aids
3	Drive the vehicle in the D4 drive range in fourth gear under steady acceleration, with a TP angle greater than 25%. Display the TCC Solenoid Valve state on the scan tool. While the valve state is OFF, does the scan tool display a TCC Slip Speed in the range shown?	-20 to +20 RPM	Go to Step 4	Go to Diagnostic Aids
4	The TCC is mechanically stuck ON. Inspect the TCC for the following conditions: • A clogged exhaust orifice in the TCC Solenoid Valve • The converter clutch apply valve is stuck in the apply position. • A misaligned valve body gasket • A damaged valve body gasket • Restricted release passage • Refer to On Vehicle Service Did you find and correct a problem?	—	Go to Step 5	—
5	1. After the repair is complete, select DTC. 2. Select Clear Info. • Hold the throttle at 25%. Accelerate to 88 km/h (55 mph). If the throttle moves more than 3%, stop the vehicle and begin again. • Ensure that the TCC slip speed is between -50 and 2500 RPM for 10 seconds, with the TCC OFF. 3. Select Specific DTC. Enter DTC P0742. Has the test run and passed?	—	System OK	Begin the diagnosis again. Go to Step 1

DTC P0748 PCS Valve Circuit Electrical

42258

Circuit Description

The Pressure Control Solenoid (PC Sol.) Valve is a PCM-controlled device that regulates the transmission line pressure. The PCM compares the TP voltage, the engine RPM, and other inputs in order to determine the appropriate line pressure for a given load. The PCM regulates the pressure by applying a varying amperage to the PCS. The applied amperage varies from 0.1 to 1.1 amps. The applied amperage is monitored by the PCM. When the PCM detects a continuous open or a continuous short to ground in the PCS circuit, then DTC P0748 sets. DTC P0748 is a type D DTC.

Conditions for Setting the DTC

- The system voltage is 10–17 volts.
- The PCM recognizes that the Pressure Control Solenoid Valve has reached the valve's electrical high limit.
- The PCM recognizes that the Pressure Control Solenoid Valve has reached the valve's electrical low limit.

Action Taken When the DTC Sets

- The PCM freezes shift adapts from being updated.
- The PCM will **not** illuminate the Malfunction Indicator Lamp (MIL).

Conditions for Clearing the DTC

- A scan tool can clear the DTC from the PCM history. The PCM clears the DTC from the PCM history if the vehicle completes 40 warm-up cycles without a failure reported.

- The PCM cancels the DTC default actions when the fault no longer exists and the ignition is OFF long enough in order to power down the PCM.

Diagnostic Aids

- Inspect the wiring for any poor electrical connections at the PCM. Inspect the wiring at the transmission 20-way connector. Look for the following conditions:
 - A bent terminal
 - A backed out terminal
 - A damaged terminal
 - Poor terminal tension
 - A chafed wire
 - A broken wire inside the insulation
- When diagnosing for an intermittent short or an open condition, massage the wiring harness while watching the test equipment for a change.

Test Description

The numbers below refer to the step numbers on the diagnostic chart.

2. This Step verifies that the PCM can command the PC Sol. Valve.
3. This Step verifies that the PC Sol. Valve has the correct resistance. This Step verifies that the Automatic Transmission wiring harness has the correct resistance.

DTC P0748 PCS Valve Circuit Electrical

Step	Action	Value(s)	Yes	No
1	Was the Powertrain On-Board Diagnostic (OBD) System Check performed?	—	Go to Step 2	Go to Powertrain OBD System Check
2	1. Install the scan tool. 2. With the engine OFF, turn the ignition switch to the RUN position. Important: Before clearing the DTCs, use the scan tool in order to record the Failure Records for reference. The Clear Info function will erase the data. 3. Record the DTC Failure Records. 4. While the engine is operating, put the transmission in Park. 5. Using the scan tool, apply 0.1 through 1.0 amp while observing PC Ref Current and PC Act. Current. Does the PC Act. Current remain within the specified range?	PC Ref Current ± 0.16 amp	Go to Diagnostic Aids	Go to Step 3
3	1. Turn the ignition switch to the OFF position. 2. Disconnect the transmission 20-way connector. 3. Install the J 39775 Jumper Harness on the transmission side of the 20-way connector. 4. Using the J 39200 DVOM and J 35616 Connector Test Adapter Kit, measure the resistance between terminals C and D. Is the resistance within the specified range?	3-7 Ω	Go to Step 7	Go to Step 4
4	1. Remove the transmission oil pan. 2. Disconnect the Automatic Transmission wiring harness at the PC Solenoid Valve. 3. Measure the resistance of the PC Solenoid Valve. Is the resistance within the specified range?	3-7 Ω	Go to Step 6	Go to Step 5
5	Replace the PC Solenoid Valve. Is the replacement complete?	—	Go to Step 10	—
6	Repair the Automatic Transmission wiring harness for an open. Refer to Electrical Diagnosis, Section 8A. Is the repair complete?	—	Go to Step 11	—
7	1. Inspect circuits 1228 and 1229 for an open. 2. Repair circuits 1228 and 1229 if necessary. Refer to Electrical Diagnosis, Section 8A. Did you find and correct a problem?	—	Go to Step 11	Go to Step 8
8	1. Inspect circuits 1228 and 1229 for a short to ground. 2. Inspect circuits 1228 and 1229 for poor connections. Refer to Electrical Diagnosis, Section 8A. Did you find and correct a problem?	—	Go to Step 11	Go to Step 9
9	Inspect the PCM connector terminals for the following conditions: • Damaged connector pins • Backed out connector pins • Weak terminal tension Repair the connectors if necessary. Did you find and correct a problem?	—	Go to Step 11	Go to Step 10

DTC P0748 PCS Valve Circuit Electrical (cont'd)

Step	Action	Value(s)	Yes	No
10	Replace the PCM. Refer to <i>PCM Replacement/Programming</i> PCM Replacement, Section 6. Is the replacement complete?	—	Go to Step 11	—
11	1. After the repair is complete, select DTC. 2. Select Clear Info. • Ensure that the duty cycle is not at the duty cycle's electrical high limit. • Ensure that the duty cycle is not at the duty cycle's electrical low limit. 3. Select Specific DTC. Enter DTC P0748. Has the test run and passed?	—	System OK	<i>Begin the diagnosis again.</i> Go to Step 1

- Commanded 2-3 shift
- The TP angle is between 17 and 32%.
- The TP angle is constant within $\pm 5\%$.
- Vehicle speed is between 32 and 72 km/h (20 and 45 mph).
- Within 1.7 seconds, the engine speed in 3rd gear must be 75 RPM less than the last speed in 2nd gear.

Condition 3

- Commanded 3-4 shift
- The TP angle is between 17 and 30%.
- The TP angle is constant within +/-3%.
- The vehicle speed is between 45 and 105 km/h (28 and 65 mph).
- Within 3 seconds, the engine speed in 4th gear must be 20 RPM greater than the last speed in 3rd gear.

Condition 4

- Commanded 4th gear
- The TCC is ON.
- The TP angle is between 13 and 26%.
- The speed ratio is between 0.85 and 1.2 (the speed ratio is the engine speed ÷ the output speed).
- The TCC slip speed is between 300 and 2000 RPM for greater than 4 seconds.

Condition 5

- Commanded 4th gear
- The TCC is ON.
- The TP is between 13 and 26%.
- The Speed ratio is between 0.5 and 0.788. (the speed ratio is the engine speed ÷ the output speed).
- The TCC slip speed is between -20 and 20 RPM for greater than 4 seconds.

Action Taken When the DTC Sets

- D2 line pressure
- The freeze shift adapts from being updated.
- The PCM illuminates the Malfunction Indicator Lamp (MIL).

Conditions for Clearing the MIL/DTC

- The PCM turns OFF the MIL after three consecutive ignition cycles without a failure reported.
- A scan tool can clear the DTC from the PCM history. The PCM clears the DTC from the PCM history if the vehicle completes 40 warm-up cycles without a failure reported.
- The PCM cancels the DTC default actions when the fault no longer exists and the ignition is OFF long enough in order to power down the PCM.

Diagnostic Aids

- Verify that the transmission meets the specifications in the 4L60-E shift speed chart.
- More than one shift may occur because of other internal transmission failures.

Test Description

The numbers below refer to the step numbers on the diagnostic chart.

2. This Step verifies that the TFP Valve Position Switch is functioning normally.
3. This Step verifies that the following sequence occurs:

The scan tool commands all shifts.

All the shift solenoids respond properly.

Not all the shifts occur.

DTC P0751 1-2 (A) Shift Solenoid Performance

Step	Action	Value(s)	Yes	No
1	Was the Powertrain On-Board Diagnostic (OBD) System Check performed?	—	Go to Step 2	Go to <i>Powertrain OBD System Check</i> , Section 6E
2	1. Install the scan tool. 2. With the engine OFF, turn the ignition switch to the RUN position. Important: Before clearing the DTCs, use the scan tool in order to record the Freeze Frame and Failure Records for reference. The Clear Info function will erase the data. 3. Record the DTC Freeze Frame and Failure Records. 4. While the engine is operating, apply the brake pedal. Select each transmission range Low, Dr 2, Dr 3, Overdrive, Park, and Reverse. Does each selected transmission range match the TR Switch displayed on the scan tool?	—	Go to Step 3	Go to <i>Pressure Switch Assembly Resistance Check</i>
3	1. While the engine is operating, raise the drive wheels. 2. Put the transmission in D4 range. Using the scan tool, command 1st, 2nd, 3rd, and 4th gears while accelerating the vehicle. Was a 1-1-4-4 or 2-2-3-3 only shift pattern detected? (Road testing the vehicle may be necessary.)	—	Go to Step 4	Go to Diagnostic Aids
4	• Examine the shift solenoid valves for an internal malfunction. • Inspect the shift solenoid valves for damaged seals. • Refer to the diagnosis charts. Did you find and correct a problem?	—	Go to Step 5	—
5	1. After the repair is complete, select DTC. . 2. Select Clear Info. 3. Operate the vehicle under the following conditions (only if the traffic and road conditions permit): • Hold the throttle at 20% and accelerate to. If the throttle moves more than 3%, stop the vehicle and start over. • Drive at 88 km/h (55 mph) for three km (two miles). 4. Select Specific DTC and enter DTC P0751. Has the test run and passed?	—	System OK	Begin the diagnosis again. Go to Step 1

DTC P0753 1-2 (A) Shift Solenoid Electrical

42259

Circuit Description

The 1-2 Shift Solenoid Valve (1-2 SS Valve) controls the fluid flow acting on the 1-2 and 3-4 shift valve. The solenoid is a normally-open exhaust valve. The combination of the 2-3 Shift Solenoid Valve and the 1-2 SS Valve allows four different shifting combinations. The solenoid attaches to the control valve body within the transmission. Circuit 439 supplies ignition voltage directly to the 1-2 SS Valve. The PCM controls the solenoid by providing a ground path through circuit 1222.

When the PCM detects a continuous open or a short to ground in the 1-2 SS Valve circuit or the 1-2 SS Valve, then DTC P0753 sets. DTC P0753 is a type A DTC.

Conditions for Setting the DTC

- The ignition is ON.
- The system voltage is 10–17 volts.
- The PCM commands the solenoid ON and the voltage remains high (B+).
- The PCM commands the solenoid OFF and the voltage remains low (0 volts).
- All conditions met for 5 seconds

Action Taken When the DTC Sets

- Maximum line pressure
- The PCM freezes shift adapts from being updated.

- The PCM illuminates the Malfunction Indicator Lamp (MIL).

Conditions for Clearing the MIL/DTC

- The PCM turns OFF the MIL after three consecutive ignition cycles without a failure reported.
- A scan tool can clear the DTC from the PCM history. The PCM clears the DTC from the PCM history if the vehicle completes 40 warm-up cycles without a failure reported.
- The PCM cancels the DTC default actions when the fault no longer exists and the ignition is OFF long enough in order to power down the PCM.

Diagnostic Aids

- Inspect the wiring for any poor electrical connections at the PCM. Inspect the wiring at the TCC brake switch. Look for the following conditions:
 - A bent terminal
 - A backed out terminal
 - A damaged terminal
 - Poor terminal tension
 - A chafed wire
 - A broken wire inside the insulation

- When diagnosing for an intermittent short or an open condition, massage the wiring harness while watching the test equipment for changes.
- An open feed circuit can set multiple DTCs.

Gear	1-2 Shift Solenoid	2-3 Shift Solenoid
1	ON	ON
2	OFF	ON
3	OFF	OFF
4	ON	OFF

Test Description

The numbers below refer to the step numbers on the diagnostic chart.

- This Step verifies that the 1-2 SS Valve and the Automatic Transmission wiring harness are functioning normally.
- This Step verifies that the ignition supplies power to the 1-2 SS Valve through the EMI fuse.
- This Step verifies that the valve's resistance is within specifications.

DTC P0753 1-2 (A) Shift Solenoid Electrical

Step	Action	Value(s)	Yes	No
1	Was the Powertrain On-Board Diagnostic (OBD) System Check performed?	—	Go to Step 2	Go to <i>Powertrain OBD System Check</i> , Section 6E
2	1. Install the scan tool. 2. With the engine OFF, turn the ignition switch to the RUN position. Important: Before clearing the DTCs, use the scan tool in order to record the Freeze Frame and Failure Records for reference. The Clear Info function will erase the data. 3. Record the DTC Freeze Frame and Failure Records. 4. Have DTCs P0753, P0758, P1860, P1864, and P1886 set?	—	Go to Step 3	Go to Step 4
3	Inspect circuit 1339, the solenoid, the EMI fuse, and the Automatic Transmission wiring harness for short to ground. Repair the harness, the solenoid, and the circuit if necessary. Refer to Electrical Diagnosis, Section 8. Did you find and correct a problem?	—	Go to Step 22	—
4	Command the 1-2 SS Valve ON and OFF three times while listening to the bottom of the transmission pan (a stethoscope may be necessary). Did the solenoid click when commanded?	—	Go to Step 5	Go to Step 6
5	1. Inspect every connection at the PCM. 2. Inspect the transmission 20-way harness for the following conditions: • Poor connections • Bent connector pins • Backed out connector pins Did you find and correct a problem?	—	Go to Step 22	Go to Diagnostic Aids
6	1. Turn the ignition switch to the OFF position. 2. <i>Automatic Transmission</i> Disconnect the transmission 20-way connector (additional DTCs will set). 3. Install the J 39775 Jumper Harness on the engine harness connector. 4. With the engine OFF, turn the ignition switch to the RUN position. 5. Connect a test lamp from J 39775 Jumper Harness cavity E to ground. Did the test lamp illuminate?	—	Go to Step 7	Go to Step 8

DTC P0753 1-2 (A) Shift Solenoid Electrical (cont'd)

Step	Action	Value(s)	Yes	No
7	1. Install a test lamp between the cavity E and the cavity A of the J 39775 Jumper Harness. 2. Using the scan tool, command the 1-2 Shift Solenoid Valve ON and OFF three times. Does the test lamp illuminate when you command the solenoid valve ON, and turn OFF when you command the solenoid valve OFF?	—	Go to Step 14	Go to Step 9
8	Repair the open or short to ground in the ignition feed circuit 439 to the 1-2 SS Valve. Refer to Electrical Diagnosis, Section 8. Did you find and correct a problem?	—	Go to Step 22	—
9	Monitor the test lamp. Was the test lamp OFF continuously?	—	Go to Step 10	Go to Step 11
10	1. Inspect circuit 1222 for an open. 2. Inspect circuit 1222 for a poor PCM connection. 3. Repair the circuit if necessary. Refer to Electrical Diagnosis, Section 8A. Did you find and correct a problem?	—	Go to Step 22	Go to Step 13
11	Was the test lamp illuminated continuously?	—	Go to Step 12	—
12	1. Inspect circuit 1222 for a short to ground. 2. Repair the circuit if necessary. Refer to Electrical Diagnosis, Section 8A. Did you find and correct a problem?	—	Go to Step 22	Go to Step 13
13	Inspect the PCM connector terminals for the following conditions: 1. Damaged connector pins 2. Backed out connector pins 3. Weak terminal tension 4. Repair the connectors if necessary. Did you find and correct a problem?	—	Go to Step 22	Go to Step 21
14	1. Turn the ignition switch to the OFF position. 2. Install the J 39775 Jumper Harness on the transmission 20-way connector. 3. Measure the resistance between terminals A and E. Is the resistance within the specified range?	19-31Ω	Go to Step 16	Go to Step 15
15	1. Disconnect the Automatic Transmission wiring harness from the 1-2 SS Valve. 2. Measure the resistance of the 1-2 SS Valve. Is the resistance within the specified range?	19-31Ω	Go to Step 17	Go to Step 20
16	1. Turn the ignition switch to the OFF position. 2. Measure the resistance between the terminal A and ground. 3. Measure the resistance between the terminal E and ground. Are both readings greater than the specified value?	250kΩ	Go to Diagnostic Aids	Go to Step 18
17	1. Inspect the Automatic Transmission wiring harness for an open circuit. 2. Repair the harness if necessary. Refer to Electrical Diagnosis, Section 8A. Did you find and correct a problem?	—	Go to Step 22	—

DTC P0753 1-2 (A) Shift Solenoid Electrical (cont'd)

Step	Action	Value(s)	Yes	No
18	1. Disconnect the Automatic Transmission wiring harness from the 1-2 SS Valve. 2. Measure the resistance from the component's terminals to ground. Are both readings greater than the specified value?	250k Ω	Go to Step 19	Go to Step 20
19	1. Inspect the Automatic Transmission wiring harness for a short to ground. 2. Repair the harness if necessary. Refer to Electrical Diagnosis, Section 8A. Did you find and correct a problem?	—	Go to Step 22	—
20	Replace the 1-2 SS Valve. Refer to <i>Valve Body</i> . Is the replacement complete?	—	Go to Step 22	—
21	Replace the PCM. Refer to <i>PCM Replacement/Programming</i> , Section 6. Is the replacement complete?	—	Go to Step 22	—
22	1. After the repair is complete, select DTC. 2. Select Clear Info. 3. Operate the vehicle under the following conditions: - When the 1-2 SS Valve is commanded ON, the voltage decreases to zero. - When the 1-2 SS Valve is commanded OFF, the voltage increases to B+ - All conditions met for 5 seconds. 4. Select Specific DTC. Enter DTC P. Has the test run and passed?	—	System OK	Begin the diagnosis again. Go to Step 1

DTC P0756 2-3 (B) Shift Solenoid Performance

42270

Circuit Description

The 2-3 Shift Solenoid Valve (2-3 SS Valve) controls the fluid flow acting on the 2-3 shift valves. The solenoid is a normally-open exhaust valve. The combination of the 2-3 SS Valve and the 1-2 Shift Solenoid Valve allows four different shift combinations.

When the PCM detects a 1-2-2-1 only shift pattern or a 4-3-3-4 only shift pattern depending on the mechanical failure, then DTC P0756 sets. DTC P0756 is a type B DTC.

Conditions for Setting the DTC

Failure Criteria

- No TP DTCs P0122 or P0123
- No VSS DTC P0502
- No TFT Sensor DTCs P0712 or P0713
- No TCC Stuck ON DTC P0742
- No 2-3 SS Valve DTC P0758
- No 1-2 SS Valve DTC P0753.
- No 3-2 SS Valve Assembly DTC P1886.
- No TCC PWM Sol. DTC P1860
- No TCC Sol. DTC P1864.
- No TFP Valve Position Switch DTC P1810
- The vehicle speed is greater than 24 km/h (15 mph).

- The gear range is D4.
- The engine vacuum is between 20 and 99 kPa.
- The engine speed is greater than 450 RPM for 2 seconds and less than 5500 RPM.
- The transmission fluid temperature is between 20° and 130° C (68° and 266° F).
- The TCC is OFF.
- All of the above conditions are met and either one of the following fail-conditions occurs:
 - The solenoid is stuck ON and Conditions 2 and 3 occur two consecutive times.
 - The solenoid is stuck OFF and Conditions 1 and 3 occur two consecutive times.

Condition 1

- The TP angle is greater than 38%.
- First gear is commanded for 2.5 seconds.
- The speed ratio is between 0.5 and 2.59 (speed ratio is engine speed ÷ output speed).
- The transmission output speed is between 600 and 1500 RPM.
- The TCC slip speed is between -93 and -2000 RPM for 1.6 seconds.

Condition 2

- The TP angle is between 13 and 55%.
- The TP angle is within +/- 3%.
- Third gear is commanded for 1 second.
- Third gear speed ratio is greater than the last 2nd gear speed ratio minus 0.2.
- Third gear TCC slip speed is greater than or equal to the last 2nd gear TCC slip speed plus 200 RPM for 1.3 seconds.
- Discontinue the test if the time since shift commanded is greater than 5 seconds.

Condition 3

- TP angle is greater than 18%.
- Fourth gear is commanded for 1 second.
- Speed ratio is between 2.05 and 8. (speed ratio is engine speed ÷ output speed).
- Transmission output speed is 0–8191 RPM.
- TCC slip speed is 1000–4000 RPM for 3 second.

Action Taken When the DTC Sets

- The PCM commands maximum line pressure.
- The PCM freezes shift adapts from being updated.
- The PCM illuminates the Malfunction Indicator Lamp (MIL).

Conditions for Clearing the MIL/DTC

- The PCM turns OFF the MIL after three consecutive ignition cycles without a failure reported.

- A scan tool can clear the DTC from the PCM history. The PCM clears the DTC from the PCM history if the vehicle completes 40 warm-up cycles without a failure reported.
- The PCM cancels the DTC default actions when the fault no longer exists and the ignition is OFF long enough in order to power down the PCM.

Diagnostic Aids

- Verify that the transmission meets the specifications in the 4L60–E shift speed chart.
- Other internal transmission failures may cause more than one shift to occur.

Gear	1-2 Shift Solenoid	2-3 Shift Solenoid
1	ON	ON
2	OFF	ON
3	OFF	OFF
4	ON	OFF

Test Description

The numbers below refer to the step numbers on the diagnostic chart.

- This Step verifies that the TFP Valve Position Switch is functioning normally.
- This Step tests for a selected gear ratio vs a ratio not obtainable under normal driving conditions.

DTC P0756 2-3 (B) Shift Solenoid Performance

Step	Action	Value(s)	Yes	No
1	Was the Powertrain On-Board Diagnostic (OBD) System Check performed?	—	Go to Step 2	Go to Powertrain OBD System Check
2	1. Install the scan tool. 2. With the engine OFF, turn the ignition switch to the RUN position. Important: Before clearing the DTCs, use the scan tool in order to record the Freeze Frame and Failure Records for reference. The Clear Info function will erase the data. 3. Record the DTC Freeze Frame and Failure Records. 4. While the engine is operating, apply the brake pedal and select each transmission range Low, Dr 2, Dr 3, Overdrive, Reverse, and Park. Does each selected transmission range match the TR Switch on the scan tool?	—	Go to Step 3	Go to Pressure Switch Assembly Resistance Check
3	1. While the engine is operating, raise the drive wheels. 2. With the transmission in D4 range, use the scan tool in order to command 1st, 2nd, 3rd, and 4th gears while accelerating the vehicle. Was 1st gear commanded and not achieved, or 4th gear commanded and other than 4th gear occurred? (Road testing the vehicle may be necessary).	—	Go to Step 4	Go to Diagnostic Aids
4	Check the shift circuit for the following conditions: • An internal malfunction in the shift solenoids. • Damaged seals on the shift solenoids. • Refer to the diagnosis charts. Did you find and correct a problem?	—	Go to Step 5	—
5	1. After the repair is complete, select DTC. 2. Select Clear Info. 3. Operate the vehicle under the following conditions (only if driving conditions allow you): • Hold the throttle at 50% and accelerate to 88 km/h (55 mph). If the throttle moves more than 3%, stop the vehicle and start again. • Hold the throttle at 20% and accelerate to 88 km/h (55 mph). 4. Select Specific DTC. Enter DTC P0756. Has the test run and passed?	—	System OK	Begin the diagnosis again. Go to Step 1

DTC P0758 2-3 (B) Shift Solenoid Electrical

42260

Circuit Description

The 2-3 Shift Solenoid Valve (2-3 SS Valve) controls the fluid acting on the 2-3 shift valves. The solenoid is a normally-open exhaust valve. In combination with the 1-2 Shift Solenoid Valve, the 2-3 SS Valve allows four different shifting combinations. The solenoid is attached to the control valve body within the transmission. Circuit 439 supplies ignition voltage directly to the 2-3 SS Valve. The PCM controls the solenoid by providing the ground path through circuit 1223.

When the PCM detects a continuous open or short to ground in the 2-3 SS Valve circuit or in the 2-3 SS Valve, then DTC P0758 sets. DTC P0758 is a type A DTC.

Conditions for Setting the DTC

- The ignition is ON.
- The system voltage is 10–17 volts.
- The PCM commands the solenoid ON and the voltage remains high (B+).
- The PCM commands the solenoid OFF and the voltage remains low (0 volts).
- All conditions met for 5 seconds

Action Taken When the DTC Sets

- Third gear only
- The PCM commands maximum line pressure
- The PCM freezes shift adapts from being updated.

- The PCM inhibits TCC engagement.
- The PCM illuminates the Malfunction Indicator Lamp (MIL).

Conditions for Clearing the MIL/DTC

- The PCM turns OFF the MIL after three consecutive ignition cycles without a failure reported.
- A scan tool can clear the DTC from the PCM history. The PCM clears the DTC from the PCM history if the vehicle completes 40 warm-up cycles without a failure reported.
- The PCM cancels the DTC default actions when the fault no longer exists and the ignition is OFF long enough in order to power down the PCM.

Diagnostic Aids

- Inspect the wiring for any poor electrical connections at the PCM. Inspect the wiring at the TCC brake switch. Look for the following conditions:
 - A bent terminal
 - A backed out terminal
 - A damaged terminal
 - Poor terminal tension
 - A chafed wire
 - A broken wire inside the insulation

- When diagnosing for an intermittent short or an open condition, massage the wiring harness while watching the test equipment for a change.

Gear	1-2 Shift Solenoid	2-3 Shift Solenoid
1	ON	ON
2	OFF	ON
3	OFF	OFF
4	ON	OFF

Test Description

The numbers below refer to the step numbers on the diagnostic chart.

- This Step verifies that the 2-3 SS Valve and the Automatic Transmission wiring harness are functioning normally.
- This Step verifies that the ignition supplies power to the 2-3 SS Valve through the EMI fuse.
- This Step verifies that the valve's resistance is within specifications.

DTC P0758 2-3 (B) Shift Solenoid Electrical

Step	Action	Value(s)	Yes	No
1	Was the Powertrain On-Board Diagnostic (OBD) System Check performed?	—	Go to Step 2	Go to Powertrain OBD System Check
2	- Install the scan tool. - With the engine OFF, turn the ignition switch to the RUN position. Important: Before clearing the DTCs, use the scan tool in order to record the Freeze Frame and Failure Records for reference. The Clear Info function will erase the data. - Record the DTC Freeze Frame and Failure Records. Were the DTCs P0753, P0758, P1860, P1864, and P1886 set?	—	Go to Step 3	Go to Step 4
3	- Inspect circuit 439, the solenoid, the EMI fuse and the automatic transmission wiring harness for an open or a short to ground. - Repair the circuit, the solenoid, and the harness if necessary. Refer to Electrical Diagnosis, Section 8. Did you find and correct a problem?	—	Go to Step 22	—
4	Command the 2-3 SS Valve ON and OFF three times while listening to the bottom of the transmission pan (a stethoscope may be necessary). Does the solenoid click when commanded?	—	Go to Step 5	Go to Step 6
5	- Examine every connection at the PCM. - Inspect the transmission 20-way connector for the following conditions: - Poor connections - Bent connector pins - Backed out connector pins Did you find and correct a problem?	—	Go to Step 22	Go to Diagnostic Aids
6	- Turn the ignition switch to the OFF position. - Automatic Transmission Disconnect the transmission 20-way connector (additional DTCs will set). - Install the J 39775 Jumper Harness on the engine harness connector. - With the engine OFF, turn the ignition switch to the RUN position. - Connect a test lamp from J 39775 Jumper Harness cavity E to ground. Does the test lamp illuminate?	—	Go to Step 7	Go to Step 8

DTC P0758 2-3 (B) Shift Solenoid Electrical (cont'd)

Step	Action	Value(s)	Yes	No
7	1. Install a test lamp from the cavity E to the cavity B of the J 39775 Jumper Harness. 2. Using the scan tool, command the 2-3 shift solenoid ON and OFF three times. Does the test lamp illuminate when you command the 2-3 shift solenoid ON, and turn OFF when you command the solenoid OFF?	—	Go to Step 14	Go to Step 9
8	Repair the open or short to ground in ignition feed circuit 439 to the 2-3 SS Valve. Refer to Electrical diagnosis, Section 8. Did you find and correct a problem?	—	Go to Step 22	—
9	Was the test lamp OFF continuously?	—	Go to Step 10	Go to Step 11
10	Inspect circuit 1223 for an open or poor PCM connection. Repair the circuit if necessary. Did you find and repair a problem?	—	Go to Step 22	Go to Step 13
11	Was the test lamp illuminated continuously?	—	Go to Step 12	—
12	Inspect circuit 1223 for a short to ground. Repair circuit 1223 if necessary. Refer to Electrical Diagnosis, Section 8. Did you find and correct a problem?	—	Go to Step 22	Go to Step 13
13	1. Inspect the PCM connector terminals for the following conditions: – Damged connector pins – Backed out connector pins – Weak terminal tension 2. Repair the connectors if necessary. Did you find and correct a problem?	—	Go to Step 22	Go to Step 21
14	1. Turn the ignition OFF. 2. Install the J 39775 Jumper Harness on the transmission 20-way connector. 3. Measure the resistance between the terminals B and E. Is the resistance within the specified range?	19-31Ω	Go to Step 16	Go to Step 15
15	1. Disconnect the Automatic Transmission wiring harness from the 2-3 SS Valve. 2. Measure the resistance of the 2-3 SS Valve. Is the resistance within the specified range?	19-31Ω	Go to Step 17	Go to Step 20
16	1. Turn the ignition OFF. 2. Using J 39200 DVOM, measure the resistance between the terminals B and E and ground. Are both readings greater than the specified value?	250kΩ	Go to Diagnostic Aids	Go to Step 18
17	1. Inspect the Automatic Transmission wiring harness for an open circuit. 2. Repair the harness if necessary. Refer to Electrical Diagnosis, Section 8A. Did you find and correct a problem?	—	Go to Step 22	—
18	1. Disconnect the Automatic Transmission wiring harness from the 2-3 SS Valve. 2. Using J 39200 DVOM, measure the resistance from the component's terminals to ground. Are both readings greater than the specified value?	250kΩ	Go to Step 19	Go to Step 20

DTC P0758 2-3 (B) Shift Solenoid Electrical (cont'd)

Step	Action	Value(s)	Yes	No
19	1. Inspect the Automatic Transmission wiring harness for a short to ground. 2. Repair the harness if necessary. Refer to Electrical Diagnosis, Section 8A. Did you find and correct a problem?	—	Go to Step 22	—
20	Replace the 2-3 SS Valve. Refer to <i>Valve Body</i> . Is the replacement complete?	—	Go to Step 22	—
21	Replace the PCM. Refer to <i>PCM Replacement/Programming</i> PCM Replacement, Section 6. Is the replacement complete?	—	Go to Step 22	—
22	1. After the repair is complete, select DTC. 2. Select Clear Info. 3. Operate the vehicle under the following conditions: - The 2-3 SS Valve is commanded ON and the voltage decreases to zero. - The 2-3 SS Valve is commanded OFF and the voltage increases to B+. - All conditions are met for 5 seconds. 4. Select Specific DTC. Enter DTC P. Has the test run and passed?	—	System OK	Begin the diagnosis again. Go to Step 1

DTC P1810 TFP Valve Position Sw CKT Malfunction

42254

Circuit Description

The Automatic Transmission Fluid Pressure (TFP) Manual Valve Position Switch consists of five pressure switches (two normally-closed and three normally-open), and an automatic transmission fluid temperature (TFT) sensor. The combined unit mounts on the valve body. The PCM supplies battery voltage to each range signal. The PCM grounds one or more of the range signal circuits through various combinations of the pressure switches. The PCM monitors the combinations, in order to detect what manual valve position has been selected. The PCM compares the actual voltage combination of the switches to a TFP Valve Position Switch combination chart stored in the memory.

The TFP Valve Position Switch cannot distinguish between Park and Neutral because the monitored valve body pressures are identical. With the ignition ON and the engine OFF, the valve pressures indicate Park or Neutral. Disconnecting the

transmission 20-way connector, removes the ground potential for the three range signals to the PCM. This disconnected state, with the ignition ON, displays as D2.

When the PCM detects an invalid state of the TFP Valve Position Switch or the TFP Val Position Sw circuit, then DTC P1810 sets. The PCM deciphers the TFP Val. Position Sw. inputs. DTC P1810 is a type B DTC.

Conditions for Setting the DTC

DTC P1810 sets if any of the following Conditions occurs:

Condition 1

This condition detects an illegal switch combination.

- The system voltage is 10–17 volts.
- The engine is running.
- The PCM detects an illegal TFP state.
- All conditions satisfied for 5 seconds.

Condition 2

This condition detects D2, D4, or Rev during an engine start.

- No VSS DTC P0502
- The system voltage is 10 17 volts.
- The engine speed is less than 100 RPM for 0.3 seconds; then
the engine speed is between 100 and 600 RPM for 0.3 seconds; then
the engine speed is greater than 600 RPM for 3 seconds.
- The vehicle speed is less than 3 km/h (2 mph).
- The detected gear range is D2, D4, or Rev.
- All conditions satisfied for 3 seconds

Condition 3

This condition detects P/N when the vehicle should be in D4.

- No VSS DTC P0502
- The engine speed is less than 2000 RPM.
- The speed ratio is between 0.39 and 0.8 (speed ratio is engine speed ÷ transmission output speed).
- The engine vacuum is between 35 and 70 kPa.
- The TCC is locked ON.
- The detected gear range is Park/Neutral.
- All conditions satisfied for 5 seconds

Action Taken When the DTC Sets

- D2 line pressure.
- D4 shift pattern.
- The PCM freezes shift adapts from being updated.
- The PCM illuminates the Malfunction Indicator Lamp (MIL).

Conditions for Clearing the MIL/DTC

- The PCM turns OFF the MIL after three consecutive ignition cycles without a failure reported.
- A scan tool can clear the DTC from the PCM history. The PCM clears the DTC from the PCM history if the vehicle completes 40 warm-up cycles without a failure reported.
- The PCM cancels the DTC default actions when the fault no longer exists and the ignition is OFF long enough in order to power down the PCM.

Diagnostic Aids

- Refer to the TFP Valve Position Switch Logic Table for the normal range signals and the illegal combinations.
- Inspect the wiring for any poor electrical connections at the PCM. Inspect the wiring at the transmission 20-way connector. Look for the following conditions:
 - A bent terminal
 - A backed out terminal
 - A damaged terminal
 - Poor terminal tension
 - A chafed wire
 - A broken wire inside the insulation
- When diagnosing for an intermittent short or an open condition, massage the wiring harness while watching the test equipment for a change.
- Refer to the Automatic Transmission Fluid Pressure (TFP) Manual Valve Position Switch Resistance Check or the Functional Test Procedure for further information.

TFP Valve Position Switch Logic

Gear Position	Range signal A	Range signal B	Range signal C
Park	OFF	ON	OFF
Reverse	ON	ON	OFF
Neutral	OFF	ON	OFF
Overdrive	OFF	ON	ON
Dr 3	OFF	OFF	ON
Dr 2	OFF	OFF	OFF
Low	ON	OFF	OFF
—	—	—	—
Illegal	ON	OFF	ON
Illegal	ON	ON	ON

Test Description

The numbers below refer to the step numbers on the diagnostic chart.

- This Step compares the indicated range signal to the manual valve you actually select.
- This Step verifies that the transmission 20-way connector receives the correct voltage from the PCM.

DTC P1810 TFP Valve Position Sw CKT Malfunction

Step	Action	Value(s)	Yes	No
1	Was the Powertrain On-Board Diagnostic (OBD) System Check performed?	—	Go to Step 2	Go to <i>Powertrain OBD System Check</i> , Section 6E
2	- Verify that the transmission linkage from the select lever to the TFP manual valve position switch is adjusted properly. - Perform the TFP Val. Position Sw. resistance check. - Perform the fluid checking procedure. Have you completed the procedure?	—	Go to Step 3	Go to 4L60-E Transmission Fluid Checking Procedure
3	- Install the scan tool. - With the engine OFF, turn the ignition switch to the RUN position. Important: Before clearing DTCs, use the scan tool in order to record the Freeze Frame and Failure Records for reference. The Clear Info function will erase the data. - Record the DTC Freeze Frame and Failure Records. - While the engine idles at the normal operating temperature, apply the parking brake. - Select each transmission range: Low, Dr 2, Dr 3, Overdrive, Reverse, and Park. Does each selected transmission range match the Trans Range displayed on the scan tool?	—	Go to Diagnostic Aids	Go to Step 4
4	- Turn the ignition switch to the OFF position. - Disconnect the transmission 20-way connector (additional DTCs may set). - Install the J 39775 Jumper Harness on the engine side of the transmission 20-way connector. Refer to <i>Automatic Transmission</i>. - With the engine OFF, turn the ignition switch to the RUN position. - Using the J 39200 DVOM and J 35616 Connector Test Adapter Kit, measure the voltage at the connector terminals N, R, and P. Did you measure battery voltage on all three circuits?	—	Go to Step 6	Go to Step 5
5	Inspect the circuits that did not indicate battery voltage for an open or a short to ground. Refer to Electrical Diagnosis, Section 8. Did you find and correct a problem?	—	Go to Step 9	Go to Step 7
6	Verify that circuits 1224, 1225, and 1226 are not shorted together. Use a fused jumper to separately ground each circuit while monitoring the scan tool TFP Switch A/B/C display. Refer to Electrical Diagnosis, Section 8. Did you find and correct a problem?	—	Go to Step 9	Refer to <i>Pressure Switch Assembly Resistance Check</i> TFP Manual Valve Position Switch Resistance Check

DTC P1810 TFP Valve Position Sw CKT Malfunction (cont'd)

Step	Action	Value(s)	Yes	No
7	1. Inspect the PCM connector terminals for the following conditions: – Damaged connector pins – Backed out connector pins – Weak terminal tension 2. Repair the connectors if necessary. Refer to Electrical Diagnosis, Section 8. Did you find and correct a problem?	—	Go to Step 9	Go Step 8
8	Replace the PCM. Refer to <i>PCM Replacement/Programming</i> , Section 6. Is the replacement complete?	—	Go to Step 9	—
9	1. After the repair is complete, select DTC. 2. Select Clear Info. 3. Operate the vehicle under the following conditions: 3.1. Turn the ignition switch to the RUN position for at least 2 seconds. 3.2. Start the vehicle and idle for 5 seconds. 3.3. Drive in D4 until the TCC locks for 20 seconds. 4. Select Specific DTC and enter DTC P1810. Has the test run and passed?	—	System OK	Begin the diagnosis again. Go to Step 1

DTC P1812 Transmission Fluid Overtemp

42254

Circuit Description

The Transmission Fluid Temperature (TFT) sensor is a negative coefficient thermistor within the Automatic Transmission Fluid Pressure (TFP) Manual Valve Position Switch. The TFT sensor controls the signal voltage to the PCM. The PCM supplies a 5 volt reference to the sensor on circuit 1227.

When the transmission fluid is cold, the sensor resistance is high and the PCM senses high signal voltage. As the fluid temperature warms to a normal transmission operating temperature of 100°C (212°F), the sensor resistance decreases and the voltage decreases to 1.5 – 2.0 volts.

When the PCM detects a high transmission temperature for a long period of time, then DTC P1812 sets. DTC P1812 is a type D DTC.

Conditions for Setting the DTC

- No TFT DTCs P0712 or P0713.
- The TFT is greater than 130°C (266°F).
- All conditions met for 15 minutes.

Action Taken When the DTC Sets

- The PCM freezes shift adapts from being updated.
- The PCM does **not** illuminate the Malfunction Indicator Lamp (MIL).

Conditions for Clearing the DTC

- A scan tool can clear the DTC from the PCM history. The PCM clears the DTC from the PCM history if the vehicle completes 40 warm-up cycles without a failure reported.
- The PCM cancels the DTC default actions when the fault no longer exists and the ignition is OFF long enough in order to power down the PCM.

Diagnostic Aids

- Inspect the wiring for any poor electrical connections at the PCM. Inspect the wiring at the TCC brake switch. Look for the following conditions:
 - A bent terminal
 - A backed out terminal
 - A damaged terminal
 - Poor terminal tension
 - A chafed wire
 - A broken wire inside the insulation
- When diagnosing for an intermittent short or an open condition, massage the wiring harness while watching the test equipment for changes.
- The scan tool should show the TFT sensor temperature rising steadily to about 100°C (212°F), then stabilize.
- Check for a torque converter stator problem.
- Verify the customer's driving habits, trailer towing, etc. . .
- A skewed (mis-scaled) sensor can result in firm shifts or TCC complaints. Evaluate the possibility of a skewed sensor by using the temperature to resistance value scale. With the temperature to resistance scale you can inspect the TFT sensor at various temperature levels.

°C	°F	OHMS
Temperature vs Resistance Values (Approximate)		
100	212	177
90	194	241
80	176	332
70	158	467
60	140	667
50	122	973
45	113	1188
40	104	1459
35	95	1802
30	86	2238
25	77	2796
20	68	3520
15	59	4450
10	50	5670
5	41	7280
0	32	9420
-5	23	12300
-10	14	16180
-15	5	21450
-20	-4	28680
-30	-22	52700
-40	-40	100700

Test Description

The numbers below refer to the step numbers on the diagnostic chart.

3. This Step verifies that the sensor is not skewed (mis-scaled). This Step also checks for a shorted circuit.
4. This Step simulates a TFT DTC P0713.

DTC P1812 Transmission Fluid Overtemp

Step	Action	Value(s)	Yes	No
1	Was the Powertrain On-Board Diagnostic (OBD) System Check performed?	—	Go to Step 2	Go to <i>Powertrain OBD System Check</i> , Section 6E
2	- Check for possible transmission problems. Check for possible engine cooling system problems. - Perform the transmission fluid checking procedure. Refer to <i>Transmission Fluid Checking Procedure</i>. Have you completed the inspections?	—	Go to Step 3	Go to 4L60-E Transmission Fluid Checking Procedure
3	1. Install the scan tool. 2. With the engine OFF, turn the ignition switch to the RUN position. Important: Before clearing the DTCs, use the scan tool in order to record the Failure Records for reference. The Clear Info function will erase the data. 3. Record the DTC Failure Records. Is the TFT Sensor signal voltage less than the specified voltage?	0.33 volt	Go to Step 4	Go to Diagnostic Aids
4	1. Turn the ignition switch to the OFF position. 2. Disconnect the transmission 20-way connector (additional DTCs may set). Is the TFT Sensor signal voltage greater than the specified voltage?	4.92 volts	Go to <i>Internal Wiring Harness Check</i>	Go to Step 5
5	Inspect circuit 1227 for a short to ground. Repair the circuit if necessary. Refer to Electrical Diagnosis, Section 8A. Did you find and correct a problem?	—	Go to Step 8	Go to Step 6
6	1. Inspect the PCM connector terminals for the following conditions: 2. Damged connector pins 3. Backed out connector pins 4. Weak terminal tension 5. Repair the connectors if necessary. Did you find and correct a problem?	—	Go to Step 8	Go to Step 7
7	Replace the PCM. Refer to <i>PCM Replacement/Programming</i> , Section 6. Is the replacement complete?	—	Go to Step 8	—
8	1. After the repair is complete, select DTC. 2. Select Clear Info. 3. Ensure the following conditions are met: - Turn the ignition switch to the RUN position. - The scan tool must indicate a TFT less than 129 °C (264 °F) for at least 5 seconds. 4. Select Specific DTC and enter DTC P1812. Has the test run and passed?	—	System OK	Begin diagnosis the again. Go to Step 1

DTC P1860 TCC PWM Solenoid Electrical

42261

Circuit Description

The TCC PWM Solenoid Valve controls the fluid acting on the converter clutch valve, which then controls the application and release of the TCC. The solenoid attaches to the control valve body within the transmission. Circuit 439 supplies ignition voltage directly to the solenoid. The PCM controls the solenoid by providing a ground path on circuit 418. Current flows through the solenoid coil according to the duty cycle (percentage of ON and OFF time). The TCC PWM Solenoid Valve provides a smooth engagement of the torque converter clutch by operating during a duty cycle percent of ON time.

When the PCM detects a continuous open or a short to ground in the TCC PWM circuit or the TCC PWM Solenoid Valve, then DTC P1860 sets. DTC P1860 is a type A DTC.

Conditions for Setting the DTC

- The system voltage is 10–17 volts.
- No 2-3 shift solenoid Valve DTCs P0756 or P0758
- No 1-2 shift solenoid Valve DTCs P0751 or P0753
- The ignition is ON.
- First gear commanded
- The PCM commands the solenoid to 0% and the voltage remains high (B+).
- All conditions met for 5 seconds

Runs only during intrusive test:

- The TCC is at 100% duty cycle for greater than 0.1 second.
- The TCC is at 0% duty cycle for greater than 5 seconds.
- Once per key cycle

Action Taken When the DTC Sets

- The PCM inhibits TCC engagement.
- The PCM inhibits 4th gear if in hot mode
- The PCM freezes shift adapts from being updated.
- The PCM commands maximum line pressure
- The PCM illuminates the Malfunction Indicator Lamp (MIL).

Conditions for Clearing the MIL/DTC

- The PCM turns OFF the MIL after three consecutive ignition cycles without a failure reported.
- A scan tool can clear the DTC from the PCM history. The PCM clears the DTC from the PCM history if the vehicle completes 40 warm-up cycles without a failure reported.
- The PCM cancels the DTC default actions when the fault no longer exists and the ignition is OFF long enough in order to power down the PCM.

Diagnostic Aids

- Inspect the wiring for any poor electrical connections at the PCM. Inspect the wiring at the transmission 20-way connector. Look for the following conditions:
 - A bent terminal
 - A backed out terminal
 - A damaged terminal
 - Poor terminal tension
 - A chafed wire
 - A broken wire inside the insulation

- When diagnosing for an intermittent short or an open condition, massage the wiring harness while watching the test equipment for a change.

Test Description

The numbers below refer to the step numbers on the diagnostic chart.

- This Step verifies that the solenoid receives current.
- This Step verifies the ability of the PCM and the wiring to control the ground circuit.
- This Step measures the resistance of the TCC PWM Sol. Valve and the Automatic Transmission wiring harness.

DTC P1860 TCC PWM Solenoid Electrical

Step	Action	Value(s)	Yes	No
1	Was the Powertrain On-Board Diagnostic (OBD) System Check performed?	—	Go to Step 2	Go to <i>Powertrain OBD System Check</i> , Section 6E
2	1. Install the scan tool. 2. With the engine OFF, turn the ignition switch to the RUN position. Important: Before clearing the DTCs, use the scan tool in order to record the Freeze Frame and the Failure Records for reference. The Clear Info function will erase the data. 3. Record the DTC Freeze Frame and the DTC Failure Records. Are DTCs P0753, P0758, P1860, P1864, and P1886 set?	—	Go to Step 3	Go to Step 4
3	Inspect circuit 439, the EMI fuse, the solenoid, and the Automatic Transmission wiring harness for an open or a short to ground. Refer to Electrical Diagnosis, Section 8. Did you find and correct a problem?	—	Go to Step 17	—
4	1. Turn the ignition switch to the OFF position. 2. Disconnect the transmission 20-way connector (additional DTCs may set). 3. Install the J 39775 Jumper Harness on the engine harness connector. <i>Automatic Transmission</i> 4. With the engine OFF, turn the ignition switch to the RUN position. 5. Connect a test lamp from the J 39775 Jumper Harness cavity E to ground. Does the test lamp illuminate?	—	Go to Step 6	Go to Step 5
5	Repair the open or short to ground in the ignition feed circuit 439 to the TCC PWM Solenoid Valve. Refer to Electrical Diagnosis, Section 8A. Is the repair complete?	—	Go to Step 17	—
6	1. Install the test lamp from cavities E to U of the J 39775 Jumper Harness. 2. Command the TCC PWM Solenoid Valve ON and OFF 3 times. Does the test lamp illuminate when you command the TCC PWM Solenoid Valve ON, and turn OFF when you command the valve OFF?	—	Go to Step 8	Go to Step 7

DTC P1860 TCC PWM Solenoid Electrical (cont'd)

Step	Action	Value(s)	Yes	No
7	1. Inspect circuit 418 for an open and a short to ground. 2. Repair circuit 418 if necessary. Refer to Electrical Diagnosis, Section 8A. Did you find and correct a problem?	—	Go to Step 17	Go to Step 9
8	1. Install the J 39775 Jumper Harness on the transmission 20-way connector. 2. Using the J 39200 DVOM and the J 35616 Connector Test Adapter Kit, measure the resistance between terminals E and U. Is the resistance within the specified range?	10-15Ω	Go to Step 11	Go to Step 10
9	1. Inspect the PCM connector terminals for the following conditions: 2. Damaged connector pins 3. Backed out connector pins 4. Weak terminal tension 5. Repair the connectors if necessary. Did you find and correct a problem?	—	Go to Step 17	Go to Step 16
10	1. Disconnect the Automatic Transmission wiring harness at the TCC PWM Solenoid Valve. 2. Measure the resistance of the TCC PWM Solenoid Valve. Is the resistance within the specified range?	10-15Ω	Go to Step 12	Go to Step 15
11	Measure the resistance between terminal E and the transmission case (ground). Measure the resistance between terminal U and ground. Are both readings greater than the specified value?	250Ω	Go to Diagnostic Aids	Go to Step 13
12	Inspect the Automatic Transmission wiring harness for an open. Repair the harness if necessary. Refer to Electrical Diagnosis, Section 8A. Did you find and repair a problem?	—	Go to Step 17	—
13	1. Disconnect the Automatic Transmission wiring harness at the TCC PWM Solenoid Valve. 2. Measure the resistance between each of the component terminals and the transmission case (ground). Are both readings greater than the specified value?	250Ω	Go to Step 14	Go to Step 15
14	Inspect the Automatic Transmission wiring harness for a short to ground. Repair the harness if necessary. Refer to Electrical Diagnosis, Section 8A. Was a problem found and corrected?	—	Go to Step 17	—
15	Replace the TCC PWM Solenoid Valve. Refer to <i>Valve Body</i> . Is the replacement complete?	—	Go to Step 17	—
16	Replace the PCM. Refer to <i>PCM Replacement/Programming</i> , Section 6. Is the replacement complete?	—	Go to Step 17	—

DTC P1860 TCC PWM Solenoid Electrical (cont'd)

Step	Action	Value(s)	Yes	No
17	1. After the repair is complete, select DTC. 2. Select Clear Info. 3. Ensure the following conditions: • When you command the TCC PWM Solenoid Valve ON, the voltage drops to zero. • When you command the TCC PWM Solenoid Valve OFF, the voltage increases to B+. • All conditions met for 5 seconds. 4. Select Specific DTC and enter DTC P1860. Has the test run and passed?	—	System OK	<i>Begin diagnosis the again. Go to Step 1</i>

DTC P1864 TCC Solenoid Electrical

42261

Circuit Description

In conjunction with the TCC PWM Solenoid Valve, the TCC Solenoid Valve controls fluid acting on the TCC Valve. The TCC Valve controls the application and release of the TCC. The TCC solenoid is a normally-open, ON/OFF device. The solenoid attaches to the transmission case assembly extending into the pump cover. The PCM monitors the TP voltage, the vehicle speed, and other inputs in order to determine when to energize the TCC Solenoid Valve. Circuit 439 supplies ignition voltage directly to the TCC Solenoid Valve. The PCM controls the solenoid by providing the ground path through circuit 422.

When the PCM detects a continuous open or a short to ground in the TCC Solenoid Valve circuit or the TCC Solenoid Valve, then DTC P1864 sets. DTC P1864 is a type A DTC.

Conditions for Setting the DTC

- The system voltage is 10–17 volts.
- The ignition is ON.
- The PCM commands the solenoid ON and the voltage remains high (B+).
- The PCM commands the solenoid OFF and the voltage remains low (0 volts).
- All conditions met for 5 seconds.

Action Taken When the DTC Sets

- The PCM inhibits TCC engagement.
- The PCM inhibits 4th gear if in hot mode.

- The PCM freezes shift adapts from being updated.
- The PCM illuminates the Malfunction Indicator Lamp (MIL).

Conditions for Clearing the MIL/DTC

- The PCM turns OFF the MIL after three consecutive ignition cycles without a failure reported.
- A scan tool can clear the DTC from the PCM history. The PCM clears the DTC from the PCM history if the vehicle completes 40 warm-up cycles without a failure reported.
- The PCM cancels the DTC default actions when the fault no longer exists and the ignition is OFF long enough in order to power down the PCM.

Diagnostic Aids

- Inspect the wiring for any poor electrical connections at the PCM. Inspect the wiring at the TCC brake switch. Look for the following conditions:
 - A bent terminal
 - A backed out terminal
 - A damaged terminal
 - Poor terminal tension
 - A chafed wire
 - A broken wire inside the insulation
- When diagnosing for an intermittent short or an open condition, massage the wiring harness while watching the test equipment for a change.

- With the TCC engaged, the TCC slip speed should be -20 to +20 RPM.
- A short to ground in the TCC Solenoid Valve circuit may also set a TCC Stuck On DTC P0742.

Test Description

The numbers below refer to the step numbers on the diagnostic chart.

- This Step verifies that the solenoid receives current.
- This Step verifies the ability of the PCM and the wiring to control the ground circuit.
- This Step measures the resistance of the TCC Solenoid Valve and the automatic transmission wiring harness.

DTC P1864 TCC Solenoid Electrical

Step	Action	Value(s)	Yes	No
1	Was the Powertrain On-Board Diagnostic (OBD) System Check performed?	—	Go to Step 2	Go to Powertrain OBD System Check, Section 6E
2	1. Install the scan tool. 2. With the engine OFF, turn the ignition switch to the RUN position. Important: Before clearing the DTCs, use the scan tool in order to record the Freeze Frame and the Failure Records for reference. The Clear Info function will erase the data. 3. Record the DTC Freeze Frame and the Failure Records. Are DTCs P0753, P0758, P1860, P1864 and P1886 set?	—	Go to Step 3	Go to Step 4
3	Inspect circuit 439, the solenoid, the EMI fuse, and the Automatic Transmission wiring harness for an open and a short to ground. Refer to Electrical Diagnosis, Section 8. Did you find and correct a problem?	—	Go to Step 15	—
4	1. Turn the ignition switch to the OFF position. 2. Disconnect the transmission 20-way connector (additional DTCs may set). 3. Install the J 39775 Jumper Harness on the engine harness connector. <i>Automatic Transmission</i> 4. With the engine OFF, turn the ignition switch to the RUN position. 5. Connect a test lamp from cavity E of the J 39775 Jumper Harness to a known good ground. Does the test lamp illuminate?	—	Go to Step 6	Go to Step 5
5	Repair the open or short to ground in the ignition feed circuit 439 to the TCC Solenoid Valve. Refer to Electrical Diagnosis, Section 8A. Is the repair complete?	—	Go to Step 15	—
6	1. Install the test lamp between the cavities E and T of the J 39775 Jumper Harness. 2. Using the scan tool, command the TCC Solenoid Valve ON and OFF 3 times. Does the test lamp illuminate when you command the TCC Solenoid Valve ON, and turn OFF when you command OFF?	—	Go to Step 8	Go to Step 7

DTC P1864 TCC Solenoid Electrical (cont'd)

Step	Action	Value(s)	Yes	No
7	1. Inspect circuit 422 for an open. 2. Inspect circuit 422 for a short to ground. 3. Repair the circuit if necessary. Refer to Electrical Diagnosis, Section 8A. Did you find and correct a problem?	—	Go to Step 15	Go to Step 9
8	1. Inspect the PCM connector terminals for the following conditions: 2. Damaged connector pins 3. Backed out connector pins 4. Weak terminal tension 5. Repair the connectors if necessary. Did you find and correct a problem?	—	Go to Step 15	Go to Step 14
9	1. Install the J 39775 Jumper Harness on the transmission 20-way connector. 2. Using the J 39200 DVOM and the J 35616 Connector Test Adapter Kit, measure the resistance between the terminal E and the transmission case (ground). 3. Measure the resistance between the terminal T and the transmission case (ground). Are both readings greater than the specified value?	250k Ω	Go to step 11	Go to Step 10
10	1. Inspect the Automatic Transmission wiring harness for a short to ground. 2. Repair the harness if necessary. Refer to Electrical Diagnosis, Section 8A. Did you find and correct a problem?	—	Go to Step 15	—
11	1. Install the J 39775 Jumper Harness on the transmission 20-way connector. 2. Using the J 39200 DVOM and the J 35616 Connector Test Adapter Kit, measure the resistance between the terminals T and E. Is the resistance within the range shown?	21-33 Ω	Go to Diagnostic Aids	Go to Step 10
12	1. Inspect the Automatic Transmission wiring harness for an open. 2. Repair the harness if necessary. Refer to Electrical Diagnosis, Section 8A. Did you find and correct a problem?	—	Go to Step 15	Go to Step 13
13	Replace the TCC Solenoid Valve. Refer to <i>Valve Body and Wiring Harness Removal</i> . Is the replacement complete?	—	Go to Step 15	—
14	Replace the PCM. Refer to <i>PCM Replacement/Programming</i> , Section 6. Is the replacement complete?	—	Go to Step 15	—
15	1. After the repair is complete, select DTC. 2. Select Clear Info. 3. Operate the vehicle. Ensure the following conditions: • Commanding the TCC Solenoid Valve ON causes the voltage to decrease to zero. • Commanding the TCC Solenoid Valve OFF causes the voltage to increase to B+. • All conditions met for 5 seconds. 4. Select Specific DTC and enter DTC P1864. Has the test run and passed?	—	System OK	Begin the diagnosis again. Go to Step 1

DTC P1870 Transmission Component Slipping

Range	Gear	1-2 SS Valve	2-3 SS Valve	2-4 Band	Forward Clutch	Forward Sprag Clutch Assembly	3-4 Clutch
OVER DRIVE	2nd	Off	On	Applied	Applied	Holding	—
3rd	Off	Off	—	Applied	Holding	Applied	
4th	On	Off	Applied	Applied	—	Applied	

Circuit Description

The PCM monitors the difference between the engine speed and the transmission output speed. In D3 drive range with the TCC engaged, the engine speed should closely match the transmission output speed. In D4 drive range with the TCC engaged, the TCC slip speed should be -20 to +20 RPM.

When the PCM detects excessive TCC slip when the TCC should be engaged, then DTC P1870 sets.

DTC P1870 is a type A DTC.

Conditions for Setting the DTC

The following conditions are met for three TCC cycles with reported excessive TCC slip conditions:

- No TP DTCs P0122 or P0123
- No VSS DTC P050
- No TFT sensor DTCs P0172 or P0173
- No 1-2 SS Valve DTCs P0751 or P0753
- No 2-3 SS Valve DTCs P0756 or P0758
- No TFP Valve Position Switch DTC P1810
- No TCC PWM Solenoid Valve DTC P1860
- No TCC Solenoid Valve DTC P1864
- The engine speed is less than 5500 RPM.
- The engine vacuum is between 35 and 70 kPa. (10.4–20.7 in Hg).
- The gear range is D4.
- Not in 1st gear
- The TP angle is between 13 and 36%.
- The TFT is between 20° and 130°C (68° and 266°F).
- The TCC is ON for greater than 0.1 second.
- The TCC is at maximum apply for 0.1 second.
- The Shift Solenoid performance counter is zero.
- The TCC slip speed is greater than 130 RPM for greater than 8 seconds.

Action Taken When the DTC Sets

- Inhibit TCC engagement
- Maximum line pressure
- Inhibit 4th gear if in hot mode
- The freeze shift adapts from being updated.
- The PCM illuminates the Malfunction Indicator Lamp (MIL).

Conditions for Clearing the MIL/DTC

- The PCM turns OFF the MIL after three consecutive ignition cycles without a failure reported.
- A scan tool can clear the DTC from the PCM history. The PCM clears the DTC from the PCM history if the vehicle completes 40 warm-up cycles without a failure reported.
- The PCM cancels the DTC default actions when the fault no longer exists and the ignition is OFF long enough in order to power down the PCM.

Diagnostic Aids

- A TFP Valve Position Switch malfunction could set DTC P1870.

- The following mechanical conditions could set DTC P1870:

- A mechanical failure of the shift solenoid valves
- A mechanical failure of the TCC Solenoid Valve
- A mechanical failure of the TCC PWM Solenoid Valve

- Internal transmission failures may set a DTC P1870.
- An engine misfire may erroneously set a DTC P1870.

- Ensure that the final drive ratio matches the PCM's calibration.

- A PRNDL DTC may falsely set DTC P1870.

Refer to 4L60-E Shift Speed Chart.

Test Description

The numbers below refer to the step numbers on the diagnostic chart.

- This Step compares the indicated range signal to the actual selected range. A faulty TFP Valve Position Switch could set a DTC P1870.
- This Step tests for slippage while the torque converter is in a commanded lock-up state.

DTC P1870 Transmission Component Slipping

Step	Action	Value(s)	Yes	No
1	Was the Powertrain On-Board Diagnostic (OBD) System Check performed?	—	Go to Step 2	Go to <i>Powertrain OBD System Check</i> , Section 6E
2	1. Install the scan tool. 2. With the engine OFF, turn the ignition switch to the RUN position. Important: Before clearing the DTCs, use the scan tool in order to record the Freeze Frame and the Failure Records for reference. The Clear Info function will erase the data. 3. Record the DTC Freeze Frame and the Failure Records. 4. Apply the brake pedal. 5. Select each transmission range: Low, Dr 2, Dr 3, Overdrive, Reverse and Park. Does each selected transmission range match the scan tool TR Switch display?	—	Go to Step 3	Go to <i>Pressure Switch Assembly Resistance Check</i>
3	Drive the vehicle in 4th gear while the TCC is engaged. At any time is the TCC Slip Speed greater than the specified value for 10 seconds?	130 RPM	Go to System Diagnosis Charts	Go to Diagnostic Aids

DTC P1873 Torque Conv Stator Temp Switch Ckt Low

42262

Circuit Description

The torque converter stator temperature switch is a normally-open, temperature-sensitive switch which sends a signal to the PCM to begin action in order to cool the torque converter. At transmission fluid temperatures of 164°C (327°F) or higher, the switch closes and the signal to the PCM changes to 0 volts. The torque converter stator temperature switch is a single lead switch that grounds through the transmission fluid cooler pipes.

When the PCM detects that the torque converter stator switch indicates a hot mode at a low transmission temperature, then DTC P1873 sets. DTC P1873 is a type D DTC.

Conditions for Setting the DTC

1. No TFT DTCs P0712 or P0713.
2. The TFT is less than 60°C (140°F).
3. The torque converter stator temperature switch circuit indicates a hot mode.
4. All conditions are met for 5 seconds.

Action Taken When the DTC Sets

- The torque converter stator temperature switch does not indicate a hot mode.
- The PCM freezes shift adapts from being updated.
- The PCM does **not** illuminate the Malfunction Indicator Lamp (MIL).

Conditions for Clearing the DTC

- A scan tool can clear the DTC from the PCM history. The PCM clears the DTC from the PCM history if the vehicle completes 40 warm-up cycles without a failure reported.

- The PCM cancels the DTC default actions when the fault no longer exists and the ignition is OFF long enough in order to power down the PCM.

Diagnostic Aids

1. If the switch and the external wiring are OK, verify the circuit ground integrity through the transmission fluid cooler pipes.
2. Inspect the wiring for poor electrical connections at the PCM. Inspect the wiring for poor electrical connections at the transmission 20-way connector. Look for the following conditions:
 - A bent terminal
 - A backed out terminal
 - A damaged terminal
 - Poor terminal tension
 - A chafed wire
 - A broken wire inside the insulation
3. When diagnosing for an intermittent short or open condition, massage the wiring harness while watching the test equipment for a change.

Test Description

The numbers below refer to the step numbers on the diagnostic chart.

3. Step 3 verifies the electrical integrity of the wiring and the PCM.

DTC P1873 Torque Conv Stator Temp Switch Ckt Low

Step	Action	Value(s)	Yes	No
1	Was the Powertrain On-Board Diagnostic (OBD) System Check performed?	—	Go to Step 2	Go to OBD Powertrain System Check
2	Perform the automatic transmission fluid checking procedure. Refer to 4L60-E Transmission Fluid Checking Procedure. Did you perform the transmission fluid checking procedure?	—	Go to Step 3	Go to the Transmission Fluid Checking Procedure
3	1. Install the scan tool. 2. With the engine OFF, turn the ignition switch to the RUN position. Important: Before clearing the DTCs, use the scan tool in order to record Failure Records for reference. The Clear Info function will erase the data. 3. Record the DTC Failure Records. 4. Disconnect the torque converter stator temperature switch. 5. Using a grounded test lamp, probe the torque converter stator temperature switch connector. Does the scan tool display "TCC Stator Temp. as High (closed switch) with the test lamp connected, and Normal (open switch) with the test lamp disconnected?	—	Go to Step 6	Go to Step 4
4	Is High (closed switch) displayed at all times?	—	Go to Step 5	Go to Diagnostic Aids
5	Repair the short to ground in circuit 585. Refer to Electrical Diagnosis, Section 8. Is the repair complete?	—	Go to Step 7	—
6	Replace the torque converter stator temperature switch. Is the replacement complete?	—	Go to Step 7	—
7	In order to verify your repair, perform the following procedure: 1. Select DTC. 2. Select Clear Info. 3. Ensure that the torque converter stator temperature switch circuit does not indicate a hot mode when the transmission fluid temperature is less than 60°C (140°F). 4. Select Specific DTC. 5. Enter DTC P1873. Has the test run and passed?	—	System OK	Begin diagnostic again. Go to Step 1

DTC P1874 Torque Conv Stator Temp Switch Ckt High

42262

Circuit Description

The torque converter stator temperature switch is a normally-open, temperature-sensitive switch which sends a signal to the PCM to begin action in order to cool the torque converter. At transmission fluid temperatures of 164°C (327°F) or higher, the switch closes and the signal to the PCM changes to 0 volts. The torque converter stator temperature switch is a single lead switch that grounds through the transmission fluid cooler pipes.

When the PCM detects that the torque converter stator switch does not indicate a hot mode at a high transmission temperature, then DTC P1873 sets. DTC P1873 is a type D DTC.

Conditions for Setting the DTC

1. No TFT DTCs P0712 or P0713.
2. The TFT is less than 140°C (284°F).
3. The torque converter stator temperature switch circuit does not indicate hot mode.
4. All conditions are met for 15 seconds.

Action Taken When the DTC Sets

- The torque converter stator temperature switch indicates a hot mode.
- The PCM freezes shift adapts from being updated.
- The PCM does **not** illuminate the Malfunction Indicator Lamp (MIL).

Conditions for Clearing the DTC

- A scan tool can clear the DTC from the PCM history. The PCM clears the DTC from the PCM history if the vehicle completes 40 warm-up cycles without a failure reported.

- The PCM cancels the DTC default actions when the fault no longer exists and the ignition is OFF long enough in order to power down the PCM.

Diagnostic Aids

1. If the switch and the external wiring are OK, verify the circuit ground integrity through the transmission fluid cooler pipes.
2. Inspect the wiring for poor electrical connections at the PCM. Inspect the wiring for poor electrical connections at the transmission 20-way connector. Look for the following conditions:
 - A bent terminal
 - A backed out terminal
 - A damaged terminal
 - Poor terminal tension
 - A chafed wire
 - A broken wire inside the insulation
3. When diagnosing for an intermittent short or open condition, massage the wiring harness while watching the test equipment for a change.

Test Description

The numbers below refer to the step numbers on the diagnostic chart.

3. Step 3 verifies the electrical integrity of the wiring and the PCM.

DTC P1874 Torque Conv Stator Temp Switch Ckt High

Step	Action	Value(s)	Yes	No
1	Was the Powertrain On-Board Diagnostic (OBD) System Check performed?	—	<i>Go to Step 2</i>	Go to OBD Powertrain System Check
2	Perform the automatic transmission fluid checking procedure. Refer to 4L60-E Transmission Fluid Checking Procedure. Did you perform the transmission fluid checking procedure?	—	<i>Go to Step 3</i>	Go to the Transmission Fluid Checking Procedure
3	1. Install the scan tool. 2. With the engine OFF, turn the ignition switch to the RUN position. Important: Before clearing the DTCs, use the scan tool in order to record Failure Records for reference. The Clear Info function will erase the data. 3. Record the DTC Failure Records. 4. Disconnect the torque converter stator temperature switch. 5. Using a grounded test lamp, probe the torque converter stator temperature switch connector. Does the scan tool display "TCC Stator Temp. as High (closed switch) with the test lamp connected, and Normal (open switch) with the test lamp disconnected?	—	<i>Go to Step 6</i>	<i>Go to Step 4</i>
4	Is Normal (open switch) displayed at all times?	—	<i>Go to Step 5</i>	Go to Diagnostic Aids
5	1. Inspect circuit 585 for an open or short to battery voltage. 2. Repair circuit 585 if necessary. Refer to Electrical Diagnosis, Section 8. Is the repair complete?	—	<i>Go to Step 7</i>	—
6	Replace the torque converter stator temperature switch. Is the replacement complete?	—	<i>Go to Step 7</i>	—
7	In order to verify your repair, perform the following procedure: 1. Select DTC. 2. Select Clear Info. 3. Ensure that the torque converter stator temperature switch circuit indicates a hot mode when the transmission fluid temperature is greater than 140 °C (284 °F) for at least 15 seconds. 4. Select Specific DTC. 5. Enter DTC P1874. Has the test run and passed?	—	System OK	<i>Begin diagnostic again. Go to Step 1</i>

DTC P1886 3-2 SS Valve Assembly CKT Electrical

42263

Circuit Description

The 3-2 Shift Solenoid Valve Assembly (3-2 SS Valve Assy) is a normally-closed, 3-port, on/off device. The device controls the 3-2 downshift. The solenoid attaches to the control valve body within the transmission. Circuit 439 supplies ignition voltage directly to the solenoid. The PCM controls the solenoid by providing a ground path on circuit 897. During a 3-2 downshift, the 2-4 band applies as the 3-4 clutch releases. The PCM varies the timing between the 3-4 clutch release and the 2-4 band apply depending on the vehicle speed and the throttle position.

When the PCM detects a continuous open or short to ground in the 3-2 SS Valve Assy circuit or the 3-2 SS Valve Assy., then DTC P1886 sets. DTC P1886 is a type A DTC.

Conditions for Setting the DTC

- The System Voltage is 10–17 volts.
- The ignition is ON.
- The PCM commands the solenoid ON and the voltage remains high (B+).
- The PCM commands the solenoid OFF and the voltage remains low (0 volts).
- All conditions are met in 5 seconds.

Action Taken When the DTC Sets

- The PCM commands a soft landing to third gear.
- The PCM commands maximum line pressure.
- The PCM freezes shift adapts from being updated.
- The PCM inhibits the TCC engagement.
- The PCM inhibits 4th gear if in hot mode.
- The PCM illuminates the Malfunction Indicator Lamp (MIL).

Conditions for Clearing the MIL/DTC

- The PCM turns OFF the MIL after three consecutive ignition cycles without a failure reported.
- A scan tool can clear the DTC from the PCM history. The PCM clears the DTC from the PCM history if the vehicle completes 40 warm-up cycles without a failure reported.
- The PCM cancels the DTC default actions when the fault no longer exists and the ignition is OFF long enough in order to power down the PCM.

Diagnostic Aids

- Inspect the wiring for any poor electrical connections at the PCM. Inspect the wiring at the transmission 20-way connector. Look for the following conditions:
 - A bent terminal
 - A backed out terminal
 - A damaged terminal
 - Poor terminal tension
 - A chafed wire
 - A broken wire inside the insulation
- When diagnosing for an intermittent short or an open condition, massage the wiring harness while watching the test equipment for a change.

Test Description

The item numbers below refer to the Step numbers on the diagnostic chart.

4. This Step verifies that the PCM can control the 3-2 shift solenoid valve assembly.
5. This Step verifies that the 3-2 Shift Solenoid Valve Assembly receives power from the ignition through the fuse.
7. This Step verifies that the PCM and the wiring properly control the ground circuit.
9. This Step measures the resistance of the automatic transmission wiring harness. This Step then compares the actual resistance to the expected resistance.

DTC P1886 3-2 SS Valve Assembly CKT Electrical

Step	Action	Value(s)	Yes	No
1	Was the Powertrain On-Board Diagnostic (OBD) System Check performed?	—	Go to Step 2	Go to <i>Powertrain OBD System Check</i> , Section 6E
2	1. Install the scan tool. 2. With the engine OFF, turn the ignition switch to the RUN position. Important: Before clearing the DTCs, use the scan tool in order to record the Freeze Frame and Failure Records for reference. The Clear Info function will erase the data. 3. Record the DTC Freeze Frame and Failure Records. Have the DTCs P0753, P0758, P1860, P1864, or P1886 set?	—	Go to Step 3	Go to Step 4
3	Inspect circuit 439, the solenoid, the EMI fuse, and the Automatic Transmission wiring harness for an open or a short to ground. Repair the circuit, the solenoid, and the harness if necessary. Refer to Electrical Diagnosis, Section 8A. Did you find and correct a problem?	—	Go to Step 18	—
4	Command the 3-2 Shift Solenoid Valve Assembly ON and OFF three times, while listening to the bottom of the transmission pan (a stethoscope may be necessary). Does the solenoid click when commanded?	—	Go to Diagnostic Aids	Go to Step 5
5	1. Turn the ignition OFF. 2. Disconnect the transmission 20-way connector (additional DTCs will set). 3. Install the J 39775 Jumper Harness on the engine harness connector. <i>Automatic Transmission</i> 4. With the engine OFF, turn the ignition to the Run position. 5. Connect a test lamp, from the J 39775 Jumper Harness cavity E to ground. Did the test lamp illuminate?	—	Go to Step 7	Go to Step 6
6	Repair the open or short to ground in the ignition feed circuit 439 to the 3-2 Shift Solenoid Valve Assembly. Refer to Electrical Diagnosis, Section 8A. Is the repair complete?	—	Go to Step 18	—

DTC P1886 3-2 SS Valve Assembly CKT Electrical (cont'd)

Step	Action	Value(s)	Yes	No
7	1. Install a test lamp between cavity E and cavity S of the J 39775 Jumper Harness. 2. Command the 3-2 shift solenoid valve assembly ON and OFF three times. Does the test lamp illuminate when you command the shift solenoid valve assembly ON, and turn OFF when you command OFF?	—	Go to Step 9	Go to Step 8
8	1. Inspect circuit 897 for an open or short to ground. 2. Repair the circuit if necessary. Refer to Electrical Diagnosis, Section 8A. Did you find and correct a problem?	—	Go to Step 18	Go to Step 10
9	1. Install the J 39775 Jumper Harness on the transmission 20-way connector. 2. Using the J 39200 DVOM and J 35616 Connector Test Adapter Kit, measure the resistance between the terminals E and S. Is the resistance within the specified range?	20–32Ω	Go to Step 13	Go to Step 11
10	1. Inspect the PCM connector terminals for the following conditions: – Damaged connector pins – Backed out connector pins – Weak terminal tension 2. Repair the connectors if necessary. Did you find and correct a problem?	—	Go to Step 18	Go to Step 17
11	1. Disconnect the Automatic Transmission wiring harness from the 3-2 shift solenoid valve assembly. 2. Measure the resistance of the 3-2 shift solenoid valve assembly. Is the resistance within the specified range?	20–32Ω	Go to Step 12	Go to Step 16
12	1. Inspect the Automatic Transmission wiring harness for an open circuit. 2. Repair the circuit if necessary. Refer to Electrical Diagnosis, Section 8A. Did you find and correct a problem?	—	Go to Step 18	—
13	• Measure the resistance between the terminal S and ground. • Measure the resistance between the terminal E and ground. Are both measurements greater than the specified value?	250kΩ	Go to Diagnostic Aids	Go to Step 14
14	1. Disconnect the Automatic Transmission wiring harness from the 3-2 shift solenoid valve assembly. 2. Measure the resistance between the component's terminals and ground. Are both readings greater than the specified value?	250kΩ	Go to Step 15	Go to Step 16
15	Inspect the Automatic Transmission wiring harness for a short to ground. Repair the harness if necessary. Refer to Electrical Diagnosis, Section 8. Did you find and correct a problem?	—	Go to Step 18	—
16	Replace the 3-2 shift solenoid. Refer to <i>Valve Body</i>. Is the replacement complete?	—	Go to Step 18	—

DTC P1886 3-2 SS Valve Assembly CKT Electrical (cont'd)

Step	Action	Value(s)	Yes	No
17	Replace the PCM. Refer to <i>PCM Replacement/Programming</i> , Section 6. Is the replacement complete?	—	Go to Step 18	—
18	- After the repair is complete, select DTC. - Select Clear Info. - Operate the vehicle. Ensure the following conditions are satisfied: - When you command the 3-2 shift solenoid ON, the voltage decreases to zero. - When you command the 3-2 shift solenoid OFF, the voltage increases to B+. - All conditions are satisfied for 5 seconds. - Select Specific DTC. Enter DTC P1886. Has the test run and passed?	—	System OK	<i>Begin the diagnosis again.</i> Go to Step 1

Description and Operation

Transmission ID Information

13268

Transmission General Information

Transmission Identification Information

6477

The HYDRA-MATIC 4L60-E transmission has the identification information stamped into the case pan rail.

26874

This information helps the service technician order the correct replacement parts from a GM parts catalog.

Additional transmission identification information is provided on the Service Parts Identification label.

This label shows the Regular Production Options (RPO) as well as the standard and mandatory options. This label is affixed to the inside of each vehicle at the assembly plant. For more information, refer to Section 0A.

6480

Legend

- (1) Vehicle Identification Number
- (2) Wheel Base
- (3) Part Number Location
- (4) Model Designation
- (5) Order Number
- (6) Exterior Color
- (7) Paint Technology

Throttle Positions

- Minimum Throttle — The least amount of throttle opening required for an upshift.
- Light Throttle — Approximately 1/4 of the accelerator pedal travel.
- Medium Throttle — Approximately 1/2 of the accelerator pedal travel.
- Heavy Throttle — Approximately 3/4 of the accelerator pedal travel.
- Wide Open Throttle (WOT) — Full travel of the accelerator pedal.
- Full Throttle Detent Downshift — A quick apply of the accelerator pedal to its full travel, forcing a downshift.
- Zero Throttle Coast Down — A full release of the accelerator pedal while the vehicle is in motion and in the drive range.
- Engine Braking — A condition where the engine is used to slow the vehicle by manually downshifting during a zero throttle coast-down.

Shift Conditions

- Bump — A sudden and forceful apply of a clutch or band.
- Chuggle — A bucking or jerking condition that may be engine related. This condition may be most noticeable when the converter clutch is engaged. Similar to the feel of towing a trailer.

- Delayed — A condition where a shift is expected but does not occur for a period of time. This condition could be described as clutch or band engagement not occurring as quickly as expected during a part throttle or wide open throttle apply of the accelerator, or when manually downshifting to a lower range. Also defined as LATE or EXTENDED shift.
- Double Bump (Double Feel) — Two sudden and forceful applies of a clutch or band.
- Early — A condition where the shift occurs before the vehicle has reached a proper speed and tends to labor the engine after the upshift.
- End Bump — A firmer feel at the end of a shift as compared to the feel at the start of a shift. Also defined as END FEEL or SLIP BUMP.
- Firm — A noticeable quick apply of a clutch or band that is considered normal with a medium to heavy throttle shift. Do not confuse with HARSH or ROUGH.
- Flare — A quick increase in engine RPM accompanied with a momentary loss of torque. This most generally occurs during a shift. Also defined as SLIPPING.
- Harsh (Rough) — A more noticeable apply of a clutch or band as compared to FIRM. This condition is considered undesirable at any throttle position.
- Hunting — A repeating quick series of upshifts and downshifts that causes a noticeable change in engine RPM. An example could be described as a 4-3-4 shift pattern. Also defined as BUSYNESS.
- Initial Feel — A distinct firmer feel at the start of a shift as compared to the finish of the shift.
- Late — A shift that occurs when the engine is at a higher than normal RPM for a given amount of throttle.
- Shudder — A repeating jerking sensation similar to CHUGGLE but more severe and rapid in nature. This condition may be most noticeable during certain ranges of the vehicle speed. You may also use Shudder to define the condition after converter clutch engagement.
- Slipping — A noticeable increase in engine RPM without a vehicle speed increase. A slip usually occurs during or after initial clutch or band engagement.
- Soft — A slow, almost unnoticeable clutch or band apply with very little shift feel.
- Surge — A repeating engine related feeling of acceleration and deceleration that is less intense than CHUGGLE.
- Tie-Up — A condition where two opposing clutches and/or bands are attempting to apply at the same time causing the engine to labor with a noticeable loss of engine RPM.

Noise Conditions

- Gear Noise — A whine, most noticeable in first gear and reverse, that is related to the vehicle speed. A gear noise condition may become less noticeable or go away after an upshift.
- Pump Noise — A high pitch whine that increases in intensity with engine RPM. This condition may also be noticeable in P (Park) or N (Neutral) operating ranges with the vehicle stationary.

Preliminary Checking Procedure

Transmission performance may be influenced by one, or more of the following items:

- Fluid level high/low.
- Engine performance.
- Manual linkage adjustment.
- Internal fluid leaks.
- Electrical system.
- Transmission or other mechanical component.

These items should be checked and corrected, if necessary, before attempting transmission diagnosis.

Transmission Fluid Checking Procedure

Checking fluid level, color, and condition at regular intervals will provide early diagnostic information about the transmission. This information may then be used to correct a condition that, if not detected early, could result in major transmission repair.

Refer to Section 0B for maintenance information and servicing intervals.

Important: New automatic transmission fluid is red. Red dye is added in order to help the assembly plant distinguish this fluid from engine oil and antifreeze. The red dye is not permanent. After some driving, the transmission fluid will look darker. Eventually, the fluid may appear light brown.

- Wait at least 30 minutes before checking the transmission fluid, if the vehicle has been driven under the following conditions:
 - Outside temperature is above 32°C (90°F)
 - At high speed for more than 15 minutes
 - In heavy traffic during hot weather
 - While pulling a trailer
- In order to get the correct reading, the fluid should be at a normal operating temperature, which is 82°C-94°C (180°F-200°F).
- Do the following for a hot check:

Warm up the vehicle by driving about 24 km (15 miles), when the outside temperature is above 10°C (50°F).

If the temperature is colder than 10°C (50°F), you may have to drive the vehicle longer.

- Do the following for a cold check:

Do a cold check when the transmission temperature is 24°C-29°C (75°F-85°F).

Let the engine run at slow idle for 5 minutes, if the outside temperature is 10°C (50°F) or higher.

If the outside temperature is colder than 10°C (50°F), you may have to idle the engine longer than 5 minutes.

- Do the following for a hot or a cold transmission fluid check:
 1. Idle the engine.
 2. Park the vehicle on a level surface.
 3. Place the shift lever in the P (Park) position.
 4. Apply the parking brake.
 5. With you foot on the brake pedal, move the shift lever through each gear, pausing for about 3 seconds in each range. Then, put the shift lever in P (Park).
 6. Idle the engine for 3 minutes or more.
- Now, do the following in order to check the fluid level:
 1. Pull out the dipstick. Wipe the dipstick well with a clean rag or a paper towel.
 2. Push the dipstick in all the way. Wait 3 seconds. Then, pull the dipstick back out again.
 3. Check both sides of the dipstick, reading the lower level.
 - For a cold check, the fluid level must be in the COLD area.
 - For a hot check, the fluid level must be in the HOT or crosshatched area.
 4. If the fluid level is OK, push the dipstick back in all the way.

Notice: Do not overfill the transmission. Overfilling will result in foaming, loss of fluid, and possible damage to the transmission.
 5. If the fluid level is low, add only enough DEXRON®-III (or, if unavailable, DEXRON®-IIE) to bring the fluid level up to the COLD area for a cold check or the HOT area for a hot check.

Generally, this will require less than a pint of fluid. Do not overfill.
 6. After adding the fluid, recheck the fluid level as described above. When the fluid level is correct, push the dipstick in all the way.
- Transmission fluid should be red in color when the fluid is new.

Automatic Transmission Diagnosis

Throttle Positions

This section provides general information on transmissions, a detailed description of HYDRA-MATIC 4L60-E operation, and the diagnostic procedures. When diagnosing any condition on the 4L60-E, begin with the "Functional Test Procedure" in this section. After you determine the cause of a condition, refer to On-Vehicle Service for repair procedures.

Minimum Throttle: The least amount of throttle opening required for upshift.

Light Throttle: Approximately $\frac{1}{4}$ of the accelerator pedal.

Medium Throttle: Approximately $\frac{1}{2}$ of the accelerator pedal travel.

Heavy Throttle: Approximately $\frac{3}{4}$ of the accelerator pedal travel.

Wide Open Throttle (WOT): Full travel of the accelerator pedal.

Full Throttle Detent Densified: A quick application of the accelerator pedal to its full travel in order to force a downshift.

Engine Braking: A condition in which you use the engine in order to slow the car by downshifting manually during a zero-throttle coastdown.

Zero throttle Coastdown: A full release of the accelerator pedal while the car is in motion and in drive range.

Shift Conditions

Bump: A sudden and forceful engagement of a clutch or band.

Chuggle: A bucking or jerking that is most noticeable when the converter clutch is engaged. A Chuggle is similar to the feel of towing a trailer.

Delayed: A condition in which a shift is expected but does not occur for a period of time. Delayed is also defined as late or Extended.

Double Bump (Double Feel): Two sudden and forceful engagements of a clutch or a band.

Early: A condition in which the shift occurs before the car has reached the proper speed. The early condition tends to labor the engine after the upshift.

End Bump: A firmer feel at the end of a shift as compared to the feel at the start of the shift. End bump also is defined as "End Feel" or "Slip Bump".

Firm: A noticeably quick engagement of a clutch or band that is considered normal with a medium to heavy throttle. This should not be confused with "Harsh" or "Rough".

Flare: A quick increase in engine rpm along with a momentary loss of torque. This generally occurs during a shift. Flare is also defined as "Slipping".

Harsh (Rough): a more noticeable engagement of a clutch or a band as compared with "Firm". This condition is considered undesirable at any throttle position.

Hunting: A repeating quick series of upshifts and downshifts that causes a noticeable change in engine rpm. An example is a 4-3-4 shift pattern. Hunting also is defined as "Busyness".

Initial Feel: a distinct sturdy feel at the start of a shift as compared to the end of the shift.

Late : A shift occurs when the engine is at a higher than normal rpm for a given amount of throttle.

Shudder: A continuous jerking condition similar to "Chuggle" but more severe rapid. This condition is most noticeable during certain car speed ranges.

Slipping: A noticeable increase in engine rpm without a car speed increase. A slip usually occurs during or after the initial clutch or band engagement.

Soft: A slow, almost unnoticeable clutch or band engagement with very little shift feel.

Surge: A repeating acceleration and deceleration that is engine-related. This condition is less intense than "Chuggle".

Tie Up: A condition in which two opposing clutches and/or bands are attempting to engage at the same time, causing the engine to labor with a noticeable loss of engine rpm.

Noise Conditions

Planetary Gear Noise: A whine related to the car speed that is most noticeable in the first gear or reverse. Planetary Gear Noise is less noticeable after an upshift.

Pump Noise: A high pitch whine that increases with engine rpm.

Transmission Scan Tool Data Definitions

BARO: Displays a range of 10–104 kPa, 0.00–5.00V. The BARO Sensor measures barometric pressure during the ignition ON cycle and during Wide Open Throttle (WOT). This allows the PCM to make fuel delivery, spark timing, and transmission line pressure adjustments for changing altitudes.

MAP (Manifold Absolute Pressure): Displays a range of 10–104 kPa, 0.00–5.00V. The MAP sensor, which is attached to the intake manifold, measures changes in intake manifold pressure. These changes result from engine speed and load changes. The PCM uses this information to adjust fuel delivery and spark plug timing according to incoming air density.

TP (Throttle Position) Sensor: Displays a range of 0.00–5.00V. The TP sensor is used by the PCM to determine the amount of throttle demanded by the driver. Voltage is below 1 volt at idle and above 4 volts at Wide Open Throttle (WOT).

TP (Throttle Position) Angle: Displays a range of 0–100%. The TP angle is computed by the PCM from the TP sensor voltage. The TP angle should read 0% at idle and 100% at Wide Open Throttle (WOT).

A/C Clutch: Displays ON or OFF. This parameter indicates the commanded state of the A/C control relay. The clutch should be engaged when ON displays.

Cruise Enabled: Displays ON or OFF. This parameter indicates whether the PCM is allowing cruise operation. The PCM has the ability to disable cruise control under certain conditions.

Hot Mode: Displays ON or OFF. This parameter monitors transmission temperature. OFF indicates the transmission temperature has not exceeded 127°C (261°F). ON indicates the transmission temperature has exceeded 135°C (275°F).

Adaptable Shift: Displays Yes or No. This parameter is the monitor of the upshift adapt. YES indicates that the adapt capability is functional and displays during shift calculation until the commanded gear changes. NO indicates that the adapt is not functional.

Current TAP (Transmission Adaptive Pressure)

Memory: Displays a range of -16 to +16 psi. This parameter is the amount of pressure that is added to base line pressure to adjust the holding effort of a clutch or a band, while shifting.

Current TAP (Transmission Adaptive Pressure):

Displays a TP cell range of 0–16. This parameter indicates the current throttle position cell used for line pressure modification (adaptation).

Long Shift Delay: Displays Yes or No. This parameter indicates whether a long shift delay occurred during the last shift. YES indicates that a long shift delay occurred. NO indicates that a long shift delay did not occur. A shift delay is determined from the time that the PCM commands the shift until the start of the engine RPM drop. When a shift delay is within a range that enables shift adapts, NO is indicated.

Long Shift Time: Displays Yes or No. This parameter indicates whether a long shift time occurred during the last shift. YES indicates that a long shift time occurred. NO indicates that a long shift time did not occur. Shift time is calculated from the beginning of the engine RPM drop to the beginning of the engine RPM increase. When shift time is within a range that enables shift adapts, NO is indicated.

TP Range: Displays Normal or Exceeded. This parameter indicates when the throttle position is within a range that enables shift adapts. Normal indicates that the TP is within the range. Exceeded indicates that the TP is not within the range.

Standard TAP (Transmission Adaptive Pressure):

Displays Yes or No. The standard TAP is an amount of pressure that is added to the base line pressure. If the shift requires standard TAP to achieve the shift, then the scan tool displays Yes. If the shift requires more or less than the standard TAP to achieve the shift, then the scan tool displays No, indicating that the TAP is out of the standard range.

VSS Delta: Displays Normal or Exceeded. This parameter indicates when the VSS is within a range that enables shift adapts. Normal indicates that the VSS is within the range. Exceeded indicates that the VSS is not within the range.

TP Delta: Displays Normal or Exceeded. This parameter indicates when the TPS is within a TPS delta range that enables shift adapts. A TPS delta range is how much the TPS is moved during the shift calculation. Normal indicates that the TPS is within the range. Exceeded indicates that the TPS is not within the range.

Engine Run Time: Displays a range of 0:00:00–18:12:15 hr/min/sec. This parameter measures how long the engine has been operating. When the ignition switch is turned OFF, the value is reset to zero.

Ignition 1: Displays a range of 0.0–25.5V. This represents the system voltage measured by the PCM at its ignition feed.

Gear Ratio: Displays a range of 0.00–3.98–1. This parameter is the actual gear ratio of the current commanded gear.

Current Gear: Displays 1, 2, 3, or 4. This parameter indicates the current commanded state of the shift solenoids.

TFT (Automatic Transmission Fluid Temperature):

Displays a range of -40°C to 151°C (-40°F to 304°F). This parameter is the input signal of the transmission fluid temperature sensor. Transmission fluid temperature is high (151°C) when signal voltage is low (0V), and transmission fluid temperature is low (-40°C) when signal voltage is high (5V).

ECT (Engine Coolant Temperature): Displays a range of -40°C to 151°C (-40°F to 304°F). This parameter is the input signal of the engine coolant temperature sensor. The engine coolant temperature is high (151°C) when the signal voltage is low (0V), and the engine coolant temperature is low (-40°C) when the signal voltage is high (5V).

TFT (Transmission Fluid Temperature) Sensor:

Displays a range of 0.00–5.00V. When the transmission fluid is cold, the sensor resistance is high and the PCM will sense high signal voltage. As the transmission fluid temperature warms to normal operating temperature, the sensor resistance becomes less and the voltage decreases to about 1.5–2.0V.

TCC (Torques Converter Clutch) Slip Speed:

Displays a range of -4080 to 4079 RPM. This parameter is the difference between transmission output speed and engine speed. A negative value indicates that the engine speed is less than the output speed (deceleration). A positive value indicates that the engine speed is greater than the output speed (Acceleration). A value of zero indicates that the engine speed is equal to the output speed (TCC applied).

TCC Brake Switch: Displays Open or Closed. This parameter indicates the state of the TCC brake switch circuit input. Open indicates a zero voltage input (brake switch open, brake pedal applied). Closed indicates a B+ voltage input (brake switch closed, brake pedal released).

TCC Duty Cycle: Displays a range of 0–100%. This parameter is the commanded percentage of ON time of the TCC PWM solenoid. 90% represents an ON (energized) commanded state. 0% represents an OFF (non-energized) commanded state. This commanded state is applied at a vehicle speed greater than approximately 16 km/h (10 mph).

TCC Enable: Displays ON or OFF. This parameter is the commanded state of the TCC solenoid. ON indicates a commanded energized state (current is flowing through the solenoid). OFF indicates a commanded non-energized state (current is not flowing through the solenoid). This commanded state occurs at various vehicle speeds between applications.

TCC Duty Open: Displays Yes or No. This parameter indicates whether an open or a short to ground exists in the TCC PWM solenoid feedback signal to the PCM.

TCC Duty Shorted: Displays Yes or No. This parameter indicates whether a short to B+ exists in the TCC PWM solenoid feedback signal to the PCM.

TCC Enable Open: Displays Yes or No. This parameter indicates whether an open or a short to ground exists in the TCC solenoid feedback signal to the PCM.

TCC Enable Short: Displays Yes or No. This parameter indicates whether a short to B+ exists in the TCC solenoid feedback signal to the PCM.

1–2 Sol / 2–3 Sol: Displays ON or OFF. These parameters are the commanded status of the 1–2 and the 2–3 shift solenoid valves. ON represents a commanded energized state (current is flowing through the solenoid). OFF represents a non-commanded state (current is not flowing through the solenoid).

1–2 Sol. Open: Displays Yes or No. this parameter indicates if an open or short to ground exists in the 1–2 shift solenoid valve feedback signal to the PCM.

1–2 Sol. Short: Displays Yes or No. this parameter indicates if a short to B+ exists in the 1–2 shift solenoid valve feedback signal to the PCM.

2–3 Sol. Open: Displays Yes or No. this parameter indicates if an open or short to ground exists in the 2–3 shift solenoid valve feedback signal to the PCM.

2–3 Sol. Short: Displays Yes or No. this parameter indicates if a short to B+ exists in the 2–3 shift solenoid valve feedback signal to the PCM.

3–2 Downshift: Displays Yes or No. This parameter indicates if the 3–2 downshift control solenoid is currently commanded On or Off. Yes indicates that the 3–2 shift solenoid is ON. No indicates that the 3–2 shift solenoid is OFF. The solenoid commanded state is based on the transmission temperature. The solenoid will change states during a 3–2 downshift to regulate the appropriate pressure. The commanded state of the solenoid occurs at approximately 30 mph with a throttle increase.

3–2 DS (Downshift) Open: Displays Yes or No. This parameter indicates if an open or short to ground exists in the 3–2 shift solenoid feedback signal to the PCM.

3–2 DS (Downshift) Shorted: Displays Yes or No. This parameter indicates if a short to B+ exists in the 3–2 shift solenoid feedback signal to the PCM.

1–2 Shift Time: Displays a range of 0.00–6.38 seconds. This parameter is the actual time of the last 1–2 shift. The shift time is based on the engine RPM drop after the commanded 1–2 shift. This value is only accurate if the Adaptable Shift parameter indicates Yes.

2–3 Shift Time: Displays a range of 0.00–6.38 seconds. This parameter is the actual time of the last 2–3 shift. The shift time is based on the engine RPM drop after the commanded 2–3 shift. This value is only accurate if the Adaptable Shift parameter indicates Yes.

1–2 Shift Error: Displays a range of -6.38 to +6.38 seconds. This parameter is the difference between the desired 1–2 shift time and the actual 1–2 shift time. This value is only accurate if the Adaptable Shift parameter indicates Yes.

2–3 Shift Error: Displays a range of -6.38 to +6.38 seconds. This parameter is the difference between the desired 2–3 shift time and the actual 1–2 shift time. This value is only accurate if the Adaptable Shift parameter indicates Yes.

3–4 Shift Time: Displays a range of 0.00–6.38 seconds. This parameter is the actual time of the last 3–4 shift. The shift time is based on the engine RPM drop after the commanded 3–4 shift. This value is only accurate if the Adaptable Shift parameter indicates Yes.

Latest Shift: Displays a range of 0.00–6.38 seconds. This parameter is the actual shift time of the last upshift. This value is only accurate if the Adaptable Shift parameter indicates Yes.

Latest Shift Error: Displays a range of -6.38 to +6.38 seconds. This parameter is the difference between the latest desired shift time and the latest actual shift time. This value is only accurate if the Adaptable Shift parameter indicates Yes.

Speed Ratio: Displays a range of 0.00–7.99. This parameter indicates engine speed divided by transmission output speed. This value is used to estimate transmission gear ratio.

Upshift Request: Displays Yes or No. This parameter indicates when the PCM is requesting an upshift. Yes indicates an upshift is requested. No indicates an upshift is not requested.

Upshift In Progress: Displays Yes or No. This parameter indicates if the transmission is currently in an upshift. Yes indicates an upshift is in progress. No indicates an upshift is not in progress.

Upshift Desired: Displays Yes or No. This parameter indicates when the PCM is requesting an upshift. Yes indicates an upshift is requested. No indicates an upshift is not requested.

DS Requested: Displays Yes or No. This parameter indicates when the PCM is requesting a downshift. Yes indicates a downshift is requested. No indicates a downshift is not requested.

DS In Progress: Displays Yes or No. This parameter indicates if the transmission is currently in a downshift. Yes indicates a downshift is in progress. No indicates a downshift is not in progress.

DS Desired: Displays Yes or No. This parameter indicates when the PCM is requesting a downshift. Yes indicates a downshift is requested. No indicates a downshift is not requested.

3-2 Started: Displays Yes or No. This parameter indicates when the transmission has started a 3-2 downshift. Yes indicates a 3-2 downshift has started. No indicates a 3-2 downshift has not started.

3-2 In Progress: Displays Yes or No. This parameter indicates whether the transmission is currently in a 3-2 downshift. Yes indicates a 3-2 downshift is in progress. No indicates a 3-2 downshift is not in progress.

Vehicle Speed: Displays a range of 0-255 km/h (0-158 mph). This parameter is the input signal from the vehicle speed sensor.

Engine Speed: Displays a range of 0-8192 RPM. This parameter indicates the rotational speed of the engine expressed as revolutions per minute.

PC Act. Current: Displays a range of 0.00-1.10 amps. This parameter is the actual current of the pressure control solenoid circuit at the control module. Zero amp (no current flow) indicates actual higher line pressure. Actual lower line pressure is indicated by 1.1 amps (high current flow).

PC Ref. (Reference) Current: Displays a range of 0.00-1.10 amps. This parameter is the commanded current of the pressure control solenoid circuit. Zero amp (no current flow) indicates commanded higher line pressure. Commanded lower line pressure is indicated by 1.1 amps (high current flow).

PC Duty Cycle: Displays a range of 0-100%. This parameter is the commanded state of the pressure control solenoid expressed as a percent of energized ON time. 0% indicates zero ON time (non-energized) or no current flow. Approximately 60% at idle indicates maximum ON time (energized) or high current flow.

Power Enrichment: Displays Yes or No. This parameter indicates when the power enrichment mode is active (moderate to heavy acceleration). Yes indicates that the power enrichment mode is active. No indicates that the power enrichment mode is not active.

Kickdown Enabled: Displays Yes or No. This parameter indicates whether enabling conditions exist for an acceleration mode downshift. No indicates that enabling conditions such as throttle position, vehicle speed, or input speed do not exist for an acceleration mode downshift. Yes indicates that enabling conditions exist for an acceleration mode downshift.

DTC Set This Ign: Displays Yes or No. This parameter displays Yes if a DTC is active during the current ignition cycle.

TR Switch: Displays a range of Invalid, Reverse, Overdrive, Drive3, Drive2, Low, or Park/Neutral. These parameters are the decoded status of the three A/B/C range inputs from the Automatic Transmission Fluid Pressure Manual Valve Position Switch Assembly. These parameters represent the position of the transmission manual valve.

Traction Control: Displays Active or Inactive. This parameter indicates the status of the TCS/ASR.

Trans OSS (Output Shaft Speed) sensor: Displays a range of 0-8192 RPM. This parameter indicates the rotational speed of the transmission output shaft expressed as revolutions per minute.

TFP Switch: Displays On/Off, On/Off, On/Off. These parameters are the three inputs from the Automatic Transmission Fluid Pressure Manual Valve Position Switch Assembly. On represents a 0 voltage signal. Off represents a B+ voltage signal.

1-2 and 2-3 Shift Solenoid Valves

8885

Important: The shift solenoid valve resistance should measure 20-40 ohms minimum when measured at 20°C (68°F). The shift solenoid current flow should not exceed 0.75 amps. The shift solenoid should energize at a voltage of 7.5 volts or more (measured across the terminals). The shift solenoid should de-energize when the voltage is one volt or less. If both solenoids lose power, only the third gear only results.

The 1-2 and 2-3 shift solenoid valves (also called A and B solenoids) are identical devices that control the movement of the 1-2 and 2-3 shift valves (the 3-4 shift valve is not directly controlled by a shift solenoid). The solenoids normally are open exhaust valves that work in four combinations to shift the transmission into different gears.

The PCM energizes each solenoid by grounding the solenoid through an internal quad driver. This sends current through the coil winding in the solenoid and moves the internal plunger out of the exhaust position. When ON, the solenoid redirects fluid to move a shift valve.

The PCM-controlled shift solenoids eliminate the need for TV and governor pressures to control shift valve operation.

The pressure control solenoid takes the place of the throttle valve that was used on the past model transmissions.

Important: The manual valve hydraulically can override the shift solenoids. Only in D4 are the shift solenoid states totally determining what gear the transmission is in. In the other manual valve positions, the transmission shifts hydraulically and the shift solenoid states "catch up" when the throttle position and the vehicle speed fall into the correct ranges. Diagnostic trouble codes 081 and 082 indicate shift solenoid circuit voltage faults.

3-2 Shift Solenoid Valve Assembly

8890

Important: The 3-2 shift solenoid valve assembly resistance should be a minimum of 9–14 ohms at 20°C (68°F), if it is operated using the pulse width modulation at a frequency of 50 Hz.

The 3-2 shift solenoid valve assembly is a pulse-width modulated solenoid that is used in order to improve the 3-2 downshift. The solenoid regulates the release of the 3-4 clutch and the 2-4 band apply.

The solenoid uses duty cycle in order to regulate the pressures that smoothly release the clutch and apply the band. The duty cycle normally is about 0% in the first gear, 90% in all other drive gears and drops

during the 3-2 downshift. Throttle position, vehicle speed and the commanded gear are used to determine the duty cycle.

If a voltage fault is detected in the 3-2 shift solenoid circuit, diagnostic trouble code 066 will set.

Transmission Pressure Control Solenoid

8884

Important: Transmission pressure control solenoid resistance should measure 3.5–8Ω when measured at 20°C (68°F).

The transmission pressure control solenoid (or force motor) is an electronic pressure regulator that controls pressure based on the current flow through its coil winding. The magnetic field produced by the coil moves the solenoid's internal valve which varies pressure to the pressure regulator valve.

The PCM controls the pressure control solenoid by commanding current between 0 and 1.1 amps. This changes the duty cycle of the solenoid, which can range between 0% and 60%. 1.1 amps correspond to the minimum line pressure, and 0 amps is the maximum line pressure (if the solenoid loses power, the transmission still has the maximum line pressure).

The PCM calculates the line pressure values, using inputs such as the throttle position sensor.

The pressure control solenoid takes the place of the throttle valve that was used on the past model transmissions.

If there is a difference between the amperage commanded by the PCM and the actual amperage, the diagnostic trouble code 073 will set. Unlike the pressure control solenoid on the HYDRA-MATIC 4L80-E, the 4L60-E pressure control solenoid does not pulse every 10 seconds for a cleaning cycle.

Torque Converter Clutch Solenoid Valve

8882

The torque converter clutch solenoid valve is a normally open exhaust valve that is used to control torque converter clutch apply and release. When grounded (energized) by the PCM, the TCC solenoid valve stops converter signal oil from exhausting. This causes converter signal oil pressure to increase and to shift the TCC solenoid valve to shift into the apply position.

The brake switch is an input to the PCM, and the PCM directly controls the TCC apply based on the brake switch status.

Important: The TCC solenoid resistance should be 20–40 ohms minimum when measured at 20°C (68°F).

Torque Converter Clutch PWM Solenoid Valve

10336

Important: TCC PWM solenoid valve resistance should be 10–11 ohms when measured at 20°C (68°F), and 3–15 ohms when measured at 100°C (212°F).

The torque converter clutch PWM solenoid valve controls the fluid acting on the converter clutch valve, which then controls the TCC apply and release. This solenoid is attached to the control valve body assembly within the transmission. The TCC PWM solenoid valve provides smooth engagement of the torque converter clutch by operating on a negative duty cycle a variable percent of ON time.

If a fault is detected in the TCC PWM circuit, code 083 will set.

Transmission Fluid Pressure (TFP) Manual Valve Position Switch

8889

Important: Seven valid components and two invalid combinations are available from the TFP: Valid combinations for Circuit A, B and C are shown below. Invalid combinations are the following:

- A=0V, B=0v AND C=0V
- A=0V, B=12v AND C=0V

The transmission fluid pressure (TFP) Manual Valve Position switch is a set of five pressure switches on the valve body that sense whether fluid pressure is present in five different valve body passages. The combination of which switches are open and closed is used by the PCM in order to determine actual manual valve position. The TFP assembly, however, cannot distinguish between PARK and NEUTRAL because the monitored valve body pressures are identical in both cases.

The switches are wired to provide three signal lines that are monitored by the PCM. These inputs are used to help control the line pressure, the torque converter clutch apply and the shift solenoid operation. Voltage at each of the signal lines is either zero or twelve volts.

In order to monitor the TFP assembly operation, the PCM compares the actual voltage combination of the switches to a TFP combination chart stored in its memory. If the PCM sees one of two 'illegal' voltage combinations a code 028 will result. A Code 28 indicates a short circuit condition in either the range signal A or the range signal C circuits.

The TFP assembly signal voltage can be measured from each pin-to-ground and compared to the combination chart. On the transmission wiring harness, pin N is range signal A, pin R is range signal B and pin P is range signal C. With the wiring harness connected and the engine running, a voltage measurement of these three lines will indicate a high reading (near 12 volts) when a circuit is open, and a low (zero volts) when the circuit is switched to ground.

The transmission temperature sensor is part of the transmission fluid pressure switch assembly.

Vehicle Speed Sensor

8886

Important: The sensor resistance should be 1260–1540 ohms when measured at 20 °C (68 °F). Output voltage varies with speed from a minimum of 0.5 volts AC at 100 RPM to more than 100 Volts AC at 8000 RPM.

The vehicle speed sensor (or transmission output speed sensor) controls shift points and calculates the TCC slip.

The speed sensor contains a coil that gives off a continuous magnetic field. A rotor rotates past the sensor and the rotor teeth break the magnetic field. Each break in the field sends a pulse to the VSSB (Vehicle Speed Sensor Buffer). The VSSB sends two signals to the PCM. The first is a 2002 pulse per mile (PPM) signal that is used by the engine. The second is the transmission/transfer case 40 pulse per revolution (PPR) signal that is used in order to control the transmission.

In two wheel drive (2WD) applications, the vehicle speed sensor is located on the transmission extension housing. Trans Output Speed = Transfer Case Speed.

Codes 024 or 072 will set if a fault exists in the vehicle speed sensor circuit 40 PPR line.

Automatic Transmission Fluid Temperature Sensor

The Automatic Transmission Fluid Temperature (TFT) Sensor is part of the Automatic Transmission Fluid Pressure Manual Valve Position (TPF Val. Position) switch assembly. This sensor helps control torque converter clutch apply and shift quality.

The temperature sensor is a resistor, or thermistor, which changes value based on temperature. At low temperatures the resistance is high, and at high temperatures the resistance is low.

The PCM sends a 5-volt signal to the temperature sensor and the PCM measures the voltage drop in the circuit. You will measure a high voltage when the transmission is cold and a low voltage when the transmission is hot..

If the temperature sensor circuit has a fault, code P0712 or P0713 is set. A code P0712 indicates a short circuit condition, while a code P0713 indicates an open circuit condition. Code P1812 is set if the transmission is operating at a high temperature for a period of time.

Transmission Sensor

Torque Converter Clutch Electrical Controls

The Torque Converter Clutch (TCC) system uses controls that are internal as well as external to the transmission. For the internal control components of the TCC system, refer to *Torque Converter Clutch Diagnosis*.

The TCC system includes the following external control components:

- Cruise Control Release Switch — In order to avoid stalling the engine when braking, the converter clutch releases anytime the brake pedal is applied.
- Powertrain Control Module (PCM) — The PCM receives input signals and grounds TCC solenoid to apply clutch when the proper operating conditions are met.
- Throttle Position (TP) Sensor — The TP Sensor sends throttle position information to the Powertrain Control Module (PCM).
- Vehicle Speed Sensor (VSS) — The VSS sends vehicle speed information to the Powertrain Control Module (PCM).
- Manifold Absolute Pressure (MAP) Sensor — The MAP Sensor sends engine vacuum (load) information to the Powertrain Control Module (PCM).
- Engine Coolant Temperature (ECT) Sensor — The ECT Sensor sends engine coolant temperature information to the Powertrain Control Module (PCM).

Electrical Connector

The transmission electrical connector is an important part of the transmission operating system. Any interference with the electrical connection can cause the transmission to set Diagnostic Trouble Codes (DTCs) or affect proper operation.

The following items can affect the electrical connection:

- Bent pins in the connector from rough handling during connection and disconnection
- Wires backing away from the pins or coming uncrimped (in either the internal or the external wiring harness)
- Dirt contamination entering the connector when disconnected
- Pins in the internal wiring connector backing out of the connector or pushed out of the connector during reconnection
- Excessive transmission fluid leaking into the connector, wicking up into the external wiring harness and degrading the wire insulation
- Moisture intrusion in the connector
- Low pin retention in the external connector from excessive connection and disconnection of the wiring connector assembly
- Pin corrosion from contamination
- Damaged connector assembly

13265

Remember the following points:

- In order to remove the connector, squeeze the two tabs toward each other and pull straight up.
- Limit twisting or wiggling the connector during removal. Bent pins can occur.
- Do not pry the connector off with a screwdriver or other tool.
- In order to reinstall the external wiring connector, first orient the pins by lining up the arrows on each half of the connector. Push the connector straight down into the transmission without twisting or angling the mating parts.
- The connector should click into place with a positive feel and/or noise.
- Whenever the transmission external wiring connector is disconnected from the internal harness and the engine is operating, DTCs will set. Clear these DTCs after reconnecting the external connector.

1996 Chevrolet Caprice, Impala SS/Buick Roadmaster/ Chevrolet Wagon and Buick Wagon Service Manual

Book 2

Foreword

This manual provides information on the diagnosis, the service procedures, the adjustments, and the specifications for the 1996 Chevrolet Caprice, Impala SS/Buick Roadmaster/Chevrolet Wagon and Buick Wagon.

BOOK 1 contains all sections EXCEPT Engine Controls (Section 6E), Automatic Transaxle Diagnosis (Section 7A) and Electrical Diagnosis (Section 8A).

BOOK 2 contains Engine Controls (Section 6E), Automatic Transaxle Diagnosis (Section 7A) and Electrical Diagnosis (Section 8A).

This service manual replaces the 1996 Caprice, Impala SS/Buick Roadmaster Preliminary Service Manual (GMP/96-B-2P).

Information on unit repair (overhaul) can be found in the 1996 Transmission/Transaxle/Transfer Case Unit Repair Manual (TURM), GMPT/96-TURM, available separately. The TURM manual contains information on automatic and manual transmissions and transaxles, and transfer cases for all GM passenger cars and light duty trucks, including the fluid flow and circuit description information.

The technicians who understand the material in this manual and in the appropriate Dealer Service Bulletins better serve the vehicle owners.

When this manual refers to a brand name, a number, or a specific tool, you may use an equivalent product in place of the recommended item. All information, illustrations and specifications in this manual are based on the latest product information available at the time of publication approval. General Motors reserves the right to make changes at any time without notice.

DIAGNOSTIC INFORMATION

The Electrical Diagnosis section contains the following types of diagnostic information (the way in which the information is arranged may vary from system to system or vehicle to vehicle):

- Electrical Schematics
- Component Location Lists
- Harness Connector Faces
- Troubleshooting Hints
- System Checks
- System Diagnosis
- Circuit Operation Descriptions
- Harness Routing Views

Using these elements together will make electrical troubleshooting faster and easier. Each element is described below.

The **Circuit Schematic** shows the electrical current paths when a circuit is operating properly. It is essential to understand how a circuit should work before trying to diagnose a failure.

The **Component Location List** helps to find where the components of a system can be located. A brief statement of the location is given and also a reference to a drawing that shows the component and its connecting wires. These **Component Location Views** are in SECTION 8A-201.

The **Harness Connector Faces** show the cavity or terminal locations in all the 4 pin or larger connectors shown in the schematic. Together with the wire colors and terminals given in the schematic, they help locate test points. The drawings show the connector faces as seen after the harness connector has been disconnected from a component or mating connector.

The **Troubleshooting Hints** offer short-cuts or checks to help determine the cause of a complaint. They

are not intended to be a rigid procedure for solving an electrical situation. Rather, Troubleshooting Hints represent a common-sense approach, based on an understanding of the circuit.

The **System Check** gives a summary of how the system should be operated and what should happen. This is especially important when working on a new system. The System Check will help identify symptoms, lead to diagnosis and confirm normal operation of the system after repair.

The **System Diagnosis** provides a procedure to follow that will locate the condition in a circuit causing a malfunction. If your own knowledge of the system and the Troubleshooting Hints have not produced a quick fix, follow the System Diagnosis. All procedures are based on symptoms to assist in locating the condition as fast as possible.

The **Circuit Operation** describes the components and how the circuit works.

Harness Routing Views are found in SECTION 8A-203. These views show the routing of the major wiring harnesses and the in-line connectors between the major harnesses.

SECTION/PAGE NUMBER

Sections are organized by subsystems with most containing a circuit schematic and the associated text. This makes the section easy to use, since the page number will stay the same year after year. For example, the Cruise Control schematic will always begin on page 8A-34-0. The other information for Cruise Control follows and is pagged 8A-34-1, 8A-34-2, etc.

Some sections may have more than one circuit schematic, such as Power Distribution, Interior Lights and Air Conditioning. The circuit of interest can either be

Figure 1—Typical Horn Schematic

located by using the Index or by a quick look through the related section.

All the engine circuits for a particular engine VIN type are in the same section. This makes that section easy to use, since schematics for other engines are not in your way. The Instrument Panel schematics are organized similarly. If you are working on a vehicle with a Digital Cluster, only the schematics that apply to that vehicle's Digital Cluster will be in the section you use. Information on the Indicators and Gages Clusters will be in other sections.

SCHEMATICS

Schematics break the entire electrical system down into individual circuits. Wiring which is not part of the circuit of interest is referenced to another page, where the circuit is shown complete.

! Important:

- It is important to realize that no attempt is made on the schematic to represent components and wiring as they physically appear on the vehicle. For example, a 4-foot length of wire is treated no differently in a schematic from one which is only a few inches long. The number of cavities for each connector is listed in the Component Location List. Similarly, switches and other components are shown as simply as possible, with regard to function only.

When diagnosing a Horn problem, the technician would reference the Horn section. The schematic in Figure 1 is a typical example of what would be found in a Horn section of SECTION 8A, along with the following text.

Voltage is applied to the Horn Relay at all times. When the relay coil is grounded by closing the Horn Switch, the relay contacts close. When the relay contacts are closed, both the LH and RH Horns are energized.

INTRODUCTION

COMPONENT LOCATIONS

To locate the schematic components on the vehicle, use the Component Location List. Refer to "Typical Entries in the Component Location List."

Listed in the left hand column are the components, connectors, grounds and splices shown on the schematic. To the right of the component is the location, "Under RH side of I/P." Reference to LH and RH is made as though the technician was sitting in the driver's seat. On the same line, in the next two columns, are page and figure references for SECTION 8A-201, "Component Location Views." In this case, you are directed to Figure 4 on page 8A-201-1.

Where connectors are listed, the number of cavities is provided. This represents the total number of cavities in the connector, regardless of how many are actually used. This information is provided to help identify connectors on the vehicle. In the far right column is a page reference where a view of the connector face may be found. Connectors with 3 cavities or less are not included in SECTION 8A-202, "Harness Connector Faces."

Grounds are listed next in the table. The location description for G101 reads, "Behind LH Composite Headlamp." You are directed to page 8A-201-8, Figure 14.

Nearly every component, connector, ground or splice shown on a schematic can be pinpointed visually by using the Component Location View figures.

S212	I/P Wiring Harn, behind I/P, above Steering Column.....	6	8	

Figure 2—Typical Entries in the Component Location List

Figure 3—Typical Harness Connector Faces

HARNESS CONNECTOR FACES

The connectors (see Figure 3) are labeled with the component they are connected to, or the connector number. In addition the color of the connector is given along with the family/series name.

If you need to backprobe a connector while it is on the component (refer to page 8A-4-3 for probing procedures), the order of the terminals must be mentally reversed. The wire color is a help in this situation. If there is more than one wire of the same color, you may need to locate a test point from its terminal number. A useful trick is to imagine that you are probing a terminal from behind the page you are looking at. Then mentally locate that terminal with respect to the keyway or other reference mark.

OTHER INFORMATION

VIN REFERENCES

If schematics for more than one variation of an engine type—V6, for example—are shown, then the schematics will be labeled with VIN designation to distinguish the variations.

SERVICE PARTS IDENTIFICATION LABEL

To aid service and parts personnel in identifying options and parts originally installed, a Service Parts Identification Label has been placed in the vehicle. See SECTION 0A for the location of the label and the definition of the option codes.

Figure 5—Typical Fuse Block Details Schematic

battery voltage is applied to the Starter Solenoid, Fusible Link D, Fuses 1 and 2 in the Fuse Block and the Light Switch in the LH Pod. These fuses are said to be Hot At All Times, since battery voltage is always applied to them.

Notice that battery voltage is also applied to Fusible Link F and Coolant Fan Relay.

FUSE BLOCK DETAILS

The Fuse Block Details schematic (see Figure 5) shows all of the wiring between a fuse and the components connected to the fuse. The Fuse Block Details schematic is extremely helpful in locating a short circuit that causes a fuse to open.

INTRODUCTION

Figure 6—Typical Ground Distribution Schematic

GROUND DISTRIBUTION

Figure 6 is a sample Ground Distribution schematic for the Headlamps. It shows exactly which components share each ground. This information can often be a time-saver when troubleshooting ground circuits.

For example, if both Headlamps and the Park/Turn Lamp on one side are out, suspect an open in their common ground wire or the ground connection itself. On the other hand, if one of the lamps work, the ground and the wire up to the splice are good. You have learned this just by inspecting the schematic and knowing the vehicle's symptoms. No actual work on the lighting system was needed.

ELECTROSTATIC DISCHARGE (ESD)
SENSITIVE DEVICES

All ESD sensitive components are Solid State and the following information applies to them.

The ESD symbol (Figure 1) is used on schematics (Figure 2) to indicate which components are ESD sensitive. When handling any electronic part, the service technician should follow the guidelines below to reduce any possible electrostatic charge build-up on the service technician's body and inadvertent discharge to the electronic part. If it is not known whether or not a component is ESD sensitive, assume it is susceptible.

Figure 1 - ESD Symbol

Figure 2 - Typical Schematic

HANDLING PROCEDURES

1. Always touch a known good ground before handling the part. This should be repeated while handling the part and more frequently after sliding across a seat, sitting down from a standing position or walking a distance.
2. Avoid touching electrical terminals of the part, unless so instructed by a written diagnostic procedure.
3. When using a voltmeter, be sure to connect the ground lead first.
4. Do not remove a part from its protective package until it is time to install the part.
5. Before removing the part from its package, ground the package to a known good ground on the vehicle.

MEASURING PROCEDURES

The circuits shown within the boxes are greatly simplified. Do not troubleshoot by measuring resistance at any terminal of these devices unless so instructed by a written diagnostic procedure. Due to the simplification of the schematics, resistance measurements could be misleading, or could lead to electrostatic discharge.

SUPPLEMENTAL INFLATABLE RESTRAINT (SIR) SYSTEM

The SIR symbol (Figure 3) is used on schematics to alert the technician to the following important caution:

Figure 3 - SIR Symbol

CAUTION: This vehicle is equipped with Supplemental Inflatable Restraint (SIR). Refer to **CAUTIONS** in SECTION 9J under "ON-VEHICLE SERVICE" and the SIR Component and Wiring Location view in SECTION 9J before performing service on or around SIR components or wiring. Failure to follow **CAUTIONS** could result in possible air bag deployment, personal injury, or otherwise unneeded SIR system repairs.

Figure 4 - OBDII Symbol

ON-BOARD DIAGNOSTICS II (OBDII) SYMBOL

The OBDII symbol (Figure 4) is used on circuit diagrams to alert the technician that the circuit is essential for proper OBDII emission control circuit operation. Any circuit which, if it fails, causes the SERVICE ENGINE SOON indicator to turn on, is identified as an OBDII circuit.

VACUUM MOTORS AND DEVICES

Vacuum Motors operate like electrical solenoids, mechanically pushing or pulling a shaft between two fixed positions. When vacuum is applied, the shaft is pulled in. When no vacuum is applied, the shaft is pushed all the way out by a spring.

Double Diaphragm Motors can be operated by vacuum in two directions. When there is no vacuum, the motor is in the center "at rest" position.

Some Vacuum Motors such as the Servo Motor in the Cruise Control can position the actuating arm at any position between fully extended and fully retracted. The servo is operated by a control valve that applies varying amounts of vacuum to the motor. The higher the vacuum level, the greater the retraction of the motor arm. Servo Motors work like the two position motors; the only difference is in the way the vacuum is applied. Servo Motors are generally larger and provide a calibrated control.

BASIC KNOWLEDGE REQUIRED

Without a basic knowledge of electricity, it will be difficult to use the diagnostic procedures contained in this section. You should understand the basic theory of electricity and know the meaning of voltage, current (amps) and resistance (ohms). You should understand what happens in a circuit with an open or a shorted wire. You should be able to read and understand a wiring diagram.

The following four-step troubleshooting procedure is recommended:

Step 1: Check the Problem

Perform a System Check to determine a symptom. Don't waste time fixing part of the problem! Do not begin disassembly or testing until you have narrowed down the possible causes.

Step 2: Read the Electrical Schematic

Study the schematic. Read the Circuit Operation text if you do not understand how the circuit should work. Check circuits that share wiring with the problem circuit. (Shared

circuits are shown on Power Distribution, Ground Distribution, Fuse Block Details and Light Switch Details pages.) Try to operate the shared circuits. If the shared circuits work, then the shared wiring is OK. The cause must be within the wiring used only by the problem circuit. If several circuits fail at the same time, chances are the power (fuse) or ground circuit is faulty.

Step 3: Find the fault and repair

- Narrow down the possible causes.
- Use the Troubleshooting Hints.
- Make the necessary measurements or checks as given in the System Diagnosis.
- Before replacing a component, check power, signal and ground wires at the component harness connector. If the checks and connections are OK, the most probable cause is component failure.

Step 4: Test the Repair

Repeat the System Check to verify that the fault has been corrected and that no other faults were induced during the repair.

HEADLIGHTS

SEE PAGE 8A-3-0
FOR MEASURING
AND HANDLING
PROCEDURES

6-3-94
BS0008A4

Figure 1—Typical Headlights Schematic

Example:

A customer brings in a vehicle and says that the HI beams do not work.

Step 1: Perform a System Check on the Headlight Circuit

You may discover that both LO beams operate. In "HI," you may notice that the HI Beam Indicator comes on, but neither HI beam operates.

Step 2: Read the Headlights Electrical Schematic (Figure 1)

This is the step that will save time and labor. Remember, it is essential to understand how a circuit should work, before trying to figure out why it doesn't.

After you understand how the circuit should operate, read the schematic again, this time keeping in mind what you have learned by operating the circuit.

Since both LO beams work, you know that the Headlight Switch, the YEL wire, the LO contacts of the Headlight Dimmer Switch, terminal "1E" of C100, the TAN wires and grounds G105 and G109 are all good.

Furthermore, since you saw that the HI Beam Indicator came on when the Headlight Dimmer Switch was moved to "HI," you know that the HI contacts of the Headlight Dimmer Switch and the LT GRN wire between the Headlight Dimmer Switch and C100 are good.

At this point, you could test for voltage at the RH Headlamp with the Headlight Dimmer Switch in "HI." However, it is extremely unlikely that the HI beam filaments have burned out in both headlamps, or that both headlamps connections are bad. The cause must be a bad connection at C100, or a break in the LT GRN wire between C100 and the RH Headlamp.

You have quickly narrowed the possible causes down to one specific area, and have done absolutely no work on the vehicle itself.

TROUBLESHOOTING PROCEDURES

Step 3: Find the fault and repair it

Using the Component Location List and the corresponding figure, you can quickly find C100 and the LT GRN wire, locate the exact trouble point and make the repair.

Step 4: Check the repair by performing a System Check on the Headlights Circuit

This, of course, means making sure that both HI beams, both LO beams and the HI Beam Indicator are all working.

Now suppose that the symptoms were different. You may have operated the Headlamps and found that the LO beams were working, but neither the HI beams nor the HI Beam Indicator were working. Looking at the schematic, you might conclude that it is unlikely that both HI beam filaments and the HI Beam Indicator have all burned out at once. The cause is probably the Headlight Dimmer Switch or its connector.

TROUBLESHOOTING TOOLS

Electrical troubleshooting requires the use of common electrical test equipment.

TEST LIGHT/DIGITAL VOLTMETER

Use a test light to check for voltage. A Test Light (J 34142-B) is made up of a 12 volt light bulb with a pair of leads attached. After grounding one lead, touch the other lead to various points along the circuit where voltage should be present. When the bulb goes on, there is voltage at the point being tested.

A DVM can be used instead of a test light. While a test light shows whether or not voltage is present, a DVM indicates how much voltage is present.

An increasing number of circuits include solid state control modules. One example is the Engine Control Module (ECM). Voltages in these circuits should be tested only with a 10-megohm or higher impedance DVM or multimeter (J 39200). Unless directed to within the diagnostics, never use a test light on circuits that contain solid state components, since damage to these components may result.

When testing for voltage or continuity at the connection, it is not necessary to separate the two halves of the connector. Unless testing a Weather Pack® or a Metri Pack® connector 150 series and below, always probe the connector from the back. Always check both sides of the connector. An accumulation of dirt and corrosion between contact surfaces is sometimes a cause of electrical problems. A terminal contact checking procedure can be found on page 8A-4-5.

CONNECTOR TEST ADAPTERS

Connector Test Adapter Kit (J 35616-A) is available for making tests and measurements at separated connectors. This kit contains an assortment of probes which mate with many of the types of terminals you will see. Avoid using paper clips and other substitutes since they can damage terminals and cause incorrect measurements.

SELF-POWERED TEST LIGHT

A self-powered test light (J 21008-A) can be used to check for continuity. This tool is made up of a light bulb, Battery and two leads. If the leads are touched together, the bulb will go on.

A self-powered test light is used only on an unpowered circuit. First remove the fuse which feeds the circuit you're working on. Select two specific points along the circuit through which there should be continuity. Connect one lead of the self-powered test light to each point. If there is continuity, the test light circuit will be completed and the bulb will go on.

Never use a self-powered test light on circuits that contain solid state components, since damage to these components may result.

OHMMETER

An ohmmeter can be used instead of a self-powered test light. The ohmmeter shows how much resistance there is between two points along a circuit. Low resistance means good continuity.

Circuits which include any solid state control modules, such as the Engine Control Module (ECM), should be tested only with a 10-megohm or higher impedance digital multimeter (J 39200).

When measuring resistance with a DVM, the vehicle Battery should be disconnected. This will prevent incorrect readings. DVMs apply such a small voltage to measure resistance that the presence of voltages can upset a resistance reading.

Diodes and solid state components in a circuit can cause an ohmmeter to give a false reading. To find out if a component is affecting a measurement, take a reading once, reverse the leads and take a second reading. If the readings differ, the solid state component is affecting the measurement.

FUSED JUMPER WIRE

A fused jumper (J 36169) is available with small clamp connectors providing adaptation to most connectors without damage. This fused jumper wire is supplied with a 20 amp fuse which may not be suitable for some circuits. Do not use a fuse with a higher rating than the fuse that protects the circuit being tested.

NOTICE: A fused jumper may not protect solid state components from being damaged.

SHORT FINDER

Short Finders (J 8681-A) are available to locate hidden shorts to ground. The short finder creates a pulsing magnetic field in the shorted circuit and shows you the location of the short through body trim or sheet metal.

FUSE TESTER

A simple tester (J 34764) can detect a blown fuse. To check a fuse, the tester is applied directly to the fuse in the Fuse Block. Two probes contact the fuse, either into the slots of a flat fuse or to the metal ends of a glass fuse. With power on, a red LED in the tester lights if the fuse is open. The handle of the tester is a tool for removing either type of fuse.

TROUBLESHOOTING TESTS

AFTERMARKET ACCESSORIES

Do not tie aftermarket accessories into SIR circuits. All such circuits are indicated on circuit diagrams with the SIR symbol. (See SECTION 8A-3.)

Do not tie aftermarket accessories into OBDII circuits. All such circuits are indicated on circuit diagrams with the OBDII symbol. (See SECTION 8A-3.)

Always check for aftermarket accessories (non-OEM) as the first step in diagnosing electrical problems. If the vehicle is so equipped, disconnect the system to verify that these add-on accessories are not the cause of the problems.

Some possible causes of vehicle problems related to aftermarket accessories include:

1. Power feeds connected to points other than the Battery.
2. Antenna location.
3. Transceiver wiring located too close to vehicle electronic modules or wiring.
4. Poor shielding or poor connectors on antenna feed line.

Refer to 1990/1991 model year bulletin entitled, "Installation Guidelines for Aftermarket Accessories" for specific information.

PROBING

After probing, when reconnecting connectors or replacing terminals, always be sure to reinstall Connector Position Assurance (CPA) and Terminal Position Assurance (TPA).

Frontprobe

When frontprobing of connectors is required, always use a mating terminal adapter from Connector Test Adapter Kit (J 35616-A). The use of proper adapters will ensure

that proper terminal contact integrity is maintained. For a terminal contact checking procedure, refer to page 8A-4-5.

Backprobe

Only backprobe connector terminals when specifically called for in diagnostic procedures. Since backprobing can be a source of damage to connector terminals, extra care must be taken to avoid deforming the terminal, either by forcing the test probe too far into the cavity or by using too large a test probe.

After backprobing any connector, always check for terminal damage. If terminal damage is suspected, check for proper terminal contact (refer to "Checking Terminal Contact," page 8A-4-5).

TESTING FOR VOLTAGE (Figure 2)

1. Connect one lead of a test light to a known good ground. When using a DVM, be sure the voltmeter's negative lead is connected to ground.
2. Connect the other lead of the test light or voltmeter to a selected test point (connector or terminal).
3. If the test light illuminates, there is voltage present. When using a DVM, note the voltage reading.

TESTING FOR CONTINUITY (Figure 3)

1. Remove the fuse to the circuit involved.
2. Connect one lead of a self-powered test light or ohmmeter to one end of the part of the circuit you wish to test.
3. Connect the other lead to the other end of the circuit.
4. If the self-powered test light glows, there is continuity. When using an ohmmeter, low or no resistance means good continuity.

Figure 2—Voltage Check

TROUBLESHOOTING PROCEDURES

TESTING FOR VOLTAGE DROP (Figure 4)

This test checks for voltage being lost along a wire, or through a connection or switch.

1. Connect the positive lead of a DVM to the end of the wire (or to one side of the connection or switch) which is closer to the Battery.

Figure 3—Continuity Check through a Switch

Figure 4—Voltage Drop Test

2. Connect the negative lead to the other end of the wire (or the other side of the connection or switch).
3. Operate the circuit.
4. The DVM will show the difference in voltage between the two points.

TESTING FOR SHORT TO GROUND

With a Test Light or DVM (Figure 5)

1. Remove the blown fuse and disconnect the load.
2. Connect a test light or voltmeter across the fuse terminals (be sure that the fuse is powered).
3. Beginning near the Fuse Block, wiggle the harness from side to side. Continue this at convenient points (about 6 inches apart) while watching the test light or DVM.
4. When the test light glows, or the DVM registers, there is a short to ground in the wiring near that point.

With a Self-Powered Test Light or Ohmmeter (Figure 6)

1. Remove the blown fuse and disconnect the Battery and load.
2. Connect one lead of a self-powered test light or ohmmeter to the fuse terminal on the load side.
3. Connect the other lead to a known good ground.

Figure 5—Testing for Short with Test Light or DVM

Figure 6—Testing for Short with Self-Powered Test Light or Ohmmeter

4. Beginning near the Fuse Block, wiggle the harness from side to side. Continue this at convenient points (about 6 inches apart) while watching the self-powered test light or ohmmeter.
5. When the self-powered test light glows, or the ohmmeter registers, there is a short to ground in the wiring near that point.

Fuses Powering Several Loads

1. Find the schematic in "Fuse Block Details," page 8A-11-0, for the fuse that has blown.
2. Open the first connector or switch leading from the fuse to each load.
3. Replace the fuse.
 - If the fuse blows, the short is in the wiring leading to the first connector or switch. Use a test light or meter as described on previous page.
 - If fuse does not blow, refer to next step.
4. Close each connector or switch until the fuse blows in order to find which circuit has the short. Connect test lamp or meter at the connector to the suspect circuit (disconnected) rather than at the fuse terminals.

JUMP STARTING PROCEDURE

Refer to SECTION 6D-1 for jump starting procedure.

INTERMITTENT AND POOR CONNECTIONS

Most intermittents are caused by faulty electrical connections or wiring, although occasionally a sticking relay or solenoid can be a problem. Some items to check are:

- Poor mating of connector halves, or terminals not fully seated in the connector body (backed out).
- Dirt or corrosion on the terminals. The terminals must be clean and free of any foreign material which could impede proper terminal contact.
- Damaged connector body, exposing the terminals to moisture and dirt, as well as not maintaining proper terminal orientation with the component or mating connector.
- Improperly formed or damaged terminals. All connector terminals in problem circuits should be checked carefully to ensure good contact tension. Use a corresponding mating terminal to check for proper tension. Refer to "Checking Terminal Contact" in this section for the specific procedure.
- The J 35616-A Connector Test Adapter Kit must be used whenever a diagnostic procedure requests checking or probing a terminal. Using the adapter will ensure that no damage to the terminal will occur, as well as giving an idea of whether contact tension is sufficient. If contact tension seems incorrect, refer to "Checking Terminal Contact" in this section for specifics.
- Poor terminal-to-wire connection. Some conditions which fall under this description are poor crimps, poor solder joints, crimping over wire insulation rather than the wire itself, corrosion in the wire-to-terminal contact area, etc.
- Wire insulation which is rubbed through, causing an intermittent short as the bare area touches other wiring or parts of the vehicle.
- Wiring broken inside the insulation. This condition could cause a continuity check to show a good circuit, but if only 1 or 2 strands of a multi-strand type wire are intact, resistance could be far too high.

To avoid any of the above problems when making wiring or terminal repairs, always follow the instructions for wiring and terminal repair outlined in SECTION 8A-5.

CHECKING TERMINAL CONTACT

When diagnosing an electrical system that utilizes Metri-Pack 150/280/480/630 series terminals (refer to Terminal Repair Kit, J 38125-A, instruction manual, J 38125-4 for terminal identification), it is important to check terminal contact between a connector and component, or between in-line connectors, before replacing a suspect component.

TROUBLESHOOTING PROCEDURES

Frequently, a diagnostic chart leads to a step that reads: "Check for poor connection." Mating terminals must be inspected to assure good terminal contact. A poor connection between the male and female terminal at a connector may be the result of contamination or deformation.

Contamination is caused by the connector halves being improperly connected, a missing or damaged connector seal, or damage to the connector itself, exposing the terminals to moisture and dirt. Contamination, usually in underhood or underbody connectors, leads to terminal corrosion, causing an open circuit or intermittently open circuit.

Deformation is caused by probing the mating side of a connector terminal without the proper adapter, improperly joining the connector halves or repeatedly separating and joining the connector halves. Deformation, usually to the female terminal contact tang, can result in poor terminal contact (see Figure 7), causing an open or intermittently open circuit.

Follow the procedure below to check terminal contact.

1. Separate the connector halves. Refer to Terminal Repair Kit, J 38125-A, instruction manual, J 38125-4.
2. Inspect the connector halves for contamination. Contamination will result in a white or green build-up within the connector body or between terminals, causing high terminal resistance, intermittent contact or an open circuit. An underhood or underbody connector that shows signs of contamination should be replaced in its entirety: terminals, seals and connector body.
3. Using an equivalent male terminal from the Terminal Repair Kit, J 38125-A, check the retention force of the female terminal in question by inserting and removing the male terminal to the female terminal in the connector body. Good terminal contact will require a certain amount of force to separate the terminals.
4. Using an equivalent female terminal from the Terminal Repair Kit, J 38125-A, compare the retention force of this terminal to the female terminal in question by joining and separating the male terminal to the good female terminal, and then joining and separating the male terminal to the female terminal in question. If the retention force is significantly different between the two female terminals, replace the female terminal in question (refer to Terminal Repair Kit, J 38125-A).

If a visual (physical) check does not reveal the cause of the problem, the vehicle may be able to be driven with a DVM connected to the suspected circuit. An abnormal voltage reading when the problem occurs indicates the problem may be in that circuit.

DETECTING ELECTRICAL INTERMITTENTS

Use the following procedure to detect intermittent terminal contact or a broken wire with an intermittent connection inside the insulation.

The J 39200 Digital Multimeter has the ability to monitor current, resistance, or voltage while recording the minimum (MIN) and maximum (MAX) values measured. The meter can also be set to display the average (AVG) value measured.

When diagnosing circuits that have voltage applied, use the voltage setting to monitor a connector (or length of a circuit) which is suspected of having an intermittent connection but is currently operating normally.

1. Connect the J 39200 Digital Multimeter to both sides of a suspect connector (still connected) or from one end of a suspect circuit to the other. This will continuously monitor the terminal contacts or length of wire being checked. See "Meter Connections" for examples of the various methods for connecting the meter to the circuit.
2. Set the meter for voltage. Since the "MIN MAX" mode does not use auto ranging, manually select the voltage range necessary before proceeding.
3. Press the "MIN MAX" button. The meter should read "100 ms RECORD" (100 millisecond record) and emit a 1/4 second beep. The meter is now ready to record and will generate an audible tone for any change in voltage. At this point, you may wish to press the "PEAK MIN MAX" button, which will record any voltage variations that occur for at least 1 millisecond.
4. Try to simulate the condition that is potentially causing an intermittent connection, either by wiggling connections or wiring, test driving or performing other operations. If an open or resistance is created, a voltage will be present and the meter will emit a tone for as long as the open or resistance exists. Any change in voltage will cause the meter to emit a tone for no less than 1/4 second. (Listening for a tone while manipulating wiring is very helpful for narrowing down an intermittent connection.)

Use the MIN and MAX values when the meter is out of sight or sound range, in noisy areas or for test driving when it may not be possible to monitor the meter.

To check the MIN and MAX recorded voltages press "MIN MAX" once for MAX and twice for MIN. A variation between MIN and MAX recorded voltages (unless nearly 0 volts) suggests an intermittent open or that resistance exists and should be repaired as necessary. Refer to SECTION 8A-5 of any current GM Service Manual for approved repair procedures.

Figure 7—Deformation of a Typical Metri-Pack 150/280/480/630 Series Female Terminal

TROUBLESHOOTING PROCEDURES

Important:

- The “100 ms RECORD” (100 millisecond record) mode is NOT the amount of time allowed to perform a specific procedure. It is the amount of time used to record each snapshot of information used for calculating “AVG” when in the “MIN MAX” mode.

METER CONNECTIONS

The previous diagnostic procedure was written to detect intermittents using the meter set to voltage. Whether using the current, voltage or resistance setting to detect intermittents, it is necessary to connect the meter to the circuit.

Following are examples of the various methods of connecting the meter to the circuit to be checked:

- Backprobe both ends of the connector and either hold the leads in place while manipulating the connector or tape the leads to the harness for continuous monitoring while performing other operations or test driving. (Do not backprobe “Weather Pack®” type connectors.)
- Disconnect the harness at both ends of the suspect circuit where it connects either to a component or to other harnesses.
- Use Connector Test Adapter Kit J 35616-A to connect the meter to the circuit.
- If the system being diagnosed has a specified pinout or breakout box, it may be used to simplify connecting the meter to the circuit or for checking multiple circuits quickly.

ADDITIONAL INFORMATION

NOTICE: Turn off power to the test circuit before attempting in-circuit resistance measurements to prevent false readings or damage to the meter. Do not use the meter to measure resistance through a solid state module.

Continuity tests that work well for detecting intermittent shorts to ground can be performed by setting the meter to “ohms” then pressing the “PEAK MIN MAX” button. An audible tone will be heard whenever the meter detects continuity for at least 1 millisecond.

The J 39200 Instruction Manual is a good source of information and should be read thoroughly upon receipt of the meter as well as kept on hand for reference during new procedures.

ELECTRICAL REPAIRS

This section provides instruction in the following repairs:

- Circuit Protection
- Typical Electrical Repairs
- Splicing Copper Wire
- Splicing Twisted/Shielded Cable
- Repairing Connectors (Except Weather Pack®)
- Repairing Weather Pack® (Environmental) Connectors
- Terminal Repair
- Diode Replacement
- Heated Oxygen Sensor (HO2S) Repair
- OBDII Circuit Repair
- GMSP0 Service Parts Ordering

After any electrical repair is made, always test the circuit afterwards by operating the devices in the circuit. This confirms not only that the repair is correct but, also, that it was the cause of the complaint.

Repair of circuits which are part of the OBDII (On-Board Diagnostics II) emissions control system have several special requirements which must be followed to ensure proper system operation. These requirements are listed on page 8A-5-12 under OBDII CIRCUIT REPAIRS.

CIRCUIT PROTECTION

The purpose of circuit protection is to protect the wiring assembly during normal and overload conditions. An overload is defined as a current requirement that is higher than normal. This overload could be caused by a short circuit or system malfunction. The short circuit could be the result of a pinched or cut wire or an internal device short circuit, such as an electronic module failure.

The circuit protection device is only applied to protect the wiring assembly, and not the electrical load at the end of the assembly. For example, if an electronic component short circuits, the circuit protection device will assure a minimal amount of damage to the wiring assembly.

However, it will not necessarily prevent damage to the component.

There are three basic types of circuit protection devices: Circuit Breaker, Fuse and Fusible Link.

CIRCUIT BREAKERS

A circuit breaker is a protective device designed to open the circuit when a current load is in excess of rated breaker capacity. If there is a short or other type of overload condition in the circuit, the excessive current will open the circuit between the circuit breaker terminals. There are two basic types of circuit breakers used in GM vehicles: cycling and non-cycling.

CYCLING CIRCUIT BREAKER

The cycling breaker will open due to heat generated when excessive current passes through it for a period of time. Once the circuit breaker cools, it will close again after a few seconds. If the cause of the high current is still present it will open again. It will continue to cycle open and closed until the condition causing the high current is removed.

NON-CYCLING CIRCUIT BREAKER

There are two types of non-cycling circuit breakers. One type is mechanical and is nearly the same as a cycling breaker. The difference is a small heater wire within the non-cycling circuit breaker. This wire provides enough heat to keep the bimetallic element open until the current source is removed.

The other type is solid state, called out in this section as Electronic Circuit Breaker (ECB). This device has a Positive Temperature Coefficient. It increases its resistance greatly when excessive current passes through it. The excessive current heats the ECB. As it heats, its resistance increases, therefore having a Positive Temperature Coefficient. Eventually the resistance gets so high that the circuit is effectively open. The ECB will not reset until the circuit is opened, removing voltage from its terminals. Once voltage is removed, the circuit breaker will re-close within a second or two.

FUSES

The most common method of automotive wiring circuit protection is the fuse (Figure 1). A fuse is a device that, by the melting of its element, opens an electrical circuit when the current exceeds a given level for a sufficient time. The action is non-reversible and the fuse must be replaced each time a circuit is overloaded or after a malfunction is repaired.

Fuses are color coded. The standardized color identification and ratings are shown in Figure 2. For service replacement, non-color coded fuses of the same respective current rating can be used.

Examine a suspect fuse for a break in the element. If the element is broken or melted, replace the fuse with one of equal current rating.

There are additional specific circuits with in-line fuses. These fuses are located within the individual wiring harness and will appear to be an open circuit if blown.

AUTOFUSE

The Autofuse, normally referred to simply as "Fuse," is the most common circuit protection device in today's vehicle. The Autofuse is most often used to protect the wiring assembly between the Fuse Block and the system components.

MAXIFUSE

The MaxiFuse was designed to replace the fusible link and Pacific Fuse elements. The MaxiFuse is designed to protect cables, normally between the battery and fuse block, from both direct short circuits and resistive short circuits.

Compared to a fusible link or a Pacific Fuse element, the MaxiFuse performs much more like an Autofuse, although the average opening time is slightly longer. This is because the MaxiFuse was designed to be a slower blowing fuse, with less chance of nuisance blows.

MINIFUSE

The MiniFuse is a smaller version of the Autofuse and has a similar performance. As with the Autofuse, the MiniFuse is usually used to protect the wiring assembly between a fuse block and system components. Since the MiniFuse is a smaller device, it allows for more system specific fusing to be accomplished within the same amount of space as Autofuses.

PACIFIC FUSE ELEMENT/MAXIFUSE

The Pacific Fuse Element and MaxiFuse were developed to be a replacement for the fusible link. Like a fusible link, the fuses are designed to protect wiring from a direct short to ground. These elements are easier to service and inspect than a fusible link and will eventually replace fusible links in all future vehicle applications.

FUSIBLE LINKS

In addition to circuit breakers and fuses, some circuits use fusible links to protect the wiring. Like fuses, fusible links are "one-time" protection devices that will melt and create an open circuit (see Figure 3).

Not all fusible link open circuits can be detected by observation. Always inspect that there is battery voltage past the fusible link to verify continuity.

Fusible links are used instead of a fuse in wiring circuits that are not normally fused, such as the ignition circuit. For AWG sizes, each fusible link is four wire gage sizes smaller than the wire it is designed to protect. For example: to protect a 10 gage wire use a 14 gage link or for metric, to protect a 5 mm² wire use a 2 mm² link (see Figure 6). Links are marked on the insulation with wire-gage size because the heavy insulation makes the link appear to be a heavier gage than it actually is. The same wire size fusible link must be used when replacing a blown fusible link.

Fusible links are available with three types of insulation: Hypalon®, Silicone/GXL (SIL/GXL) and Expanded Duty. All future vehicles that use fusible links will utilize the Expanded Duty type of fusible link. When servicing fusible links, all fusible links can be replaced with the Expanded Duty type. SIL/GXI fusible links can be used to replace either SIL/GXI or Hypalon® fusible links. Hypalon® fusible links can only be used to replace Hypalon® fusible links.

Determining characteristics of the types of fusible links are:

- Hypalon® (limited use): only available in 0.35 mm² or smaller and its insulation is one color all the way through.
- SIL/GXL (widely used): available in all sizes and has a white inner core under the outer color of insulation.

Figure 2 - Fuse Rating and Color

Figure 3 - Good and Damaged Fusible Links

Figure 4 - Single Wire Feed Fusible Link

— Expanded Duty: available in all sizes, has an insulation that is one color all the way through and has three dots following the writing on the insulation. Service fusible links are available in many lengths. Choose the shortest length that is suitable. If the fusible link is to be cut from a spool, it should be cut 150-225 mm (approx. 6-9 in.) long. NEVER make a fusible link longer than 225 mm (approx. 9 in.).

CAUTION: Fusible links cut longer than 225 mm (approx. 9 in.) will not provide sufficient overload protection.

To replace a damaged fusible link (Figure 4), cut it off beyond the splice. Replace with a repair link. When connecting the repair link, strip wire and use staking-type pliers to crimp the splice securely in two places. For more details on splicing procedures, see "Splicing Copper Wire." Use crimp and seal splices whenever possible. When using splice clips, refer to page 8A-5-4; when using crimp and seal splice sleeves, refer to page 8A-5-6.

To replace a damaged fusible link which feeds two harness wires, cut them both off beyond the splice. Use two repair links, one spliced to each harness wire (see Figure 5).

Figure 5 - Double Wire Feed Fusible Link

REPAIR PROCEDURES

TYPICAL ELECTRICAL REPAIRS

An open circuit is an incomplete circuit. Power cannot reach the load or reach ground. If a circuit is open, active components do not energize. A short circuit is an unwanted connection between one part of the circuit and either ground or another part of the circuit. A short circuit causes a fuse to blow or a circuit breaker to open.

REPAIRING SHORT CIRCUITS CAUSED BY DAMAGED WIRE INSULATION

- Locate the damaged wire.
- Find and correct the cause of the wire insulation damage.
- For minor damage, tape over the wire. If damage is more extensive, replace the faulty segment of the wire (refer to the splicing instructions for copper or shielded cable for the correct splicing procedure).

SPLICING COPPER WIRE USING SPLICE CLIPS

Splice clips are included in the J 38125-A Terminal Repair Kit. The splice clip is a general purpose wire repair device. It may not be acceptable for applications having special requirements such as moisture sealing. Refer to the appropriate Service Manual section to determine if there are any special requirements.

Step 1: Open the Harness

If the harness is taped, remove the tape. To avoid wire insulation damage, use a sewing "seam ripper" to cut open the harness (available from sewing supply stores). If the harness has a black plastic conduit, simply pull out the desired wire.

Step 2: Cut the Wire

Begin by cutting as little wire off the harness as possible. You may need the extra length of the wire later if you decide to cut more wire off to change the location of a splice. You may have to adjust splice locations to make certain that each splice is at least 40 mm (1.5 in.) away from other splices, harness branches or connectors.

Step 3: Strip the Insulation

When replacing a wire, use a wire of the same size as the original wire or larger. The schematics list wire size in metric units. The following table (Figure 6) shows the commercial (AWG) wire sizes that can be used to replace each metric wire size. Each AWG size is either equal to or larger than the equivalent metric size.

To find the correct wire size either find the wire on the schematic page and convert the metric size to the AWG size, or use an AWG wire gage.

If you aren't sure of the wire size, start with the largest opening in the wire stripper and work down until a clean strip of the insulation is removed. Be careful to avoid nicking or cutting any of the wires.

METRIC WIRE SIZES (mm ²)	AWG SIZES
0.22	24
0.35	22
0.5	20
0.8	18
1.0	16
2.0	14
3.0	12
5.0	10
8.0	8
13.0	6
19.0	4
32.0	2

Figure 6 - Wire Size Conversion Table

Step 4: Crimp the Wires

Select the proper clip to secure the splice. To determine the proper clip size for the wire being spliced, follow the directions included in the J 38125-A Terminal Repair Kit. Select the correct anvil on the crimper. (On most crimpers your choice is limited to either a small or large anvil.) Overlap the stripped wire ends and hold them between your thumb and forefinger as shown in Figure 7. Then, center the splice clip under the stripped wires and hold it in place.

- Open the crimping tool to its full width and rest one handle on a firm flat surface.
- Center the back of the splice clip on the proper anvil and close the crimping tool to the point where the former touches the wings of the clip.
- Make sure that the clip and wires are still in the correct position. Then, apply steady pressure until the crimping tool closes (see Figure 8).
- Before crimping the ends of the clip, be sure that:
 - The wires extend beyond the clip in each direction.
 - No strands of wire are cut loose.
 - No insulation is caught under the clip.

Crimp the splice again, once on each end. Do not let the crimping tool extend beyond the edge of the clip or you may damage or nick the wires (see Figure 9).

Step 5: Solder

Apply 60/40 rosin core solder to the opening in the back of the clip (see Figure 10). Follow the manufacturer's instruction for the solder equipment you are using.

Figure 7 - Centering the Splice Clip

Figure 9 - Completing the Crimp

Figure 8 - Crimping the Splice Clip

Figure 10 - Applying the Solder

Step 6: Tape the Splice

Center and roll the splicing tape. The tape should cover the entire splice. Roll on enough tape to duplicate the thickness of the insulation on the existing wires. Do not flag the tape. Flagged tape may not provide enough insulation, and the flagged ends will tangle with the other wires in the harness (see Figure 11).

If the wire does not belong in a conduit or other harness covering, tape the wire again. Use a winding motion to cover the first piece of tape (Figure 12).

REPAIR PROCEDURES

Figure 11 - Proper First Taping

Figure 12 - Proper Second Taping

SPlicing COPPER WIRE USING CRIMP AND SEAL SPLICE SLEEVES

Crimp and seal splice sleeves may be used on all types of insulation except Tefzel and coaxial to form a one-to-one splice. They are to be used where there are special requirements such as moisture sealing. Refer to the appropriate section of the Service Manual to determine if the crimp and seal is necessary. Crimp and seal splice sleeves are included in the J 38125-A Terminal Repair Kit.

Step 1: Open the Harness

If the harness is taped, remove the tape. To avoid wire insulation damage, use a sewing "seam ripper" to cut open the harness (available from sewing supply stores). The crimp and seal splice sleeves may be used on all types of insulation except Tefzel and coaxial and may only be used to form a one-to-one splice.

Step 2: Cut the Wire

Begin by cutting as little wire off the harness as possible. You may need the extra length of wire later if you decide to cut more wire to change the location of a splice. You may have to adjust splice locations to make certain that each splice is at least 40 mm (1.5 in.) away from other splices, harness branches or connectors. This will help prevent moisture from bridging adjacent splices and causing damage.

Step 3: Strip the Insulation

If it is necessary to add a length of wire to the existing harness, be certain to use the same size as the original wire (refer to Figure 6, "Wire Size Conversion Table").

To find the correct wire size either find the wire on the schematic and convert the metric size to the equivalent AWG size or use an AWG wire gage. If unsure about the wire size, begin with the largest opening in the wire stripper and work down until a clean strip of the insulation is removed. Strip approximately 7.5 mm (5/16 in.) of insulation from each wire to be spliced. Be careful to avoid nicking or cutting any of the wires. Check the stripped wire for nicks or cut strands. If the wire is damaged, repeat this procedure after removing the damaged section.

Step 4: Select and Position the Splice Sleeve

Select the proper splice sleeve according to wire size. The splice sleeves and tool nests are color coded (see following chart).

CRIMP AND SEAL SPLICE SLEEVE CHART

Color splice sleeve	Crimp tool nest color	Wire gage AWG/(metric)
Salmon (yellowish-pink)	Red	20, 18/(0.5, 0.8)
Blue	Blue	16, 14/(1.0, 2.0)
Yellow	Yellow	12, 10/(3.0, 5.0)

Using the J 38125-8 splice crimp tool (Figure 13), position the splice sleeve in the proper color nest of the hand crimp tool. Place the splice sleeve in the nest so that the crimp falls midway between the end of the barrel and the stop.

The sleeve has a stop in the middle of the barrel to prevent the wire from going further (see Figure 14). Close the hand crimper handles slightly to hold the splice sleeve firmly in the proper nest.

Figure 13 - Hand Crimp Tool

Figure 14 - Seal Splice Sequence

Step 5: Insert Wires into Splice Sleeve and Crimp

Insert the wire into the splice sleeve until it hits the barrel stop and close the handles of the J 38125-8 crimper tightly until the crimper handles open when released. The crimper handles will not open until the proper amount of pressure is applied to the splice sleeve. Repeat steps 4 and 5 for opposite end of the splice.

Step 6: Shrink the Insulation Around the Splice

Using the Ultratorch J 38125-5 (follow instructions that accompany Ultratorch), apply heat where the barrel is crimped. Gradually move the heat barrel to the open end of the tubing, shrinking the tubing completely as the heat is moved along the insulation. A small amount of sealant will come out of the end of the tubing when sufficient shrinking is achieved (Figure 14).

SPLICING TWISTED/SHIELDED CABLE

Twisted/shielded cable is sometimes used to protect wiring from electrical noise (stray signals). For example, two-conductor cable of this construction is used between the ECM and the distributor. See Figure 15 for a breakdown of twisted/shielded cable construction.

Step 1: Remove Outer Jacket

Remove the outer jacket and discard it. Be careful to avoid cutting into the drain wire or the mylar tape.

Step 2: Unwrap the Tape

Unwrap the aluminum/mylar tape, but do not remove it. The tape will be used to rewrap the twisted conductors after the splices have been made.

Figure 15 - Twisted/Shielded Cable

REPAIR PROCEDURES

Step 3: Prepare the Splice

Untwist the conductors. Then, prepare the splice by following the splicing instructions for copper wire presented earlier. Remember to stagger splices to avoid shorts (Figure 16).

Step 4: Re-assemble the Cable

After you have spliced and taped each wire, rewrap the conductors with the mylar tape. Be careful to avoid wrapping the drain wire in the tape.

Next, splice the drain wire following the splicing instructions for copper wire. Then, wrap the drain wire around the conductors and mylar tape (Figure 17).

Step 5: Tape the Cable

Tape over the entire cable using a winding motion (see Figure 18). This tape will replace the section of the jacket you removed to make the repair.

REPAIRING CONNECTORS

- The following general repair procedures can be used to repair most types of connectors. The repair procedures are divided into three general groups: Push-to-Seat and Pull-to-Seat and Weather Pack®.
- See "Harness Connector Faces," page 8A-202-0, to determine which type of connector is to be serviced.
- Use the proper Pick(s) or Tool(s) that apply to the terminal.
- The Terminal Repair Kit (J 38125-A) contains further information.

PUSH-TO-SEAT AND PULL-TO-SEAT CONNECTOR REPAIR

Follow the steps below to repair Push-to-Seat (Figure 19) or Pull-to-Seat (Figure 20) connectors. The steps are illustrated with typical connectors. Your connector may differ, but the repair steps are similar. Some connectors do not require all the steps shown. Skip those that don't apply.

Step 1:

Remove any CPA (Connector Position Assurance) Locks. CPAs are designed to retain connectors when mated.

Step 2:

Remove any TPA (Terminal Position Assurance) Locks. TPAs are designed to keep the terminal from backing out of the connector.

NOTICE: The TPA must be removed prior to terminal removal and must be replaced when the terminal is repaired and resealed.

Figure 16 - The Untwisted Conductors

Figure 17 - The Re-assembled Cable

Figure 18 - Proper Taping

Step 3:

Open any secondary locks. A secondary lock aids in terminal retention and is usually molded to the connector.

Step 4:

Separate the connector halves and back out seals.

Step 5:

Grasp the lead and push the terminal to the forward most position. Hold the lead at this position.

Step 6:

Locate the terminal lock tang in the connector canal.

Figure 19 - Typical Push-to-Seat Connector and Terminal

Figure 20 - Typical Pull-to-Seat Connector and Terminal

Step 7:

Insert the proper size pick (refer to Terminal Repair Kit J 38125-A) straight into the connector canal at the mating end of the connector.

Step 8:

Depress the locking tang to unseat the terminal.

- Push-to-Seat—Gently pull on the lead to remove the terminal through the back of the connector.
- Pull-to-Seat—Gently push on the lead to remove the terminal through the front of the connector.

NOTICE: Never use force to remove a terminal from a connector.

Step 9:

Inspect terminal and connector for damage. Repair as necessary (see "Terminal Repair," page 8A-5-10).

Step 10:

Reform lock tang and reseal terminal in connector body. Apply grease if connector was originally equipped with grease.

Step 11:

Install any CPAs or TPAs, close any secondary locks and join connector halves.

WEATHER PACK® CONNECTOR REPAIR

Follow the steps below to repair Weather Pack® connectors (Figure 21).

Step 1:

Separate the connector halves.

Step 2:

Open secondary lock. A secondary lock aids in terminal retention and is usually molded to the connector.

REPAIR PROCEDURES

Figure 21 - Typical Weather Pack® Connector and Terminal

Figure 22 - Terminal Repair

Step 3:

Grasp the lead and push the terminal to the forward most position. Hold the lead at this position.

Step 4:

Insert the Weather Pack® terminal removal tool into the front (mating end) of the connector cavity until it rests on the cavity shoulder.

Step 5:

Gently pull on the lead to remove the terminal through the back of the connector.

NOTICE: Never use force to remove a terminal from a connector.

Step 6:

Inspect the terminal and connector for damage. Repair as necessary (see "Terminal Repair," on this page).

Step 7:

Re-form the lock tang and reseal terminal in connector body.

Step 8:

Close secondary locks and join connector halves.

TERMINAL REPAIR

The following repair procedures can be used to repair Push-to-Seat, Pull-to-Seat or Weather Pack® terminals (Figure 22). Some terminals do not require all steps shown. Skip those that don't apply. The Terminal Repair Kit (J 38125-A) contains further information.

Step 1:

Cut off terminal between core and insulation crimp (minimize wire loss) and remove seal for Weather Pack® terminals.

Step 2:

Apply correct seal per gauge size of wire and slide back along wire to enable insulation removal (Weather Pack® terminals only).

Step 3:

Remove insulation.

Step 4:

Align seal with end of cable insulation (Weather Pack® terminals only).

Step 5:

Position strip (and seal for Weather Pack®) in terminal.

Step 6:

Hand crimp core wings.

Step 7:

Hand crimp insulation wings (non-Weather Pack®). Hand crimp insulation wings around seal and cable (Weather Pack®).

Step 8:

Solder all hand crimped terminals.

DIODE REPLACEMENT

Many vehicle electrical systems use a diode to isolate circuits and protect the components from voltage spikes. When installing a new diode, use the following procedure:

Step 1: Open the Harness

If the diode is taped to the harness, remove all of the tape.

Step 2: Remove Inoperative Diode

Paying attention to current flow direction, remove inoperative diode from the harness with a suitable soldering tool. If the diode is located next to a connector terminal, remove the terminal(s) from the connector to prevent damage from the soldering tool.

Step 3: Strip the Insulation

Carefully strip away a section of insulation next to the old soldered portion of the wire(s). Do not remove any more than is needed to attach the new diode.

Step 4: Install New Diode

Check current flow direction of the new diode, being sure to install the diode with correct bias. Reference the appropriate service manual wiring schematic to obtain the correct diode installation position. Reference Figure 23 for replacement diode symbols and current flow explanations. Attach the new diode to the wire(s) using 60/40 rosin core

solder. Use a heat sink (aluminum alligator clip) attached across the diode wire ends to protect the diode from excess heat. Follow the manufacturer's instructions for the soldering equipment you are using.

Step 5: Install Terminal(s)

Install terminal(s) into the connector body if previously removed in Step 2.

Step 6: Tape Diode to Harness

Tape the diode to the harness or connector using electrical tape. To prevent shorts to ground and water intrusion, completely cover all exposed wire and diode attachment points.

ACCEPTABLE DIODE REPLACEMENTS

Diode Brand	Rating Number	Rating	P/N
GMSP0	1N4004	1 amp, 400 PIV	12112421

GMSP0	1N4005	1 amp, 600 PIV	16011840
GMSP0	1N4004	1 amp, 400 PIV	16039386

In the event 1 amp, 50 PIV (Peak Inverse Rating) diodes are unavailable, a universal diode with a 1 amp, 400 PIV rating can be used for the following applications:

- A/C Compressor Clutch
- ABS/4WAL (the ABS Diode on the Delco Moraine is hidden inside of an electrical connector under the carpet at the right panel)

Figure 23 - Diode Identification

REPAIR PROCEDURES

- Wiper
- Charging System (hidden in wire harness)
- Parking Brake (vehicle with ABS)
- Relays
- Solenoids
- Diesel Glow Plug Circuit

HEATED OXYGEN SENSOR (HO2S) REPAIR

If the Heated Oxygen Sensor pigtail wiring, connector or terminal is damaged, the entire Oxygen Sensor Assembly must be replaced. Do not attempt to repair the wiring, connector or terminals. In order for the sensor to function properly, it must have provided to it a clean air reference. This clean air reference is obtained by way of the Oxygen Sensor signal and heater wires. Any attempt to repair the wires, connectors or terminals could result in the obstruction of the air reference and degraded Oxygen Sensor performance.

The following guidelines should be used when servicing the Heated Oxygen Sensor:

- Do not apply contact cleaner or other materials to the sensor or vehicle harness connectors. These materials may get into the sensor causing poor performance. Also, the sensor pigtail and harness wires must not be damaged in such a way that the wires inside are exposed. This could provide a path for foreign materials to enter the sensor and cause performance problems.
- Neither the sensor or vehicle lead wires should be bent sharply or kinked. Sharp bends, kinks, etc., could block the reference air path through the lead wire.
- Do not remove or defeat the Oxygen Sensor ground wire (where applicable). Vehicles that utilize the ground wired sensor may rely on this ground as the only ground contact to the sensor. Removal of the ground wire will also cause poor engine performance.
- To prevent damage due to water intrusion, be sure that the peripheral seal remains intact on the vehicle harness connector.

The Engine Harness may be repaired using Packard's Crimp and Splice Seals Terminal Repair Kit J 38125-A. Under no circumstances should repairs be soldered since this could result in the air reference being obstructed.

OBDII CIRCUIT REPAIRS

Repairs for On-Board Diagnostics II (OBDII) emission control circuits follow the procedures stated in SECTION 8A-5. When servicing OBDII circuits, the following guidelines are also essential:

- Do not move or alter grounds from their manufactured locations.
- Do not tie aftermarket accessories into OBDII circuits.

- Only repair OBDII circuits in accordance with the manufactured configuration.
- Always replace a relay in an OBDII circuit the same replacement part. Damaged relays should be discarded, not repaired.
- Refer to SECTION 8A-11 to identify OBDII circuit fusing.
- Make sure that CPA (connector position assurance) locks and TPA (terminal position assurance) locks are reinstalled on connectors that use them.
- After repair of connectors or connector terminals, make sure to achieve proper terminal retention. Refer to REPAIRING CONNECTORS on page 8A-5-8 for procedures.
- Before repairing OBDII heated oxygen sensors and related wiring, always review the special repair guidelines provided on page 8A-5-12 under HEATED OXYGEN SENSOR REPAIR.
- When installing an electrical ground fastener, be sure to apply the specified torque. Ground torque specifications are listed in SECTION 8A-14.
- After repair of connectors, make sure to reinstall connector seals, where used. Inspect seals for wear and damage. Replace worn or damaged seals.

GMSP0 SERVICE PARTS**GMSP0 STANDARD PARTS CATALOG**

Check the GMSP0 Standard Parts Catalog, Group 8.965. Fuses, circuit breakers, connectors, terminals, conduit, pigtail kits, and seals are listed in that group.

GMSP0 CARLINE PARTS CATALOG

The GMSP0 Carline Parts Catalog, Group 2.535 contains connector repair kits with terminals and leads.

COMPLETE HARNESS

In many cases repairs can be made by ordering pigtail assemblies (prewired connectors) rather than the entire wiring harness. Only order complete harnesses when there is major damage to the wiring harness. Always repair minor damage. Complete harnesses and pigtail part numbers can be found in the GMSP0 Carline Parts Catalog.

ORDERING SERVICE PARTS

1. If you can't find the repair parts you need in the J 38125-A Terminal Repair Kit, GMSP0 Standard Parts Catalog, or the GMSP0 Carline Parts Catalog, refer to SECTION 8A-202 (Harness Connector Faces) to find a listing of the OE part number(s).

2. Call PARTECH (1-800-433-6961) and give the PARTECH advisor the OE part number(s). The PARTECH advisor can determine if there is a GMSPO part number(s) for the OE part number(s).
3. If PARTECH cannot find a GMSPO part number, call the Service Parts Assistance Center (SPAC) with the OE part number(s). The SPAC advisor will assist you in placing a priority order using the "No Part Number" process with the Packard Electric Division. The SPAC advisor may have you place the order with the Packard Electric Division (1-800-PACKARD). Parts are typically shipped within 24 hours direct to your dealership.

Rear Window Defogger Switch.....	Center of I/P, part of Heater and A/C Control.....	17		28
Rear Window Wiper and Washer and Multifunction Switch.....	LH side of I/P	10		17
Rear Window Wiper Motor.....	Attached to Rear Header	36		52
Relay Panel.....	In RH Rear Trunk			
Remote Control Door Lock Receiver (Sedan).....	Near center of LH "D" Pillar	29		42
Remote Control Door Lock Receiver (Wagon)	Mounted on bracket above LH Rear Wheelhouse, under Trim Panel			
Roof Rail and Courtesy Reading Lamp, LH.....	LH rear Roof Rail.....	26		37
Roof Rail and Courtesy Reading Lamp, RH.....	RH rear Roof Rail.....	26		38
Secondary Air Injection (AIR) Pump Relay.....	Located in Underhood Electrical Center			
Secondary Engine Coolant Fan Relay.....	In Underhood Electrical Center			
Side Window Lockout Switch...	LH Front Side Door, attached to Accessory Switch Panel.....	19		30
Side Window Master Switch....	LH Front Door Armrest.....	19		30
Spot Lamp, LH	At LH "A" Pillar			
Spot Lamp, RH	At RH "A" Pillar			
Starter Motor Theft Deterrent Relay.....	RH "A" Pillar, behind RH kickpad.....	11		19
Stoplamp Switch.....	Attached to Brake Pedal Bracket (bottom switch)			
Sunshade Illuminated Mirror, LH.....	LH Visor	26		37
Sunshade Illuminated Mirror, RH	RH Visor	26		37
Taillamp, LH.....	LH Rear of Vehicle.....	34		49
Taillamp, RH	RH Rear of Vehicle.....	36		52
Theft Deterrent Module	Behind LH I/P left of Brake Pedal Bracket	11		19
Turn Signal Lamp Flasher.....	In Convenience Center, LH I/P.....	12		20
Turn Signal Switch	Mounted on upper LH side of Steering Column.....	13		21
Underhood Electrical Center.....	Engine Compartment, attached to RH Wheelhouse			
Underhood Lamp.....	RH rear of Hood			
Upper Tail Turn/ Stoplamp, LH.....	LH Rear of Vehicle.....	37		53

STARTER AND CHARGING TROUBLESHOOTING HINTS

(Perform before beginning System Diagnosis)

Starter

1. Visually inspect the hydrometer (built into Battery).
 - Green dot—Battery is charged.
 - Dark dot—Charge and load test Battery, refer to SECTION 6D1. If Battery passes load test, refer to System Diagnosis, page 8A-30-2.
 - Clear or light yellow dot—Battery electrolyte is low. Replace Battery.
2. Check that Starter Solenoid Switch terminals "S" and "B" and Battery connections are clean and tight.
3. Check that Maxifuse #11 and I/P Fuse #24 are OK. If these fuses are open, check for a short to ground in CKT 5, CKT 142 or CKT 806.
4. Check that G100 and G101 are clean and tight.
 - Check for a broken (or partially broken) wire inside of the insulation which could cause system malfunction but prove "GOOD" in a continuity/voltage check with a system disconnected. These circuits may be intermittent or resistive when loaded, and if possible, should be checked by monitoring for a voltage drop with the system operational (under load).
 - Check for proper installation of aftermarket electronic equipment which may affect the integrity of other systems (see "Troubleshooting Procedures," page 8A-4-0).
 - Refer to System Diagnosis.

Charging System

1. Visually inspect the hydrometer (built into Battery).
 - Green dot—Battery is charged.
 - Dark dot—Charge and load test Battery, refer to SECTION 6D1. If Battery passes load test, refer to System Diagnosis, page 8A-30-2.
 - Clear or light yellow dot—Battery electrolyte is low. Replace Battery.
2. Check U/Hood Fuse #8 and I/P Fuse #11. Check Maxifuse #11.
3. Check that the Generator Connector and Generator "BAT" terminal are both clean and tight.
4. Check that the Battery connections are clean and tight.
5. Check Generator belt.
 - Check for a broken (or partially broken) wire inside of the insulation which could cause system failure but prove "GOOD" in a continuity/voltage check (see "Troubleshooting Procedures," page 8A-4-0).
 - Check for proper installation of aftermarket electronic equipment which may affect the integrity of other systems (see "Troubleshooting Procedures," page 8A-4-0).
 - Refer to System Diagnosis.

SYSTEM DIAGNOSIS

! Important:

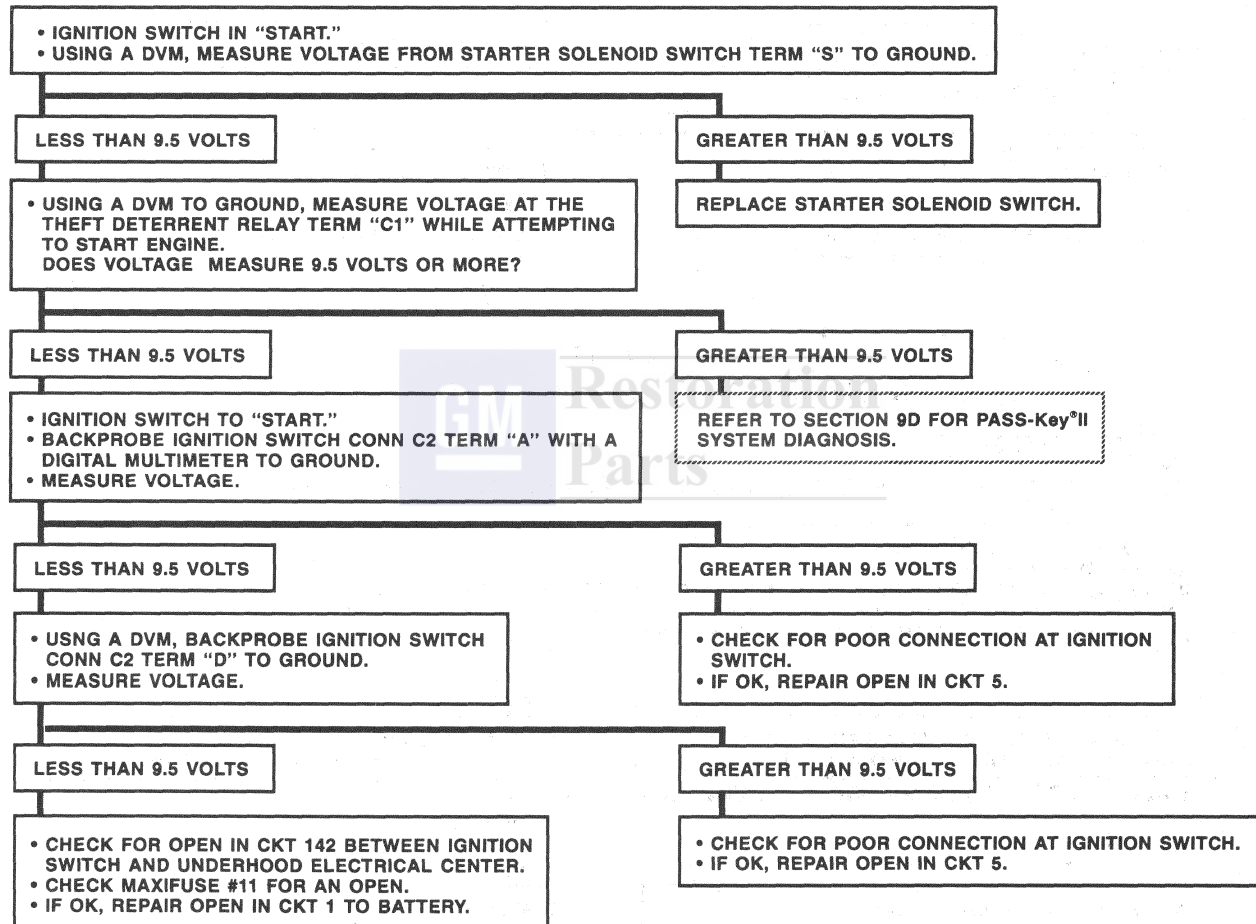

- If the Starter or Charging System continues to malfunction after the following diagnostic procedures are performed, refer to SECTIONS 6D2 and 6D3.

SYMPTOM TABLE

SYMPTOM	PROCEDURE	PAGE NUMBER
Engine does not crank, Starter Solenoid Switch does not click.	Chart #1	8A-30-3
Starter Solenoid Switch clicks, Engine does not crank.	Chart #2	8A-30-4
Engine cranks/cranks slowly but does not start.	Refer to Engine Controls.	
Battery is undercharged or overcharged.	Chart #3	8A-30-4
"CHARGE" Warning Indicator on at all times.	Chart #4	8A-30-5
"CHARGE" Warning Indicator inoperative.	Chart #5	8A-30-6

CHART #1**ENGINE DOES NOT CRANK, STARTER SOLENOID SWITCH DOES NOT CLICK****IMPORTANT:**

- BATTERY MUST BE IN A CHARGED STATE TO AVOID MISDIAGNOSIS. REFER TO SECTION 6D1.

STARTER AND CHARGING

CHART #2

STARTER SOLENOID SWITCH CLICKS, ENGINE DOES NOT CRANK

**IMPORTANT:**

- BATTERY MUST BE IN A CHARGED STATE TO AVOID MISDIAGNOSIS. REFER TO SECTION 6D1.

C8131

CHART #3

BATTERY IS UNDERCHARGED OR OVERCHARGED

**IMPORTANT:**

- BATTERY MUST BE IN A CHARGED STATE TO AVOID MISDIAGNOSIS. REFER TO SECTION 6D1.

C8132

CHART #4**"VOLTS" OR "CHECK GAGE" INDICATOR ON AT ALL TIMES****IMPORTANT:**

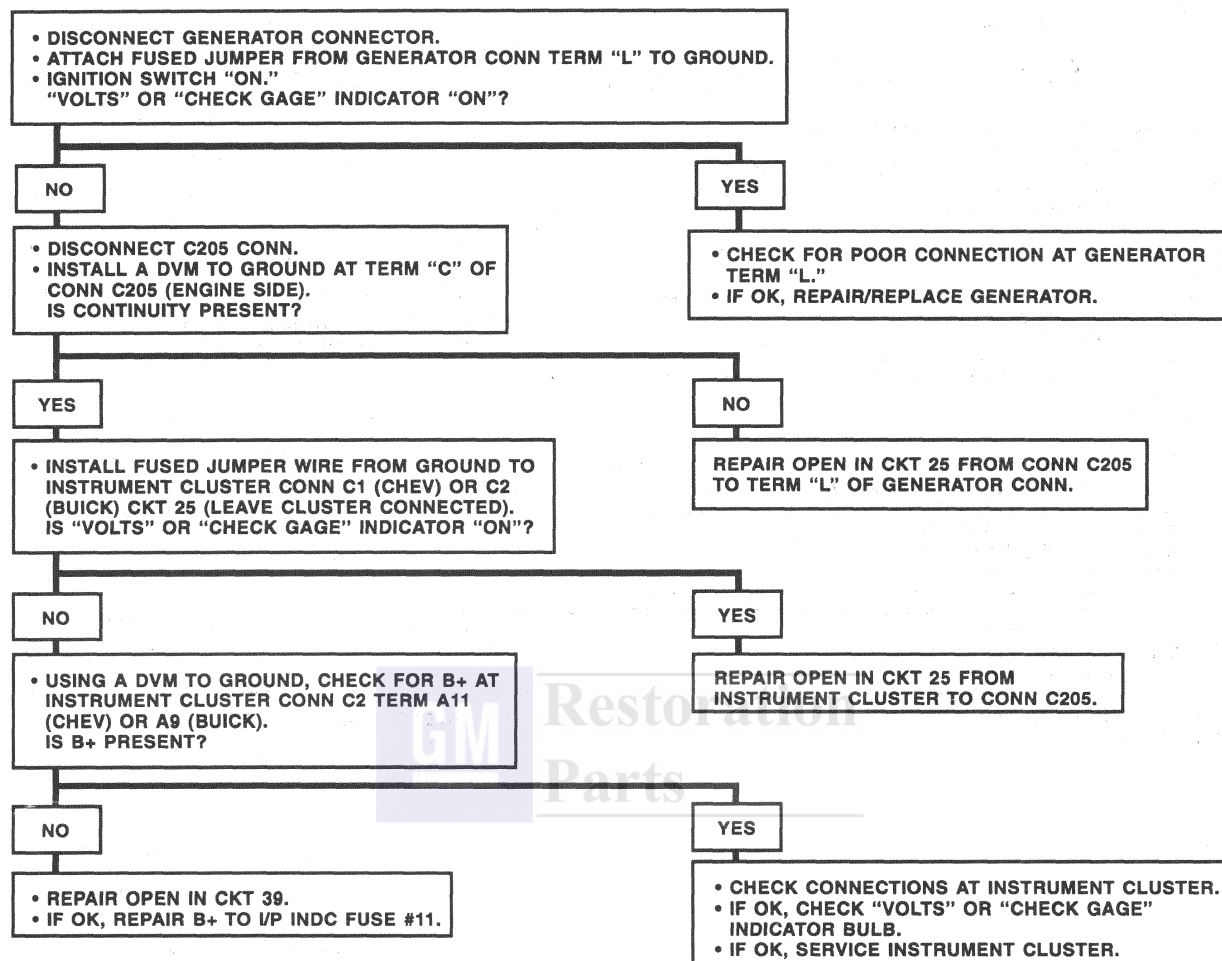

- CHECK GENERATOR ROTOR SHAFT DRIVE END NUT. IF LOOSE, TIGHTEN NUT TO 100 N M/75 LB FT. INSPECT GENERATOR PULLEY FOR DAMAGE. REFER TO SECTION 6D3.

C8133

STARTER AND CHARGING

CHART #5
"VOLTS" OR "CHECK GAGE" INDICATOR INOPERATIVE

CIRCUIT OPERATION

Starter

Battery voltage is applied to the Ignition Switch at all times through Maxifuse #11. When the Ignition Switch is turned to "START," battery voltage is applied through the closed contacts of the Ignition Switch, (through the contacts of the Theft Deterrent Relay). This relay is controlled by the Theft Deterrent Module, (NON SEO). Then it goes to the Starter Solenoid Switch at terminal "S." When battery voltage is applied to terminal "S" of the Starter Solenoid Switch, the Hold-In Coil and Pull-In Coil of the Starter Solenoid Switch are energized with the Pull-In Coil grounded through the Starter Motor. The coils, when energized, work together to pull in and hold the Plunger of the Starter Solenoid Switch. As the Plunger is pulled in, it closes the Starter Solenoid Switch contacts and causes the Shift Lever to rotate, engaging the Drive Assembly to the Flywheel. With battery voltage applied directly to the Starter Motor, through the closed Solenoid Contacts, the Starter Motor begins to rotate the Drive Assembly as the Drive Assembly comes in contact with the Flywheel. The Pull-In Coil is de-energized by having battery voltage at both ends of the coil. The Starter Motor continues to rotate to crank the Engine through the Drive Assembly-Flywheel gear combination.

Battery voltage is removed from the Starter Solenoid Switch terminal "S" when the Ignition Switch is released from the "START" position. The Hold-In Coil is de-energized and the return spring in the Starter Solenoid Switch causes the Plunger to disengage the Drive Assembly from the Flywheel. As the Plunger returns, the Plunger opens the Solenoid Contacts removing battery voltage from the Starter Motor.

Charging

The Generator provides voltage to operate the vehicle's electrical system and charge the Battery. The Regulator supplies current to the field coil of the Rotor. When current flows through the field coil, a magnetic field is created.

This field rotates as the Rotor is driven by the Engine, creating an AC voltage and current in the Stator windings. This AC signal is converted to DC by the rectifier bridge and available to the vehicle's electrical system at the "BAT" terminal.

The Generator must supply sufficient current to all vehicle electrical loads especially for charging the vehicle's Battery. Since the Rotor speed varies with Engine speed, the Generator must also maintain the output voltage at a constant value. The Generator's Regulator switches current to the field coil of the Rotor on or off controlling the output voltage of the Generator. When the Ignition Switch is turned to "RUN," battery voltage is supplied from U/Hood Fuse #8 to the Generator at terminal "F," turning on the Regulator. If for any reason terminal "F" did not supply any current to the connection inside the Generator, the Regulator could still turn on because CKT 25 would function as a backup source of "TURN ON" current.

The Regulator switches on the field current by connecting the field coil of the Rotor to battery voltage available at the "BAT" terminal.

The field current creates a weak magnetic field in the field coil when the Engine is being started. The Regulator senses Generator rotation by detecting an AC voltage at the Stator through an internal wire. Once the Engine is running, the Regulator can monitor the internal AC voltage and DC output at the "BAT" terminal. The Regulator will then vary the current in the field coil of the Rotor, as needed, to provide a constant output voltage and adequate current to the electrical system of the vehicle.

"VOLTS" INDICATOR (BUICK)

"CHECK GAGE" INDICATOR (CHEV)

Battery voltage is applied to the Instrument Cluster through I/P Fuse #11 whenever the Ignition Switch is in "RUN," or "START." A ground is provided at the Generator "L" terminal when the Regulator senses a high or low voltage condition or when the Rotor stops turning.

TROUBLESHOOTING HINTS

(Perform before beginning System Diagnosis)

! Important:

- The "Set To Get Cruise" feature requires the operator to set the initial set speed by using the Set/Coast button before the R/A (Resume/Accel) slider switch input will be recognized. The "Set To Get Cruise" feature must be applied whenever cruise is turned "OFF" or the Ignition Switch is cycled.

! Important:

- The "Brake Before Cruise" feature requires the cruise module to see terminal "D" change states, once each

Ignition Cycle before allowing Cruise Control. (Some Cruise Modules will use either terminal "D" or "G".)

1. Check that Cruise Control Module Linkage is connected and moving freely.
2. Check Cruise Cable Adjustment. See SECTION 9B.
 - Cruise will not function with Hazard Lamps "ON."
 - Make sure that CKT 17 and the Stoplamps are working properly. If inoperative, Cruise Module will be disabled.
 - Cruise performance can be affected by trailer towing and steep grades.

CRUISE CONTROL

- Check for a broken (or partially broken) wire inside of the insulation which could cause system malfunction but prove "GOOD" in a continuity/voltage check with a system disconnected. These circuits may be intermittent or resistive when loaded, and if possible, should be checked by monitoring for a voltage drop with the system operational (under load).

- Check for proper installation of aftermarket electronic equipment which may affect the integrity of other systems (see "Troubleshooting Procedures," page 8A-4-0).
- Refer to System Diagnosis.

SYSTEM DIAGNOSIS

- Perform the System Check and refer to the Symptom Table for the appropriate diagnostic procedure(s).
- If speedometer is inoperative, refer to "Vehicle Speed Sensor," page 8A-81-20.

SYSTEM CHECK

ACTION	NORMAL RESULTS
[1] • Drive vehicle above 25 mph. • Cruise Switch to "ON." • Depress Set Switch once and release. • Remove foot from accelerator pedal.	Vehicle maintains set speed at time of release.
[2] • Depress and hold Set Switch until vehicle speed decreases by 4 to 5 mph. • Release Set Switch.	Vehicle decelerates and maintains a new lower set speed, if speed is above 25 mph.
[3] • Depress and hold R/A Switch until vehicle speed increases by 4 to 5 mph. • Release R/A Switch.	Vehicle accelerates and maintains a new higher set speed.
[4] • Depress brake pedal slightly.	Cruise Control disengages. Memory unchanged.
[5] • Depress R/A Switch once (less than 3/4 seconds) and release.	Vehicle accelerates to and maintains previous set speed.
[6] • Depress R/A Switch once and release (less than 1/2 of a second).	Vehicle speed increases by 1 mph and maintains new set speed.
[7] • Depress Set Switch once and release (less than 1/2 of a second).	Vehicle speed decreases by 1 mph and maintains new set speed.
[8] • Depress Set and R/A Switches simultaneously.	Vehicle put in Non-Cruise mode with memory unchanged.
[9] • Depress R/A Switch once (less than 3/4 seconds) and release.	Vehicle accelerates to and maintains previous set speed.
[10] • Cruise Switch to "OFF."	Cruise Control disengages. Memory lost.

ADDITIONAL SYSTEM CHECK

The following procedure may be used as a System Check to verify operation of the Cruise Control System after repairs.

- Set Park Brake.
- Start Engine.
- Move Cruise Control Switch to "OFF."
- Move Cruise Control Switch to "ON" and then

wait at least 3 seconds before doing next step.

- Push Cruise Set Switch in and hold.
- Hold Cruise Slider Switch in "R/A" position.
- Fully depress and hold brake pedal.
- After 10 seconds, release brake pedal while still holding R/A and Set Switches.
- Engine rpm should increase momentarily then return to normal.

C9180

CRUISE CONTROL

CHART #4
"CRUISE" INDICATOR ON AT ALL TIMES (BUICK)

CIRCUIT OPERATION

The Electro-Motor Cruise Control is a speed control system which maintains a desired vehicle speed under normal driving conditions. The system has the capability to CRUISE, COAST, RESUME SPEED, ACCELERATE, TAP-UP and TAP-DOWN.

Depressing the Set and R/A Switches simultaneously will suspend cruise control operation without removing memory speed.

An Electronic Controller and Electric Motor are contained in the Cruise Control Module. The Controller monitors vehicle speed and operates the Electric Motor. In response to the Controller, the motor moves a connecting strap that is attached to the Cruise Control Cable. The Cable moves the Throttle Linkage to vary throttle position in order to maintain the desired cruise speed. The Cruise Control Module contains a low speed limit which will prevent system engagement below a minimum speed, about 25 mph. The module is controlled by mode control switches located on the LH Steering Column, part of the Turn Signal/Headlamp Dimmer Switch/Cruise Control Actuator/Windshield Wiper/Windshield Washer Lever.

With the Ignition Switch in "RUN," battery voltage is applied to terminal "F" of the Cruise Control Module. When the Slider Switch is moved to the "ON" position, battery voltage is applied to terminal "A" of the Cruise Control Module Connector. If the brake pedal is not depressed, battery voltage is present at module terminal "D." If the brake pedal is depressed, battery voltage is present at module terminal "G." The module must see terminal "D" change state once each Ignition cycle. (The brake pedal must be depressed once each Ignition cycle for cruise operation to occur). (Some Cruise Modules will use either terminal "D" or "G"). With the brake pedal not depressed, terminal "G" must see current flow through CKT 17 for cruise to operate properly. When the Slider Switch is moved to the "R/A" position, battery voltage is applied to terminal "C" of the module. With the Set Switch depressed, battery voltage is present at module terminal "B." Cruise Control Module Connector terminal "K" is the speed signal terminal. In operation, voltage will oscillate between a high of 4 to 5 volts and a low of near ground. Cruise Module terminal "H" is not used. Ground is at module terminal "E."

TROUBLESHOOTING HINTS

(Perform before beginning System Diagnosis)

- Check I/P Fuse #32. If I/P Fuse #32 is open, check for a short to ground in CKT 1340 or CKT 29.
- Check for a broken (or partially broken) wire inside of the insulation which could cause system malfunction but prove "GOOD" in a continuity/voltage check with a system disconnected. These circuits may be intermittent or resistive when loaded, and if possible,

should be checked by monitoring for a voltage drop with the system operational (under load).

- Check for proper installation of aftermarket electronic equipment which may affect the integrity of other systems (see "Troubleshooting Procedures," page 8A-4-0).
- Refer to System Diagnosis.

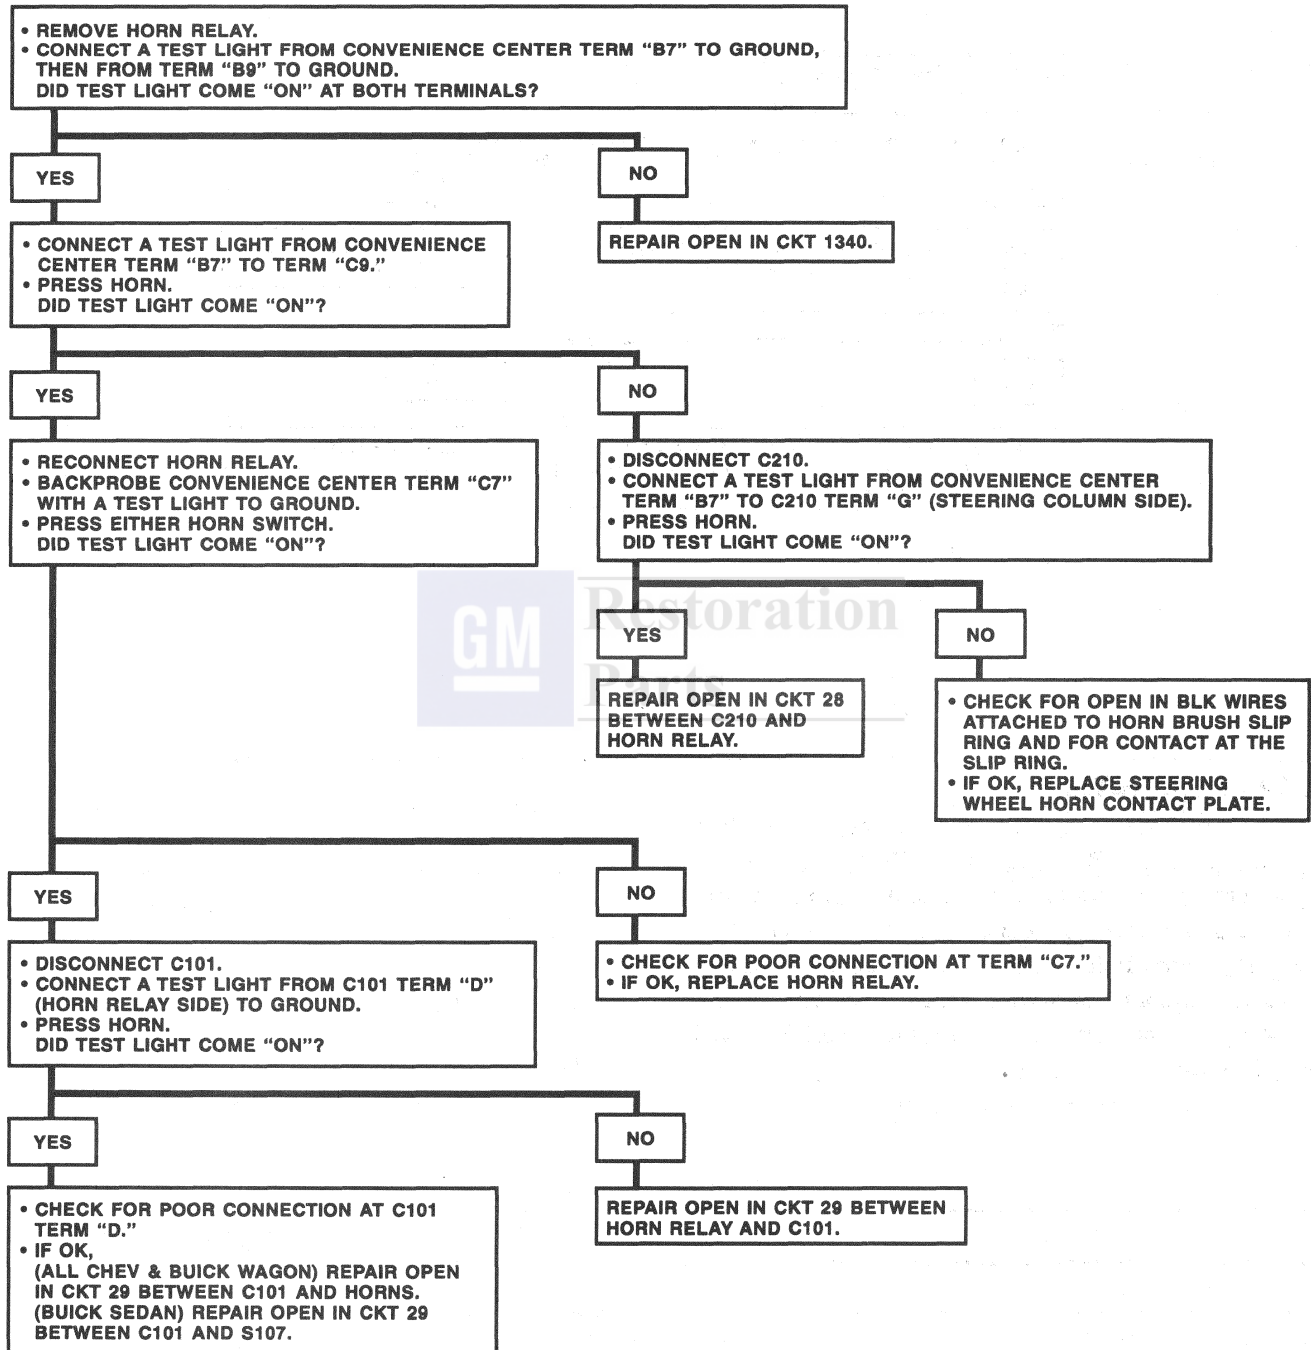

SYSTEM DIAGNOSIS

- See Symptom Table for the appropriate diagnostic procedure(s).

SYMPTOM TABLE

SYMPTOM	PROCEDURE	PAGE NUMBER
Horns inoperative.	Chart #1	8A-40-3
One Horn inoperative.	Remove connector from inoperative Horn. Attach one end of a fused jumper to B+. Momentarily touch the other end to the Horn. If the Horn sounds, repair open in CKT 29. If the Horn does not sound, check the Horn for a clean and tight ground at its case. If OK, replace Horn.	
Horns "ON" at all times.	Chart #2	8A-40-4

BRAKE WARNING SYSTEM

CHART #5

"BRAKE" INDICATOR STAYS ON WITH IGNITION SWITCH IN "RUN" AND PARK BRAKE RELEASED (WITH DAYTIME RUNNING LAMPS)

CIRCUIT OPERATION

Voltage is applied to the "BRAKE" Indicator from I/P Fuse #11 when the Ignition Switch is turned to "RUN," "BULB TEST" or "START." The "BRAKE" Indicator is controlled by any one of three switches: the Brake Pressure Switch, Ignition Switch or Park Brake Indicator Switch.

When the Ignition Switch is turned to "BULB TEST" or "START," CKT 209 is grounded through the Ignition Switch to activate the "BRAKE" Indicator. When the

Brake Pressure Switch is closed, CKT 209 is grounded through the contacts of the Brake Pressure Switch to activate the "BRAKE" Indicator. CKT 33 is grounded through the Park Brake Switch when the Park Brake is set, to activate the "BRAKE" Indicator.

With the Daytime Running Lamps (DRL) Control Module grounded through CKT 33, the module provides ground to CKT 209, lighting the "BRAKE" Indicator.

AUTOMATIC LEVEL CONTROL (ALC)**TROUBLESHOOTING HINTS****(Perform before beginning System Diagnosis)**

1. Check Underhood Electrical Center Fuse #1. If Fuse #1 is open, check for a short to ground in CKT 1040.
2. Check I/P Fuse Block Fuse #12. If Fuse #12 is open, check for a short to ground in CKT 639.
3. Check I/P Fuse Block Fuse #27. If Fuse #27 is open, check for a short to ground in CKT 740.
4. Check that G102 and G300 are clean and tight.
5. If ALC Air Compressor runs continuously for approximately 7 minutes, check system air hoses for cracks or leaks.
 - Check for a broken (or partially broken) wire inside of the insulation which could cause system malfunction but prove "GOOD" in a

continuity/voltage check with a system disconnected. These circuits may be intermittent or resistive when loaded, and if possible, should be checked by monitoring for a voltage drop with the system operational (under load).

- Check for proper installation of aftermarket electronic equipment which may affect the integrity of other systems (see "Troubleshooting Procedures," page 8A-4-0).
- Refer to System Diagnosis.

SYSTEM DIAGNOSIS

- Refer to Section 3D1 to perform the ALC System Operational Check.
- Refer to Symptom Table for the appropriate diagnostic procedure(s).

SYMPTOM TABLE

SYMPTOM	PROCEDURE	PAGE NUMBER
Compressor Motor does not turn "ON" to raise rear of vehicle.	Chart #1	8A-42-3
ALC System does not vent to lower rear of vehicle (checks Exhaust Solenoid).	Chart #2	8A-42-4
Compressor Motor runs continuously (longer than 7 minutes).	Chart #3	8A-42-5
Compressor Motor runs for maximum run time (approximately 4.5 to 7 minutes) then stops.	Refer to Section 3D1. Check for air leaks in the ALC System and for proper adjustment of the ALC Sensor. If OK, replace ALC Sensor.	
ALC System continuously re-levels vehicle with no change in load.	Refer to Section 3D1. Check for air leaks in the ALC System.

C8135

CHART #3
COMPRESSOR MOTOR RUNS CONTINUOUSLY (LONGER THAN 7 MINUTES)

C8136

CIRCUIT OPERATION

Automatic Level Control (ALC)

The Automatic Level Control keeps the rear of the vehicle at a constant height. If weight is added to the vehicle, the ALC Sensor turns on the ALC Air Compressor. Air is pumped into the shock absorbers until the ALC Sensor senses that the vehicle is level. An Actuator Arm is linked between the upper RH Control Arm and the Sensor, which is mounted to the rear crossmember of the frame. It turns as the vehicle height changes. The Sensor detects this motion and operates switches to control the air flow into and out of the shock absorbers.

Voltage is applied, at all times, to the Compressor by Underhood Electrical Center Fuse #1 and to the Sensor by I/P Fuse Block fuse #27. This allows the ALC System to vent after a load is removed. Voltage is also applied to the Sensor by I/P Fuse Block Fuse #12, with the Ignition Switch in "RUN," "BULB TEST" or "START."

To ensure that the shock absorbers are filled with adequate residual pressure, the Compressor Motor will run for 3 to 5 seconds, approximately 35 to 50 seconds after the Ignition Switch is turned to "RUN."

The Sensor must detect a "Car-Low" or "Car-High" state for 7-14 seconds before activating the intake or exhaust outputs. This prevents system operation during normal ride motions. In addition, the Sensor limits Compressor Motor run time or Exhaust Solenoid energized time to a maximum of 4.5 to 7 minutes.

This time limit is necessary to prevent continuous Compressor Motor operation in case of a severe system leak or continuous vent. Cycling the Ignition Switch to "OFF" and back to "RUN" resets the 4.5 to 7 minute maximum run timer.

Raising the Vehicle

When a load is added to the vehicle, the vehicle body is moved downward. When the ALC Sensor has detected a "Car-Low" state for 7-14 seconds, the Intake Control Switch is closed to ground. With CKT 321 grounded, the coil in the Compressor Motor Relay is energized and the relay contacts close. Battery voltage is applied to the Compressor Motor, which operates the Compressor and pumps air into the adjustable shock absorbers. As the shocks extend, the rear of the vehicle rises. When the vehicle body reaches its original height of +25 mm (+1 inch), the ALC Sensor opens the Intake Control Switch, de-energizing the Relay coil and the Compressor Motor stops.

AUTOMATIC LEVEL CONTROL (ALC)

Lowering the Vehicle

When a load is removed from the vehicle, the vehicle body is moved upward. When the ALC Sensor has detected a "Car-High" state for 7-14 seconds, the Exhaust Control Switch is closed to ground. With CKT 320 grounded, the Exhaust Solenoid is energized allowing the Exhaust Valve

to open. The ALC System vents into the atmosphere, lowering the rear of the vehicle. When the vehicle body reaches its original height of +25 mm (+1 inch), the Sensor opens the Exhaust Control Switch, de-energizing the Solenoid and closing the Exhaust Valve.

ANTILOCK BRAKE SYSTEM

CAUTION: Certain components in the Antilock Brake System are not intended to be serviced individually. Attempting to remove or disconnect certain system components may result in personal injury and/or improper system operation. Only those components with approved removal and installation procedures in Section 5E1 should be serviced.

TROUBLESHOOTING HINTS

(Perform before beginning System Diagnosis)

- If scan tool displays "Pin D Always Low" for approximately 3 seconds, then starts displaying a rapidly changing Duty cycle of approximately 25 to 80 %, check for an open in CKT 1294 or a poor connection at terminal "B" of the Power Steering Control Module Connector. To verify this condition, cycle the Ignition "OFF" then "ON" with the Signal Generator connected at set to 60 Hz. Refer to "System Check" for connection of Signal Generator.

- A short to B+ on CKT 1294 will not drive the actuator pintle out to cause a decrease in assist. The fault is detected by the Power Steering Control Module which enables CKT 1294, and the scan tool will read "No Duty Cycle Present."
- Resistance of the Steering Wheel Speed Sensor from terminal "A" to terminal "C" should be between 8 k Ω and 15 k Ω , from terminal "A" to terminal "B" should be 500 Ω to 16 k Ω and from terminal "B" to terminal "C" should be 500 Ω to 16 k Ω . If not, replace the Steering Wheel Speed Sensor.
- Refer to System Diagnosis.

SYSTEM DIAGNOSIS

USING SIGNAL GENERATOR J 38522

! Important:

- Assume Power Steering Components are operating normally. If Power Steering Pump, Gear, or any other basic Power Steering Components are suspect, refer to "Mechanical/Hydraulic Diagnosis" in SECTION 3B5.

SYSTEM CHECK

ACTION	NORMAL RESULTS
[1] • Disconnect Power Steering Control Module Connector. • Back-out terminal "A2" (DK GRN/WHT wire) from the connector. Use a jumper made from a 1 foot piece of 16 or 18 gage (1 or .8 mm) wire and a female Metri-Pack 630 terminal #12015870. Insert the terminal into cavity "A2" of the Power Steering Control Module Connector. Strip the end of the wire and clip it to the RED lead of J 38522. Clip the BLACK lead of J 38522 to a good ground. • Reconnect the Power Steering Control Module Connector. • Connect the scan tool with an ABS cartridge and select the VES Duty Cycle Test. • J 38522 not plugged in. • Start the Engine.	Duty Cycle is approximately 20 to 30%.
[2] • Engine idling. • Rotate the Steering Wheel, in half turns, quickly to the left and then to the right, 2 or 3 times.	• No change in Duty Cycle. • Full power steering assist with no lag or decrease in assist.
[3] • Plug in J 38522 and set for a 5 V square wave at 30 Hz with a 50% Duty Cycle.	Duty Cycle increases to approximately 42 to 52%.
[4] • Increase frequency to 60 Hz.	Duty Cycle increases to approximately 57 to 67%.
[5] • Rotate the Steering Wheel, in half turns, quickly to the left and then to the right, 2 or 3 times.	• Duty Cycle decreases and returns to previous Duty Cycle (changing rapidly, reaching a low of approximately 35 to 45%). • A noticeable decrease in assist is felt, especially at the beginning of the turns.
[6] • Steps 7 and 8 are for further verification of system operation. Perform these steps only if dissatisfied with normal results of the previous steps.	

VARIABLE EFFORT STEERING

SYSTEM CHECK (Continued)

ACTION	NORMAL RESULTS
[7] • Engine "OFF." • J 38522 unplugged. • Install Power Steering Pressure Tester J 5176-D. (Refer to SECTION 3 for installation procedure.) • Start Engine, let Engine reach normal operating temperature. • Engine at idle.	• Duty Cycle is approximately 20 to 30%. • Power steering pressure is approximately 150 psi.
[8] • Plug in J 38522 and set for a 5 V square wave at 60 Hz with a 50% Duty Cycle.	• Duty Cycle increases to approximately 57 to 67%. • Power steering pressure drops significantly to approximately 50 psi.

CIRCUIT OPERATION

Variable Effort Steering

The Variable Effort Steering (VES) System uses inputs from the Vehicle Speed Sensor (VSS) and the Steering Wheel Speed Sensor to determine the desired amount of power steering assist. The power steering assist is controlled by the Power Steering Control Module (PSCM).

The PSCM constantly compares the amount of current actually flowing through the Power Steering Pump Actuator to the desired current it has calculated. The Actuator is an electromechanical current regulated device mounted to the Power Steering Pump. The Actuator has a pintle that moves in and out of an orifice, regulating power steering fluid pressure. The PSCM can change the amount of current flowing through the Actuator by varying the Output Duty Cycle. The current through the Actuator at 0 mph is approximately 230-250 mA, and with a 60 Hz signal on the VSS input of the PSCM approximately 600-650 mA. If the Actuator is disconnected, the pintle will be pulled out of the orifice for maximum power steering assist.

The PSCM has the ability to detect faults in the Steering Wheel Speed Sensor, the Actuator, or the circuitry to those components. Any fault detected will cause the power steering assist to remain at maximum with the pintle in its normally retracted position for all speeds. For example, a short to battery voltage on the high side (CKT 1294) of the Actuator will cause the PSCM to open the low side (CKT 1295) and the pintle will not extend to decrease power steering assist.

When the system is operating normally, increasing vehicle speed will decrease power steering assist, allowing the driver to have improved road feel and directional stability. When sudden steering wheel turns are made, as in evasive maneuvers, is detected by the PSCM through the Steering Wheel Speed Sensor. When detected, the PSCM reduces current to the Actuator, allowing greater power steering assist.

CAUTION: This vehicle is equipped with Supplemental Inflatable Restraint (SIR). Refer to CAUTIONS in Section 9J under "ON-VEHICLE SERVICE" and the SIR Component and Wiring Location view in Section 9J before performing service on or around SIR components or wiring. Failure to follow CAUTIONS could result in possible air bag deployment, personal injury, or otherwise unneeded SIR system repairs.

TROUBLESHOOTING HINTS (CHEV)

(Perform before beginning System Diagnosis)

1. Check Circuit Breaker #4. If open, check for short to ground in CKT 1640.
2. Check Fuse #11. If open, check for short to ground in CKT 39.
3. Check Rear Window Defogger Grid for opens, refer to SECTION 10-2.
4. Check that grounds G200, G201, G300 and G400 are clean and tight.
5. If both Mirror Defoggers are inoperative but Rear Window Defogger operates normally, check I/P Fuse #44. If Fuse #44 is open, check for a short to ground in CKT 676. If OK, perform Chart #3 on page 8A-61-8.
6. If Mirror Defoggers operate normally but Rear Window Defogger is inoperative, check that the Rear Window Defogger Grid connection is firmly mated and ground G300 (Sedan) or G400 (Wagon) is clean and tight. If OK, perform Chart #5 on page 8A-61-9.

- Check for a broken (or partially broken) wire inside of the insulation which could cause system malfunction but prove "GOOD" in a continuity/voltage check with a system disconnected. These circuits may be intermittent or resistive when loaded, and if possible, should be checked by monitoring for a voltage drop with the system operational (under load).
- Check for proper installation of aftermarket electronic equipment which may affect the integrity of other systems (see "Troubleshooting Procedures," page 8A-4-0).
- Refer to System Diagnosis.

SYSTEM DIAGNOSIS

- Perform the System Check and refer to the Symptom Table for the appropriate diagnostic procedure(s).
- For Diagnosis of the Buick Rear Defogger and Heated Mirrors Refer to SECTION 1C.

SYSTEM CHECK

ACTION	NORMAL RESULTS
[1] • Push Rear Window Defogger Control Switch to "ON" and release.	Switch returns to "REST" position. Rear Window Defogger Indicator is "ON" and Rear Window Defogger Grid becomes warm (also Heated Mirrors if equipped). Defogger Grid and Indicator turn "OFF" in approximately 10 minutes.
[2] • After first 10 minute time period, push Rear Window Defogger Control Switch to "ON" and release.	Switch returns to "REST" position. Indicator and Defogger Grid (also heated mirrors if equipped) remain "ON" for approximately 5 minutes and then turn "OFF."

CIRCUIT OPERATION (CHEV)

When the Ignition Switch is turned to "RUN," voltage is applied from I/P Fuse #11 to the Heater and A/C Control. When the Rear Window Defogger Switch is pushed to "ON," voltage is momentarily applied to the Rear Window Defogger Solid State Timer through CKT 39. When voltage is applied to the Rear Window Defogger Timer, the Solid State Timer will close the internal contacts. The internal contacts remain closed until the defog cycle is complete or the Rear Window Defogger Switch is pushed "OFF."

When the internal contacts of the Rear Window Defogger Switch are closed, voltage from I/P Circuit

Breaker #4 is applied to the indicator and to CKT 293, the Rear Window Defogger Grid and I/P Fuse #44 if equipped with Heated Mirrors.

The Heater and A/C Control contains an internal timer to control the time the internal contacts are closed. When the Ignition Switch is turned to "RUN" and the Rear Window Defogger Switch is pushed to "ON" for the first time, the defog cycle lasts 10 minutes. Further operation will result in 5 minute defog cycles. The defog cycle is reset to 10 minutes when the Ignition Switch is turned to "OFF" and back to "RUN."

TROUBLESHOOTING HINTS

(Perform before beginning System Diagnosis)

1. Check I/P Fuse # 17 for open. If open, check for short to ground through CKT 641.
2. Check U/Hood Maxifuse #10 for open. If open, check for short to ground through CKT 42.
3. Check G200 by noting normal operation of the Underhood Lamp or License Lamp.
 - Check for a broken (or partially broken) wire inside of the insulation which could cause system malfunction but prove "GOOD" in a continuity/voltage check with a system disconnected. These circuits may be intermittent or

resistive when loaded, and if possible, should be checked by monitoring for a voltage drop with the system operational (under load).

- Check for proper installation of aftermarket electronic equipment which may affect the integrity of other systems (see "Troubleshooting Procedures," page 8A-4-0).
- Refer to System Diagnosis.

SYSTEM DIAGNOSIS

- Perform the "System Check" and refer to the "Symptom Table" for the appropriate diagnostic procedures.

SYSTEM CHECK

ACTION	NORMAL RESULTS
• Ignition Switch in "RUN." • Heater Mode Selector in any mode except "OFF." • Move Heater and A/C Blower Switch from "LO" to "M1" to "M2" to "HI," then back to "LO."	Fan speed increases at each speed level selected, to "HI" then decreases back to "LO"

SYMPTOM TABLE

SYMPTOM	PROCEDURE	PAGE NUMBER
Blower inoperative at any speed.	Chart #1	8A-63-4
Low speed inoperative, medium and high speeds operate normally.	Chart #2	8A-63-5
Medium speed inoperative, low and high speeds operate normally.	Chart #3	8A-63-6
High speed inoperative, low and medium speeds operate normally.	Chart #4	8A-63-7
Blower "ON" with Ignition Switch in "OFF."	Check for short to B+ on CKT 60, CKT 52, CKT 63, CKT 64, CKT 65, CKT 72 and CKT 101. If OK, replace High Blower Relay	
Blower "ON" at all times with Ignition Switch in "RUN" and Heater and A/C Selector Switch in "OFF."	Check for short to Ignition voltage on CKT 60, CKT 52, CKT 63, CKT 64, CKT 65, CKT 72 and CKT 101. If OK, replace Heater and A/C Selector Switch.	

- For Buick Diagnosis, refer to SECTION 1C.

HVAC BLOWER CONTROL

CHART #3

MEDIUM SPEED(S) INOPERATIVE, LOW AND HIGH SPEEDS OPERATE NORMALLY

CHART #4

HIGH SPEED INOPERATIVE, LOW AND MEDIUM SPEEDS OPERATE NORMALLY

C9225

CIRCUIT OPERATION (CHEV)

The Blower Motor is a variable speed motor, which runs at a speed proportional to the applied voltage. The higher the voltage applied to the motor, the faster the speed.

While the Ignition Switch is in the "RUN" position, battery voltage is applied to the Heater and A/C Control through I/P Fuse #17. With the Heater and A/C Control Selector Switch in the "OFF" position, no voltage is supplied to the Blower Motor.

When any other mode position is selected, voltage is applied to the Heater and A/C Control Blower Switch, and Blower Motor Resistor if not in "HI."

With the Heater and A/C Control Blower Switch in the "LO" position, voltage is applied to CKT 60 from the Heater and A/C Control Blower Switch to terminal "A" of

the Blower Resistor, through the resistor to the relay contacts in the High Blower Relay, and the Blower Motor. The Blower Motor runs at low speed.

As the Heater and A/C Control Blower Switch is moved through positions "M1" and "M2," the switch bypasses part of the Blower Resistor allowing more voltage to be applied to the Blower Motor, which will increase its speed.

When the Heater and A/C Control Blower Switch is in the "HI" position, voltage is applied through CKT 52 to the coil of the High Blower Relay. The High Blower Relay energizes, removing the Blower Resistor from the circuit. Battery voltage is then applied directly to the Blower Motor through the High Blower Relay contacts. The motor runs at maximum speed.

TROUBLESHOOTING HINTS**(Perform before beginning System Diagnosis)**

1. Check I/P Fuse Block Fuse #33. If open, check for a short to ground in CKT
- 2.
3. Check I/P Fuse Block Fuse #13. If open, check for a short to ground in CKT 639.
4. Check I/P Fuse Block Fuse #12. If open, check for a short to ground in CKT 239.
5. Check that ground G200 is clean and tight.
6. If Speedometer or Cruise Control (if equipped) does not operate properly, refer to "Vehicle Speed Sensor," SECTION 8A-81,82.
 - Check for a broken (or partially broken) wire inside of the insulation which could cause system malfunction but prove "GOOD" in a continuity/voltage check with a system disconnected. These circuits may be intermittent or resistive when loaded, and if possible, should be checked by monitoring for a voltage drop with the system operational (under load).
 - Check for proper installation of aftermarket electronic equipment which may affect the integrity of other systems (see "Troubleshooting Procedures," page 8A-4-0).
 - Refer to System Diagnosis.

SYSTEM DIAGNOSIS

Perform the System Check in the order shown. When a fault is found, refer to the Symptom Table for the appropriate diagnostic procedure(s). If a normal result is found at each and every step of the System Check, the fault may be intermittent.

To help isolate an intermittent fault, first examine the mating terminals at each component and connector for a poor connection. Also check that each terminal of mating connectors is properly seated in the connector body. If the connections appear to be reliable, try the System Check again while moving the wiring harness from side to side at each component and in-line connector, to try and induce the intermittent fault.

Once a fault has been corrected, perform the System Check to verify the diagnosis.

SYSTEM CHECK

ACTION	NORMAL RESULTS
[1] LAMPS "ON" WARNING • Remove Ignition Key from Ignition Lock Cylinder. • Headlamp Switch to "HEAD." • Headlamp Switch To "OFF."	Lamps "ON" Warning (approximately one pulse per half second) sounds as long as the Headlamps are "ON."
[2] IGNITION KEY WARNING • Ignition Key in Ignition Lock Cylinder. • Ignition Switch to "OFF." • Open LH front door. • Close LH front door.	Ignition Key Warning (approximately one pulse per second) sounds when the key is in the Ignition Lock Cylinder and the LH front door is open.
[3] IGNITION KEY WARNING • Driver's seat belt latched. • Ignition Switch to "RUN." • Open LH front door. • Close LH front door.	No Alarm sounds.

SYSTEM CHECK (Continued)

ACTION	NORMAL RESULTS
[4] FASTEN SEAT BELT WARNING • Driver's seat belt unlatched. • Ignition Switch to "RUN."	Fasten Seat Belt Warning (approximately one pulse every 1 1/2 seconds) sounds continuously and the "FASTEN SEAT BELT" Indicator goes out after 5-8 seconds.
[5] FASTEN SEAT BELT WARNING • Latch driver's seat belt. • Ignition Switch to "OFF" and back to "RUN."	None

SYMPTOM TABLE

SYMPTOM	PROCEDURE	PAGE NUMBER
All warning alarms inoperative.	Chart #1	8A-76-6
Ignition Key Warning inoperative.	Chart #2	8A-76-6
Fasten Seat Belt Warning inoperative.	Chart #3	8A-76-7
"FASTEN SEAT BELT" Indicator "ON" continuously.	Chart #4	8A-76-7
"FASTEN SEAT BELT" Indicator inoperative.	Chart #5	8A-76-8
Turn Signal "ON" Reminder inoperative.	Chart #6	8A-76-9
Turn Signal "ON" Reminder "ON" at all times.	Replace Alarm Module	
Lamps "ON" Warning inoperative.	Check for poor connection at Convenience Center terminal "A4" or open in CKT 8 to the Module. If OK, replace Module. (On non-T82 vehicles, make sure the Instrument Panel Dimmer Switch is NOT turned "ON").	
Ignition Key Warning sounds when LH front door is open and key is not in Ignition Switch.	Check Turn/Hazard Switch Pigtail for a short to ground. If OK, replace Ignition Key Alarm Switch.	
Ignition Key Warning continues to sound when LH front door is closed and Ignition Switch is in "RUN."	Repair short to ground in CKT 80.	
Ignition Key Warning sounds continuously with Ignition Switch in "OFF," "LOCK" or "ACC" position and LH front door is closed.	Repair short to ground in CKT 159.	
Fasten Seat Belt Warning sounds continuously.	Replace Alarm Module.	
Courtesy Lights are inoperative with "DOOR(S) OPEN" (Non-SEO).	Chart # 7	8A-76-10
Courtesy Lamps stay "ON" continuously (Non-SEO).	Chart # 8	8A-76-11
Courtesy Lamps stay "ON" or are inoperative (SEO).	Refer to SECTION 8A-114.

CHART #6 **TURN SIGNAL "ON" REMINDER INOPERATIVE**

IMPORTANT:

- CHECK FOR PCM DTC 24. IF PRESENT, REFER TO ENGINE CONTROLS.

- REMOVE IGNITION KEY FROM IGNITION LOCK CYLINDER.
- TURN HEADLAMP SWITCH TO "PARK" OR "HEAD."

LIGHTS "ON" WARNING SOUNDS

- REMOVE WARNING ALARM.
- TURN IGNITION SWITCH TO "RUN."
- MEASURE VOLTAGE AT WARNING ALARM CONN TERM "A6."

B+

- REINSTALL WARNING ALARM.
- RAISE AND SUITABLY SUPPORT VEHICLE.
- GEAR SELECTOR SWITCH TO "NEUTRAL."
- TURN DRIVE WHEELS BY HAND WHILE USING A DVM TO MEASURE VOLTAGE BETWEEN TERM "A5" AND GROUND.

VOLTAGE VARIES FROM LESS THAN 1 VOLT TO GREATER THAN 4 VOLTS

- CHECK FOR POOR CONNECTION AT TERM "A5."
- IF OK, REPLACE WARNING ALARM.

LIGHTS "ON" WARNING DOES NOT SOUND

- CHECK FOR POOR CONNECTION AT TERM "A4."
- IF OK, REPLACE WARNING ALARM.

0 VOLTS

- CHECK FOR OPEN IN CKTS 16 AND 239.
- IF OK, REPLACE TURN SIGNAL FLASHER.

VOLTAGE DOES NOT VARY FROM LESS THAN 1 VOLT TO GREATER THAN 4 VOLTS

- CHECK FOR OPEN OR SHORT TO GROUND IN CKT 817 BETWEEN WARNING ALARM TERM "A5" AND PCM B CONN TERM "8."
- IF OK, REPLACE PCM. REFER TO ENGINE CONTROLS.

CHART #8
COURTESY LIGHTS STAY "ON" CONTINUOUSLY (NON-SEO)

C9209

CIRCUIT OPERATION

The Seat Belt/Ignition Key/Lamps/Turn Signal Alarm generates three audible warnings which are: Lamps "ON" Warning and Turn Signal "ON" Reminder, Ignition Key Warning and Fasten Seat Belt Warning. Each warning is a series of pulsed tones or chimes. The Lamps "ON" Warning and Turn Signal "ON" Reminder are pulsed approximately every one half second, sounding the quickest. The Ignition Key Warning is pulsed once every second. The Fasten Seat Belt Warning is pulsed approximately once every 1 1/2 seconds, sounding the slowest.

LAMPS "ON" WARNING

When the Headlamp Switch is in "PARK" or "HEAD," voltage is applied to the Lamps "ON" Signal of the Alarm. When the Ignition Switch is turned out of the "RUN" position, voltage is removed from the Ignition Signal of the Alarm. When voltage is present at the Lamps "ON" Signal and no voltage applied to the Ignition Signal, the Alarm will sound the Lamps "ON" Warning.

For non-T82 vehicles, the Lamps "ON" Warning can be turned off by turning the Instrument Panel Dimmer Switch to the "OFF" position.

TURN SIGNAL "ON" REMINDER

When a turn signal is operated, the Alarm begins to monitor the distance the vehicle has traveled. If a turn signal is still flashing after the vehicle has traveled 8 km (.5 mile), the Alarm turns the Lamps "ON" Warning on. The Lamps "ON" Warning continues to sound until the turn signal is turned "OFF."

IGNITION KEY WARNING

The Alarm applies voltage at all times to the Ignition Key Alarm Switch. When the Ignition Key is placed into the Ignition Lock Cylinder, the Ignition Key Alarm Switch is closed. When the LH front door is open, the LH Front Door Jamb Switch closes the circuit to ground. The Alarm senses a voltage drop at the Ignition Key Signal and will sound the Ignition Key Warning.

AUDIBLE WARNINGS

FASTEN SEAT BELT WARNING

The Alarm applies voltage to the Seat Belt Switch at all times. The Alarm senses a voltage drop at the Seat Belt Latch Signal through the closed contacts of the Seat Belt Switch when the driver's seat belt is unlatched. When the driver's seat belt is latched, the Seat Belt Switch is opened and the Alarm senses voltage at the Seat Belt Latch Signal. When the Ignition Switch is turned to "RUN," voltage is applied to the Alarm Ignition Signal. When voltage is present at the Ignition Signal and no voltage is present at the Seat Belt Latch Signal, the Alarm will sound the Fasten Seat Belt Warning for about 5 to 8 seconds. If voltage is present at the Ignition Signal and the Seat Belt Latch Signal, the Alarm will disable the Fasten Seat Belt Warning Chime.

When the Ignition Switch is turned to "RUN," the Alarm senses voltage at the Ignition Signal. When voltage is applied to the Ignition Signal, the Alarm applies voltage to the "FASTEN SEAT BELT" Indicator for 5 to 8 seconds independent of the Seat Belt Switch and Fasten Seat Belt Warning Chime.

COURTESY LAMPS

When CKT 156 is pulled low because a door has been opened, the Alarm will ground CKT 1393. When CKT 1393 is pulled low, the relay contacts in the Dome Courtesy Relay will close, allowing CKT 149 to go low via CKT 450. CKT 149 is the ground side of the Courtesy Lamp System. CKT 149 can also be grounded at the Headlamp/Panel Dimmer Switch.

ILLUMINATED ENTRY

When a door is opened and closed, the Courtesy Lamps will stay "ON" for 30-40 seconds unless the Ignition Switch is turned to the "RUN" position. Voltage on CKT 639 will cause the Courtesy Lamps to shut "OFF" immediately.

If the vehicle (Buick only) is equipped with Keyless Entry (AUO), the RCDLR will ground CKT 1393 for 30-40 seconds, unless the Ignition Switch is in the "RUN" position. Refer to SECTION 8A-132 for Keyless Entry Schematic Details.

TROUBLESHOOTING HINTS

(Perform before beginning System Diagnosis)

1. Check I/P Fuse #33. If open, check CKT 40 for short to ground.
2. Check I/P Fuse #11. If open, check CKT 39 for short to ground.
3. Check any inoperative indicator bulb.
4. Make sure grounds G104, G106, G200 and G401 are clean and tight.
5. If Instrument Cluster is completely or partially inoperative, check CKT 39 and CKT 439 for an open.
 - For Instrument Cluster removal and replacement procedures, refer to SECTION 8C.
 - Check for a broken (or partially broken) wire inside of the insulation which could cause system malfunction but prove "GOOD" in a continuity/voltage check with a system disconnected. These circuits may be intermittent or resistive when loaded, and if possible, should be checked by monitoring for a voltage drop with the system operational (under load).
 - Check for proper installation of aftermarket electronic equipment which may affect the integrity of other systems (see "Troubleshooting Procedures," page 8A-4-0).
 - Refer to System Diagnosis.

"OIL" PRESSURE INDICATOR DIAGNOSIS

If the "OIL PRESSURE" Indicator stays "ON" with the Engine running:

- Disconnect Fuel Pump Switch and Engine Oil Pressure Gage Sender. If the indicator goes "OFF," replace sender. If the indicator stays "ON," check CKT 31 for short to ground.
 - Inspect the Instrument Cluster printed circuit for a short. Also check that the printed circuit is mating properly with its connectors and not shorted there.
- If the "OIL PRESSURE" Indicator does not come

"ON" before the Engine starts, and the bulb is good, measure the resistance from the Fuel Pump Switch and Engine Oil Pressure Gage Sender connector to ground.

- If the resistance is approximately 1 ohm or more, check CKT 31 for an open.
- Connect a fused jumper between Fuel Pump Switch and Engine Oil Pressure Gage Sender connector terminal "A" and ground. If the indicator comes "ON," replace the sender. If the indicator stays "OFF," remove Instrument Cluster for repair.
- Check that the printed circuit has no cracks or flaws and is mating properly with its connector.

"HOT" COOLANT TEMPERATURE INDICATOR DIAGNOSIS (COOLANT TEMPERATURE GAGE "NORMAL")

If the Coolant "HOT" Indicator comes "ON" with the Engine running, but not overheated:

- Check the Instrument Cluster printed circuits for shorts to ground. If OK, service Instrument Cluster.

If "HOT" Coolant Temperature Indicator does not come "ON" while starting the Engine, and the bulb is good:

- Ground CKT 135 at Ignition Switch connector C1 terminal "C." If the indicator comes "ON," the circuit is good. Replace the Ignition Switch.
- If the indicator does not come "ON," check the Instrument Cluster printed circuit for an open. If OK, service Instrument Cluster.

SYSTEM DIAGNOSIS

- For Instrument Cluster removal and replacement procedures, refer to SECTION 8C.
- Perform the System Check and refer to the Symptom Table for the appropriate diagnostic procedure(s).

INSTRUMENT CLUSTER

SYSTEM CHECK

ACTION	NORMAL RESULTS
[1] • Turn Ignition Switch to "RUN."	• "AIR BAG" Indicator will flash 7 times, then go "OFF." • "ANTI-LOCK" Indicator is "ON" for at least 2 seconds. • Coolant Temperature Gage shows the coolant temperature. • Fasten Seat Belt Indicator will come "ON." • Fuel Gage shows current fuel level. • "HOT" Coolant Temperature Indicator illuminates for 2 seconds. • "LOW FUEL" Indicator illuminates for 2 seconds. • "LOW OIL LEVEL" illuminates for 2 seconds or more. • "LOW WASH FLUID" Indicator illuminates for 2 seconds. • "OIL" Pressure Indicator is "ON." • "PASS KEY" Indicator illuminates for 5 seconds. • "SERVICE ENGINE SOON" Indicator is "ON." • "VOLTS" Indicator is "ON." • Warning Alarm will sound if the driver's safety belt is unbuckled.
[2] • With Ignition Switch in "RUN," first operate the RH Turn Signal then the LH Turn Signal.	RH and LH Turn Indicators flash.
[3] • With the Headlamp Switch in "HEAD," place Headlamp Dimmer Switch in "HI."	HI Beam Indicator is "ON."
[4] • With Ignition Switch in "RUN," apply the Park Brake.	"BRAKE" Indicator is "ON."
[5] • With the Headlamp Switch in "HEAD" or "PARK," adjust the dimmer control.	Instrument Cluster illumination varies with dimmer control.
[6] • Start Engine and let idle.	Coolant Temperature Gage indicates current coolant temperature. During "CRANK," "AIR BAG" Indicator is "ON" (not flashing). After "START" ("RUN"), indicator will flash 6 times, then go "OFF."
[7] • Open Endgate.	"GATE AJAR" Indicator is "ON."
[8] • Turn Ignition Switch to "BULB TEST."	"BRAKE" Indicator is "ON." Coolant Temperature gage reads "H".

CIRCUIT OPERATION

See the circuit referred to for the complete operation of an indicator and other components that work with it. Only the indicators that do not appear in other schematics are described in this section.

"OIL" PRESSURE INDICATOR

The "OIL PRESSURE" Indicator bulb will ground at the Fuel Pump Switch and Engine Oil Pressure Gage Sensor, when Engine oil pressure drops below 4 lbs.

"HOT" COOLANT TEMPERATURE INDICATOR

The "HOT COOLANT TEMPERATURE" Indicator comes "ON" to warn the driver of high coolant temperature.

With the Ignition Switch in "RUN," "BULB TEST" or "START," voltage from I/P Fuse #11 is applied to the "HOT" Coolant Temperature Indicator. In "BULB TEST" or "START," the lamp is grounded through the Instrument Cluster Logic Chip so that the bulb can be tested. In

"RUN," the current path is also completed through the Logic Chip in the Instrument Cluster. The Engine Coolant Temperature Gage Sensor resistance will be low when the coolant temperature exceeds 1265°C (2585°F) causing the Logic Chip to command the lamp "ON."

FUEL GAGE

With the Ignition Switch in "RUN," "BULB TEST" or "START," voltage is applied from I/P Fuse #11 to the Fuel Gage. The Fuel Gage pointer is controlled by varying the Fuel Sender resistance. Voltage is applied from Fuse #11 to the Empty coil of the Fuel Gage and divides into two paths: 1) through the Fuel Gage Sender to ground, and 2) through the Full coil to ground. The Gage pointer is controlled by changes in the Sender's resistance. When the Fuel Gage resistance decreases, more current flows through the Sender and the Empty coil. At the same time, the current through the Full coil decreases.

With two coils operating the pointer, the gage is not affected by changes in the voltage of the system.

COOLANT TEMPERATURE GAGE

The Coolant Temperature Gage applies voltage from CKT 135 to the Engine Coolant Temperature Gage Sensor. The Engine Coolant Temperature Gage Sensor contains a variable resistor. At 385°C (1005°F) the resistance is approximately 1365 ohms and at 1275°C (2605°F) the resistance is approximately 55 ohms. As the resistance of the Engine Coolant Temperature Gage Sensor decreases, the Coolant Temperature Gage senses a smaller voltage drop across the Engine Coolant Temperature Gage Sensor, indicating higher coolant temperature. As the resistance of the Engine Coolant Temperature Gage Sensor increases, the Coolant Temperature Gage senses a larger voltage drop across the Engine Coolant Temperature Gage Sensor, indicating a lower coolant temperature.

"GATE AJAR" INDICATOR

Voltage is applied at all times to the "GATE AJAR" Indicator from I/P Fuse #33. When the Endgate is opened, (as a door) the "GATE AJAR" Switch closes completing the path to ground and turns the indicator "ON."

"LOW OIL LEVEL" INDICATOR

The "LOW OIL LEVEL" Indicator ground is controlled by the PCM. The PCM also supplies B+ to the Engine Oil Level Sensor, mounted in the Engine oil pan. The PCM will not check for a low oil condition until the drop in Engine Coolant Temperature corresponds with the chart below. The PCM compares the drop in coolant temperature from the last Ignition "OFF" cycle to the coolant temperature at the start of the current Ignition "ON" cycle.

If the coolant temperature drop conditions are not met, the "LOW OIL LEVEL" Indicator will come on for the 2 second bulb test only. (The Ignition must be "OFF" for a minimum of 5 seconds before the "LOW OIL LEVEL" Indicator can come "ON" again.) If the Indicator is "ON" because of a low oil condition, it will remain "ON" for the rest of the current Ignition Cycle, even if oil is added to the crankcase. A low oil condition exists with 2 3/4 or less quarts of oil remaining in Engine oil pan.

Ignition "ON"°C	Temperature drop since last Ignition "OFF" Cycle°C
-40	7
-28	7
-16	7
-4	7
8	7
20	8
32	10
44	12
56	14
68	16
80	19
92	22
104	22
116	22
128	22
140	22
152	22

"LOW COOLANT LEVEL" INDICATOR

Ignition voltage is applied at all times to the Low Engine Coolant Indicator Probe. A magnetic float in the Coolant Recovery Reservoir rises and falls with the coolant level. A serviceable Reed-Type Switch (mounted in the bottom of the reservoir) senses the floating magnet. When the float (magnet) position gets lower in the reservoir, the Switch contacts are pulled together, grounding CKT 68.

"LOW WASH FLUID" LEVEL INDICATOR

When the Ignition Switch is turned to "RUN," voltage is applied to the Windshield Washer Solvent Level Switch. If washer solvent level is low, and the Windshield Washer Solvent Level Switch is closed, ground is applied to the "LOW WASH FLUID" Indicator. Once the indicator has been turned "ON," it will stay "ON" until the windshield washer solvent container has been refilled, causing the Windshield Washer Solvent Level Switch to open. The Ignition Switch must then be cycled from "OFF" to "RUN" for the Indicator to turn "OFF."

INSTRUMENT CLUSTER

"LOW FUEL" INDICATOR

The Instrument Cluster Logic Chip monitors the Fuel Sender resistance using CKT 30. When the Fuel Gage registers less than 1/8 tank of fuel, the resistance at terminal "A2" of connector C2 will be approximately $10 \pm 2 \Omega$. If this condition is met for 128 ± 64 seconds, the Logic Chip within the Instrument Cluster will ground the "LOW FUEL" Indicator, causing it to turn "ON." After refueling, the resistance at terminal "A2" of connector C2 will be above $15 \pm 2 \Omega$, depending on the amount of fuel in the fuel tank. Within the same Ignition Cycle, after approximately 128 ± 64 seconds, the Logic Chip within the Instrument Cluster will turn the "LOW FUEL" Indicator "OFF."

SPEEDOMETER

The Speed Sensor Circuit consists of a magnetic type sensor and wiring. Gear teeth pressed on the Transmission Output Shaft induce an alternating current in the sensor. This sensor generates a sine wave output with a frequency proportional to vehicle speed. The PCM converts this signal to an output that is switched to ground at a frequency of 4000 pulses per mile at the DK GRN/WHT wire (CKT 817), which feeds the Turn Signal Alarm, Power Steering Control Module, Instrument Cluster, Cruise Control Module and Radio (Chev only).

TROUBLESHOOTING HINTS

(Perform before beginning System Diagnosis)

1. Check I/P Fuses #11, #20, #33 and #42.
2. Check the indicator bulbs.
3. If more than one indicator is out, check the Instrument Cluster Printed Circuit for flaws.
4. Check that grounds G104, G106, G200, G202 and G401 are clean and tight.
 - For Instrument Cluster removal and replacement procedures, refer to SECTION 8C.
5. If any segment of Speedometer fails to illuminate, send cluster out for repair.
 - Check for a broken (or partially broken) wire inside of the insulation which could cause system malfunction but prove "GOOD" in a continuity/voltage check with a system disconnected. These circuits may be intermittent or resistive when loaded, and if possible, should be checked by monitoring for a voltage drop with the system operational (under load).

- Check for proper installation of aftermarket electronic equipment which may affect the integrity of other systems (see "Troubleshooting Procedures," page 8A-4-0).
- Refer to System Diagnosis.

SPEEDOMETER SEGMENTS FAIL TO DIM

If the Speedometer segments fail to dim, perform the following check:

- Remove Instrument Cluster, disconnect Instrument Cluster connector C1. Check for varying voltage on terminal "A4" while turning dimming wheel, with Headlamp Switch in "PARK."
 - 0 volts: Repair open in CKT 8 to source.
 - Voltage present: Check for battery voltage on terminal "B2" of Instrument Cluster connector C2.
 - 0 volts: Repair open in CKT 32.
 - Voltage present: Service Instrument Cluster.

INSTRUMENT CLUSTER: DIGITAL

INSTRUMENT CLUSTER IS PARTIALLY OR COMPLETELY INOPERATIVE

If the Instrument Cluster is not operating properly, perform the following checks:

- Check terminals "A5," "B6," and "A11" of Instrument Cluster connector C2, and terminal "B2" of Instrument Cluster connector C1 for battery voltage.
 - No voltage one or more terminals: Repair open circuit to Fuse Block.
 - Battery voltage all terminals: Service Instrument Cluster.

- Check terminals "A6" and "B4" of Instrument Cluster connector C2, and terminal "B3" of Instrument Cluster connector C1 for continuity to ground.

- No continuity to ground on one or more terminals: Repair open circuit to ground.
- Continuity to ground all terminals: Service Instrument Cluster.

SYSTEM DIAGNOSIS

- Perform the System Check and refer to the Symptom Table for the appropriate diagnostic procedure(s).

SYSTEM CHECK

ACTION	NORMAL RESULTS
[1] • Turn Ignition Switch to "RUN."	• "AIR BAG" Indicator will flash 7 times, then go "OFF." • "ABS" Indicator is "ON" for at least 2 seconds. • "CHECK GAGE" Indicator will illuminate. • Coolant Temperature Gage shows the coolant temperature. • Fasten Seat Belt Indicator will come "ON" for 6-8 seconds. • Fuel Gage shows current fuel level. • "LOW" Fuel Indicator will come "ON" for 2 seconds. • "LOW OIL LEVEL" Indicator illuminates for 2 seconds. • Oil Pressure Gage reads low. • "PASS KEY FAULT" Indicator will illuminate for 2-3 seconds. • "SERVICE ENGINE SOON" Indicator is "ON." • Speedometer illuminates briefly. • Voltmeter displays battery voltage. • Warning Alarm will sound if the driver's safety belt is unbuckled.
[2] • With Ignition Switch in "RUN," first operate the RH Turn Signal then the LH Turn Signal.	RH and LH Turn Indicators flash.
[3] • With the Headlamp Switch in "HEAD," place Headlamp Dimmer Switch in "HI."	HI Beam Indicator is "ON."
[4] • With Ignition Switch in "RUN," apply the Park Brake.	"BRAKE" Indicator is "ON."
[5] • With the Headlamp Switch in "HEAD" or "PARK," adjust the dimmer control.	Instrument Cluster illumination varies with Dimmer Control.
[6] • Start Engine and let idle.	• Coolant Temperature Gage indicates current coolant temperature. • During "CRANK," "AIR BAG" Indicator is "ON" (not flashing). • After "START" ("RUN"), Indicator will flash again 6 times, then go "OFF."

SYSTEM CHECK (Continued)

ACTION	NORMAL RESULTS
[7] • Turn Ignition Switch to "BULB TEST."	• "BRAKE" Indicator is "ON." • Coolant Temperature Gage reads "H." • Voltmeter reads low voltage.
[8] • Open any door.	"DOOR OPEN" Indicator is "ON."
[9] • Open Endgate as a door.	"GATE AJAR" Indicator comes "ON."

SYMPTOM TABLE

SYMPTOM	PROCEDURE	PAGE NUMBER
Fuel Gage inoperative or inaccurate.	Chart #1	8A-82-19
Coolant Temperature Gage inoperative or inaccurate.	Chart #2	8A-82-21
Oil Pressure Gage low at all times. (Non-SEO.)	Chart #3	8A-82-21
Oil Pressure Gage reads approx 3/4 scale with Ignition Switch in "RUN" and Engine not running. (non-SEO)	Chart #4	8A-82-22
"LOW OIL LEVEL" Indicator "ON," oil level OK.	Chart #5	8A-82-22
"LOW OIL LEVEL" Indicator inoperative, oil level low.	Chart #6	8A-82-23
"GATE AJAR" Indicator inoperative from Endgate.	Chart #7	8A-82-23
"GATE AJAR" Indicator "ON" at all times; Tailgate closed	Chart #8	8A-82-24
"LOW COOLANT" Indicator "ON," Coolant level OK.	Chart #9	8A-82-25
"LOW COOLANT" Indicator inoperative, Coolant level low.	Chart #10	8A-82-25
"LOW WASHER FLUID" Indicator does not come "ON" with Low Windshield Solvent Level.	Chart #11	8A-82-26
"LOW WASHER FLUID" Indicator is always "ON."	Chart #12	8A-82-26
Oil Pressure Gage inoperative or inaccurate. (SEO)	Chart #13	8A-82-27
"CHECK GAGE" Indicator does not come "ON" with Ignition in "RUN."	Check bulb. If bulb is OK, service Instrument Cluster.	
"DOOR OPEN" Indicator operates improperly.	Refer to SECTION 8A-114.	

8A - 82 - 18 ELECTRICAL DIAGNOSIS**INSTRUMENT CLUSTER: DIGITAL****SYMPTOM TABLE (Continued)**

SYMPTOM	PROCEDURE	PAGE NUMBER
Voltmeter inoperative or inaccurate.	Check that Charging System is operating normally and the Battery is fully charged. If OK, service Instrument Cluster.	
Oil Pressure and Fuel Gages are inaccurate.	Connect a jumper wire from a good chassis ground to Instrument Cluster Connector C1 terminal "B3." If Gages are still inaccurate, service Instrument Cluster.	
"BRAKE" Indicator is inoperative or remains "ON" when Park Brake is released.	Refer to "Brake Warning System," page 8A-41-0.	
"FASTEN SEAT BELT" Indicator does not work properly.	Refer to "Audible Warnings," page 8A-76-0.	
"HI BEAM" Indicator does not work properly.	Refer to "Headlamps," page 8A-100-0.	
"TURN" Indicators do not work properly.	Refer to "Exterior Lamps," page 8A-110-0.	
"LOW FUEL" Indicator operates improperly.	Check bulb. Fuel Gage must operate normally for "LOW FUEL" Indicator to function. If Fuel Gage is OK, service Instrument Cluster.	
"SERVICE ENGINE SOON" Indicator remains illuminated or flashes.	Refer to Engine Controls.	
"AIR BAG" Indicator does not illuminate and/or flash.	Refer to SECTION 9J.	
"ABS" Indicator is inoperative or does not work properly.	Refer to SECTION 5E1.	
Instrument Cluster and/or Panel Illumination Lamps do not dim properly.	Refer to "Instrument Panel Dimming," page 8A-117-0.	
Speedometer inoperative. DTC P1652 set.	Refer to Engine Controls.	
Speedometer inoperative; DTC P1652 not set.	Chart #14	8A-82-28
Speedometer is Inaccurate	Chart #15	8A-82-28
Tachometer is Inoperative or Inaccurate (Engine runs normally)	Chart #16	8A-82-29
Speedometer inoperative. DTC P1652 not set. Cruise Control operates.	Check for open in CKT 817 between S251 and Instrument Cluster Connector. Also check for poor connection at I/P Cluster Connector C1 terminal "A2" (Chev) or connector C2 terminal "A4" (Buick). If OK, service Instrument Cluster.	
"DOOR OPEN" Indicator inoperative.	Check CKT 149 from Instrument Cluster connector C2 terminal "A8" to S229. If OK, refer to "Interior Lamps" page 8A-114-0.

CIRCUIT OPERATION

See the circuit referred to for the complete operation of an indicator and other components that work with it. Only the indicators that do not appear in other schematics are described in this section.

"CHECK GAGE" INDICATOR

When the Ignition Switch is in "RUN" and Engine oil pressure is at 0-3 psi, if the Generator voltage is below 10V or above 16V or Engine coolant temperature exceeds 140°C (255°F), the Instrument Cluster Logic Chip turns the "CHECK GAGE" Indicator "ON."

FUEL GAGE

The Fuel Gage pointer is controlled by varying the Fuel Level Sender resistance. With the Ignition Switch in "RUN," voltage is applied from I/P Fuse #11 to the Empty coil of the Fuel Gage and divides into two paths: 1) through the Fuel Sender to ground, and 2) through the Full coil to ground. The Gage pointer is controlled by changes of the Fuel Sender resistance. When the Fuel Gage resistance decreases, more current flows through the Fuel Sender and the Empty coil. At the same time, the current through the Full coil decreases.

With two coils operating the pointer, the gage is not affected by changes in the voltage of the system.

COOLANT TEMPERATURE GAGE

The Coolant Temperature Gage applies voltage from CKT 135 to the Engine Coolant Temperature Gage Sensor. The Engine Coolant Temperature Gage Sensor contains a

variable resistor. At 405°C (1005°F) the resistance is approximately 1365 ohms and at 1255°C (2605°F) the resistance is approximately 55 ohms. As the resistance of the Engine Coolant Temperature Gage Sensor decreases, the Coolant Temperature Gage senses a smaller voltage drop across the Engine Coolant Temperature Gage Sensor, indicating a higher coolant temperature. As the resistance of the Engine Coolant Temperature Gage Sensor increases, the Coolant Temperature Gage senses a larger voltage drop across the Engine Coolant Temperature Gage Sensor, indicating a lower coolant temperature.

OIL PRESSURE GAGE (NON-SEO)

A two position switch opens with oil pressure greater than approximately 24 kPa (3 psi), directing current flow in CKT 31 through a 68 ohm resistor to ground. This causes the Oil Pressure Gage to deflect approximately 3/4 scale.

VOLTMETER

The voltmeter senses Ignition voltage on CKT 241 and is grounded on CKT 351.

DIGITAL SPEEDOMETER

The Digital Speedometer Display uses a vacuum fluorescent display to show vehicle speed only. With the Ignition Switch in "RUN," current flows from I/P Fuse #20 to the Instrument Cluster connector C2. For 3 seconds, the entire display lights up to check all segments. After the segment check, only the vehicle speed data is displayed.

INSTRUMENT CLUSTER: DIGITAL

"GATE AJAR" INDICATOR

B+ is applied at all times to Instrument Cluster connector C2 terminal "B6," powering the "GATE AJAR" Indicator. CKT 146 connects this indicator to the Endgate Lower Lock Ajar Switch. When this switch closes to ground, the "GATE AJAR" Indicator comes "ON."

"LOW OIL LEVEL" INDICATOR

The "LOW OIL LEVEL" Indicator ground is controlled by the PCM. The PCM also supplies B+ to the Engine Oil Level Sensor, mounted in the Engine oil pan. The PCM will not check for a low oil condition until the drop in Engine Coolant Temperature corresponds with the chart below. The PCM compares the drop in coolant temperature from the last Ignition "OFF" cycle to the coolant temperature at the start of the current Ignition "ON" cycle.

If the coolant temperature drop conditions are not met, the "LOW OIL LEVEL" Indicator will come on for the 2 second bulb test only. (The Ignition must be "OFF" for a minimum of 5 seconds before the "LOW OIL LEVEL" Indicator can come "ON" again.) If the Indicator is "ON" because of a low oil condition, it will remain "ON" for the rest of the current Ignition Cycle, even if oil is added to the crankcase. A low oil condition exists with 2 3/4 or less quarts of oil remaining in Engine Oil Pan.

Ignition "ON"°C	Temperature drop since last Ignition "OFF" Cycle°C
-40	7
-28	7
-16	7
-4	7
8	7
20	8
32	10
44	12
56	14
68	16
80	19
92	22
104	22
116	22
128	22
140	22
152	22

OIL PRESSURE GAGE (SEO)

SEO vehicles use a Fuel Pump Switch and Engine Oil Pressure Gage Sensor to allow for a constant reading of the engines oil pressure. The resistance of the sensing portion varies from 1 to 88 ohms.

"LOW COOLANT" INDICATOR

Ignition voltage is applied at all times to the Low Engine Coolant Indicator Probe. A magnetic float in the Coolant Recovery Reservoir rises and falls with the coolant level. A serviceable Reed-Type Switch (mounted in the bottom of the reservoir) senses the floating magnet. When the float (magnet) position gets lower in the reservoir, the Switch contacts are pulled together, grounding CKT 68.

"LOW FUEL" INDICATOR

The Instrument Cluster Logic Chip monitors the Fuel Sender resistance using CKT 30. When the Fuel Gage registers less than 1/8 tank of fuel, the resistance at terminal "A2" of connector C2 will be approximately $10 \pm 2 \Omega$. If this condition is met for 128 ± 64 seconds, the Logic Chip within the Instrument Cluster will ground the "LOW FUEL" Indicator, causing it to turn "ON." After refueling, the resistance at terminal "A2" of connector C2 will be above $15 \pm 2 \Omega$, depending on the amount of fuel in the fuel tank. Within the same Ignition Cycle, after approximately 128 ± 64 seconds, the Logic Chip within the Instrument Cluster will turn the "LOW FUEL" Indicator "OFF."

"LOW WASHER FLUID" INDICATOR

When the Ignition Switch is turned to "RUN," voltage is applied to the Windshield Washer Solvent Level Switch. If washer solvent level is low, the Windshield Washer Solvent Level Switch is closes, grounding CKT 99. The Instrument Cluster Logic Chip monitors CKT 99. When CKT 99 goes low, the Logic Chip grounds the "LOW WASHER FLUID" Indicator, causing it to turn "ON." Once the indicator has been turned "ON," it will stay "ON" until the windshield washer solvent container has been refilled, causing the Windshield Washer Solvent Level Switch to open. The Ignition Switch must then be cycled from "OFF" to "RUN" for the Indicator to turn "OFF."

TROUBLESHOOTING HINTS

(Perform before beginning System Diagnosis)

1. Check LO Beam Lamps and HI Beam Lamps for damage to the filament or bulb.

CAUTION: Halogen bulbs contain a gas under pressure. Handling a bulb improperly could cause it to shatter into flying glass fragments. To help avoid personal injury:

- Turn the Headlamp Switch to "OFF" and allow bulb to cool before changing bulbs. Leave the Switch in the "OFF" position until bulb change is complete.
- Always wear eye protection when changing a halogen bulb.
- Handle the bulb only by its base. Avoid touching the glass.
- Do not drop or scratch the bulb. Keep moisture away.
- Place the used bulb in the new bulb's carton and dispose of it properly. Keep halogen bulbs out of reach of children.

2. Check Fusible Link A for damage, refer to "Power Distribution," page 8A-10-0 wiring schematic. If Fusible Link A is open, check for short to ground in CKT 2 or Headlamp Switch.

3. Check the LH and RH Headlamp connectors to be sure the connector seal is not damaged or missing.

- Check for a broken (or partially broken) wire inside of the insulation which could cause system malfunction but prove "GOOD" in a continuity/voltage check with a system disconnected. These circuits may be intermittent or resistive when loaded, and if possible, should be checked by monitoring for a voltage drop with the system operational (under load).
- Check for proper installation of aftermarket electronic equipment which may affect the integrity of other systems (see "Troubleshooting Procedures," page 8A-4-0).
- Refer to System Diagnosis.

SYSTEM DIAGNOSIS

- Perform the System Check and refer to the Symptom Table for the appropriate diagnostic procedure(s).

SYSTEM CHECK

ACTION	NORMAL RESULTS
[1] • Headlamp Switch to "HEAD."	LO Beam Headlamps only are "ON."
[2] • Dimmer Switch to "HI."	LO Beam Headlamps are "OFF." HI Beam Headlamps are "ON." HI Beam Indicator is "ON."
[3] • Dimmer Switch to "LO."	HI Beam Headlamps are "OFF." HI Beam Indicator is "OFF." LO Beam Headlamps are "ON."
[4] • Headlamp Switch to "OFF."	HI and LO Beam Headlamps and HI Beam Indicator are "OFF."

C9690

CIRCUIT OPERATION

When the Headlamp Switch is moved to "HEAD," battery voltage is applied to the Dimmer Switch. When the Dimmer Switch is placed in "LO," battery voltage is applied, through the closed contacts of the Dimmer Switch, to the LO Beam Lamps. When the Dimmer Switch is placed in "HI," battery voltage is applied to the HI Beam Lamps and HI Beam Indicator. The LO Beam Lamps, HI Beam Lamps and HI Beam Indicator are permanently grounded so that when battery voltage is applied, the lamps operate.

TROUBLESHOOTING HINTS

(Perform before beginning System Diagnosis)

1. Check LO Beam Headlamps and HI Beam Headlamps for damage to the filament or bulb.

CAUTION: Halogen bulbs contain a gas under pressure. Handling a bulb improperly could cause it to shatter into flying glass fragments. To help avoid personal injury:

- Turn the Lamp Switch to "OFF" and allow bulb to cool before changing bulbs. Leave the switch in "OFF" until bulb change is complete.
- Always wear eye protection when changing a halogen bulb.
- Handle the bulb only by its base. Avoid touching the glass.
- Do not drop or scratch the bulb. Keep moisture away.
- Place the used bulb in the new bulb's carton and dispose of it properly. Keep halogen bulbs out of reach of children.

2. Check I/P Fuse #31 for open. If open, check for short to ground in CKT 240.
3. Check I/P Fuse #13 for open. If open, check for short to ground in CKT 639.
4. Check that grounds G102, G106, G200 and G202 are clean and tight.
5. Check that the Headlamp Automatic Control Ambient Light Sensor is not obstructed.
6. If Headlamps are dimly lit on one side, check the ground on that side.
7. If HI Beam Headlamps do not operate and the HI Beam Indicator is "ON," check LT GRN (11) wire for an open.

8. If one Headlamp does not work, check the connections, the Headlamp, and the wires to that Headlamp.

9. If either the Headlamps or the Park Lamps, but not both, remain "ON," disconnect Headlamp Automatic Control Module.

- If lamps go "OFF," replace the Headlamp Auto Control Module.
- If lamps remain "ON," replace the Headlamp Switch.
- Check for a broken (or partially broken) wire inside of the insulation which could cause system malfunction but prove "GOOD" in a continuity/voltage check with a system disconnected. These circuits may be intermittent or resistive when loaded, and if possible, should be checked by monitoring for a voltage drop with the system operational (under load).
- Check for proper installation of aftermarket electronic equipment which may affect the integrity of other systems (see "Troubleshooting Procedures," page 8A-4-0).
- Refer to System Diagnosis.

SYSTEM DIAGNOSIS

Perform the System Check in the order shown. When a fault is found, refer to the Symptom Table for the appropriate diagnostic procedure(s). If a normal result is found at each and every step of the System Check, the fault may be intermittent.

To help isolate an intermittent fault, first examine the mating terminals at each component and connector for a poor connection. Also check that each terminal of mating connectors is properly seated in the connector body. If the connections appear to be reliable, try the System Check again while moving the wiring harness from side to side at each component and in-line connector, to try and induce the intermittent fault.

Once a fault has been corrected, perform the System Check to verify the diagnosis.

8A - 101 - 6 ELECTRICAL DIAGNOSIS**HEADLAMPS WITH TWILIGHT SENTINEL****SYSTEM CHECK**

ACTION	NORMAL RESULTS
[1] • Twilight Sentinel Switch to "OFF." • Headlamp Switch to "OFF." • Apply a bright light to the Headlamp Automatic Control Ambient Light Sensor. • Ignition Switch to "RUN."	• Tail and License Lamps "OFF." • Front Park Lamps "OFF." • Headlamps "OFF."
[2] • Twilight Sentinel Switch to "ON." • Cover Headlamp Automatic Control Ambient Light Sensor.	• Tail and License Lamps "ON." • Front Park and Opera Lamps (if equipped) "ON." • Headlamps "ON," after 15-20 seconds.
[3] • Apply a bright light to the Headlamp Automatic Control Ambient Light Sensor.	• Tail, License, Front Park and Opera Lamps (if equipped) "OFF." • Headlamps "OFF," after 15-20 seconds.
[4] • Cover the Headlamp Automatic Control Ambient Light Sensor and wait for lamps to turn "ON." • Wait 5 seconds, turn Ignition Switch "OFF."	• Lamps turn "OFF" after a time delay of 5 seconds with Twilight Sentinel Switch set to "MIN" and 3 minutes with Switch set to "MAX."
[5] • Turn Ignition "ON." • Headlamps "ON" under Twilight Sentinel Control. • Open Driver's Door.	Lamps "ON" Warning does not sound.
[6] • Turn Ignition "OFF." • Headlamp Switch in "PARK." • Open Driver's Door. • Ignition Key out of Lock Cylinder.	Lamps "ON" Warning sounds.
[7] • Twilight Sentinel Switch to "OFF." • Headlamp Switch "OFF." • Open Driver's Door.	Lamps "ON" Warning does not sound.
[8] • Ignition Switch to "OFF."	Headlamps, Tail, License, Front Park and Opera Lamps (if equipped) "OFF."

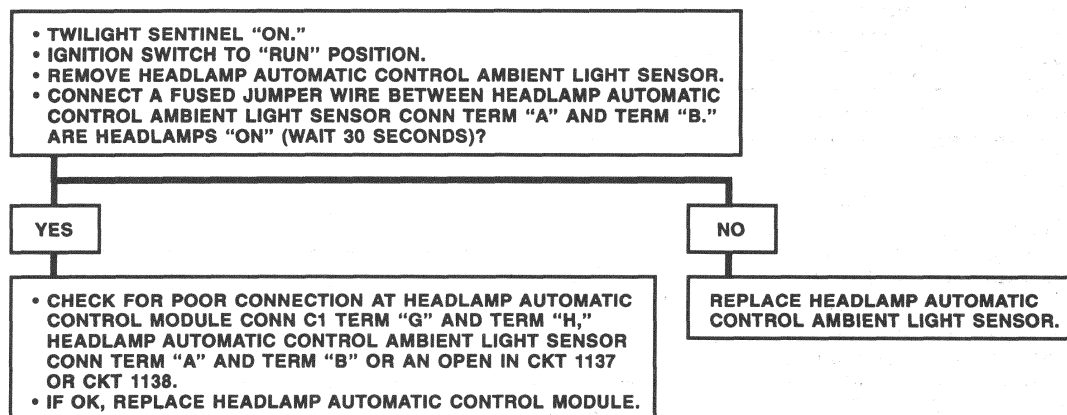

SYMPTOM TABLE

SYMPTOM	PROCEDURE	PAGE NUMBER
Headlamps and/or Tail, Front Park and Opera Lamps "ON" with daylight conditions.	Chart #1	8A-101-8
Using Twilight Sentinel Control: Tail, Front Park and Opera Lamps are inoperative, Headlamps operate normally.	Chart #2	8A-101-9
Using Twilight Sentinel Control: Headlamps are inoperative. Tail, Front Park and Opera Lamps operate normally and Headlamp Switch operates normally.	Chart #3	8A-101-10

8A - 101 - 14 ELECTRICAL DIAGNOSIS

HEADLAMPS WITH TWILIGHT SENTINEL

CHART #6
LAMPS "ON" WARNING INOPERATIVE

CIRCUIT OPERATION

HEADLAMPS

Voltage is applied to the Headlamp Switch at all times. The Headlamp Switch includes a self-resetting circuit breaker which opens if the headlamp circuit draws too much current. When the Headlamp Switch is in "HEAD," the Dimmer Switch directs current to either the LO Beams or the HI Beams. When the Dimmer Switch is in "HI," current also flows to the HI Beam Indicator.

TWILIGHT SENTINEL

The Twilight Sentinel System automatically turns the interior and exterior driving lamps on and off according to light conditions. The system also keeps the lamps on for a selected amount of time after the driver has parked and left the vehicle. The system can be turned off to give the driver manual control over the lamps.

The Twilight Sentinel will send a lamps "ON" signal to the Audible Warnings only if the Headlamp Switch is in the "PARK" or "HEAD" position.

Voltage is applied at all times through Fusible Link A to the Headlamp Switch terminal "K" (Chev) or terminal "F" conn C2 (Buick) and from the Headlamp Switch terminal "G" (Chev) or terminal "D" conn C2 (Buick) to the Headlamp Automatic Control Module connector C2 terminal "D."

When the Ignition Switch is in "RUN," voltage from I/P Fuse #13 is applied to connector C1 terminal "E" of the Headlamp Automatic Control Module. Ground is supplied from G200.

As the intensity of light reaching the Headlamp Automatic Control Ambient Light Sensor decreases, the resistance of the Headlamp Automatic Control Ambient Light Sensor increases. When the Headlamp Automatic Control Module senses a high resistance in the Headlamp

Automatic Control Ambient Light Sensor, the Headlamp Automatic Control Module energizes the Internal Head Relay. Battery voltage is applied through the closed contacts of the Head Relay to CKT 10. With the Dimmer Switch in "LO," the LO Beam Headlamps are "ON." With the Dimmer Switch in "HI," the HI Beam Headlamps and Indicator are "ON." The Headlamp Automatic Control Module also energizes the Internal Park Relay, which applies battery voltage to CKT 9 and turns "ON" the Tail, Front Side Marker and Opera Lamps.

As the intensity of light reaching the Headlamp Automatic Control Ambient Light Sensor increases, the resistance of the Headlamp Automatic Control Ambient Light Sensor decreases. When the Headlamp Automatic Control Module senses a low resistance in the Headlamp Automatic Control Ambient Light Sensor, the Headlamp Automatic Control Module de-energizes the Internal Head Relay which turns the Headlights "OFF," and also de-energizes the Internal Park Relay which turns the Tail, Front Side Marker and Opera Lamps "OFF."

If the Ignition Switch is moved to "OFF," the Headlamp Automatic Control Module loses ignition voltage through I/P Fuse #13, and will cause a delay of five (5) seconds to three (3) minutes and then turn the lamps off. This delay is set by changing the resistance of a delay rheostat in the Twilight Sentinel Switch.

When the Twilight Sentinel Switch is turned to "OFF," the path to ground at connector C1 terminal "A" at the Headlamp Automatic Control Module is opened. The system is turned off and the Headlamps will operate only by moving the Headlamp Switch to the "PARK" or "HEAD" position.

The Headlamp Automatic Control Module does not react instantly to ambient signals. Turn-on or turn-off is delayed from 15-20 seconds. This avoids needless operation for short periods of time.

TROUBLESHOOTING HINTS

(Perform before beginning System Diagnosis)

CAUTION: Halogen bulbs contain a gas under pressure. Handling a bulb improperly could cause it to shatter into flying glass fragments. To help avoid personal injury:

- Turn the Headlamp Switch to the "OFF" position and allow bulb to cool before changing bulbs. Leave the switch in the "OFF" position until bulb change is complete.
 - Always wear eye protection when changing a halogen bulb.
 - Handle the bulb only by its base. Avoid touching the glass.
 - Do not drop or scratch the bulb.
 - Keep moisture away.
 - Place the used bulb in the new bulb's carton and dispose of it properly. Keep halogen bulbs out of the reach of children.
1. Check LO Beam Lamps and HI Beam Lamps for damage to the filament or bulb.
 2. Check I/P Fuse Block Fuse #31. If open, check for a short to ground in CKT 240.
 3. Check I/P Fuse Block Fuse #13. If open, check for a short to ground in CKT 639.
 4. Check I/P Fuse Block Fuse #20. If open, check for a short to ground in CKT 241.
 5. Check that the Headlamp Automatic Control Ambient Light Sensor is not obstructed.

6. Check Fusible Link A. If open, check for short to ground in CKT 2 or Headlamp Switch.
7. Check the LH and RH Headlamp connectors to be sure the connector seal is not damaged or missing.
8. If one Headlamp doesn't work, check the connections, Headlamp and the wires to the Headlamp.
9. If HI Beam Headlamps do not light, but the HI Beam Indicator lamps, check LT GRN (11) wire for an open.
 - Check for a broken (or partially broken) wire inside of the insulation which could cause system malfunction but prove "GOOD" in a continuity/voltage check with a system disconnected. These circuits may be intermittent or resistive when loaded, and if possible, should be checked by monitoring for a voltage drop with the system operational (under load).
 - Check for proper installation of aftermarket electronic equipment which may affect the integrity of other systems (see "Troubleshooting Procedures," page 8A-4-0).
 - Refer to System Diagnosis.

SYSTEM DIAGNOSIS

Perform the System Check in the order shown. When a fault is found, refer to the Symptom Table for the appropriate diagnostic procedure(s). If a normal result is found at each and every step of the System Check, the fault may be intermittent.

To help isolate an intermittent fault, first examine the mating terminals at each component and connector for a poor connection. Also check that each terminal of mating connectors is properly seated in the connector body. If the connections appear to be reliable, try the System Check again while moving the wiring harness from side to side at each component and in-line connector, to try and induce the intermittent fault.

Once a fault has been corrected, perform the System Check to verify the diagnosis.

SYSTEM CHECK

ACTION	NORMAL RESULTS
[1] • Headlamp Switch to "OFF." • Set Park Brake. • Apply a bright light to the Headlamp Automatic Control Ambient Light Sensor. • Ignition Switch to "RUN."	• Tail and License Lamps "OFF." • Front Park Lamps "OFF." • Headlamps "OFF."
[2] • Remove bulb from Headlamp Automatic Control Ambient Light Sensor. • Cover Headlamp Automatic Control Ambient Light Sensor. • Release Park Brake.	• Tail, License and Front Park Lamps "ON." • LO Beam Headlamps "ON" at full intensity.
[3] • Apply a bright light to the Headlamp Automatic Control Ambient Light Sensor.	• Tail, License and Front Park Lamps "OFF." • LO Beam Headlamps "ON" at reduced intensity.
[4] • Cover Headlamp Automatic Control Ambient Light Sensor. • Headlamp Dimmer Switch to "HI."	• Tail, License and Front Park Lamps "ON." • LO Beam Headlamps "OFF." • HI Beam Headlamps and HI Beam Indicator "ON."
[5] • Headlamp Dimmer Switch to "LO."	• Tail, License and Front Park Lamps "ON." • LO Beam Headlamps "ON."
[6] • Ignition Switch to "OFF."	Tail, License, Front Park Lamps and Headlamps "OFF."

C9782

CIRCUIT OPERATION

The LO Beam Headlamps are automatically controlled by the Daytime Running Lamps (DRL) Module. With sufficient ambient light (daylight), the DRL Module will activate the LO Beam Headlamps at a reduced intensity. With low light conditions, the DRL Module will activate the Park and Tail Lamps, and LO Beam Headlamps at full intensity. If the DRL System is inoperative, the Headlamp Switch overrides the DRL System to provide manual control of the Headlamps. If the Park Brake is set when the Ignition Switch is turned to "RUN," the DRL Module will not activate the LO Beam Headlamps until the Park Brake is released.

Battery voltage is applied at all times to the DRL Module through I/P Fuse #31 to power the Park and Tail Lamps. Voltage is applied to the DRL Module through I/P Fuse #20 to power the control circuitry of the DRL Module. Battery voltage is applied to the DRL Module through CKT 274 with the Headlamp Switch "OFF," to power the LO Beam Headlamps at reduced or full intensity.

As the intensity of light reaching the Headlamp Automatic Control Ambient Light Sensor decreases, the resistance of the Sensor increases. When the DRL Module senses a high resistance in the Sensor, the DRL Module

de-energizes the internal DRL Relay and energizes the internal Head Relay. Battery voltage is applied through the closed contacts of the Head Relay to CKT 10. With the Headlamp Dimmer Switch in "LO," the LO Beam Headlamps are "ON" at full intensity. With the Dimmer Switch in "HI," the HI Beam Headlamps and Indicator are "ON."

As the intensity of light reaching the Sensor increases, the resistance of the Sensor decreases. When the DRL Module senses a low resistance in the Sensor, the DRL Module de-energizes the internal Head Relay and energizes the internal DRL Relay. Battery voltage is applied through the closed contacts of the DRL Relay to the DRL Diode. Due to the voltage drop across the DRL Diode, the LO Beam Headlamps are "ON" at a reduced intensity.

When the Park Brake Switch is closed (Park Brake set), CKT 33 is grounded. If the Ignition Switch is turned to "RUN" when CKT 33 is grounded, the DRL Module senses a voltage drop at the Park Brake Input and will not energize the Head Relay or the DRL Relay until the ground through CKT 33 is removed (Park Brake Switch open). Reapplying the Park Brake during the same Ignition cycle will not affect further DRL operation, during the same ignition cycle.

TROUBLESHOOTING HINTS

(Perform before beginning System Diagnosis)

1. If the Turn Lamps or Backup Lamps do not work, check I/P Fuse #12. If open, check for short to ground in CKT 239.
2. If the Stop Lamps or Hazard Lamps do not work, check I/P Fuse #37. If open, check for short to ground in CKT 140.
3. If one of the Turn Indicators goes on when the Park Lamps are turned on, check the Park and Front Side Marker Lamp on that side for open or poor connection.
4. If Turn Lamps stay on (do not flash) in both Turn Left and Turn Right, replace the Turn Flasher.
5. For any of the following symptoms, replace the Turn Signal Switch:
 - Turn Signal Switch will not turn "ON/OFF."
 - All Turn/Hazard/Stop Lamps do not work and C210 is firmly mated.
 - Some Turn Lamps work and all Hazard Lamps work.
 - Some Hazard Lamps work and all Turn Lamps work.
 - Hazard Lamps do not turn "OFF."
6. If Hazard Lamps stay on (do not flash) in "Hazard," but Stop Lamps operate normally, replace the Hazard Flasher.
7. If Stop Lamps do not turn "OFF" adjust/replace the Stoplamp Switch.
8. If a Turn Indicator does not light but the Turn Signal works, check the bulb, connections and wiring to the Indicator. Refer to "Instrument Cluster," page 8A-81-0 (Buick) or 8A-82-0 (Chevrolet).
9. If only one lamp does not operate, check the lamp, socket and related wiring for opens or corrosion (see schematic).
10. With Twilight Sentinel, if Parking Lamps stay on and Headlamps stay at full intensity with daylight conditions check for an obstruction covering the Twilight Sentinel Photocell (See "Headlamps With Twilight Sentinel," page 8A-101-0).
11. If one Front Park and/or Marker Lamp does not light, check that its ground is clean and tight.
12. If none of the Park/Taillamps work, check I/P Fuse #31. If open, check for short to ground in CKT 240.
13. If Park Lamps do not turn "OFF," check Headlamp Switch. If OK, repair short to B+ in CKT 9.
14. Sedan: If License Lamp is inoperative, check for open in CKT 750 between S408 and lamp socket. Check for open in CKT 1256 between S417 and lamp socket. Wagon: If one License Lamp is inoperative, check for open in CKT 750 between S403 and inoperative lamp socket. Check for open in CKT 1256 between S409 and inoperative lamp socket.
 - Check for a broken (or partially broken) wire inside of the insulation which could cause system malfunction but prove "GOOD" in a continuity/voltage check with a system disconnected. These circuits may be intermittent or resistive when loaded, and if possible, should be checked by monitoring for a voltage drop with the system operational (under load).
 - Check for proper installation of aftermarket electronic equipment which may affect the integrity of other systems (see "Troubleshooting Procedures," page 8A-4-0).
 - Refer to System Diagnosis.

SYSTEM DIAGNOSIS

- Perform the System Check and refer to the Symptom Table for the appropriate diagnostic procedures.

EXTERIOR LAMPS**SYSTEM CHECK**

ACTION	NORMAL RESULTS
[1] • Headlamp Switch to "PARK."	All Exterior Lamps are "ON" (except Headlamps).
[2] • Hazard Switch to "ON."	Front and Rear Turn Lamps flash continuously from minimum intensity to maximum intensity. Front Marker Lamps flash continuously from "OFF" to "ON."
[3] • Headlamp Switch still set in "PARK" position. • Hazard Switch "ON." • Depress brake pedal.	Front and Rear Turn Lamps stay "ON" at maximum intensity and Front Marker Lamps stay "OFF," as long as brake pedal is depressed.
[4] • Headlamp Switch "OFF." • Brake pedal released. • Hazard Lamps still "ON."	Front and Rear Turn Lamps flash continuously from "OFF" to "LOW" intensity.
[5] • Operate LH or RH Turn Switch.	Turn Lamps flash continuously "ON" and "OFF."

PARK, MARKER, TAIL AND LICENSE LAMPS

Voltage is applied at all times from I/P Fuse #31 to the Headlamp Switch and, if equipped, to the Automatic Headlamp Control or DRL Module from CKT 240. With the Headlamp Switch in "PARK" or "HEAD" or with low light conditions, if equipped with Twilight Sentinel, voltage is applied to CKT 9. Current flows through CKT 9, to I/P Fuse Block, which feeds all Park, Marker, Tail and License Lamps turning them "ON." The only lamps that see a current from CKT 308 and do not turn "ON," are the turn filaments in the Park/Turn Lamps. They do not activate because the voltage drop across the Front Side Marker Lamps is much higher than that across the Turn Lamp Filaments.

TURN LAMPS

With the Ignition Switch in "RUN," "BULB TEST" or "START," voltage is applied from I/P Fuse #12 and the Turn Flasher to the normally closed pole of the Hazard Switch in the Turn/Hazard Switch Assembly. With the Turn Switch in the "TURN LEFT" position, voltage is applied from the Turn Switch to CKT 14 at terminal "H" of the Turn Signal Switch connector C210 and to CKT 18 at terminal "M" of C210. LH Front Turn, Rear Turn and Indicator Lamps flash "ON" and "OFF" as current flow heats up the timing element in the Turn Flasher, and it continuously opens and closes the circuit (for RH Turn Lamps CKT 15 terminal "J" of C210 and CKT 19 terminal "N" of C210). With Park Lamps "ON" and Turn Lamps "ON," voltage is applied to both terminals of the Front Marker Lamp causing it to be "OFF." When the Front Turn Lamp is "OFF," voltage is applied to only one terminal of the Marker Lamp causing it to flash "ON." They continue to flash "ON" and "OFF" out of sequence until Turn Switch is turned "OFF."

HAZARD LAMPS

Voltage is applied at all times from I/P Fuse #37 and the Hazard Flasher to the normally open poles of the Hazard Switch in the Turn/Hazard Switch Assembly. With the Hazard Switch in "HAZARD," voltage is applied to the Stop-Turn Lamps. All of the Stop-Turn Lamps and both Turn Indicators flash on and off.

STOP LAMPS

Voltage is applied at all times from I/P Fuse #37 to the Stoplamp Switch. When the brake pedal is depressed, voltage is applied from the Stoplamp Switch and Turn Signal Switch to CKT 18 and CKT 19, turning "ON" the LH and RH Tail/Stop/Turn Lamps.

Voltage is supplied at all times through I/P Fuse #37 to the Stoplamp/Cruise Release Switch. When the brake pedal is depressed, voltage is applied from the Stoplamp/Cruise Release Switch to CKT 17 and the High Mount Stoplamp, turning "ON" the High Mount Stoplamp.

Buick Wagons with Remote Keyless Entry (AU0) have a 400 ohm resistor in CKT 17 and CKT 750. This Resistor is used to prevent accidental locking of the door locks in cases where the Hazard Switch has been activated and the Rear glass is released. Residual voltage in CKT 17 could cause the Remote Control Door Lock Receiver to activate a Door Lock Cycle. The 400 ohm resistor will keep CKT 17 "LOW," thus preventing an unwanted Lock Cycle. Refer to SECTION 9K for additional information on the Remote Keyless Entry System.

TROUBLESHOOTING HINTS

(Perform before beginning System Diagnosis)

1. Check I/P Fuse Block Fuse #12. If open, check CKT 239 for a short to ground.
2. Check the Backup Lamps for damage to the filament or corrosion between the Backup Lamp and Backup Lamp Socket.
 - Check for a broken (or partially broken) wire inside of the insulation which could cause system malfunction but prove "GOOD" in a continuity/voltage check with a system

disconnected. These circuits may be intermittent or resistive when loaded, and if possible, should be checked by monitoring for a voltage drop with the system operational (under load).

- Check for proper installation of aftermarket electronic equipment which may affect the integrity of other systems (see "Troubleshooting Procedures," page 8A-4-0).
- Refer to System Diagnosis.

SYSTEM DIAGNOSIS

- Refer to the Symptom Table for the appropriate diagnostic procedure(s).

C9919

CIRCUIT OPERATION

Voltage is applied to the Backup Lamp and Transmission Position Sensor (PNP) Switch with the Ignition Switch in "RUN," "BULB TEST" or "START." When the Transmission is shifted into "REVERSE," the Backup Lamp and Transmission Position Sensor (PNP) Switch closes the circuit and voltage is applied to the Backup Lamps. The Backup Lamps are permanently grounded.

CORNERING LAMPS

TROUBLESHOOTING HINTS

(Perform before beginning System Diagnosis)

1. Check I/P Fuse #31. If it is open, check CKT 240 for a short to ground.
 2. Check I/P Fuse #41. If it is open, check CKT 308 for a short to ground and Refer to 8A-110 for Diagnosis of Park Lamps.
 3. Make sure that G102 and G106 are clean and tight.
 4. Check bulbs and sockets for damage or corrosion.
- Check for a broken (or partially broken) wire inside of the insulation which could cause system malfunction but prove "GOOD" in a

continuity/voltage check with a system disconnected. These circuits may be intermittent or resistive when loaded, and if possible, should be checked by monitoring for a voltage drop with the system operational (under load).

- Check for proper installation of aftermarket electronic equipment which may affect the integrity of other systems (see "Troubleshooting Procedures," page 8A-4-0).
- Refer to System Diagnosis.

SYSTEM DIAGNOSIS

- Perform the System Check and refer to the Symptom Table for the appropriate diagnostic procedure(s).

SYMPTOM TABLE

SYMPTOM	PROCEDURE	PAGE NUMBER

C9912

CORNERING LAMPS

CHART #2
ONE CORNERING LAMP IS INOPERATIVE

CHART #3

ONE CORNERING LAMP IS ON WHENEVER PARK LAMPS ARE ACTIVATED

C9914

CIRCUIT OPERATION

Voltage is applied to the Headlamp Switch at all times. With the Headlamp Switch in "PARK" or "HEAD," voltage is applied to the Cornering Lamps Switch, which is part of the Turn Signal Switch. With the Turn Signal Switch in either the "TURN LEFT" or "TURN RIGHT" position, voltage is applied to the corresponding Front Side Marker and Cornering Lamp. The LH Front Side Marker and Cornering Lamp is permanently grounded to G102 and the RH Front Side and Cornering Lamp is permanently grounded to G106.

TROUBLESHOOTING HINTS

(Perform before beginning System Diagnosis)

1. Check I/P Fuse #33. If Fuse #33 is open, check for a short to ground in CKT 40.
2. Check I/P Fuse #35. If Fuse #35 is open, check for a short to ground in CKT 2040.
3. Check I/P Fuses 13, 27 and 28. If Fuses are open, check for short to ground in CKT's 1040, 740 and 2540.
4. Check that grounds G104, G200, G201, G400 and G401 are clean and tight.
 - Check for a broken (or partially broken) wire inside of the insulation which could cause system

malfunction but prove "GOOD" in a continuity/voltage check with a system disconnected. These circuits may be intermittent or resistive when loaded, and if possible, should be checked by monitoring for a voltage drop with the system operational (under load).

- Check for proper installation of aftermarket electronic equipment which may affect the integrity of other systems (see "Troubleshooting Procedures," page 8A-4-0).
- Refer to System Diagnosis.

SYSTEM DIAGNOSIS

- Do the test listed, or make the necessary repairs, for your symptom in the Symptom Table.

INTERIOR LAMPS

SYMPTOM TABLE

SYMPTOM	PROCEDURE
All Courtesy Lamps are inoperative with Door Jamb Switches (SEO).	Check for poor connection at Term "D" C302. If OK, repair open in CKT 149/156 between Warning Alarm Term "A11" and S341. Refer to "Audible Warnings," page 8A-76-0, for additional details.
All Courtesy Lamps are inoperative with one or more Door Jamb Switches (NON-SEO).	Check CKT 149 between S253 and Dome Courtesy Lamp Relay for an open. Check CKT 450 between Dome Courtesy Lamp Relay and G200 for an open. Refer to "Audible Warnings," page 8A-76-0, for additional details.
All Courtesy Lamps are inoperative with I/P Dimmer/Headlamp Switch only.	Check CKT 149 (between S229 and I/P Dimmer/Headlamp Switch) and CKT 450 (between I/P Dimmer/Headlamp Switch and G200) for an open. If OK, replace I/P Dimmer/Headlamp Switch.
Any or all of the Courtesy Lamps are on at all times.	Perform Lamp Short Test on page 8A-114-10. If OK, refer to "Audible Warnings," page 8A-76-0, for additional details.
Any or all the Courtesy Lamps are on at all times.	Perform Lamp Short Test on page 8A-114-10. If OK, refer to "Audible Warnings," page 8A-76-0, for additional details.
One or both Roof Rail Courtesy and Reading Lamps are inoperative with Door Jamb Switches or I/P Dimmer/Headlamp Switch.	Check bulb(s), CKT 2040 (between S318 and Lamps) and CKT 149 (between Lamps and S320) for an open. If OK, replace Roof Rail Courtesy and Reading Lamp(s).
One or both Roof Rail Courtesy and Reading Lamps are inoperative with Headlamp and I/P Dimmer Switch.	Check CKT 149 (between S320 and S253) for an open. If OK, replace Roof Rail Courtesy Lamp(s).
One or both I/P Courtesy Lamps are inoperative.	Check bulb(s), CKT 2040 (between S214 and Lamps) and CKT 149 (between Lamps, and I/P Dimmer/Headlamp Switch for an open.
One or more Door Courtesy Lamps are inoperative.	Check bulb(s), CKT 2040 (between S312 and Lamps) and CKT 149 (between Lamps and S306) for an open. If OK, replace Door Courtesy Lamp(s).
One or both Rear Compartment Courtesy Lamps are inoperative with Endgate Lower Lock Ajar Switch.	Perform Endgate Lower Lock Ajar Switch Test on page 8A-114-9.
One or both Rear Compartment Courtesy Lamps are inoperative with Lamp Switches.	Check CKT 750 (between Lamps and G400) for an open. If OK, replace Rear Courtesy Lamp(s).
Inside Rear View Mirror Lamps are inoperative with Door Jamb Switches or I/P Dimmer/Headlamp Switch.	Check bulbs, CKT 2040 (between S318 and Lamps) and CKT 149 (between Mirror and S320). If OK, replace Inside Mirror.
Inside Rear View Mirror Lamps are inoperative with Lamp Switches.	Check CKT 750 (between Lamps and S316) for an open. If OK, replace Inside Mirror.
Underhood Lamp is inoperative.	Check bulb, CKT 540 (between I/P Fuse and Lamp) and CKT 350 (between Lamp and G104) for an open. If OK, replace Underhood Lamp.
One or both Sunshade Lamps are inoperative.	Check bulbs and CKT 2040 (between S318 and Lamps) for an open. Also check Sunshade for a clean and tight ground connection. If OK, replace Sunshade.
I/P Compartment Lamp is inoperative.	Check bulb, CKT 40 (between I/P Fuse #33 and Lamp) and CKT 450 (between Lamp and G200) for an open. If OK, replace I/P Compartment Lamp. Check I/P Compartment Switch for open on Buick.

SYMPTOM TABLE (Continued)

SYMPTOM	PROCEDURE
Rear Compartment Courtesy Lamp is inoperative.	Check bulb, CKT 740 (between S240 and Lamp) and CKT 450 (between Lamp and G200) for an open. If OK, replace Rear Compartment Courtesy Lamp.
Cigar Lighter is inoperative.	Check for corrosion or element damage. Also check CKT 2540 (between I/P Fuse #28 and Lighter) and CKT 450 (between Lighter and G200) for an open. If OK, replace Cigar Lighter.
"DOOR OPEN" Indicator inoperative.	If Courtesy Lamps operate properly, check CKT 149 between S229 and Instrument Cluster Conn C2 Term "A8" for an open. If OK, service Instrument Cluster.
"DOOR OPEN" Indicator "ON" at all times.	Perform Lamp Short Test on page 8A-114-10.

ENDGATE LOWER LOCK AJAR SWITCH TEST

INTERIOR LAMPS

LAMP SHORT TEST

With all the doors closed and the Lamp Switch turned off, disconnect the Door Jamb Switches and the Lamp Switch one at a time.

- If the lamps go out when a particular switch is disconnected, replace that switch.
- If the lamps remain lit with all switches disconnected, check for short to ground in CKT 149 or 1393. If OK, refer to "Audible Warnings," page 8A-76-0, for additional details.

CIRCUIT OPERATION

DOOR COURTESY, INSIDE REAR VIEW MIRROR COURTESY, I/P COURTESY, REAR COURTESY AND READING AND ROOF RAIL COURTESY LAMPS

Voltage is applied through Fuse #35 at all times to the Door Courtesy Lamps, Inside Rear View Mirror, I/P Courtesy Lamps, Rear Courtesy Lamps and to the Roof Rail Courtesy and Reading Lamps will light whenever a door is opened or whenever the I/P Dimmer Courtesy Switch is turned to "ON." The Rear Courtesy Lamps will light whenever the Endgate is opened. The Inside Rear View Mirror Courtesy/Reading Lamps, the Rear Courtesy

Lamps and the Roof Rail Courtesy Lamps also have a separate switch in the circuit. When turned to "ON," this switch allows for individual operation of these Lamps. Refer to "Audible Warnings," page 8A-76-0, for additional information on Courtesy Lamps and Circuit Operation.

HEADLAMP SWITCH ILLUMINATION LAMP

Whenever the Ignition Switch is turned to "RUN," "BULB TEST" or "START," voltage is applied through Fuse #17 to the Headlamp Switch Illumination Lamp. The Lamp remains lit until the Ignition Switch is turned to "OFF."

SUNSHADE ILLUMINATED MIRROR

Voltage is applied through Fuse #35 at all times to the LH and RH Mirror. The LH and RH Mirror Lamps will light whenever the Visor is pulled down and the cover is opened.

CIGAR LIGHTER

Voltage is applied through Fuse #28 at all times to the Cigar Lighter. The Cigar Lighter has a heating element that, when pushed in, completes the circuit and begins to heat up. When the element is sufficiently heated, the Cigar Lighter opens the circuit.

INSTRUMENT PANEL DIMMING (CHEV)

INSTRUMENT PANEL DIMMING (BUICK)

TROUBLESHOOTING HINTS

(Perform before beginning System Diagnosis)

1. Make sure Park Lamps turn "ON" and "OFF" normally before proceeding with System Diagnosis, refer to "Exterior Lamps," page 8A-110-0 for Park Lamp diagnosis.
2. Check I/P Fuse #42. If I/P Fuse #42 is open, check for a short to ground in CKT 44, CKT 8, or in CKT 32.
3. Check that G200 and G201 are clean and tight.
 - Check for a broken (or partially broken) wire inside of the insulation which could cause system malfunction but prove "GOOD" in a continuity/voltage check with a system

disconnected. These circuits may be intermittent or resistive when loaded, and if possible, should be checked by monitoring for a voltage drop with the system operational (under load).

- Check for proper installation of aftermarket electronic equipment which may affect the integrity of other systems (see "Troubleshooting Procedures," page 8A-4-0).
- Refer to System Diagnosis.

SYSTEM DIAGNOSIS

- Refer to the Symptom Table for the appropriate diagnostic procedure(s).

SYMPTOM TABLE

SYMPTOM	PROCEDURE	PAGE NUMBER
None of the Panel Lamps will light with Headlamp Switch in "PARK" or "HEAD."	Chart #1 (BUICK) Chart #2 (CHEV)	8A-117-8 8A-117-9
All Panel Lamps remain lit at all times.	Check CKT 9, CKT 44, CKT 8 and CKT 32 for a short to B+.	
I/P Dimmer Switch will not change the brightness of the Panel Lamps.	Check for short to B+ in CKT 8. Check for short to B+ in CKT 44 (CHEV). If OK, replace I/P Dimmer/Headlamp Switch.	
Brightness of Panel Lamps changes erratically when I/P Lamp Dimmer Switch is turned.	Check for poor connections at I/P and Headlamp Dimmer Switch. If OK, replace I/P and Headlamp Dimmer Switch.	
One or more Panel Lamps will not illuminate or dim properly.	Check CKT 8 (between suspect Panel Lamp and S209) and CKT 450 (between suspect Panel Lamp and G200) for an open. If OK, replace suspect Panel Lamp bulb.	
SEO speedometer and Radio displays do not illuminate with Park Lamps "OFF."	Check for shorted SEO I/P Dimmer Switch. If OK, repair short to B+ in CKT 911 or CKT 1244.	
SEO speedometer and Radio displays will not dim to "OFF" when using the SEO I/P Dimmer Switch.	Check for defective SEO I/P Dimmer Switch. If OK, repair open in CKT 911 or CKT 1244.	

INSTRUMENT PANEL DIMMING

CHART #1 (BUICK)

IN "PARK" OR "HEAD"

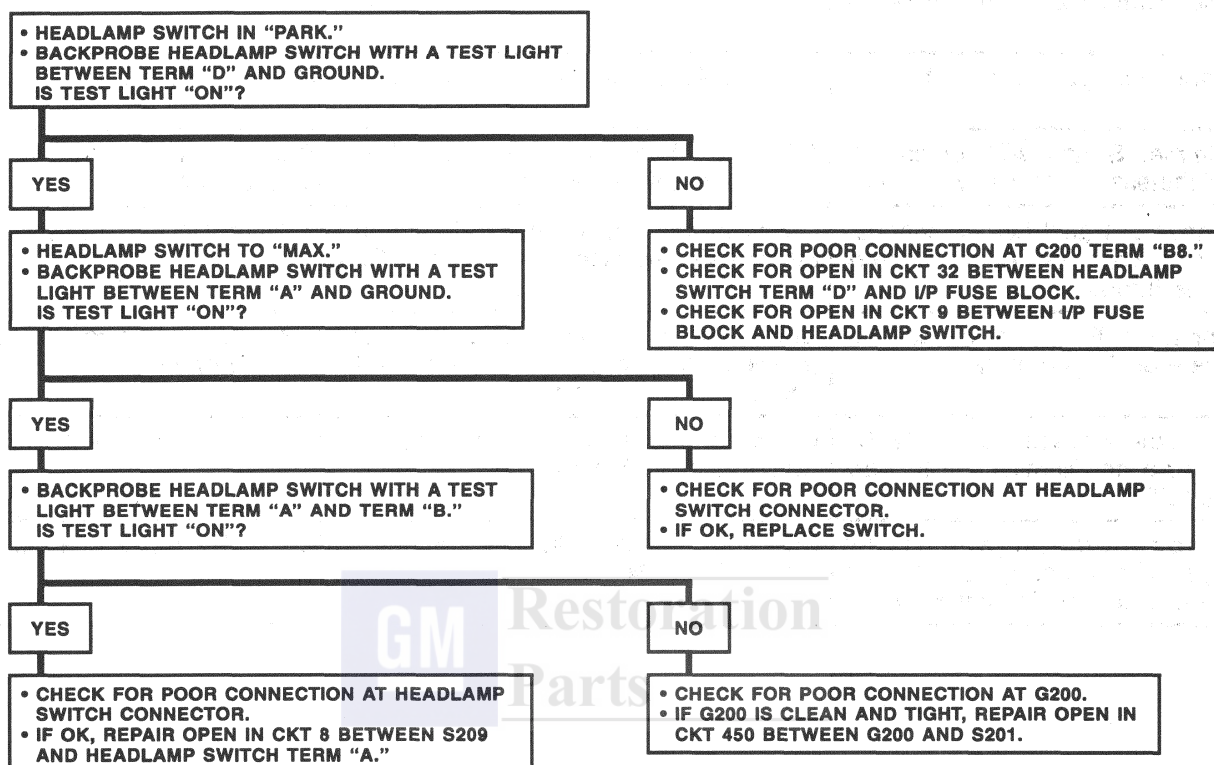

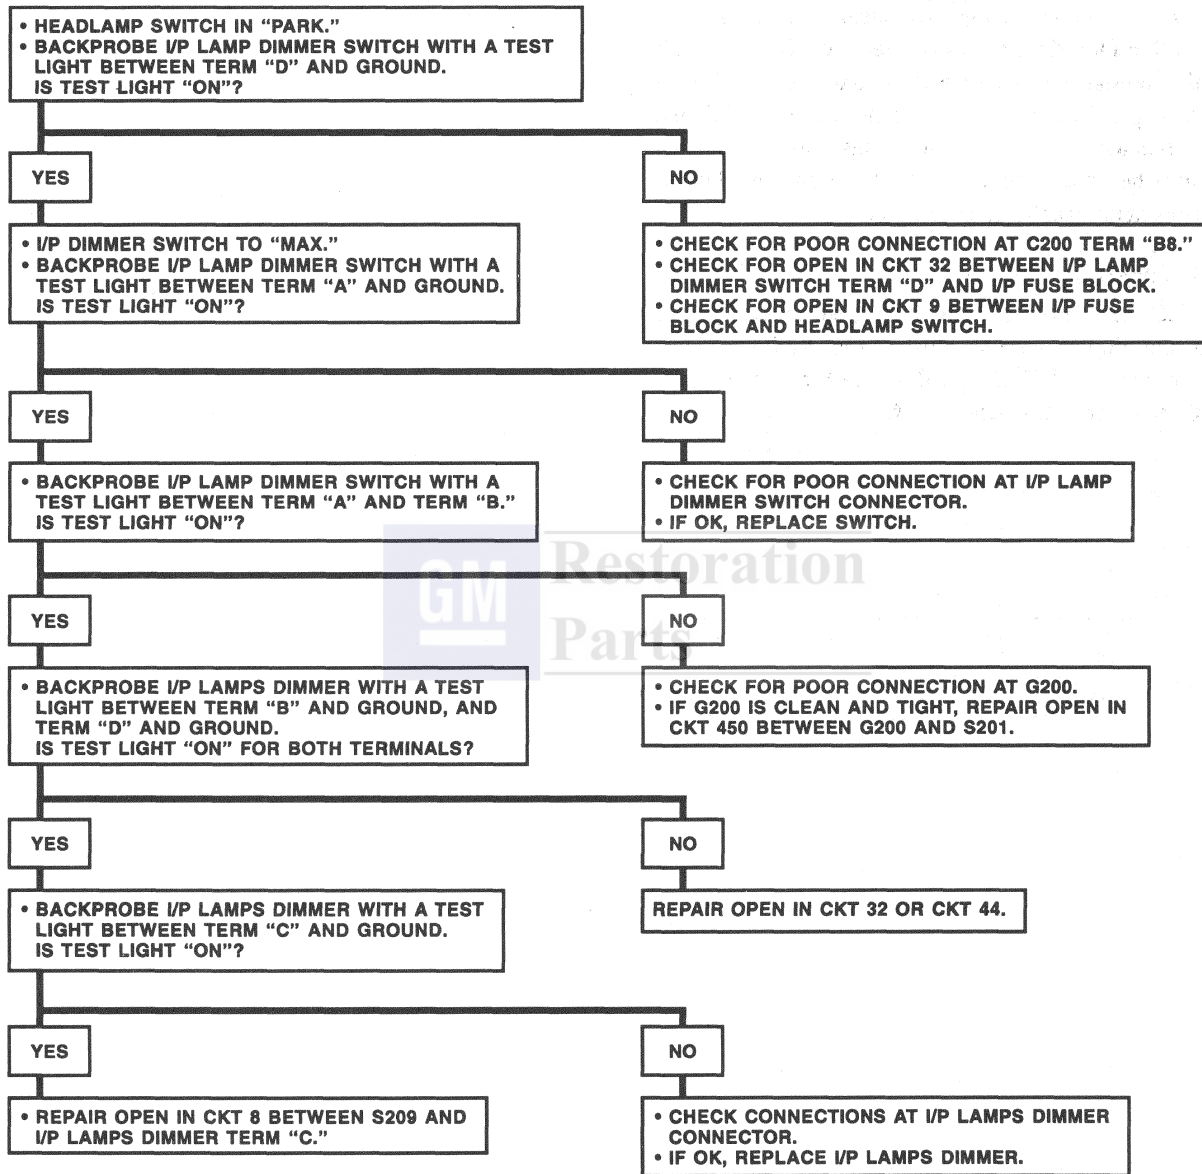

CHART #2 (CHEV)
NONE OF THE PANEL LAMPS WILL LIGHT WITH HEADLAMP SWITCH
IN "PARK" OR "HEAD"

INSTRUMENT PANEL DIMMING

CIRCUIT OPERATION

Battery voltage is applied at all times to the Headlamp Switch. When the Headlamp Switch is in "HEAD" or "PARK," voltage is applied through I/P Fuse #42 to the I/P and Headlamp Dimmer Switch.

The I/P and Headlamp Dimmer Switch controls the brightness of the Panel Lamps by means of a rheostat. When the Dimmer Switch is turned to the "MAX" position, the resistance is reduced to 60 ohms and the Panel Lamps are bright. When the knob is turned to "LO," the resistance increases to about 190 ohms, and the Panel Lamps dim. Chevrolet models use an additional module to control Instrument Panel Lamp brilliance.

SEO I/P Dimmer Switch

The SEO I/P Dimmer Switch is used to completely blank out the digital speedo cluster and Radio display. Applying voltage to CKT 1244 will cause the V/F displays to turn "OFF," with Park Lamps off.

TROUBLESHOOTING HINTS

(Perform before beginning System Diagnosis)

1. If all Power Windows are inoperative, check Circuit Breaker #2. If open, check for a short to ground in CKT 341.
2. If windows move slowly, check that:
 - Windows free of mechanical binding and pivot joints are greased.
 - Battery is fully charged.
 - Ground G201 is clean and tight.
3. If switches do not illuminate when Park Lamps are turned "ON," refer to "Interior Lamps," page 8A-114-0.
4. If the Express Down Feature does not work, but window moves down with each switch depression, replace the Side Window Master Switch (Chev) or Power Window Control Module (Buick).

5. If the Side Window Lockout Switch does not disable the windows, check CKT 1307 for a short to B+. If OK, replace the Side Window Lockout Switch.

- Check for a broken (or partially broken) wire inside of the insulation which could cause system malfunction but prove "GOOD" in a continuity/voltage check with a system disconnected. These circuits may be intermittent or resistive when loaded, and if possible, should be checked by monitoring for a voltage drop with the system operational (under load).
- Check for proper installation of aftermarket electronic equipment which may affect the integrity of other systems (see "Troubleshooting Procedures," page 8A-4-0).
- Refer to System Diagnosis.

SYSTEM DIAGNOSIS

- Perform the System Check and refer to the Symptom Table for the appropriate diagnostic procedure(s).

SYSTEM CHECK

ACTION	NORMAL RESULTS
[1] • Operate each window "UP" and "DOWN" from the Side Window Master Switch.	Each window operates quietly and smoothly, with no sticking. LH Front Window rolls down all the way without the switch being held (Express Down Feature).
[2] • Operate each window from its individual Side Window Switch, with the Side Window Lockout Switch in the "UNLOCK" position.	Each window operates quietly and smoothly, with no sticking.
[3] • Side Window Lockout Switch in the "LOCK" position. • Repeat steps 1 and 2.	Each window inoperative from individual switches, but they operate from the Side Window Master Switch.

BUT OPERATE FROM SIDE WINDOW MASTER SWITCH**

C9907

CIRCUIT OPERATION

With the Ignition Switch in the "RUN" position, voltage from Circuit Breaker #2 is applied to the Side Window Master Switch through CKT 341 and the individual Side Window Switches through the Side Window Lockout Switch that connects CKT 1307 and CKT 341. The Side Door Window Regulator Motors and Side Window Switches receive ground through the Side Window Master Switch, which is grounded at G201. When a window other than the LH Front Window is operated from the Side Window Master Switch, battery voltage will be sent to the Side Door Window Regulator Motor through the individual Side Window Switch. The LH Front Window is operated directly from the Side Window Master Switch.

The Power Windows are driven by reversible, permanent magnet motors. Each motor is controlled by a set of two switches, which are normally closed to ground. When any Side Window Switch is moved to the "UP" position, the "UP" switch will provide battery voltage to the Side Door Window Regulator Motor through the DK BLU/WHT wire. The Side Door Window Regulator Motor will receive ground through the BRN wire, the "DOWN" switch, and the Side Window Master Switch and drive the

window up. When the switch is released, the switch contacts will return to their normal grounded position.

To lower the window, the "DOWN" switch will connect the BRN wire to battery voltage. Ground will be provided to the DK BLU/WHT wire through the "UP" switch and the Side Window Master Switch. The polarity across the motor will be reversed, causing the motor to rotate in the opposite direction and lower the window.

The Power Windows System also includes an Express Down Feature for the LH Front Window. This allows the LH Front Window to open fully when the LH Front Side Window Switch is pressed momentarily. All of the solid state circuitry controlling this feature is contained within the Side Window Master Switch.

Each motor is protected by an Electronic Circuit Breaker (ECB). If a Side Window Switch is held in the "UP" or "DOWN" position too long with the window obstructed, or after the window is fully up or down, the ECB will increase its resistance. By increasing its resistance, the ECB will prevent the Side Door Window Regulator Motor from overloading. The ECB will reset to normal resistance when voltage to the Side Door Window Regulator Motor is interrupted.

TROUBLESHOOTING HINTS**(Perform before beginning System Diagnosis)**

1. Check I/P Fuse #35. If open, check for a short to ground in CKT 2040.
2. Check for a poor connection at G201.
 - Check for a broken (or partially broken) wire inside of the insulation which could cause system failure but prove "GOOD" in a continuity/voltage check (see "Troubleshooting Procedures," page 8A-4-0).

- Check for proper installation of aftermarket electronic equipment which may affect the integrity of other systems (see "Troubleshooting Procedures," page 8A-4-0).
- Refer to System Diagnosis.

SYSTEM DIAGNOSIS

- Refer to the Symptom Table for the appropriate diagnostic procedure(s).

POWER DOOR LOCKS AND ENDGATE LOCK

CIRCUIT OPERATION

POWER DOOR LOCKS AND ENDGATE LOCK

Battery voltage from I/P Fuse #39 is applied at all times to the Door Lock Relay through CKT 1740. Battery voltage from I/P Fuse #35 is applied at all times to the Door Lock Switches through CKT 2040. The Door Lock Relay is permanently grounded at G201.

When either Door Lock Switch is pushed to the "LOCK" position, battery voltage is applied to the Door Lock Relay through CKT 195. This energizes the relay, which then applies battery voltage from I/P Fuse #39 to the Door Lock Actuators and the Endgate Lock Actuator through CKT 295. Ground is provided to the Door Lock

Actuators and the Endgate Lock Actuator through CKT 294 and the Door Lock Relay. The Door Lock Actuators will lock the Endgate and doors.

When either Door Lock Switch is pushed to the "UNLOCK" position, battery voltage is applied to the Door Lock Relay through CKT 194. This energizes the relay, which then applies battery voltage from I/P Fuse #39 to the Door Lock Actuators and the Endgate Lock Actuator through CKT 294. Ground is provided to the Door Lock Actuators and the Endgate Lock Actuator through CKT 295 and the Door Lock Relay. The Door Lock Actuators will rotate in the opposite direction and unlock the Endgate and doors.

SYSTEM DIAGNOSIS

- Refer to SECTION 9K.

CAUTION: This vehicle is equipped with Supplemental Inflatable Restraint (SIR). Refer to CAUTIONS in Section 9J under "ON-VEHICLE SERVICE" and the SIR Component and Wiring Location view in Section 9J before performing service on or around SIR components or wiring. Failure to follow CAUTIONS could result in possible air bag deployment, personal injury, or otherwise unneeded SIR system repairs.

TROUBLESHOOTING HINTS

(Perform before beginning System Diagnosis)

1. Check I/P Fuse #29. If open, check for a short to ground in CKT 1940.
2. Check that G104 and G401 are clean and tight.
 - Check for a broken (or partially broken) wire inside of the insulation which could cause system malfunction but prove "GOOD" in a continuity/voltage check with a system disconnected. These circuits may be intermittent or resistive when loaded, and if possible, should be checked by monitoring for a voltage drop with the system operational (under load).

- Check for proper installation of aftermarket electronic equipment which may affect the integrity of other systems (see "Troubleshooting Procedures," page 8A-4-0).

- Refer to System Diagnosis for Rear Compartment Lid Release (Sedan) or Endgate Window Release (Wagon).

SYSTEM DIAGNOSIS

Rear Compartment Lid Release (Sedan)

- Perform the System Check and refer to the Symptom Table for the appropriate diagnostic procedure(s).

SYSTEM CHECK

C9894

TRUNK/REAR WINDOW RELEASE

CIRCUIT OPERATION

Rear Compartment Lid Release (SEO, and Chev without Remote Keyless Entry)

Battery voltage is applied at all times from I/P Fuse #29 to the Rear Compartment Lid Release Switch. With the Switch closed, voltage is applied to the Rear Compartment Lid Release Actuator which is grounded at G401. When the Rear Compartment Lid Release Actuator is activated it will release the Rear Compartment Lid Latch.

Rear Compartment Lid Release (with Remote Keyless Entry)

Battery voltage is applied at all times from I/P Fuse #29 to the Rear Compartment Lid Release Relay and the Rear Compartment Lid Release Switch. The relay will receive voltage on the coil side when the Rear Compartment Lid Release Switch is depressed (closed). With Buick, the Rear Compartment Lid Release Enable Switch must also be closed for the relay to receive voltage on the coil side. Once voltage is applied to the coil side of the Rear Compartment Lid Release Relay, the Relay must then see a ground through the Backup Lamp and Park/Neutral Position Switch, when in "PARK" or "NEUTRAL," which is grounded at G104, therefore energizing the Relay which then sends voltage to the Rear

Compartment Lid Lock Release Actuator which receives its ground through G401 and activates the actuator and releases the Rear Compartment.

Endgate Window Release

The Endgate Window Release can be activated from within the vehicle by pressing the Endgate Window Release Switch in the Accessory Switch Panel. The Endgate Window can also be released from outside the vehicle by using the Endgate Upper Latch Switch when the Endgate is unlocked.

Battery voltage is applied, at all times, to the normally open contacts of the Endgate Window Release Relay from I/P Fuse #29. With the Endgate Window Release Switch or the Endgate Upper Latch Switch and Endgate Lock Switch closed, voltage from I/P Fuse #29 is applied to the coil of the Endgate Window Release Relay.

The coil of the relay receives a ground through the Backup Lamp and Park/Neutral Position Switch at G104. Thus, the Endgate Window Release Relay can only be energized when the gear selector is in the "PARK" or "NEUTRAL" position.

When the Endgate Window Release Relay is energized, its contacts close, and voltage is applied to the Endgate Window Release Actuator, which is case grounded. The Endgate Window will be released when the Endgate Window Release Actuator is energized.

TROUBLESHOOTING HINTS

(Perform before beginning System Diagnosis)

This Section assumes mechanical operation is normal, with no interference. For mechanical repair, refer to SECTION 10-8.

- Rear Compartment Lid Lock must securely lock to Striker for proper operation of Pull-Down Unit.
- Check for a broken (or partially broken) wire inside of the insulation which could cause system malfunction but prove "GOOD" in a continuity/voltage check with a system disconnected. These circuits may be

intermittent or resistive when loaded, and if possible, should be checked by monitoring for a voltage drop with the system operational (under load).

- Check for proper installation of aftermarket electronic equipment which may affect the integrity of other systems (see "Troubleshooting Procedures," page 8A-4-0).
- Refer to System Diagnosis.

SYSTEM DIAGNOSIS

- Refer to the Symptom Table for the appropriate diagnostic procedure(s).

SYMPTOM TABLE

SYMPTOM	PROCEDURE	PAGE NUMBER
Striker Unit does not extend when Rear Compartment Lid is unlatched.	Chart #1	8A-135-2

CHART #1
STRIKER UNIT DOES NOT EXTEND WHEN REAR COMPARTMENT LID IS UNLATCHED

C9891

CHART #2
STRIKER UNIT DOES NOT RETRACT WHEN REAR COMPARTMENT LID IS CLOSED

C10033

CIRCUIT OPERATION

Battery voltage is applied at all times to the Striker Motor within the Rear Compartment Lid Pull-Down Actuator. The polarity to the Striker Motor is determined by the position of the Striker Switches. In position "1," ground will be available through the Rear Compartment Lid Pull-Down Switch whenever the Deck Lid is shut. With the Rear Compartment Lid Pull-Down Switch closed, the Striker Motor retracts the Striker Unit until the Striker Switches are moved to position "2." In position "2," ground will be available through the Rear Compartment Limit Switch once the Rear Compartment Lid is opened. When the Rear Compartment Lid is opened, the Striker Motor extends the Striker Unit until the Striker Switches are moved to Position "1."

TROUBLESHOOTING HINTS**(Perform before beginning System Diagnosis)**

1. Check I/P Fuse Block Fuse #12. If open, check CKT 239, CKT 275 and CKT 924 for a short to ground.
 2. Make sure G200 is clean and tight.
 3. If Transmission Shift Lever does not shift out of Park, make sure the linkage is properly adjusted. Refer to SECTION 7A.
- Check for a broken (or partially broken) wire inside of the insulation which could cause system malfunction but prove "GOOD" in a continuity/voltage check with a system disconnected. These circuits may be

intermittent or resistive when loaded, and if possible, should be checked by monitoring for a voltage drop with the system operational (under load).

- Check for proper installation of aftermarket electronic equipment which may affect the integrity of other systems (see "Troubleshooting Procedures," page 8A-4-0).
- Refer to System Diagnosis.

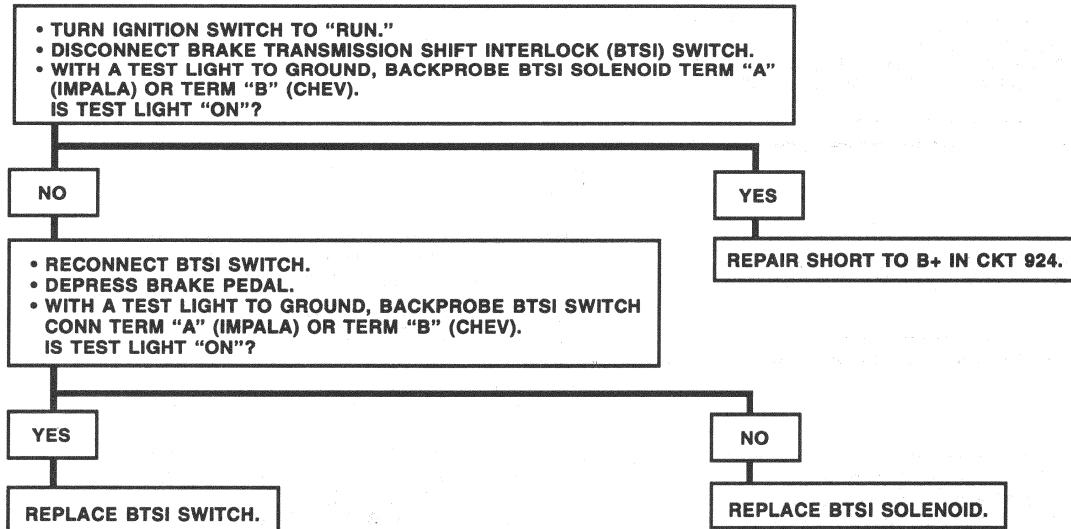

SYSTEM DIAGNOSIS

- Refer to the Symptom Table for the appropriate diagnostic procedure(s).

SYMPTOM TABLE

SYMPTOM	PROCEDURE	PAGE NUMBER
Transmission does not shift out of Park with brake pedal depressed and Ignition Switch in "RUN."	Chart #1	8A-138-3
Transmission shifts out of Park with Ignition Switch in "RUN" and Brake Pedal not depressed.	Chart #2	8A-138-4

CHART #1

PEDAL DEPRESSED AND IGNITION SWITCH IN "RUN"

C9944

BRAKE TRANSMISSION SHIFT INTERLOCK

CHART #2
TRANSMISSION SHIFTS OUT OF PARK WITH IGNITION
SWITCH IN "RUN" AND BRAKE PEDAL NOT DEPRESSED

CIRCUIT OPERATION

The Backup Lamp and Transmission Position Sensor Switch or Park/Neutral Position Switch receives Ignition voltage from I/P Fuse #12 in "RUN," "BULB TEST" and "START." When the Transmission Shift Lever is in "PARK," the switch relays voltage to the BTSI Switch. The BTSI Switch is normally closed, providing voltage to the BTSI Solenoid, which is permanently grounded at G200. When the BTSI Solenoid receives voltage, it is energized and prevents the Transmission Shift Lever from being moved out of "PARK." When the Brake Pedal is depressed, the BTSI Switch opens, removing voltage from the BTSI Solenoid. This de-energizes the Solenoid, allowing operation of the Shift Lever.

TROUBLESHOOTING HINTS

(Perform before beginning System Diagnosis)

1. Check Circuit Breaker #3 by noting Power Seat operation. If Circuit Breaker #3 is open, check for short to ground in CKT 1740.
2. If the Rear or Front Height does not function, but entire seat moves up and down, replace the Driver or Passenger Seat Adjuster Switch.
3. Make sure G201 is clean and tight.
 - Check for a broken (or partially broken) wire inside of the insulation which could cause system malfunction but prove "GOOD" in a continuity/voltage check with a system

disconnected. These circuits may be intermittent or resistive when loaded, and if possible, should be checked by monitoring for a voltage drop with the system operational (under load).

- Check for proper installation of aftermarket electronic equipment which may affect the integrity of other systems (see "Troubleshooting Procedures," page 8A-4-0).
- Refer to System Diagnosis.

SYSTEM DIAGNOSIS

- Refer to the Symptom Table for the appropriate diagnostic procedure(s).

POWER SEATS

CHART #7
REAR HEIGHT WILL NOT MOVE "UP" AND/OR "DOWN" (BUICK)

CIRCUIT OPERATION

There are three reversible motors that operate the power seats. The front and rear height of the seat are operated by different motors. They can be raised or lowered independently of each other. When the Entire Seat Switch is pushed to the "UP" or "DOWN" position, both motors run to move the front and rear of the seat at the same time.

Ground is applied at all times to both sides of each motor. When a switch is depressed, battery voltage is applied to the appropriate side of the motor.

The Forward/Back Motor is operated by the Entire Seat Switch. When it is held in the "FORWARD" position, battery voltage is applied from the Switch contacts through the TAN wire to the Forward/Back Motor. Ground applied

to the motor through the LT GRN wire. The motor runs to drive the seat forward until the switch is released.

In the "BACK" position, the LT GRN wire receives battery voltage and the TAN wire has ground. This reversed polarity causes the motor to run in the opposite direction and drive the seat backward.

The Front and Rear Height Motors work in a similar way when the Front or Rear Height Switch is operated.

To lower the entire seat, the Entire Seat Switch is held in the "DOWN" position. This applies battery voltage to both the DK BLU and LT BLU wires. Both motors run to drive the entire seat down. A similar action occurs to move the entire seat up.

Each motor contains a solid state self-resetting circuit breaker to protect it from overload.

TROUBLESHOOTING HINTS

(Perform before beginning System Diagnosis)

! Important:

- To avoid misdiagnosis, inspect mechanical linkage for binding which would prevent smooth operation or cause system failure.
- Substitute I/P Circuit Breaker #1 with one of equal value (20 amp) known to be operational.
- Check for a broken (or partially broken) wire inside of the insulation which could cause system malfunction but prove "GOOD" in a continuity/voltage check with a system disconnected. These circuits may be intermittent or resistive when loaded, and if possible, should be checked by monitoring for a voltage drop with the system operational (under load).
- Check for proper installation of aftermarket electronic equipment which may affect the integrity of other systems (see "Troubleshooting Procedures," page 8A-4-0).
- Refer to "System Diagnosis."

SYSTEM DIAGNOSIS

Perform the "System Check" in the order shown. When a fault is found, refer to the Symptom Table for the appropriate diagnostic procedure(s). If a normal result is found at each and every step of the "System Check," the fault may be intermittent.

To help isolate an intermittent fault, first examine the mating terminals at each component and connector for a poor connection. Also check that each terminal of mating connectors is properly seated in the connector body. If the connections appear to be reliable, try the "System Check" again while moving the wiring harness from side to side at each component and in-line connector, to try and induce the intermittent fault.

Once a fault has been corrected, perform the "System Check" to verify the diagnosis.

CHART #1
DRIVER SEAT RECLINER INOPERATIVE
PASSENGER SEAT RECLINER OPERATES NORMALLY

POWER RECLINING SEAT(S)

CHART #2
PASSENGER SEAT RECLINER INOPERATIVE
DRIVER SEAT RECLINER OPERATES NORMALLY

CIRCUIT OPERATION

Battery voltage from I/P Circuit Breaker #1 is applied to the Driver Seat Recliner Switch and the Passenger Seat Recliner Switch through CKT 2240. The Recliner Switches, which are grounded at G201, normally ground both sides of the Recliner Motors. When the Recliner Switch is moved to the "BACK" position, battery voltage is applied to the Recliner Motor through the LT BLU wire and the Recliner Switch. The motor will rotate to move the

seatback back. The Recliner Motor will be grounded through the LT GRN wire.

When the Recliner Switch is moved to the "FORWARD" position, battery voltage is applied to the Recliner Motor through the LT GRN wire. The Recliner Motor will be grounded through the LT BLU wire and the Recliner Switch. The Recliner Motor will rotate in the opposite direction and move the seatback forward.

TROUBLESHOOTING HINTS

(Perform before beginning System Diagnosis)

! Important:

- To avoid misdiagnosis, inspect cable for binding which would prevent smooth operation or cause system failure.
- Substitute I/P Circuit Breaker #1 with one of equal value (20 amp) known to be operational.
- Check for a broken (or partially broken) wire inside of the insulation which could cause system malfunction but prove "GOOD" in a continuity/voltage check with a system disconnected. These circuits may be intermittent or resistive when loaded, and if possible, should be checked by monitoring for a voltage drop with the system operational (under load).
- Check for proper installation of aftermarket electronic equipment which may affect the integrity of other systems (see "Troubleshooting Procedures," page 8A-4-0).
- Refer to System Diagnosis.

SYSTEM DIAGNOSIS

Perform the System Check in the order shown. When a fault is found, refer to the Symptom Table for the appropriate diagnostic procedure(s). If a normal result is found at each and every step of the System Check, the fault may be intermittent.

To help isolate an intermittent fault, first examine the mating terminals at each component and connector for a poor connection. Also, check that each terminal of the mating connector is properly seated in the connector body. If the connections appear to be reliable, try the System Check again while moving the wiring harness from side to side at each component and in-line connector, to try and induce the intermittent fault.

Once a fault has been corrected, perform the System Check to verify the diagnosis.

LUMBAR SUPPORTS**SYSTEM CHECK**

ACTION	NORMAL RESULTS
[1] • Move Driver Seat Back Lumbar Support Switch rearward.	Driver Seatback Lumbar Support increases.
[2] • Move Driver Seat Back Lumbar Support Switch forward.	Driver Seatback Lumbar Support decreases.

LUMBAR SUPPORTS

CHART #2
PASSENGER LUMBAR SUPPORT INOPERATIVE
DRIVER LUMBAR SUPPORT OPERATES NORMALLY

CIRCUIT OPERATION

Battery voltage from I/P Circuit Breaker #1 is applied to the Driver Seatback Lumbar Support Switch and the Passenger Seatback Lumbar Support Switch through CKT 2240. The Switches, which are grounded at G201, normally ground both sides of the Adjuster Actuator Motors. When the switch is moved to rearward position, battery voltage is applied to the motor through the LT BLU wire and the switch. The motor will rotate to increase the seatback. The Lumbar Support Motor will be grounded through the LT GRN wire.

When the switch is moved to the forward position, battery voltage is applied to the motor through the LT GRN wire. The motor will be grounded through the LT BLU wire and the switch. The motor will rotate in the opposite direction and decrease the Seatback Lumbar Support.

```

CIRCUIT OPERATION

When "LO" is pressed on the Heated Seat Switch and the Ignition Switch is in "RUN," the Heated Seat Control Module LO input terminal is momentarily grounded. This causes the Seat Control Module to turn on the Heater LED Indicator and apply voltage to the Seat Heaters. The Heated Seat Control Module monitors the seat surface temperature through a thermistor located in the Center Seat Bottom. The Heated Seat Control Module will maintain the seat surface temperature at approximately 37.5° C (98.5° F) when "LO" has been selected.

Operation of the Heated Seat in the HI mode is similar to LO operation except the Heater LED Indicator will be lit and seat surface temperature will be maintained at approximately 42.5° C (107.5° F).

When the "OFF" Switch is pressed, the Heated Seat Control Module's "OFF" input is grounded momentarily. The module will react by turning off the voltage applied to the Seat Heaters. The module will also turn off the Heated Seats whenever the Ignition Switch has been cycled "OFF" and then back to "RUN."

CIRCUIT OPERATION

The six-way power seats move when voltage is applied to one or more of the three Seat Motors. The direction the motor turns depends on the polarity of the supply voltage which is set by the control switches and sent to the motors by the Seat Memory Module. Note that control power only, not motor power, comes from the LH Seat Switch.

The three Seat Motors directly operate the three seat movements: Front Height, Rear Height, and Forward/Back.

The Driver's Seat Adjuster Memory Module must see 12 volts at terminal "D," from the Park/Neutral Position and Backup Lamp Switch Assembly. Voltage will be present if the gear selector is in the "PARK" position. Once the gear selector is moved out of the "PARK" position, voltage will not be present at terminal "D" of the Driver's Seat Adjuster Memory Module, therefore disabling the Memory Seats.

Voltage from the I/P Fuse Block Circuit Breaker is first applied to the Driver's Seat Adjuster Memory Module, which then operates the motors, depending on the switch inputs received.

The Driver's Seat Adjuster Memory Module controls the three Seat Motors by turning them off and on by using their selected directions. These selections are made by counting motor pulses produced when the seat is moved to the desired position for the first time.

The Memory Seat System provides an automatic return of the Driver's Seat to one of two reset positions. When a switch is closed to operate the Power Seat, the Driver's Seat Adjuster Memory Module transmits the voltage applied from the switch to the Seat Motors. In addition, the Driver's Seat Adjuster Memory Module counts the pulses that are produced by the operation of each motor. The Solid State unit in the module stores this pulse count in its memory, and is able to remember the seat location.

If the "SET MEMORY BUTTOM" is pushed, and the Memory Select Switch is moved to either the Memory 1 position or Memory 2 position, then the pulse count for each of the three motors are stored. When that memory position is selected at a later time, the seat will return to that set position.

With the Easy Exit Switch closed, voltage is applied simultaneously to the Memory 1 and Memory 2 inputs of the Driver's Seat Adjuster Memory Module. The module takes this as a signal to move the seat to a fully down and fully back position. The module applies voltage to all three LH seat motors until the seat is fully back and down. The Easy Exit function will operate the Ignition Switch I "OFF."

Each motor contains an electronic circuit breaker (ECB). It resets only after voltage is removed from the motor.

TROUBLESHOOTING HINTS

(Perform before beginning System Diagnosis)

1. Check I/P Fuse Block Fuse #35 by operating door locks. If Fuse #35 is open, check CKT 2040 for a short to ground.
2. Check that ground G200 is clean and tight.
3. If both mirrors are inoperative, check for poor connection at Outside Remote Control Rearview Mirror Switch.
4. If only one mirror operates properly, check for poor connection at C500 (LH Outside Mirror) or C600 (RH Outside Mirror).
 - Refer to SECTION 10-6 for Outside Rearview Mirror replacement.

- Check for a broken (or partially broken) wire inside of the insulation which could cause system malfunction but prove "GOOD" in a continuity/voltage check with a system disconnected. These circuits may be intermittent or resistive when loaded, and if possible, should be checked by monitoring for a voltage drop with the system operational (under load).
- Check for proper installation of aftermarket electronic equipment which may affect the integrity of other systems (see "Troubleshooting Procedures," page 8A-4-0).
- Refer to System Diagnosis.

SYSTEM DIAGNOSIS

- Perform the System Check and refer to the Symptom Table for the appropriate diagnostic procedure(s).

POWER MIRRORS**CIRCUIT OPERATION (CHEV)**

Each Outside Rearview Mirror has two reversible motors. One adjusts the mirror up and down, and the other adjusts the mirror right and left. These motors are controlled by the Outside Remote Control Rearview Mirror Switch. The Mirror Switch contains a Mirror Position Switch. The Mirror Position Switch is a five-position switch that controls the polarity of the voltage to the motors. The Mirror Switch also contains a Mirror Select Switch, which directs the voltage to either the RH or LH Outside Rearview Mirror. The Outside Mirror Switch receives battery voltage at all times from I/P Fuse Block Fuse #35 through CKT 2040 and is permanently grounded at G200.

When the LH Outside Rearview Mirror is selected, the Mirror Position Switch will control the motors of the LH Outside Mirror. When the Mirror Position Switch is pressed to the "UP" position, voltage is applied to the Up/Down Motor of the LH Outside Rearview Mirror through CKT 88. Ground will be provided to the Up/Down Motor by the Mirror Switch through CKT 89. The Up/Down Motor in the LH Outside Rearview Mirror will run and turn the LH Outside Rearview Mirror up.

When the Mirror Position Switch is pressed to the "DOWN" position, voltage is applied to the Up/Down Motor of the LH Outside Rearview Mirror through CKT 89, and ground is provided through CKT 88. This will cause the Up/Down Motor to rotate in the opposite direction, and turn the LH Outside Rearview Mirror down.

The Left/Right Motor of the LH Outside Rearview Mirror operates in a similar manner. When the Mirror Position Switch is pressed to the "LEFT" position, voltage is applied to the Left/Right Motor of the LH Outside Rearview Mirror through the CKT 81. Ground will be provided to the Left/Right Motor by the Mirror Switch through CKT 89. The Left/Right Motor will run and turn the LH Outside Rearview Mirror to the left.

When the Mirror Position Switch is pressed to the "RIGHT" position, voltage is applied to the Left/Right Motor of the LH Outside Rearview Mirror through the CKT 89, and ground is provided through CKT 81. This will cause the Left/Right Motor to rotate in the opposite direction, and turn the LH Outside Rearview Mirror to the right.

The RH Outside Rearview Mirror is adjusted in the same way when the Mirror Select Switch is moved to the "RH" position and the appropriate position switch is operated.

CIRCUIT OPERATION (BUICK)

Each Outside Rearview Mirror has two reversible motors. One adjusts the mirror up and down, and the other adjusts the mirror right and left. These motors are controlled by the Outside Remote Control Rearview Mirror Switch. The Mirror Switch contains a Mirror Position Switch. The Mirror Position Switch is a five-position switch that controls the polarity of the voltage to the motors. The Mirror Switch also contains a Mirror Select Switch, which directs the voltage to either the RH or LH Outside Rearview Mirror. The Mirror Switch receives battery voltage at all times from I/P Fuse Block Fuse #35 through CKT 2040 and is permanently grounded at G200.

When the LH Outside Rearview Mirror is selected, the Mirror Position Switch will control the motors of the LH Outside Rearview Mirror. When the Mirror Position Switch is pressed to the "UP" position, voltage is applied to the Up/Down Motor of the LH Outside Rearview Mirror through CKT 89. Ground will be provided to the Up/Down Motor by the Mirror Switch through CKT 88. The Up/Down Motor in the LH Outside Rearview Mirror will run and turn the LH Outside Rearview Mirror up.

When the Mirror Position Switch is pressed to the "DOWN" position, voltage is applied to the Up/Down Motor of the LH Outside Rearview Mirror through CKT 88 and ground is provided through CKT 89. This will cause the Up/Down Motor to rotate in the opposite direction, and turn the LH Outside Rearview Mirror down.

The Left/Right Motor of the LH Outside Rearview Mirror operates in a similar manner. When the Mirror Position Switch is pressed to the "LEFT" position, voltage is applied to the Left/Right Motor of the LH Outside Rearview Mirror through the CKT 81. Ground will be provided to the Left/Right Motor by the Mirror Switch through CKT 82. The Left/Right Motor will run and turn the LH Outside Rearview Mirror to the left.

When the Mirror Position Switch is pressed to the "RIGHT" position, voltage is applied to the Left/Right Motor of the LH Outside Rearview Mirror through the CKT 82 and ground is provided through CKT 81. This will cause the Left/Right Motor to rotate in the opposite direction, and turn the LH Outside Rearview Mirror to the right.

The RH Outside Rearview Mirror is adjusted in the same way when the Mirror Select Switch is moved to the "RH" position and the appropriate position switch is operated.

S421	Body Harn, approx 14 cm from High Mount Stoplamp breakout			

TROUBLESHOOTING HINTS

(Perform before beginning System Diagnosis)

1. Check that the mirror is getting power from I/P Fuse Block Fuse #13 by observing that the label on the mirror "ON" indicator is illuminated.
2. Check the Backup Lamp Switch and I/P Fuse Block Fuse #12 by checking operation of the Backup Lamps.
3. Be sure photocells are not dirty or obstructed.
 - Check for a broken (or partially broken) wire inside of the insulation which could cause system malfunction but prove "GOOD" in a continuity/voltage check with a system

disconnected. These circuits may be intermittent or resistive when loaded, and if possible, should be checked by monitoring for a voltage drop with the system operational (under load).

- Check for proper installation of aftermarket electronic equipment which may affect the integrity of other systems (see "Troubleshooting Procedures," page 8A-4-0).
- Refer to System Diagnosis.

SYSTEM DIAGNOSIS

- Perform the System Check and refer to the Symptom Table for the appropriate diagnostic procedures.

8A - 148 - 2 ELECTRICAL DIAGNOSIS

AUTOMATIC DAY/NIGHT MIRROR

SYSTEM CHECK

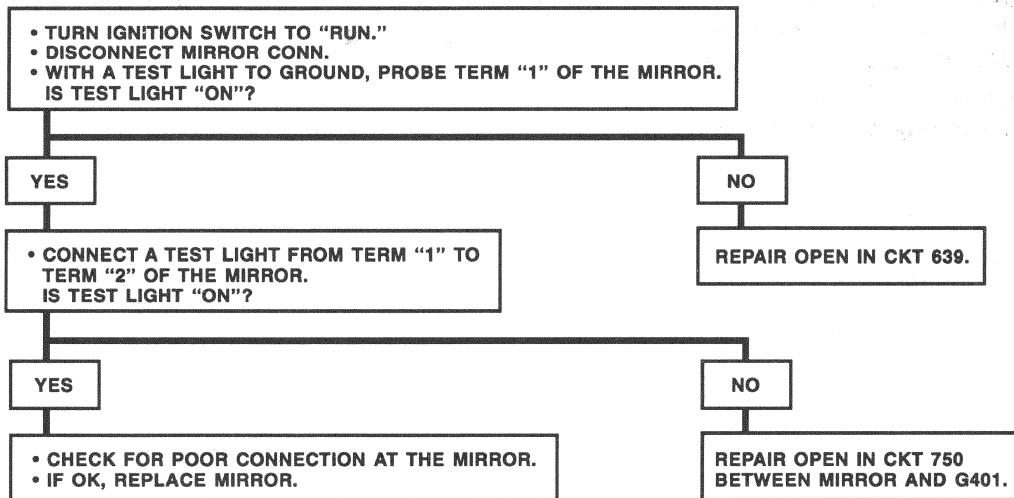

ACTION	NORMAL RESULTS
[1] • Cover Ambient Light Sensor (windshield side) with dark cloth. • Shine light on Headlamp Sensor (mirror side).	Mirror gradually darkens.
[2] • Gear Selector Lever: "REVERSE."	Mirror gradually lightens to clear state.
[3] • Gear Selector Lever: "PARK."	Mirror gradually darkens.
[4] • Remove cloth and light.	Mirror gradually lightens to clear state.

SYMPTOM TABLE

SYMPTOM	PROCEDURE	PAGE NUMBER
Mirror does not darken at night with lights shining on mirror.	Chart #1	8A-148-3
Mirror does not lighten to clear state with Gear Selector Lever in "REVERSE."	Chart #2	8A-148-3

CHART #1
AUTOMATIC DAY/NIGHT MIRROR DOES NOT DARKEN AT NIGHT WITH A LIGHT SHINING ON THE MIRROR SIDE

C10094

CHART #2
AUTOMATIC DAY/NIGHT MIRROR DOES NOT LIGHTEN WITH GEAR SELECTOR LEVER IN "REVERSE"

C10095

AUTOMATIC DAY/NIGHT MIRROR

CIRCUIT OPERATION

The Electrochromic Inside Rearview Mirror uses two photocell sensors to determine light conditions in the front and back of the vehicle. At night, as the glare of headlamps from behind increases, the mirror gradually becomes darker to absorb the glare. In the daytime, the mirror is in a clear state. With the Ignition Switch in "RUN," battery voltage is applied to terminal "A." With the Gear Selector Lever in "REVERSE," battery voltage is applied to terminal "3" of the mirror. The mirror then gradually changes to a clear state.

RADIO/AUDIO SYSTEMS**TROUBLESHOOTING HINTS****Radio Inoperative**

1. For checking a speaker, use a "C" or "D" cell battery and momentarily connect and disconnect it across the circuits to that speaker while listening for a slight popping sound or watching for the cone of the speaker to move in and out. If either happens, the speaker and circuitry are usually OK.
2. Check Fuse #30. If open, check for a short to ground through CKT 640.
3. Check Fuse #9. If open, check for a short to ground through CKT43.
4. Make sure ground G202 is clean and tight.

Radio Noise

A noise "sniffer" may be used to aid in troubleshooting radio noise. See details on page 8A-150-20.

General

- Check for a broken (or partially broken) wire inside of the insulation which could cause system malfunction but prove "GOOD" in a continuity/voltage check with a system disconnected. These circuits may be intermittent or resistive when loaded, and if possible, should be checked by monitoring for a voltage drop with the system operational (under load).
- Check for proper installation of aftermarket electronic equipment which may affect the integrity of other systems (see "Troubleshooting Procedures," page 8A-4-0).
- Refer to System Diagnosis.

SYSTEM DIAGNOSIS

1. Verify customer complaint.
2. Refer to: Delco Sound Service Guide (DE SSG) and Dealer Service Manuals; fill out the Service Writer Form provided in the Delco Sound Service Guide (DE SSG).
3. Follow radio service procedures.
4. If technical assistance is required, have all the pertinent information available before placing the call.
5. For a more complete diagnostic overview, consult the DE SSG.

IDENTIFYING CONCERNS

- CHECK for technical service bulletins. Check the Dealer Communication System for any applicable Preliminary Information (P/I) for customer concerns.
- CHECK for stored diagnostic trouble codes. Refer to Engine Controls.

- For reception concerns, determine if the station is obtainable in the customer's listening area.
- For an FM reception concern, refer to the FM reception section in the DE SSG.
- For an AM reception concern, refer to the AM reception section in the DE SSG.
- To test for audio reception/noise, position the vehicle outside of the building with the hood down.
- Duplicate the customer's complaint before trying to diagnose the system. Have the customer demonstrate the condition. Test drive the vehicle with the customer and then test drive another similar model vehicle (with a similar audio system) to do a comparison of the two vehicles to determine if the condition is abnormal.
- Before diagnosing, identify components, their features and the customer's complaint.
- Determine if any aftermarket equipment is installed on the vehicle. Disconnect the aftermarket equipment and determine if the customer's complaint still exists. Follow GM guidelines for installation of aftermarket components. Refer to the DE SSG.
- Perform the following steps to identify a noisy component:
 1. Identify ignition key switch position in which the noise appears, such as: accessory, key ON engine not running, and key ON engine running.
 2. REMOVE fuses one at a time until the complaint condition has been eliminated.
 3. Mark the complaint fuse(s) and reinstall all fuses and circuit breakers.
 4. Refer to SECTION 8A-10 and SECTION 8A-11 to identify all systems and components powered by the complaint fuse(s).
 5. Disconnect the components powered by the complaint fuse(s) one at a time until the complaint condition has been eliminated and the noisy component is identified.
 6. CHECK the ground integrity of the complaint causing component.
- An interference condition is NOT necessarily an audible noise.
- Most noises can be found on weak stations near the low end of the band and are considered to be a normal condition.
- Ignition noise on FM could indicate a possible defective ignition system.
- Malfunctioning and marginal components, relays, and solenoids may induce noise and/or poor reception.

CORRECTIVE ACTION

- Use proper tools for diagnostics and repairs.
- Follow ESD guidelines.
- Use available noise suppression devices:
 - 220 mF (50V) capacitor GM P/N 1227895
 - 0.47 mF capacitor GM P/N 1227894
 - Fuse block capacitor GM P/N 469328
 - Feed through capacitor GM P/N 477371
 - Filter package GM P/N 1224205
 - Turn signal suppression GM P/N 3861565
 - Fuel pump suppresser GM P/N 25027405
 - 21 inch braided ground strap GM P/N 8910791
 - 19 inch braided ground strap GM P/N 6286800
 - 10.5 inch braided ground strap GM P/N 6287160
 - 8.5 inch braided ground strap GM P/N 12091511
- Utilize the test tape/CD Diagnostic Kit GM P/N J39916-A to optimize proper audio diagnostics.
- If the condition requires the radio to be sent to the service center, describe the symptoms on the warranty form accurately. Along with the warranty form, send a copy of the Service Writer Check List with the unit.
- Do not leave a CD or tape in the car. Extreme heat could cause permanent damage.
- Cassette tapes could be damaged if not stored in the case. The vibration in the vehicle can cause the tape to unwind inside the cartridge.
- Use the trouble trees/noise charts in the DE SSG.
- Before removing speaker(s), check all connectors and wiring to the speaker(s). Examine the connectors for bent or loose pins. Refer to Troubleshooting Procedures in SECTION 8A-4.
- If a test antenna is used in diagnostics, ground the antenna base to the vehicle body and do not hold the mast.

Important:

- CHECK the antenna coax connectors for corrosion or bad connections/crimps. Route coax separately from the other wires. Shield antenna coax interconnections with aluminum or nickel tape as described in the DE SSG.
- CHECK all vehicle grounds, NOT just radio and antenna grounds. Refer to the antenna diagnostic section.
- Coated screws or bolts can act as poor grounds.
- Always use a braided ground strap when applying grounds. Keep the ground strap as short as possible. The shorter the ground strap the better.
- When shielding the dash, wires, hoses (most hoses are conductive unless they have a white stripe), etc., use aluminum foil tape or nickel tape to shield against magnetically induced interference. For optimum results, try varying the following ground techniques:
 - Add a ground at both ends of the tape.
 - Add a ground to just one end of the tape.
 - Do not add ground to the tape.
- When shielding a harness with tape, attach a ground strap to the end of the tape and then wrap the strap 360° around the tape securing the other end of the strap to a known good chassis ground.
- Any interference is best corrected by suppression at the source of the interference, if possible.
- Care should be used when applying suppression. Signal wires (such as sensor outputs, clock, and communication circuits) CANNOT be suppressed. Battery and ignition wires can be suppressed. After adding any suppression, all vehicle systems (even those not related to the audio system) should be checked for proper operation and function.
- Interference can usually be eliminated by shielding/grounding or suppressing.
- Capacitors work best on switch pops and low frequency noise. Filters work best on high frequency whines and static.
- Whenever possible, make a test harness that includes filters and capacitors. Always check the effectiveness and operation before permanently installing a FIX.
- Recommended capacitor application for an audible pop induced from a switching operation is:
 - Add a capacitor across the contacts of the switch.
 - Add a capacitor from the hot side of the switch to ground.
 - Add a capacitor to each side of the switch to ground.
- If a complaint condition is only present with the ignition key in the RUN position and the engine running, perform the following checks:
 - CHECK the integrity of the ignition system (proper spark plug wire routing, no misfiring, etc.). Refer to SECTION 6D-4.
 - CHECK the integrity of the engine compartment grounds.
 - CHECK for malfunctioning relays, solenoids, or other components which may be inducing "noise" or poor reception.
 - CHECK the ground integrity of the complaint causing component.
- For noise and/or poor reception, perform the Antenna System Test and make the necessary repairs.

RADIO/AUDIO SYSTEMS

GENERATOR WHINE CONCERNS

Inspect:

- CHECK the ground terminal on the battery.
- CHECK for coated mounting bolts on the generator bracket.
- CHECK for a faulty mounting of the generator to the engine.
- Make sure all ground straps between the engine and the frame are clean and tight.
- Try the following fixes:
 1. If noise is still present, check the charging system. Refer to SECTION 6D-3.
 2. If the charging system is functioning normally, check for technical service bulletins on generator whine.
 3. Install a filter, GM P/N 1224205, in the battery feed to the radio.
 4. Try installing the filter with the following variations if noise is not eliminated.
 - INSTALL the filter with the single wire side toward the radio and the ground wire attached to a good ground.

- REMOVE the ground to the filter.
- REVERSE the filter so the two wire side is toward the radio with the ground wire attached to a good ground.

- REMOVE the ground from the filter.

5. If noise is still present, install another filter, GM P/N 1224205, in the ignition feed to the radio. Install using the same variations as the first filter. If the installation of this filter causes turn ON or turn OFF delays or other noticeable performance concerns, REMOVE it and INSTALL a 0.47 mF capacitor to ground in its place.
6. REMOVE any unneeded filters after REPAIR, before reassembling the vehicle.

NOTICE TO TECHNICIANS:

Electromagnetic interference (EMI) can cause a fewer number of stations to be received in one of the three ignition suited modes. The EMI can be caused by various vehicle components. This may eliminate engine running components, ignition on components, etc. For example, if the same number of stations are received with the engine running as when the engine was off, the components that are active with the engine running are not causing the interference.

SYMPTOM TABLE

SYMPTOM	PROCEDURE	PAGE NUMBER
Display is inoperative, no sound from any speaker	Chart #1	8A-150-14
No sound from one speaker	Chart #2	8A-150-15
Compact Disc Player does not operate properly	Chart #3	8A-150-16
Tape Player does not operate properly	Chart #4	8A-150-17
Speed Compensated Volume (Chev up level Radios) does not operate properly	Check for PCM diagnostic trouble code (DTC P1652.) If set, refer to "Driveability and Emissions," Engine Controls for diagnosis. (All other systems that use the Vehicle Speed Signal should be checked for proper operation as well.) Check for open in CKT 817 between splice and radio. If OK, service radio.	
Radio memory (clock and station presets) is inoperative.	Check CKT 640 for an open or high resistance between Radio and I/P Fuse #30. If OK, service Radio.	
Radio does not "MUTE" or Radio is always muted if equipped with (UV8) cellular phone option.	Refer to Motorola Cellular Telephone Diagnostic Manual.	
Radio display is inoperative; speakers are OK. (Buick with C68)	Check CKT 724 for a short to B+. If OK, service Radio.	
Radio controls are inoperative.	Service Radio.	
Radio will not shut "OFF."	Service Radio.	
Radio display does not dim with I/P Dimmer Switch. (Buick with C68)	Check CKT 724 for an open or high resistance between Radio and Heater-A/C control. If OK, service Radio.	
Radio display does not dim with I/P Dimmer Switch. (Chev and Buick with C67)	Check CKT 8 for an open. If OK, service radio.	
Radio displays "LOC."	Remove Fuse #9 and Fuse #30 for one minute then reinstall fuses. If Radio still displays "LOC," refer to SECTION 9A.	
Radio display does not dim and/or Radio face and buttons do not illuminate with Park Lamps "ON."	Check CKT 32 for an open or high resistance between Radio and I/P Fuse #42. If OK, service Radio.	
Radio face and buttons do not dim with I/P Dimmer Switch; display dims normally.	Refer to "Instrument Panel Dimming."	8A-117-0

RADIO/AUDIO SYSTEMS

CHART #1
DISPLAY IS INOPERATIVE, NO SOUND FROM ANY SPEAKER

CHART #2
NO SOUND FROM ONE SPEAKER

RADIO/AUDIO SYSTEMS

CHART #3
COMPACT DISC PLAYER DOES NOT OPERATE PROPERLY

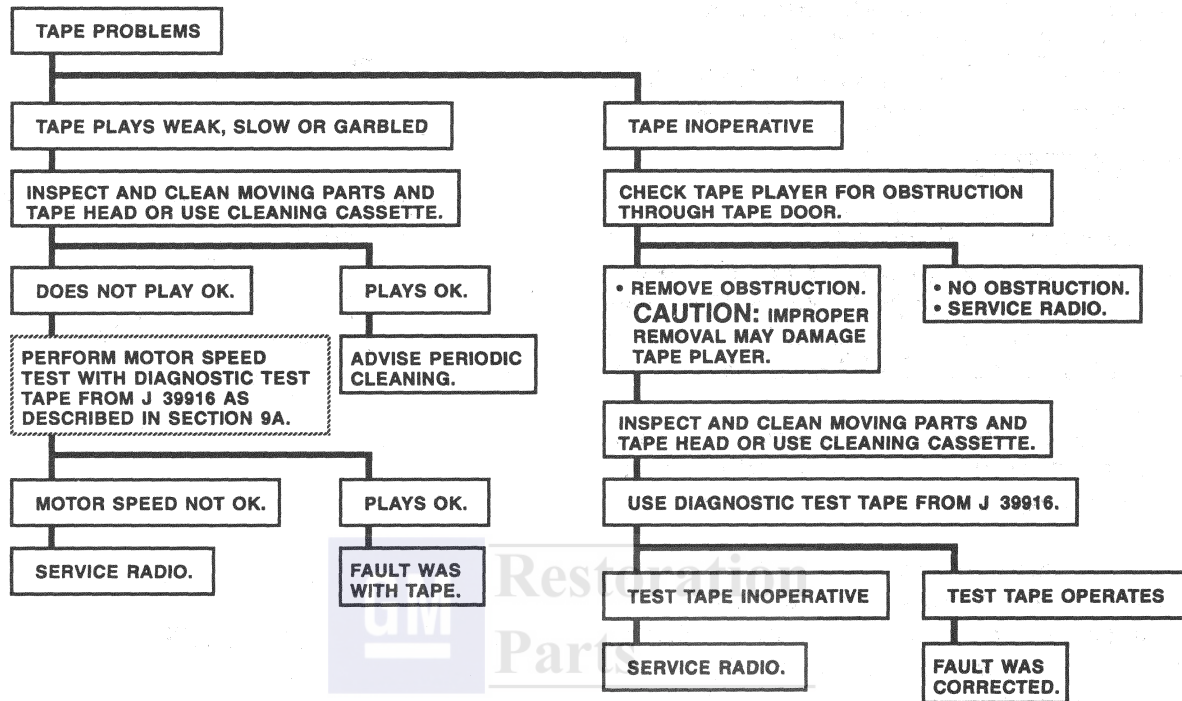

CHART #4
TAPE PLAYER DOES NOT OPERATE PROPERLY

RADIO/AUDIO SYSTEMS

! Important:

- Before measuring the resistance of the Antenna, remove the negative lead of the Battery and "zero" the meter before taking measurements. When checking resistance, cautiously wiggle the antenna mast, the lead-in tip, and the cable. The readings below should always be obtained. If not, some portion of the lead-in is intermittent and the lead-in should be replaced.

CUSTOMER'S TIPS

HOW TO ENJOY FM STEREO

- A. Select Stations Within Range - The best FM fidelity will be obtained from stations within a 10-40 mile range. Beyond that "noise" or "flutter" may begin to appear due to the "line of sight" range limitations of FM signals.

- SOLUTION: Reduce treble response by moving the treble control down (or to the left) in fringe areas. On EQ Radios, slowly slide the 10K control down.

- B. Realize Tall Structures Can Interfere - Tall buildings or hills may cause "shadows" or cancellation of FM signals (this is similar to the "ghost" or "flutter" effect seen on television sometimes when airplanes are flying in the vicinity). It will sound like a "pop" or momentary "hiss."

- SOLUTION: Reduce the treble or 10K setting to a lower volume.

- C. Interference From Another Station - Although the circuits in Delco receivers are the most advanced available, there are rare instances where a station being listened to will be interfered with by another station. This only happens when the stations are on almost the same frequency and certain geographical criteria are present.

- SOLUTION: Select another station or switch to tape.

HOW TO ENJOY AM

Reception Characteristics

AM does not have the flutter characteristics of FM (caused by tall buildings, hills, etc.). However, it is subject to interference from power lines, neon signs, atmospheric conditions, and unwanted stations.

WAYS TO REDUCE NOISE

1. Move treble control down.
2. Tune to a stronger station.

CIRCUIT OPERATION

The Radio receives battery voltage at all times on CKT 640 through I/P Fuse #30 to keep clock and preset station memory alive when the Ignition is "OFF." With the Ignition Switch in "ACCY" or "RUN," voltage is applied to CKT 43 through I/P Fuse #9 to enable Radio operation.

When the Park Lamps or Headlamps are turned "ON," voltage is applied to the Radio on CKT 32 from the Headlamp Switch. When voltage is applied to CKT 32 at the Radio, the Radio will dim the display a preset amount (Step Dim). With the Headlamps or Park Lamps "ON," the Radio display may be dimmed manually using the I/P Dimmer Switch. The I/P Dimmer Switch varies the voltage on CKT 8 to the Radio to control the radio face display dimming.

The Heater and A/C Control on Buicks with Automatic Control Air Conditioning (C68) will also supply the Radio with a Pulse Width Modulated signal on CKT 724. This signal (voltage) is used to dim the VF display of the Radio when the I/P Dimmer switch is dimmed manually.

ANTENNA SYSTEM TEST

- DISCONNECT NEGATIVE BATTERY CABLE.
- DISCONNECT ANTENNA LEAD-IN CONNECTOR AT THE RADIO RECEIVER.
- WITH A DVM, MEASURE RESISTANCE BETWEEN THE COAX (OUTER CONDUCTOR) CONNECTOR AND THE NEGATIVE BATTERY CABLE.

IMPORTANT:

- TO AVOID MISDIAGNOSIS BE SURE TO "ZERO" METER BEFORE TAKING MEASUREMENTS. IS RESISTANCE VALUE GREATER THAN .15 OHMS?

NO

YES

- GRASP THE ANTENNA MAST.
- WHILE OBSERVING THE DVM, WIGGLE THE ANTENNA. DOES THE METER INDICATE INTERMITTENT CONTINUITY?

- CHECK THE BASE OF THE ANTENNA FOR A GOOD CONNECTION TO BODY GROUND.
- CHECK THE COAXIAL CABLE INTERCONNECTS FOR A POOR CONNECTION OR CORROSION.
- CHECK THE GROUND CONNECTION FROM THE BATTERY NEGATIVE CABLE TO THE BODY. REPAIR THE ANTENNA GROUND CIRCUIT AS NECESSARY.

NO

YES

- WITH A DVM, MEASURE RESISTANCE BETWEEN THE RADIO COAX LEAD-IN CONNECTOR (CENTER CONDUCTOR) AND THE ANTENNA MAST.

IMPORTANT:

- TO AVOID MISDIAGNOSIS BE SURE TO "ZERO" METER BEFORE TAKING MEASUREMENTS. DOES THE MEASURED RESISTANCE APPROXIMATELY EQUAL THE VALUE GIVEN IN THE FOLLOWING TABLE?

COAX TYPE	RESISTANCE MEASURE IN OHMS
RG-58 RG-59	LESS THAN 0.2
RG-62 RG-62M	LESS THAN 3.5

- CHECK THE BASE OF THE ANTENNA FOR A GOOD CONNECTION TO BODY GROUND.
- CHECK THE COAXIAL CABLE INTERCONNECTS FOR A POOR CONNECTION OR CORROSION.
- CHECK THE GROUND CONNECTION FROM THE BATTERY NEGATIVE CABLE TO THE BODY. REPAIR THE ANTENNA GROUND CIRCUIT AS NECESSARY.

TROUBLESHOOTING HINTS

(Perform before beginning System Diagnosis)

If Power Antenna goes up or down only part way, check Antenna Mast for bent or dirty condition. Refer to SECTION 9A for cleaning and lubricating procedures.

- Check for a broken (or partially broken) wire inside of the insulation which could cause system malfunction but prove "GOOD" in a continuity/voltage check with a system disconnected. These circuits may be intermittent or resistive when loaded, and if possible,

should be checked by monitoring for a voltage drop with the system operational (under load).

- Check for proper installation of aftermarket electronic equipment which may affect the integrity of other systems (see "Troubleshooting Procedures," page 8A-4-0).
- Refer to System Diagnosis.

SYSTEM DIAGNOSIS

- Refer to the Symptom Table for the proper diagnostic procedure(s).

SYMPTOM TABLE

SYMPTOM	PROCEDURE	PAGE NUMBER
Radio Power Antenna will not extend.	Chart #1	8A-151-4
Radio Power Antenna will not retract.	Chart #2	8A-151-5
Radio Power Antenna goes up and down properly, but the Radio will not receive signals.	Refer to "Radio/Audio Systems."	8A-150-0
Radio Power Antenna Motor operates normally, but Antenna Mast will not extend or retract.	Replace Power Antenna Mast; refer to SECTION 9A.	

POWER ANTENNA

CHART #1
RADIO POWER ANTENNA WILL NOT EXTEND

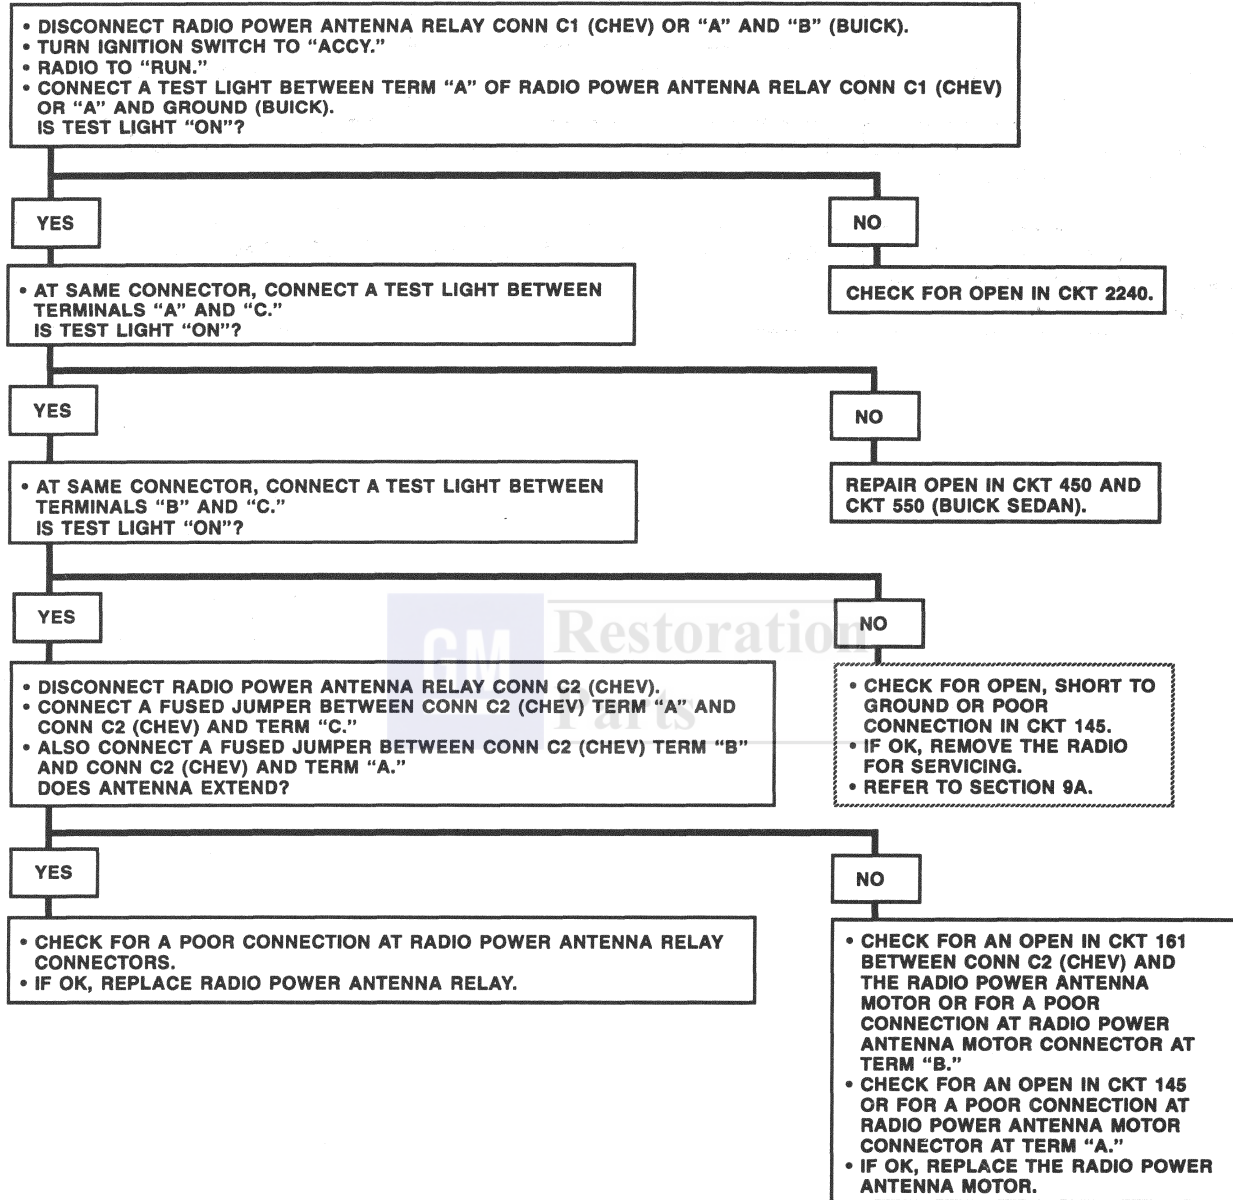

CHART #2

RADIO POWER ANTENNA WILL NOT RETRACT

C10121

CIRCUIT OPERATION

When the Radio Control is in the "ON" position, voltage is applied from the radio (CKT 145) to the Radio Power Antenna Relay Coil. The relay contacts close, and battery voltage is applied through CKT 145 to the Radio Power Antenna Motor. The "B" motor terminal is grounded through the "UP" switch, CKT 161 and the relay contacts. The motor drives the Antenna Mast up. When the antenna is at its full height, the "UP" switch opens and the motor stops.

When the radio or Ignition Switch is in the "OFF" position, voltage is removed from the Radio Power Antenna Relay Coil. The Radio Power Antenna Relay contacts open, applying battery voltage to the motor through CKT 160. The motor ground is now CKT 145. Since the "DOWN" switch at the antenna is now making contact to CKT 160, the voltage to the motor has reversed polarity. It runs in the opposite direction, retracting the Antenna Mast.

At the end of the antenna's travel, the "DOWN" switch opens and breaks the current flow. Both sets of switches are now in the places shown in the schematic, the radio is "OFF," and the Antenna Mast is down.

The antenna is connected to the radio by coaxial cable.

CELLULAR MOBILE TELEPHONE

CELLULAR MOBILE TELEPHONE

COMPONENT	LOCATION	201-PG	FIG.	CONN
Antenna Conn.....	Center of Rear Windshield, cable routed down RH Rear "C" Pillar	8	13	
Handset Conn.....	Center of Tunnel, below I/P			
Microphone Conn.....	Center of Windshield Header, cable routed down RH Front "A" Pillar.....	26	37	
PAC Module Conn.....	Center of I/P, below Radio			
Transceiver Conn	In Front of Rear Compartment			

For Cellular Mobile Telephone diagnosis, refer to the Motorola Cellular Telephone Diagnostic Manual provided with the dealer installed Cellular Mobile Telephone.

2 - BOOK 1 INDEX

Anticorrosion Treatment (General Body Service).....	10-1-11
Antilock Brake System (ABS), Diagnostic Processes.....	5E1-5
Antilock Brake System (ABS), Diagnostic System Check.....	5E1-9
Antilock Brake System (ABS), Displaying DTC's	5E1-6
Antilock Brake System (ABS), DTC Diagnostic Charts	5E1-18
Antilock Brake System (ABS), Electronic Brake Control Module (EBCM).....	5E1-58
Antilock Brake System (ABS), General Description	5E1-1
Antilock Brake System (ABS), Hydraulic Components.....	5E1-56
Antilock Brake System (ABS), On-Vehicle Service	5E1-54
Antilock Brake System (ABS), Service Precautions	5E1-54
Antilock Brake System (ABS), Symptom Table	5E1-10
Antilock Brake System (ABS), System Components.....	5E1-2
Antilock Brake System (ABS), System Operation	5E1-1
Antilock Brake System (ABS), Tech 1 Diagnostics	5E1-7
Antilock Brake System (ABS), Warning/Indicator Lamps	5E1-63
Antilock Brake System (ABS), Warning System Operation	5E1-1
Antilock Brake System (ABS), Wheel Speed Sensors.....	5E1-59
Antilock Brake System (ABS), Wiring Diagrams	5E1-12
Anti-Chip Coating Material	10-1-14
Approximate Fluid Capacities	0B-10
Armrest, Rear Seat, On-Vehicle Service.....	10-10-32
Armrest Cover, On-Vehicle Service	10-10-14
Ashtray and Cigarette Lighter, On-Vehicle Service.....	8C-9
Ashtray Lamp, General Description.....	8B-4
Ashtray Lamp Bulb Replacement, On-Vehicle Service	8B-21
Audio Systems, Antenna Lead-In Cable Check	9A-10
Audio Systems, Audio System Diagnosis	SECTION 8A
Audio Systems, Cassette Tape Player Care.....	9A-12
Audio Systems, Compact Disc Player Care	9A-12
Audio Systems, Compact Disc Player	9A-9
Audio Systems, Diagnosis	9A-9
Audio Systems, Fixed Antenna, Diagnosis.....	9A-9
Audio Systems, General Description.....	9A-1
Audio Systems, Mast Section Replacement, Power Antenna.....	9A-15
Audio Systems, On-Vehicle Service.....	9A-12
Audio Systems, Power Antenna Care.....	9A-12
Audio Systems, Power Antenna Check	9A-10
Audio Systems, Power Antenna, Diagnosis	SECTION 8A
Audio Systems, Power Antenna Relay Replacement	9A-15
Audio Systems, Power Antenna Lead-In Cables	9A-16
Audio Systems, Radios, General Description.....	9A-2
Audio Systems, Radio Controls, General Description	9A-3
Audio Systems, Speaker Diagnosis (Cassette only)	9A-10
Audio Systems, Theftlock	9A-9
Audio Systems, Unlocking Secured Radio	9A-9
Automatic Lamp Operation, General Description	9C-1
Automatic Transmission, Accumulators, On-Vehicle Service	7A-21
Automatic Transmission, Adapt Function, Diagnosis.....	7A-14A-9
Automatic Transmission, 2-4 Band Servo, On-Vehicle Service	7A-20
Automatic Transmission, Brake Transmission Shift Interlock	3F5A
Automatic Transmission, Case Extension, On-Vehicle Service	7A-19
Automatic Transmission, Changing Fluid and Filter.....	7A-14
Automatic Transmission, Column Shift, Backup Lamp and Transmission Position Sensor Switch, On-Vehicle Service.....	7A-11
Automatic Transmission, Component and System Descriptions.....	7A-14A-8
Automatic Transmission, Component Resistance Chart, Diagnosis	7A-14A-29
Automatic Transmission, Control and Shift Solenoids, On-Vehicle Service.....	7A-25
Automatic Transmission, Control Valve and Pressure Switch, On-Vehicle Service.....	7A-24
Automatic Transmission, Converter Cover, On-Vehicle Service	7A-23
Automatic Transmission, Diagnosis	7A-14A-17
Automatic Transmission, Diagnosis Charts	7A-14A-36
Automatic Transmission, Diagnostic Trouble Code Diagnosis	7A-14A-46
Automatic Transmission, Diagnostic Trouble Code Identification.....	7A-14A-49
Automatic Transmission, Electronic Component Location Views	7A-14A-11
Automatic Transmission, Electrical/Garage Shift Test, Diagnosis.....	7A-14A-17
Automatic Transmission, Flexplate/Torque Converter Clutch Vibration Test Procedure.....	7A-6
Automatic Transmission, Floor Shift, Backup Lamp/Trans Position Sensor Switch	7A-11
Automatic Transmission, Floor Shift, BTSI Solenoid, On-Vehicle Service.....	7A-11
Automatic Transmission, Floor Shift, Removal and Installation.....	7A-11
Automatic Transmission, Floor Shift, Shift Control Cable.....	7A-13
Automatic Transmission, Fluid, Changing Of Fluid and Filter	7A-14
Automatic Transmission, Fluid, Checking Procedure.....	7A-4
Automatic Transmission, Fluid Filler Tube and Seal, On-Vehicle Service.....	7A-17
Automatic Transmission, Fluid Leak Diagnosis	7A-14A-32

- Automatic Transmission, Fluid Passage
Identification..... 7A-14A-117
- Automatic Transmission, Functional Check
Procedure, Diagnosis 7A-14A-17

6 - BOOK 1 INDEX

Cruise Control, General Description	9B-1
Cruise Control, On-Vehicle Service	9B-3
Cruise Control, Release Switch and Stoplamp Switch, On-Vehicle Service	9B-3
Cruise Control, Release Switch, General Description	9B-1
Cruise Control, Vehicle Speed Sensor, General Description	9B-2

D

Day/Night Rearview Mirror, Electrochromic	10-2-23
Daytime Running Lamps (DRL), Ambient Light Sensor	9C-2
Daytime Running Lamps (DRL), General Description	9C-2
Decimal and Metric Equivalents	0A-12
Defogger, On-Vehicle Service	10-2-26
Disconnecting the Negative Battery Cable	0A-1
Door, Center Pillar Switches	10-6-59
Door, Center Pillar Exterior Trim	10-6-59
Door, Front Adjustment	10-6-45
Door, Front Bottom Auxiliary Sealing Strip, On-Vehicle Service	10-6-31
Door, Front Door Moldings, On-Vehicle Service	10-6-23
Door, Front Exterior Trim, On-Vehicle Service	10-6-23
Door, Front Handles, On-Vehicle Service	10-6-39
Door, Front Inside Handle Lever, On-Vehicle Service	10-6-40
Door, Front Interior Trim, On-Vehicle Service	10-6-20
Door, Front Latch, On-Vehicle Service	10-6-44
Door, Front Lock Actuator, On-Vehicle Service	10-6-47
Door, Front Locking System Module, On-Vehicle Service	10-6-44
Door, Front Lock Switch, On-Vehicle Service	10-6-33
Door, Front Lock Strikers, On-Vehicle Service	10-6-44
Door, Front, On-Vehicle Service	10-6-52
Door, Front Outside Rearview Mirror, On-Vehicle Service	10-6-35
Door, Front Outside Rearview Mirror Motor, On-Vehicle Service	10-6-37
Door, Front Pull Handle, On-Vehicle Service	10-6-40
Door, Front Radio Speaker, On-Vehicle Service	10-6-37
Door, Front Sealing Strips, On-Vehicle Service	10-6-31
Door, Front Switches, On-Vehicle Service	10-6-33
Door, Front Water Deflector, On-Vehicle Service	10-6-34
Door, Front Water Deflector General Description	10-6-2
Door, Front Weatherstrips, On-Vehicle Service	10-6-30
Door, Front Window	10-6-53
Door, Front Window Belt Sealing Strips, On-Vehicle Service	10-6-64
Door, Front Window, On-Vehicle Service	10-6-53
Door, Front Window Regulator and Motor, On-Vehicle Service	10-6-56
Door, General Description	10-6-2
Door, Hinges General Description	10-6-3
Door, Hinges, Front Door, Upper and Lower, On-Vehicle Service	10-6-49
Door, Lock Cylinder Inspection	10-6-49
Door, Lock Strikers General Description	10-6-2
Door, Lock Strikers, On-Vehicle Service	10-6-47
Door, Locking System Module, General Description	10-6-3
Door, Outside Handles General Description	10-6-3
Door, Outside Rearview Mirrors General Description	10-6-3
Door, Outside Rearview Mirror, On-Vehicle Service	10-6-35
Door, Rear, On-Vehicle Service	10-6-69
Door, Rear Upper Front Auxiliary Sealing Strip, On-Vehicle Service	10-6-63
Door, Rear Exterior Trim, On-Vehicle Service	10-6-60
Door, Rear Interior Trim, On-Vehicle Service	10-6-60
Door, Rear Lock Actuator, On-Vehicle Service	10-6-68
Door, Rear Locking Rod Lever, On-Vehicle Service	10-6-68
Door, Rear Locking System Module, On-Vehicle Service	10-6-68
Door, Rear Lock Strikers, On-Vehicle Service	10-6-68
Door, Rear Molding, On-Vehicle Service	10-6-60
Door, Rear Sealing Strips, On-Vehicle Service	10-6-64
Door, Rear Security Lock, General Description	10-6-3
Door, Rear Side Door Interior Trim, On-Vehicle Service	10-6-60
Door, Rear Side Door Exterior Trim, On-Vehicle Service	10-6-60
Door, Rear Side Door Switches	10-6-67
Door, Rear Side Door Window, On-Vehicle Service	10-6-70
Door, Rear Water Deflector, On-Vehicle Service	10-6-68
Door, Rear Window, On-Vehicle Service	10-6-70
Door, Rear Window Belt Outer Sealing Strip, On-Vehicle Service	10-6-64
Door, Rear Window Belt Inner Sealing Strip, On-Vehicle Service	10-6-64
Door, Rear Window Front and Rear Channel, On-Vehicle Service	10-6-65
Door, Rear Window Regulator, On-Vehicle Service	10-6-71
Door, Rear Window Regulator Motor, On-Vehicle Service	10-6-72
Door, Rear Weatherstrip, On-Vehicle Service	10-6-65
Door, Rear Side Door Window Weatherstrip ...	10-6-65
Driveability and Emissions, General Information	SECTION 6E
Driveability and Emissions, Sequential Multiport Fuel Injection	SECTION 6E3
Driveshaft	Refer to Propeller Shaft

Windshield, On-Vehicle Service	10-2-8
Windshield, Short Method-Removal	10-2-4
Windshield Side Reveal Molding, On-Vehicle Service	10-2-2
Windshield Upper Reveal Molding, On-Vehicle Service	10-2-2
Windshield Wiper/Washer, Arm Pressure Check	8E-19
Windshield Wiper/Washer, Arm Replacement	8E-11
Windshield Wiper/Washer, Blade/Element Replacement	8E-13
Windshield Wiper/Washer, Diagnosis	8E-2
Windshield Wiper/Washer, General Description	8E-1
Windshield Wiper/Washer, Linkage Assembly Replacement	8E-17
Windshield Wiper/Washer, Motor Replacement	8E-15
Windshield Wiper/Washer, Off-Vehicle Service	8E-18
Windshield Wiper/Washer, On-Vehicle Service ...	8E-11
Windshield Wiper/Washer, Pump Replacement	8E-11
Windshield Wiper/Washer, Switch Replacement	8E-18
Windshield Wiper/Washer, Wiper Chatter Repair	8E-19
Window Reveal Moldings, On-Vehicle Service	10-2-7

A

Accelerator Controls	
5.7L	6E-414, 6E-415
A/C Clutch Circuit	
5.7L	6E-479
Air Filter Element Replacement	
5.7L	6E-413
Air Intake System Description	
5.7L	6E-484
Air Vacuum Bleed Valve Replacement	
5.7L	6E-463
Automatic Transmission	
General Information	7A-125
Scan Tool Data Definitions	7A-128
Automatic Transmission 4L60-E	
Component Location Table	7A-58
Connector End Views	7A-60
Controls - Cell 39	7A-53
Diagnosis	7A-128
3-2 Flare or Tie-Up	7A-45
Component Resistance	7A-38
Electronic Component Malfunctions	7A-42
Fluid Checking Procedure	7A-27
Fluid Leak	7A-50
Functional Test Procedure	7A-27
Harsh Garage Shift	7A-47
Harsh Shifts	7A-43
Inaccurate Shift Points	7A-43
Line Pressure Check Procedure	7A-29
Malfunction Trouble Code	7A-52
Noise and Vibration Analysis	7A-31
No Park	7A-49
No TCC Apply	7A-48
Oil Out the Vent	7A-49
Oil Pressure High or Low	7A-42
Road Test Procedure	7A-30
Slipping or Rough 1-2 Shift	7A-45
Slips in 1st Gear	7A-44
Tech 1 Data Value Examples	7A-35
Torque Converter Clutch	7A-33
Disassembled View	7A-7
Electrical Connector Description	7A-135
Electronic Component Description	7A-131
Electronic Component Location Table	7A-61
Fastener Tightening Specifications	7A-3
Forward Clutch Piston Travel Check	7A-5
Input Carrier Pinion End Play	7A-5
Oil Pump Rotor and Slide Measurement	7A-6
On-Car Lubrication Specifications	7A-3
Range Reference Table	7A-3
Reverse Input and Input Clutches	7A-6
Schematic Icon Table	7A-57
Schematic Reference Table	7A-57
Shift Speed Table	7A-4
Special Tools	7A-137
Torque Converter End Play Check	7A-6
Transmission End Play Check	7A-5

C

Clean Air Cover and Gasket Replacement	
5.7L	6E-421
Crankcase Ventilation System Description	
5.7L	6E-493
Crankshaft Position Sensor Replacement	
5.7L	6E-450

D

Distributor Ignition System Description	
5.7L	6E-481
Draining Fuel Tank	
5.7L	6E-423
Diagnostic Trouble Codes	
Engine	6E-59 - 6E-358
Transmission	7A-62 - 7A-121

E

ECT Sensor Replacement	
5.7L	6E-407
EEPROM	
5.7L	6E-472
EGR System Description	
5.7L	6E-492
EGR Vacuum Control Signal Sol	
Valve Replacement 5.7L	6E-454
EGR Valve Replacement	
5.7L	6E-453
Electric Cooling Fan	
5.7L	6E-480
Engine Controls	
Scan Tool Data Definitions	6E-10
Engine Controls 5.7L	
Component Location Table	6E-38
Connector End Views	6E-31
Engine Controls	6E-14
Scan Tool Data List	6E-6
System/Fuel System Torque Specifications	6E-5
Temperature vs Resistance Table	6E-5
Engine Controls Special Tools	
5.7L	6E-495
Engine Diagnosis 5.7L	6E-373
A/C Request Circuit Check	6E-386
Backfire	6E-376
Cuts Out	6E-368
Detonation	6E-365
Dieseling	6E-376
Distributor Ignition System Check	6E-390
Distributor Vent System Check	6E-394
Electric Cooling Fan	6E-388
Engine Cranks but Does Not Run	6E-47
Fuel Injector Balance Test	6E-396
Fuel Injector Coil Test	6E-399, 6E-401
Fuel Pump Relay Circuit	6E-50
Fuel System	6E-53
Fuel Tank Leak Check	6E-395
Hard Start	6E-361
Hesitation	6E-366
Incorrect Idle	6E-373

Engine Diagnosis 5.7L.....	(cont.)
Misses	6E-368
No Scan Tool Data	6E-44
OBD System Check	6E-42
PNP Switch Check	6E-382
Poor Fuel Economy	6E-370
Power Steering Pressure Switch Check.....	6E-384
Restricted Exhaust System Check	6E-380
Rough Idle	6E-373
Run-On.....	6E-376
Sag	6E-366
Stalling	6E-373
Strategy Based Diagnostic Flow	6E-40
Surges/Chuggles.....	6E-363
Symptoms	6E-361
EVAP Canister Hoses Replacement	
5.7L	6E-459
EVAP Canister Purge Solenoid	
Valve Replacement 5.7L	6E-458
EVAP Canister Replacement	
5.7L	6E-455
EVAP Control System Description	
5.7L	6E-488
EVAP Purge Vacuum Switch Replacement	
5.7L	6E-457

F

Fuel Crossover Tube Replacement	
5.7L	6E-433
Fuel Hose and Pipes Replacement	
5.7L	6E-442, 6E-445
Fuel Injector Replacement	
5.7L	6E-435
Fuel Metering Modes of Operation	
5.7L	6E-486
Fuel Metering System Components	
5.7L	6E-486
Fuel Outlet Tube Replacement	
5.7L	6E-431
Fuel Pressure Connection Valve Replacement	
5.7L	6E-430
Fuel Pressure Regulator Replacement	
5.7L	6E-437
Fuel Pressure Relief Procedure	
5.7L	6E-441
Fuel Pump Relay Replacement	
5.7L	6E-447
Fuel Rail Assembly Replacement	
5.7L	6E-439
Fuel Sender Assembly	
5.7L	6E-427
Fuel Sender Assembly Service	
5.7L	6E-428
Fuel Supply Components	
5.7L	6E-484
Fuel System Cleaning	
5.7L	6E-426
Fuel Tank Replacement	
5.7L	6E-424

H

Heated Oxygen Sensor (HO2S)	
Replacement 5.7L.....	6E-410, 6E-411

I

IAC Valve Replacement	
5.7L	6E-416
IAT Sensor Replacement	
5.7L	6E-413
Idle Air Control Valve Replacement	
5.7L	6E-419
Information Sensors	
5.7L	6E-473
In-Line Fuel Filter Replacement	
5.7L	6E-422

K

Knock Sensor Module Replacement	
5.7L	6E-452
Knock Sensor Replacement	
5.7L	6E-451
Knock Sensor System Description	
5.7L	6E-479

L

Long Term Fuel Trim	
5.7L	6E-472

M

MAF Sensor Replacement	
5.7L	6E-409
MAP Sensor Replacement	
5.7L	6E-409

P

PCM Function	
5.7L	6E-471
PCM Replacement.....	6E-404
Powertrain Control Module Description	
5.7L	6E-464
Preliminary Checking Procedure (4L60-E)	7A-127
Programming PCM	6E-404

R

Relay	
Fuel Pump	
5.7L.....	6E-447

S

Secondary Air Check Valve and Pipes Replacement	
5.7L	6E-461, 6E-462
Secondary Air Injection System Description	
5.7L	6E-490
Secondary Air Pump Replacement	
5.7L	6E-459
Servicing Quick Connect Fittings	
5.7L	6E-447
Short Term Fuel Trim	
5.7L	6E-472
Speed Density System	
5.7L	6E-473

T

Throttle Body Assembly Replacement	
5.7L	6E-417
Torque Converter Clutch Electrical Controls.....	7A-135
TP Sensor Replacement	
5.7L	6E-412
Transmission Fluid Checking	
Procedure (4L60-E)	7A-127
Transmission ID Information.....	7A-125

V

Valve	
EGR	
5.7L	6E-453
IAC, Replacement	
5.7L	6E-416
